Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About IPv6 Routing: Multiprotocol BGP Extensions for IPv6

Multiprotocol BGP Extensions for IPv6

Multiprotocol BGP is the supported Exterior Gateway Protocol (EGP) for IPv6. Multiprotocol BGP extensions for IPv6 supports many of the same features and functionality as IPv4 BGP. IPv6 enhancements to multiprotocol BGP include support for an IPv6 address family and Network Layer Reachability Information (NLRI) and next hop (the next device in the path to the destination) attributes that use IPv6 addresses.

How to Implement Multiprotocol BGP for IPv6

Configuring an IPv6 BGP Routing Process and BGP Router ID

Perform this task to configure an IPv6 BGP routing process and an optional BGP router ID for a BGP-speaking device.

BGP uses a router ID to identify BGP-speaking peers. The BGP router ID is 32-bit value that is often represented by an IPv4 address. By default, the router ID is set to the IPv4 address of a loopback interface on the device. If no loopback interface is configured on the device, then the software chooses the highest IPv4 address configured to a physical interface on the device to represent the BGP router ID.

When configuring BGP on a device that is enabled only for IPv6 (that is, the device does not have an IPv4 address), you must manually configure the BGP router ID for the device. The BGP router ID, which is represented as a 32-bit value using an IPv4 address syntax, must be unique to the BGP peers of the device.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **no bgp default ipv4-unicast**
5. **bgp router-id** *ip-address*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Device(config)# router bgp 65000	Configures a BGP routing process, and enters router configuration mode for the specified routing process.

	Command or Action	Purpose
Step 4	no bgp default ipv4-unicast Example: <pre>Device(config-router)# no bgp default ipv4-unicast</pre>	Disables the IPv4 unicast address family for the BGP routing process specified in the previous step. Note Routing information for the IPv4 unicast address family is advertised by default for each BGP routing session configured with the neighbor remote-as command unless you configure the no bgp default ipv4-unicast command before configuring the neighbor remote-as command.
Step 5	bgp router-id ip-address Example: <pre>Device(config-router)# bgp router-id 192.168.99.70</pre>	(Optional) Configures a fixed 32-bit router ID as the identifier of the local device running BGP. Note Configuring a router ID using the bgp router-id command resets all active BGP peering sessions.

Configuring IPv6 Multiprotocol BGP Between Two Peers

By default, neighbors that are defined using the **neighbor remote-as** command in router configuration mode exchange only IPv4 unicast address prefixes. To exchange other address prefix types, such as IPv6 prefixes, neighbors must also be activated using the **neighbor activate** command in address family configuration mode for the other prefix types, as shown for IPv6 prefixes.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp as-number**
4. **neighbor {ip-address | ipv6-address [%] | peer-group-name} remote-as autonomous-system-number [alternate-as autonomous-system-number ...]**
5. **address-family ipv6 [unicast | multicast]**
6. **neighbor {ip-address | peer-group-name | ipv6-address %} activate**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp as-number Example: Device(config)# router bgp 65000	Enters router configuration mode for the specified routing process.
Step 4	neighbor {ip-address ipv6-address [%] peer-group-name} remote-as autonomous-system-number [alternate-as autonomous-system-number ...] Example: Device(config-router)# neighbor 2001:DB8:0:CC00::1 remote-as 64600	Adds the IPv6 address of the neighbor in the specified autonomous system to the IPv6 multiprotocol BGP neighbor table of the local device.
Step 5	address-family ipv6 [unicast multicast] Example: Device(config-router)# address-family ipv6	Specifies the IPv6 address family and enters address family configuration mode. • The unicast keyword specifies the IPv6 unicast address family. By default, the device is placed in configuration mode for the IPv6 unicast address family if a keyword is not specified with the address-family ipv6 command. • The multicast keyword specifies IPv6 multicast address prefixes.
Step 6	neighbor {ip-address peer-group-name ipv6-address %} activate Example: Device(config-router-af)# neighbor 2001:DB8:0:CC00::1 activate	Enables the neighbor to exchange prefixes for the IPv6 address family with the local device.

Advertising Routes into IPv6 Multiprotocol BGP

By default, networks that are defined in router configuration mode using the **network** command are injected into the IPv4 unicast database. To inject a network into another database, such as the IPv6 BGP database, you must define the network using the **network** command in address family configuration mode for the other database, as shown for the IPv6 BGP database.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv6** [*vrf vrf-name*] [**unicast** | **multicast** | **vpn6**]
5. **network** {*network-number* [**mask** *network-mask*] | *nsap-prefix*} [**route-map** *map-tag*]
6. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Device(config)# router bgp 65000	Enters router configuration mode for the specified BGP routing process.
Step 4	address-family ipv6 [<i>vrf vrf-name</i>] [unicast multicast vpn6] Example: Device(config-router)# address-family ipv6 unicast	Specifies the IPv6 address family, and enters address family configuration mode. • The unicast keyword specifies the IPv6 unicast address family. By default, the device is placed in configuration mode for the IPv6 unicast address family if a keyword is not specified with the address-family ipv6 command. • The multicast keyword specifies IPv6 multicast address prefixes.
Step 5	network { <i>network-number</i> [mask <i>network-mask</i>] <i>nsap-prefix</i> } [route-map <i>map-tag</i>] Example: Device(config-router-af)# network 2001:DB8::/24	Advertises (injects) the specified prefix into the IPv6 BGP database (the routes must first be found in the IPv6 unicast routing table). • The prefix is injected into the database for the address family specified in the previous step. • Routes are tagged from the specified prefix as “local origin.” • The <i>ipv6-prefix</i> argument in the network command must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.

	Command or Action	Purpose
		The <i>prefix-length</i> argument is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.
Step 6	exit Example: Device(config-router-af) # exit	Exits address family configuration mode, and returns the device to router configuration mode. Repeat this step to exit router configuration mode and return the device to global configuration mode.

Configuring a Route Map for IPv6 Multiprotocol BGP Prefixes

- By default, neighbors that are defined using the **neighbor remote-as** command in router configuration mode exchange only IPv4 unicast address prefixes. To exchange other address prefix types, such as IPv6 prefixes, neighbors must also be activated using the **neighbor activate** command in address family configuration mode for the other prefix types, as shown for IPv6 prefixes.
- By default, route maps that are applied in router configuration mode using the **neighbor route-map** command are applied to only IPv4 unicast address prefixes. Route maps for other address families must be applied in address family configuration mode using the **neighbor route-map** command, as shown for the IPv6 address family. The route maps are applied either as the inbound or outbound routing policy for neighbors under the specified address family. Configuring separate route maps under each address family type simplifies managing complicated or different policies for each address family.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **neighbor** {*ip-address* | *ipv6-address* [%] | *peer-group-name*} **remote-as** *autonomous-system-number* [*alternate-as autonomous-system-number ...*]
5. **address-family ipv6** [*vrf vrf-name*] [**unicast** | **multicast** | **vpn6**]
6. **neighbor** {*ip-address* | *peer-group-name* | *ipv6-address* %} **activate**
7. **neighbor** {*ip-address* | *peer-group-name* | *ipv6-address* [%]} **route-map** *map-name* {**in** | **out**}
8. **exit**
9. **exit**
10. **route-map** *map-tag* [**permit** | **deny**] [*sequence-number*]
11. **match ipv6 address** {*prefix-list prefix-list-name* | *access-list-name*}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Device(config)# router bgp 65000	Enters router configuration mode for the specified routing process.
Step 4	neighbor {<i>ip-address</i> <i>ipv6-address</i>[%] <i>peer-group-name</i>} remote-as <i>autonomous-system-number</i> [<i>alternate-as autonomous-system-number</i> ...] Example: Device(config-router)# neighbor 2001:DB8:0:cc00::1 remote-as 64600	Adds the link-local IPv6 address of the neighbor in the specified remote autonomous system to the IPv6 multiprotocol BGP neighbor table of the local device.
Step 5	address-family ipv6 [<i>vrf vrf-name</i>] [<i>unicast</i> <i>multicast</i> <i>vpn</i>] Example: Device(config-router)# address-family ipv6	Specifies the IPv6 address family, and enters address family configuration mode. - The unicast keyword specifies the IPv6 unicast address family. By default, the device is placed in configuration mode for the IPv6 unicast address family if the unicast keyword is not specified with the address-family ipv6 command. - The multicast keyword specifies IPv6 multicast address prefixes.
Step 6	neighbor {<i>ip-address</i> <i>peer-group-name</i> <i>ipv6-address</i> %} activate Example: Device(config-router-af)# neighbor 2001:DB8:0:cc00::1 activate	Enables the neighbor to exchange prefixes for the IPv6 address family with the local device using the specified link-local addresses.
Step 7	neighbor {<i>ip-address</i> <i>peer-group-name</i> <i>ipv6-address</i> [%]} route-map <i>map-name</i> {<i>in</i> <i>out</i>}	Applies a route map to incoming or outgoing routes. Changes to the route map will not take effect for existing peers until the peering is reset or a soft reset is performed.

	Command or Action	Purpose
	Example: <pre>Device(config-router-af)# neighbor 2001:DB8:0:cc00::1 route-map rtp in</pre>	Using the clear bgp ipv6 command with the soft and in keywords will perform a soft reset.
Step 8	exit Example: <pre>Device(config-router-af)# exit</pre>	Exits address family configuration mode, and returns the device to router configuration mode.
Step 9	exit Example: <pre>Device(config-router)# exit</pre>	Exits router configuration mode, and returns the device to global configuration mode.
Step 10	route-map map-tag [permit deny] <i>[sequence-number]</i> Example: <pre>Device(config)# route-map rtp permit 10</pre>	Defines a route map and enters route-map configuration mode. Follow this step with a match command.
Step 11	match ipv6 address {prefix-list prefix-list-name access-list-name} Example: <pre>Device(config-route-map)# match ipv6 address prefix-list cisco</pre>	Distributes any routes that have a destination IPv6 network number address permitted by a prefix list, or performs policy routing on packets.

Redistributing Prefixes into IPv6 Multiprotocol BGP

Redistribution is the process of redistributing, or injecting, prefixes from one routing protocol into another routing protocol. This task explains how to inject prefixes from a routing protocol into IPv6 multiprotocol BGP. Specifically, prefixes that are redistributed into IPv6 multiprotocol BGP using the **redistribute** router configuration command are injected into the IPv6 unicast database.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp as-number**
4. **address-family ipv6 [vrf vrf-name] [unicast | multicast | vpnv6]**
5. **redistribute bgp [process-id] [metric metric-value] [route-map map-name] [source-protocol-options]**
6. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Device(config)# router bgp 65000	Enters router configuration mode for the specified BGP routing process.
Step 4	address-family ipv6 [<i>vrf vrf-name</i>] [<i>unicast</i> <i>multicast</i> <i>vpn</i>] Example: Device(config-router)# address-family ipv6	Specifies the IPv6 address family, and enters address family configuration mode. - The unicast keyword specifies the IPv6 unicast address family. By default, the device is placed in configuration mode for the IPv6 unicast address family if a keyword is not specified with the address-family ipv6 command. - The multicast keyword specifies IPv6 multicast address prefixes.
Step 5	redistribute bgp [<i>process-id</i>] [<i>metric metric-value</i>] [<i>route-map map-name</i>] [<i>source-protocol-options</i>] Example: Device(config-router-af)# redistribute bgp 64500 metric 5	Redistributes IPv6 routes from one routing domain into another routing domain.
Step 6	exit Example: Device(config-router-af)# exit	Exits address family configuration mode, and returns the device to router configuration mode. Repeat this step to exit router configuration mode and return the device to global configuration mode.

Clearing External BGP Peers

SUMMARY STEPS

1. `enable`
2. `clear bgp ipv6 {unicast | multicast} external [soft] [in | out]`
3. `clear bgp ipv6 {unicast | multicast} peer-group name`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	clear bgp ipv6 {unicast multicast} external [soft] [in out] Example: Device# clear bgp ipv6 unicast external soft in	Clears external IPv6 BGP peers.
Step 3	clear bgp ipv6 {unicast multicast} peer-group <i>name</i> Example: Device# clear bgp ipv6 unicast peer-group marketing	Clears all members of an IPv6 BGP peer group.

Advertising IPv4 Routes Between IPv6 BGP Peers

If an IPv6 network is connecting two separate IPv4 networks, IPv6 can be used to advertise the IPv4 routes. Configure the peering using the IPv6 addresses within the IPv4 address family. Set the next hop with a static route or with an inbound route map because the advertised next hop will usually be unreachable. Advertising IPv6 routes between two IPv4 peers is also possible using the same model.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **neighbor** *peer-group-name* **peer-group**
5. **neighbor** {*ip-address* | *ipv6-address*[%] | *peer-group-name*} **remote-as** *autonomous-system-number* [**alternate-as** *autonomous-system-number* ...]
6. **address-family ipv4** [**mdt** | **multicast** | **tunnel** | **unicast** [**vrf** *vrf-name*] | **vrf** *vrf-name*]
7. **neighbor** *ipv6-address* **peer-group** *peer-group-name*
8. **neighbor** {*ip-address* | *peer-group-name* | *ipv6-address* [%]} **route-map** *map-name* {**in** | **out**}
9. **exit**
10. **exit**
11. **route-map** *map-tag* [**permit** | **deny**] [*sequence-number*]
12. **set ip next-hop** *ip-address* [... *ip-address*] [**peer-address**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Device(config)# router bgp 65000	Enters router configuration mode for the specified routing process.
Step 4	neighbor <i>peer-group-name</i> peer-group Example: Device(config-router)# neighbor 6peers peer-group	Creates a multiprotocol BGP peer group.

	Command or Action	Purpose
Step 5	neighbor { <i>ip-address</i> <i>ipv6-address</i> [%] <i>peer-group-name</i> } remote-as <i>autonomous-system-number</i> [alternate-as <i>autonomous-system-number</i> ...] Example: <pre>Device(config-router)# neighbor 6peers remote-as 65002</pre>	Adds the IPv6 address of the neighbor in the specified autonomous system to the IPv6 multiprotocol BGP neighbor table of the local device.
Step 6	address-family ipv4 [mdt multicast tunnel unicast [vrf <i>vrf-name</i>] vrf <i>vrf-name</i>] Example: <pre>Device(config-router)# address-family ipv4</pre>	Enters address family configuration mode to configure a routing session using standard IPv4 address prefixes.
Step 7	neighbor <i>ipv6-address</i> peer-group <i>peer-group-name</i> Example: <pre>Device(config-router-af)# neighbor 2001:DB8:1234::2 peer-group 6peers</pre>	Assigns the IPv6 address of a BGP neighbor to a peer group.
Step 8	neighbor { <i>ip-address</i> <i>peer-group-name</i> <i>ipv6-address</i> [%]} route-map <i>map-name</i> { in out } Example: <pre>Device(config-router-af)# neighbor 6peers route-map rmap out</pre>	Applies a route map to incoming or outgoing routes. Changes to the route map will not take effect for existing peers until the peering is reset or a soft reset is performed. Using the clear bgp ipv6 command with the soft and in keywords will perform a soft reset.
Step 9	exit Example: <pre>Device(config-router-af)# exit</pre>	Exits address family configuration mode, and returns the device to router configuration mode.
Step 10	exit Example: <pre>Device(config-router)# exit</pre>	Exits router configuration mode, and returns the device to global configuration mode.
Step 11	route-map <i>map-tag</i> [permit deny] [<i>sequence-number</i>] Example: <pre>Device(config)# route-map rmap permit 10</pre>	Defines a route map and enters route-map configuration mode.
Step 12	set ip next-hop <i>ip-address</i> [... <i>ip-address</i>] [peer-address] Example: <pre>Device(config-route-map)# set ip next-hop 10.21.8.10</pre>	Overrides the next hop advertised to the peer for IPv4 packets.

Configuration Examples for Multiprotocol BGP for IPv6

Example: Configuring a BGP Process, BGP Router ID, and IPv6 Multiprotocol BGP Peer

The following example enables IPv6 globally, configures a BGP process, and establishes a BGP router ID. Also, the IPv6 multiprotocol BGP peer 2001:DB8:0:CC00::1 is configured and activated.

```
ipv6 unicast-routing
!
router bgp 65000
 no bgp default ipv4-unicast
 bgp router-id 192.168.99.70
 neighbor 2001:DB8:0:CC00::1 remote-as 64600
 address-family ipv6 unicast
  neighbor 2001:DB8:0:CC00::1 activate
```

Example: Configuring an IPv6 Multiprotocol BGP Peer Group

The following example configures the IPv6 multiprotocol BGP peer group named group1:

```
router bgp 65000
 no bgp default ipv4-unicast
 neighbor group1 peer-group
 neighbor 2001:DB8:0:CC00::1 remote-as 64600
 address-family ipv6 unicast
  neighbor group1 activate
 neighbor 2001:DB8:0:CC00::1 peer-group group1
```

Example: Advertising Routes into IPv6 Multiprotocol BGP

The following example injects the IPv6 network 2001:DB8::/24 into the IPv6 unicast database of the local device. (BGP checks that a route for the network exists in the IPv6 unicast database of the local device before advertising the network.)

```
router bgp 65000
 no bgp default ipv4-unicast
 address-family ipv6 unicast
  network 2001:DB8::/24
```

Example: Configuring a Route Map for IPv6 Multiprotocol BGP Prefixes

The following example configures the route map named rtp to permit IPv6 unicast routes from network 2001:DB8::/24 if they match the prefix list named cisco:

```
router bgp 64900
 no bgp default ipv4-unicast
```

Example: Redistributing Prefixes into IPv6 Multiprotocol BGP

```

neighbor 2001:DB8:0:CC00::1 remote-as 64700
address-family ipv6 unicast
  neighbor 2001:DB8:0:CC00::1 activate
  neighbor 2001:DB8:0:CC00::1 route-map rtp in
ipv6 prefix-list cisco seq 10 permit 2001:DB8::/24
route-map rtp permit 10
  match ipv6 address prefix-list cisco

```

Example: Redistributing Prefixes into IPv6 Multiprotocol BGP

The following example redistributes RIP routes into the IPv6 unicast database of the local device:

```

router bgp 64900
no bgp default ipv4-unicast
address-family ipv6 unicast
  redistribute rip

```

Example: Advertising IPv4 Routes Between IPv6 Peers

The following example advertises IPv4 routes between IPv6 peers when the IPv6 network is connecting two separate IPv4 networks. Peering is configured using IPv6 addresses in the IPv4 address family configuration mode. The inbound route map named rmap sets the next hop because the advertised next hop is likely to be unreachable.

```

router bgp 65000
!
neighbor 6peers peer-group
neighbor 2001:DB8:1234::2 remote-as 65002
address-family ipv4
neighbor 6peers activate
neighbor 6peers soft-reconfiguration inbound
neighbor 2001:DB8:1234::2 peer-group 6peers
neighbor 2001:DB8:1234::2 route-map rmap in
!
route-map rmap permit 10
  set ip next-hop 10.21.8.10

```

Feature Information for IPv6 Routing: Multiprotocol BGP Extensions for IPv6

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for IPv6 Routing: Multiprotocol BGP Extensions for IPv6

Feature Name	Releases	Feature Information
IPv6 Routing: Multiprotocol BGP Extensions for IPv6	Cisco IOS XE Release 3.3SE	Multiprotocol BGP Extensions for IPv6 supports the same features and functionality as IPv4 BGP. In Cisco IOS XE Release 3.3SE, support was added for the Cisco Catalyst 3650 Series Switches and Cisco Catalyst 3850 Series Switches.
