VRF Aware BGP Translate-Update

The VRF aware BGP translate-update feature enables multicast forwarding on those customer-edge (CE) devices, which have an older version of Cisco software that does not support multicast BGP (mBGP) routing.

The provider-edge (PE) devices establish a virtual routing and forwarding (VRF) session with the neighbor CE devices, and configure the translate-update feature under an IPv4/IPv6 VRF address family. The PE devices translate the updates from unicast to multicast on CE devices and put them as multicast updates in the Border Gateway Protocol (BGP) VRF routing table of the PE devices for processing.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VRF Aware BGP Translate-Update

• The VRF aware translate-update feature applies only to IPv4/IPv6 virtual routing and forwarding (VRF) address-families.

• You must use peer-group for the configuration of the neighbor under IPv4/IPv6 VRF address families.

• BGP neighbors that are only capable of unicast routing, must be activated under both unicast and multicast address families.
• BGP neighbors must also be enabled under the compatible multicast address family for the VRF aware translate-update feature to function as designed.

• The provider-edge (PE) devices must have multicast VRF enabled and must have a session established with the customer-edge (CE) devices.

Restrictions for VRF Aware BGP Translate-Update

• You must not configure (nonVRF) IPv4/IPv6 address families for the VRF aware BGP translate-update feature. The IPv4/IPv6 address family must be configured for multicast routing using the Subsequent Address Family Identifier (SAFI) feature.

• The VRF aware BGP translate-update feature does not support configuration of BGP neighbor using peer-template.

Information About VRF Aware BGP Translate-Update

VRF Aware BGP Translate-Update Overview

The VRF aware BGP translate-update feature enables multicast forwarding on those customer-edge (CE) devices, which have an older version of Cisco software that does not support multicast BGP (mBGP) routing.

This feature is analogous to the Subsequent Address Family Identifier (SAFI), which provides the capability to support multicast routing in the service provider's core IPv4 network, but is limited in support to IPv4/IPv6 address families. In the case of the virtual routing and forwarding (VRF) aware BGP translate-update feature, provider-edge (PE) devices establish a VRF session with the neighbor CE devices, and have the translate-update feature configured under an IPv4/IPv6 VRF address family.

When the neighbor translate-update command is configured on a PE device under the (IPv4 VRF) address-family configuration mode or the (IPv6 VRF) address-family configuration mode, the PE devices translate the updates from unicast to multicast on CE devices and put them in the Border Gateway Protocol (BGP) VRF routing table of the PE devices, as multicast updates, for processing. If you also configure the optional keyword unicast, the updates that are not translated, are placed in the PE device's unicast queue and populates the unicast VRF BGP table. The translation from unicast to multicast routes occurs from CE devices to PE devices only, and the multicast and unicast prefixes are only advertised from the CE device to the PE device's multicast neighbors.

For example, when you configure the VRF aware BGP translate-update feature under a VRF (v1) for a neighbor CE device (CE1), a neighbor topology under the IPv4-multicast-VRF or IPv6-multicast-VRF address-family is added to CE1's session with a PE device (PE1). The multicast-VRF neighbor topology does not actively participate in these multicast sessions and only forwards announcements that arrive from CE1. Once such announcements arrive, they are translated into multicast and placed in the nonactive multicast VRF neighbor's routing table. The Cisco software ensures that the routes advertised by CE1 configured under the IPv4/IPv6 VRF address-family are available on PE1's IPv4/IPv6 multicast VRF v1 address-family BGP table. These routes, along with PE1's IPv4/IPv6 multicast VRF v1 address-family BGP table, are advertised to PE1's multicast peers if you have configured the neighbor translate-update command. The routes are also advertised to PE1's unicast peers if you have also configured the optional keyword unicast.
The `unicast` keyword is optional, yet significant, as it enables the PE devices to place unicast advertisements from the CE devices in the unicast BGP table of the PE devices. Therefore, route advertisements from CE devices populates both unicast and multicast BGP tables, else CE device's routes only populate the PE device's multicast BGP table.

---

**Note**
You must also enable address-family under the compatible multicast address-family for VRF aware BGP translate-update feature to function as designed.

---

# How To Configure VRF Aware BGP Translate-Update

## Configuring VRF Aware BGP Translate-Update

Perform this task to configure VRF aware BGP translate-update feature:

### SUMMARY STEPS

1. `enable`
2. `configure` terminal
3. `router bgp` `as-number`
4. `address-family` ipv4 [mdt | tunnel | {multicast | unicast} [vrf `vrf-name`] | `vrf vrf-name`]
5. `neighbor` `peer-group-name` `peer-group`
6. `neighbor` `{ipv4-addr | ipv6-addr | peer-group-name}` `remote-as` `autonomous-system-number`
7. `neighbor` `{ipv4-addr | ipv6-addr}` `peer-group` `peer-group-name`
8. `neighbor` `{ipv4-addr | ipv6-addr | peer-group-name}` `activate`
9. `neighbor` `{ipv4-address | ipv6-address}` `translate-update` `multicast` [unicast]
10. `end`
11. `show bgp vpnv4 multicast` {all | `vrf vrf-name` | `rd route-distinguisher`}
12. `show ip route multicast` `vrf vrf-name`
13. `show running-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device&gt;</code> <code>enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure</code> terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device#</code> <code>configure</code> terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step</strong></td>
<td><strong>Command or Action</strong></td>
</tr>
<tr>
<td>---------</td>
<td>----------------------</td>
</tr>
</tbody>
</table>
| 3       | `router bgp as-number` | Enters router configuration mode and creates a BGP routing process.  
**Example:**  
Device(config)# router bgp 65000 |
| 4       | `address-family ipv4 [mdt | tunnel | {multicast | unicast} [vrf vrf-name] | vrf vrf-name]` | Enters address family configuration mode to configure a routing session using standard IP Version 4 (IPv4) address prefixes.  
**Example:**  
Device(config)# address-family ipv4 vrf v1 |
| 5       | `neighbor peer-group-name peer-group` | Creates a BGP or multiprotocol BGP peer group.  
**Example:**  
Device(config-af)# neighbor n2 peer-group |
| 6       | `neighbor {ipv4-addr | ipv6-addr | peer-group-name} remote-as autonomous-system-number` | Adds an entry to the BGP or multiprotocol BGP neighbor table.  
**Example:**  
Device(config-af)# neighbor n2 remote-as 4 |
| 7       | `neighbor {ipv4-addr | ipv6-addr} peer-group peer-group-name` | Configures a BGP neighbor to be a member of a peer group.  
**Example:**  
Device(config-af)# neighbor 10.1.1.1 peer-group n2 |
| 8       | `neighbor {ipv4-addr | ipv6-addr | peer-group-name} activate` | Enables exchange of information with a BGP neighbor.  
**Example:**  
Device(config-af)# neighbor 10.1.1.1 activate |
| 9       | `neighbor {ipv4-address | ipv6-address} translate-update multicast [unicast]` | Enables multicast routing on devices, which are not capable of multicast BGP (mBGP) routing.  
**Example:**  
Device(config-af)# neighbor 10.1.1.1 translate-update multicast unicast |
| 10      | `end` | Returns to privileged EXEC mode.  
**Example:**  
Device(config-af)# end |
### Purpose

**Command or Action** | **Purpose**  
--- | ---  
**Step 11**  
show bgp vpnv4 multicast \{all | vrf vrf-name | rd route-distinguisher\}  
**Example:**  
Device# show bgp vpnv4 mul vrf v1 summary  
Displays Virtual Private Network Version 4 (VPNv4) multicast entries in a BGP table.  
**Step 12**  
show ip route multicast vrf vrf-name  
**Example:**  
Device# show ip route multicast vrf v1  
Displays the IP routing table associated with a specific multicast VPN routing and forwarding (VRF) instance.  
**Step 13**  
show running-config  
**Example:**  
Device# show running-config  
Displays the running configuration on the device.  
---

### Removing the VRF Aware BGP Translate-Update Configuration

Perform this task to disable the VRF aware BGP translate-update feature:

#### SUMMARY STEPS

1. enable  
2. configure terminal  
3. router bgp as-number  
4. address-family ipv4 \{mdt | tunnel | {multicast | unicast} \{vrf vrf-name | vrf vrf-name\}  
5. no neighbor \{ipv4-address | ipv6-address\} translate-update multicast [unicast]  
6. end  
7. show running-config

#### DETAILED STEPS

</table>

## Configuration Examples for VRF Aware BGP Translate-Update

### Example: Configuring VRF aware BGP Translate-Update

The following example shows how to configure the translate-update feature for an IPv4 VRF address-family named v1 and BGP neighbor n2 peer-group for VRF configuration:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 65000
Device(config-router)# address-family ipv4 vrf v1
Device(config-router-af)# neighbor n2 peer-group
Device(config-router-af)# neighbor n2 remote-as 4
Device(config-router-af)# neighbor 10.1.1.1 peer-group n2
Device(config-router-af)# neighbor 10.1.1.1 activate
```

**Note**

Peer-template configuration for BGP neighbor is not supported for this feature due to conflicts with the earlier versions of Cisco software.
Device(config-router-af)# neighbor 10.1.1.1 translate-update multicast unicast
Device(config-router-af)# end

The following is sample output from the `show bgp vpnv4 multicast vrf` command. As the VRF aware BGP translate-update feature is configured, the state of the neighbor displays “NoNeg”:

Device# show bgp vpnv4 multicast vrf v1 summary

<table>
<thead>
<tr>
<th>Neighbor</th>
<th>V</th>
<th>AS</th>
<th>MsgRcvd</th>
<th>MsgSent</th>
<th>TblVer</th>
<th>InQ</th>
<th>OutQ</th>
<th>Up/Down</th>
<th>State/PfxRcd</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.1.1.1</td>
<td>4</td>
<td>4</td>
<td>5</td>
<td>10</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>00:01:10 (NoNeg)</td>
<td></td>
</tr>
<tr>
<td>10.1.3.2</td>
<td>4</td>
<td>2</td>
<td>12</td>
<td>10</td>
<td>8</td>
<td>0</td>
<td>0</td>
<td>00:01:33</td>
<td></td>
</tr>
</tbody>
</table>

The following is sample output from the `show ip route multicast vrf` command:

Device# show ip route multicast vrf v1

| B | + 10.1.1.0/24 [20/0] via 10.1.1.1 (v1), 00:00:08 |

The following is sample output from the `show running-config` command:

Device# show running-config

address-family ipv4 vrf v1
redistribute connected
redistribute static
neighbor 10.1.1.1 remote-as 4
neighbor 10.1.1.1 activate
neighbor 10.1.1.1 translate-update multicast unicast
neighbor 10.1.1.1 remote-as 4
neighbor 10.1.1.1 activate
exit-address-family

! address-family ipv4 multicast vrf v1
redistribute connected
redistribute static
neighbor 10.1.1.1 remote-as 4
neighbor 10.1.1.1 activate
neighbor 10.1.1.1 soft-reconfiguration inbound
neighbor 10.1.1.1 route-map x in
exit-address-family

Note: The “neighbor 10.1.1.1 soft-reconfiguration inbound” and the “neighbor 10.1.1.1 route-map x in” field in the output indicate that only the routes in the BGP multicast table are affected.

The following is sample output from the `show running-config` command when you configure a neighbor under different address-families:

Configuration for IPv4/IPv6 unicast address-family:

Device# show running-config

address-family ipv4
neighbor 20.2.2.1 activate
neighbor 20.2.2.1 translate-update multicast unicast
exit-address-family

! address-family ipv4 multicast
neighbor 20.2.2.1 activate
exit-address-family

Configuration for IPv4/IPv6 VRF unicast address-family:

Device# show running-config

address-family ipv4 vrf v1
neighbor 20.2.2.1 remote-as 4
neighbor 20.2.2.1 activate
neighbor 20.2.2.1 translate-update multicast unicast
exit-address-family

! address-family ipv4 multicast vrf v1
neighbor 20.2.2.1 remote-as 4
neighbor 20.2.2.1 activate
exit-address-family

!
The following is sample configuration of the translate-update feature from a device with the old version of Cisco Software. The neighbor, in this case, is configured for IPv4/IPv6 unicast address-family, without running the `address-family` command:

Configuration in the old format, without an address-family configured:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 65000
Device(config-router)# neighbor 20.2.2.1 remote-as 4
Device(config-router)# neighbor 20.2.2.1 translate-update nlri ipv4 multicast unicast
Device(config-router-af)# end
```

Configuration in the new format, without an address-family configured:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 65000
Device(config-router)# neighbor 20.2.2.1 remote-as 4
Device(config-router)# neighbor 20.2.2.1 translate-update nlri multicast unicast
Device(config-router-af)# end
```

**Example: Removing VRF aware BGP Translate-Update Configuration**

The following example shows how to disable the VRF aware BGP translate-update feature for an IPv4 VRF address-family named v1 and BGP neighbor n2 peer-group for VRF:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 65000
Device(config-router)# address-family ipv4 vrf v1
Device(config-router-af)# no neighbor 10.1.1.1 translate-update multicast unicast
Device(config-router-af)# end
```

The following output displays the debug logs after you disable the translate-update feature on the neighbor:

```
*Nov 20 07:09:15.902: %BGP_SESSION-5-ADJCHANGE:
neighbor 2.2.2.1 IPv4 Multicast vpn vrf v1 topology base removed from session Neighbor deleted
*Nov 20 07:09:15.902: %BGP-5-ADJCHANGE:
neighbor 2.2.2.1 vpn vrf v1 Down Neighbor deleted
*Nov 20 07:09:15.902: %BGP_SESSION-5-ADJCHANGE:
neighbor 2.2.2.1 IPv4 Unicast vpn vrf v1 topology base removed from session Neighbor deleted
*Nov 20 07:09:16.877: %BGP-5-ADJCHANGE:
neighbor 2.2.2.1 vpn vrf v1 Up
```

The following is sample output from the `show running-config` command:
The associated neighbor 10.1.1.1 is removed even from the nonvolatile generation (NVGEN) after translate-update is disabled on that neighbor.

Device# show running-config

```
address-family ipv4 vrf v1
redistribute connected
redistribute static
neighbor 10.1.1.1 remote-as 4
neighbor 10.1.1.1 activate
exit-address-family
!
address-family ipv4 multicast vrf v1
redistribute connected
redistribute static
exit-address-family
```

### Feature Information for VRF Aware BGP Translate-Update

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
