

BGP 4

BGP is an interdomain routing protocol designed to provide loop-free routing between separate routing domains that contain independent routing policies (autonomous systems).

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About BGP 4

BGP Version 4 Functional Overview

BGP is an interdomain routing protocol designed to provide loop-free routing links between organizations. BGP is designed to run over a reliable transport protocol; it uses TCP (port 179) as the transport protocol because TCP is a connection-oriented protocol. The destination TCP port is assigned 179, and the local port is assigned a random port number. Cisco software supports BGP version 4 and it is this version that has been used by Internet service providers (ISPs) to help build the Internet. RFC 1771 introduced and discussed a number of new BGP features to allow the protocol to scale for Internet use. RFC 2858 introduced multiprotocol

extensions to allow BGP to carry routing information for IP multicast routes and multiple Layer 3 protocol address families, including IPv4, IPv6, and CLNS.

BGP is mainly used to connect a local network to an external network to gain access to the Internet or to connect to other organizations. When connecting to an external organization, external BGP (eBGP) peering sessions are created. Although BGP is referred to as an exterior gateway protocol (EGP), many networks within an organization are becoming so complex that BGP can be used to simplify the internal network used within the organization. BGP peers within the same organization exchange routing information through internal BGP (iBGP) peering sessions.

BGP uses a path-vector routing algorithm to exchange network reachability information with other BGP-speaking networking devices. Network reachability information is exchanged between BGP peers in routing updates. Network reachability information contains the network number, path-specific attributes, and the list of autonomous system numbers that a route must transit to reach a destination network. This list is contained in the AS-path attribute. BGP prevents routing loops by rejecting any routing update that contains the local autonomous system number because this indicates that the route has already traveled through that autonomous system and a loop would therefore be created. The BGP path-vector routing algorithm is a combination of the distance-vector routing algorithm and the AS-path loop detection.

BGP selects a single path, by default, as the best path to a destination host or network. The best path selection algorithm analyzes path attributes to determine which route is installed as the best path in the BGP routing table. Each path carries well-known mandatory, well-known discretionary, and optional transitive attributes that are used in BGP best path analysis. Cisco software provides the ability to influence BGP path selection by altering some of these attributes using the command-line interface (CLI.) BGP path selection can also be influenced through standard BGP policy configuration. For more details about using BGP to influence path selection and configuring BGP policies to filter traffic, see the “BGP 4 Prefix Filter and Inbound Route Maps” module and the “BGP Prefix-Based Outbound Route Filtering” module.

BGP uses the best-path selection algorithm to find a set of equally good routes. These routes are the potential multipaths. In Cisco IOS Release 12.2(33)SRD and later releases, when there are more equally good multipaths available than the maximum permitted number, the oldest paths are selected as multipaths.

BGP can be used to help manage complex internal networks by interfacing with Interior Gateway Protocols (IGPs). Internal BGP can help with issues such as scaling the existing IGPs to match the traffic demands while maintaining network efficiency.

Note

BGP requires more configuration than other routing protocols and the effects of any configuration changes must be fully understood. Incorrect configuration can create routing loops and negatively impact normal network operation.

BGP Router ID

BGP uses a router ID to identify BGP-speaking peers. The BGP router ID is a 32-bit value that is often represented by an IPv4 address. By default, the Cisco software sets the router ID to the IPv4 address of a loopback interface on the router. If no loopback interface is configured on the device, the software chooses the highest IPv4 address configured on a physical interface of the device to represent the BGP router ID. The BGP router ID must be unique to the BGP peers in a network.

BGP-Speaker and Peer Relationships

A BGP-speaking device does not discover another BGP-speaking device automatically. A network administrator usually manually configures the relationships between BGP-speaking devices. A peer device is a BGP-speaking device that has an active TCP connection to another BGP-speaking device. This relationship between BGP devices is often referred to as a neighbor, but because this can imply the idea that the BGP devices are directly connected with no other device in between, the term *neighbor* will be avoided whenever possible in this document. A BGP speaker is the local device, and a peer is any other BGP-speaking network device.

When a TCP connection is established between peers, each BGP peer initially exchanges all its routes—the complete BGP routing table—with the other peer. After this initial exchange, only incremental updates are sent when there has been a topology change in the network, or when a routing policy has been implemented or modified. In the periods of inactivity between these updates, peers exchange special messages called keepalives.

A BGP autonomous system is a network that is controlled by a single technical administration entity. Peer devices are called external peers when they are in different autonomous systems and internal peers when they are in the same autonomous system. Usually, external peers are adjacent and share a subnet; internal peers may be anywhere in the same autonomous system.

BGP Peer Session Establishment

When a BGP routing process establishes a peering session with a peer, it goes through the following state changes:

- Idle—The initial state that the BGP routing process enters when the routing process is enabled or when the device is reset. In this state, the device waits for a start event, such as a peering configuration with a remote peer. After the device receives a TCP connection request from a remote peer, the device initiates another start event to wait for a timer before starting a TCP connection to a remote peer. If the device is reset, the peer is reset and the BGP routing process returns to the Idle state.
- Connect—The BGP routing process detects that a peer is trying to establish a TCP session with the local BGP speaker.
- Active—in this state, the BGP routing process tries to establish a TCP session with a peer device using the ConnectRetry timer. Start events are ignored while the BGP routing process is in the Active state. If the BGP routing process is reconfigured or if an error occurs, the BGP routing process will release system resources and return to an Idle state.
- OpenSent—The TCP connection is established, and the BGP routing process sends an OPEN message to the remote peer, and transitions to the OpenSent state. The BGP routing process can receive other OPEN messages in this state. If the connection fails, the BGP routing process transitions to the Active state.
- OpenReceive—The BGP routing process receives the OPEN message from the remote peer and waits for an initial keepalive message from the remote peer. When a keepalive message is received, the BGP routing process transitions to the Established state. If a notification message is received, the BGP routing process transitions to the Idle state. If an error or configuration change occurs that affects the peering session, the BGP routing process sends a notification message with the Finite State Machine (FSM) error code and then transitions to the Idle state.
- Established—The initial keepalive is received from the remote peer. Peering is now established with the remote neighbor and the BGP routing process starts exchanging update message with the remote

peer. The hold timer restarts when an update or keepalive message is received. If the BGP process receives an error notification, it will transition to the Idle state.

BGP Session Reset

Whenever the routing policy changes due to a configuration change, BGP peering sessions must be reset by using the **clear ip bgp** command. Cisco software supports the following three mechanisms to reset BGP peering sessions:

- Hard reset—A hard reset tears down the specified peering sessions including the TCP connection and deletes routes coming from the specified peer.
- Soft reset—A soft reset uses stored prefix information to reconfigure and activate BGP routing tables without tearing down existing peering sessions. Soft reconfiguration uses stored update information, at the cost of additional memory for storing the updates, to allow you to apply new BGP policy without disrupting the network. Soft reconfiguration can be configured for inbound or outbound sessions.
- Dynamic inbound soft reset—The route refresh capability, as defined in RFC 2918, allows the local device to reset inbound routing tables dynamically by exchanging route refresh requests to supporting peers. The route refresh capability does not store update information locally for nondisruptive policy changes. It instead relies on dynamic exchange with supporting peers. Route refresh must first be advertised through BGP capability negotiation between peers. All BGP devices must support the route refresh capability. To determine if a BGP device supports this capability, use the **show ip bgp neighbors** command. The following message is displayed in the output when the device supports the route refresh capability:

Received route refresh capability from peer.

The **bgp soft-reconfig-backup** command was introduced to configure BGP to perform inbound soft reconfiguration for peers that do not support the route refresh capability. The configuration of this command allows you to configure BGP to store updates (soft reconfiguration) only as necessary. Peers that support the route refresh capability are unaffected by the configuration of this command.

BGP Route Aggregation

BGP peers store and exchange routing information and the amount of routing information increases as more BGP speakers are configured. The use of route aggregation reduces the amount of information involved. Aggregation is the process of combining the attributes of several different routes so that only a single route is advertised. Aggregate prefixes use the classless interdomain routing (CIDR) principle to combine contiguous networks into one classless set of IP addresses that can be summarized in routing tables. Fewer routes now need to be advertised.

Two methods are available in BGP to implement route aggregation. You can redistribute an aggregated route into BGP or you can use a form of conditional aggregation. Basic route redistribution involves creating an aggregate route and then redistributing the routes into BGP. Conditional aggregation involves creating an aggregate route and then advertising or suppressing the advertising of certain routes on the basis of route maps, autonomous system set path (AS-SET) information, or summary information.

The **bgp suppress-inactive** command configures BGP to not advertise inactive routes to any BGP peer. A BGP routing process can advertise routes that are not installed in the routing information database (RIB) to BGP peers by default. A route that is not installed into the RIB is an inactive route. Inactive route advertisement

can occur, for example, when routes are advertised through common route aggregation. Inactive route advertisements can be suppressed to provide more consistent data forwarding.

BGP Route Aggregation Generating AS_SET Information

AS_SET information can be generated when BGP routes are aggregated using the **aggregate-address** command. The path advertised for such a route is an AS_SET consisting of all the elements, including the communities, contained in all the paths that are being summarized. If the AS_PATHs to be aggregated are identical, only the AS_PATH is advertised. The ATOMIC-AGGREGATE attribute, set by default for the **aggregate-address** command, is not added to the AS_SET.

Routing Policy Change Management

Routing policies for a peer include all the configurations for elements such as a route map, distribute list, prefix list, and filter list that may impact inbound or outbound routing table updates. Whenever there is a change in the routing policy, the BGP session must be soft-cleared, or soft-reset, for the new policy to take effect. Performing inbound reset enables the new inbound policy configured on the device to take effect. Performing outbound reset causes the new local outbound policy configured on the device to take effect without resetting the BGP session. As a new set of updates is sent during outbound policy reset, a new inbound policy of the neighbor can also take effect. This means that after changing inbound policy, you must do an inbound reset on the local device or an outbound reset on the peer device. Outbound policy changes require an outbound reset on the local device or an inbound reset on the peer device.

There are two types of reset: hard reset and soft reset. The table below lists their advantages and disadvantages.

Table 1: Advantages and Disadvantages of Hard and Soft Resets

Type of Reset	Advantages	Disadvantages
Hard reset	No memory overhead.	The prefixes in the BGP, IP, and Forwarding Information Base (FIB) tables provided by the neighbor are lost. A hard reset is not recommended.
Outbound soft reset	No configuration, and no storing of routing table updates.	Does not reset inbound routing table updates.
Dynamic inbound soft reset	Does not clear the BGP session and cache. Does not require storing of routing table updates, and has no memory overhead.	Both BGP devices must support the route refresh capability. Note Does not reset outbound routing table updates.

Type of Reset	Advantages	Disadvantages
Configured inbound soft reset (uses the neighbor soft-reconfiguration router configuration command)	<p>Can be used when both BGP devices do not support the automatic route refresh capability.</p> <p>The bgp soft-reconfig-backup command was introduced to configure inbound soft reconfiguration for peers that do not support the route refresh capability.</p>	<p>Requires preconfiguration.</p> <p>Stores all received (inbound) routing policy updates without modification; is memory-intensive.</p> <p>Recommended only when absolutely necessary, such as when both BGP devices do not support the automatic route refresh capability.</p> <p>Note Does not reset outbound routing table updates.</p>

Once you have defined two devices to be BGP neighbors, they will form a BGP connection and exchange routing information. If you subsequently change a BGP filter, weight, distance, version, or timer, or if you make a similar configuration change, you must reset BGP connections in order for the configuration change to take effect.

A soft reset updates the routing table for inbound and outbound routing updates. Cisco software supports soft reset without any prior configuration. This soft reset allows the dynamic exchange of route refresh requests and routing information between BGP devices, and allows the subsequent readvertisement of the respective outbound routing table. There are two types of soft reset:

- When soft reset is used to generate inbound updates from a neighbor, it is called dynamic inbound soft reset.
- When soft reset is used to send a new set of updates to a neighbor, it is called outbound soft reset.

To use soft reset without preconfiguration, both BGP peers must support the soft route refresh capability, which is advertised in the OPEN message sent when the peers establish a TCP session.

BGP Peer Groups

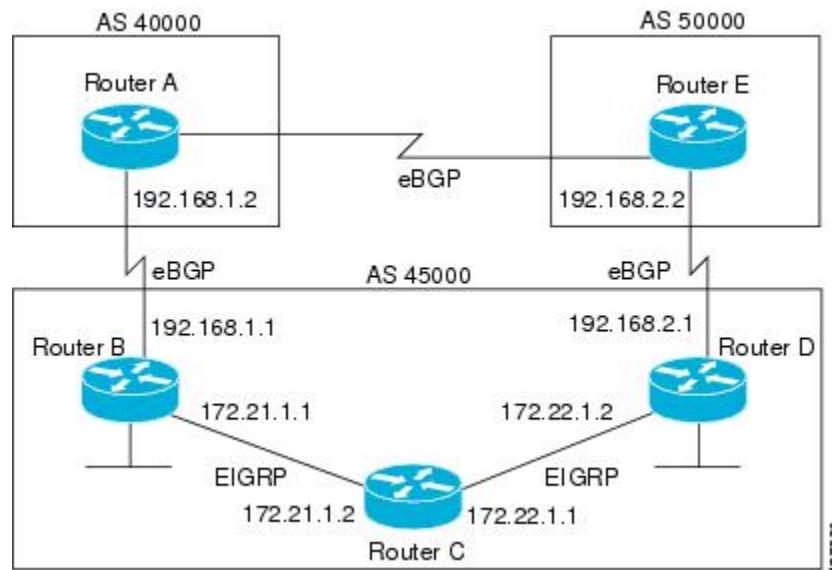

Often, in a BGP network, many neighbors are configured with the same update policies (that is, the same outbound route maps, distribute lists, filter lists, update source, and so on). Neighbors with the same update policies can be grouped into BGP peer groups to simplify configuration and, more importantly, to make configuration updates more efficient. When you have many peers, this approach is highly recommended.

BGP Backdoor Routes

In a BGP network topology with two border devices using eBGP to communicate to a number of different autonomous systems, using eBGP to communicate between the two border devices may not be the most efficient routing method. In the figure below, Router B as a BGP speaker will receive a route to Router D through eBGP, but this route will traverse at least two autonomous systems. Router B and Router D are also connected through an Enhanced Interior Gateway Routing Protocol (EIGRP) network (any IGP can be used here), and this route has a shorter path. EIGRP routes, however, have a default administrative distance of 90, and eBGP routes have a default administrative distance of 20, so BGP will prefer the eBGP route. Changing

the default administrative distances is not recommended because changing the administrative distance may lead to routing loops. To cause BGP to prefer the EIGRP route, you can use the **network backdoor** command. BGP treats the network specified by the **network backdoor** command as a locally assigned network, except that it does not advertise the specified network in BGP updates. In the figure below, this means that Router B will communicate to Router D using the shorter EIGRP route instead of the longer eBGP route.

Figure 1: BGP Backdoor Route Topology

How to Configure BGP 4

Configuring a basic BGP network consists of a few required tasks and many optional tasks. A BGP routing process must be configured and BGP peers must be configured, preferably using the address family configuration model. If the BGP peers are part of a VPN network, the BGP peers must be configured using the IPv4 VRF address family task.

Configuring a BGP Routing Process

Perform this task to configure a BGP routing process. You must perform the required steps at least once to enable BGP. The optional steps here allow you to configure additional features in your BGP network. Several of the features, such as logging neighbor resets and immediate reset of a peer when its link goes down, are enabled by default but are presented here to enhance your understanding of how your BGP network operates.

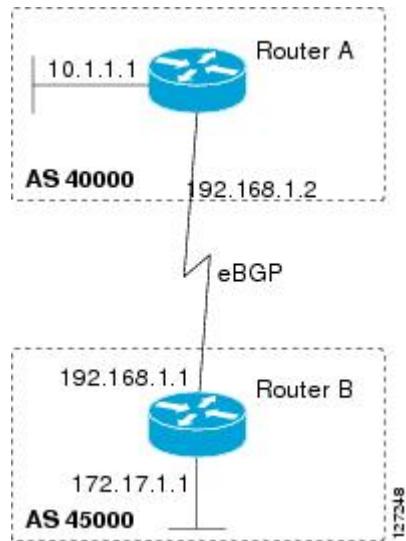

Note

A device that runs Cisco software can be configured to run only one BGP routing process and to be a member of only one BGP autonomous system. However, a BGP routing process and autonomous system can support multiple concurrent BGP address family and subaddress family configurations.

The configuration in this task is done at Router A in the figure below and would need to be repeated with appropriate changes to the IP addresses (for example, at Router B) to fully achieve a BGP process between

the two devices. No address family is configured here for the BGP routing process, so routing information for the IPv4 unicast address family is advertised by default.

Figure 2: BGP Topology with Two Autonomous Systems

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *autonomous-system-number***
4. **network *network-number* [mask *network-mask*] [route-map *route-map-name*]**
5. **bgp router-id *ip-address***
6. **timers bgp *keepalive holdtime***
7. **bgp fast-external-failover**
8. **bgp log-neighbor-changes**
9. **end**
10. **show ip bgp [network] [network-mask]**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 40000	Configures a BGP routing process, and enters router configuration mode for the specified routing process. <ul style="list-style-type: none">• Use the <i>autonomous-system-number</i> argument to specify an integer, from 0 and 65534, that identifies the device to other BGP speakers.
Step 4	network <i>network-number</i> [mask <i>network-mask</i>] [route-map <i>route-map-name</i>] Example: Device(config-router)# network 10.1.1.0 mask 255.255.255.0	(Optional) Specifies a network as local to this autonomous system and adds it to the BGP routing table. <ul style="list-style-type: none">• For exterior protocols, the network command controls which networks are advertised. Interior protocols use the network command to determine where to send updates.
Step 5	bgp router-id <i>ip-address</i> Example: Device(config-router)# bgp router-id 10.1.1.99	(Optional) Configures a fixed 32-bit router ID as the identifier of the local device running BGP. <ul style="list-style-type: none">• Use the <i>ip-address</i> argument to specify a unique router ID within the network. Note Configuring a router ID using the bgp router-id command resets all active BGP peering sessions.
Step 6	timers bgp <i>keepalive holdtime</i> Example: Device(config-router)# timers bgp 70 120	(Optional) Sets BGP network timers. <ul style="list-style-type: none">• Use the <i>keepalive</i> argument to specify the frequency, in seconds, with which the software sends keepalive messages to its BGP peer. By default, the keepalive timer is set to 60 seconds.• Use the <i>holdtime</i> argument to specify the interval, in seconds, after which the software, having not received a keepalive message, declares a BGP peer dead. By default, the holdtime timer is set to 180 seconds.
Step 7	bgp fast-external-fallover Example: Device(config-router)# bgp fast-external-fallover	(Optional) Enables the automatic resetting of BGP sessions. <ul style="list-style-type: none">• By default, the BGP sessions of any directly adjacent external peers are reset if the link used to reach them goes down.

	Command or Action	Purpose
Step 8	bgp log-neighbor-changes Example: Device(config-router) # bgp log-neighbor-changes	(Optional) Enables logging of BGP neighbor status changes (up or down) and neighbor resets. <ul style="list-style-type: none"> • Use this command for troubleshooting network connectivity problems and measuring network stability. Unexpected neighbor resets might indicate high error rates or high packet loss in the network and should be investigated.
Step 9	end Example: Device(config-router) # end	Exits router configuration mode and enters privileged EXEC mode.
Step 10	show ip bgp [network] [network-mask] Example: Device# show ip bgp	(Optional) Displays the entries in the BGP routing table. Note Only the syntax applicable to this task is used in this example. For more details, see the <i>Cisco IOS IP Routing: BGP Command Reference</i> .

Examples

The following sample output from the **show ip bgp** command shows the BGP routing table for Router A in the figure above after this task has been configured on Router A. You can see an entry for the network 10.1.1.0 that is local to this autonomous system.

```
BGP table version is 12, local router ID is 10.1.1.99
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
              Network          Next Hop          Metric LocPrf Weight Path
*> 10.1.1.0/24      0.0.0.0                  0        32768 i
```

Troubleshooting Tips

Use the **ping** command to check basic network connectivity between the BGP routers.

Configuring a BGP Peer

Perform this task to configure BGP between two IPv4 devices (peers). The address family configured here is the default IPv4 unicast address family, and the configuration is done at Router A in the figure above. Remember to perform this task for any neighboring devices that are to be BGP peers.

Before You Begin

Before you perform this task, perform the “Configuring a BGP Routing Process” task.

**Note**

By default, neighbors that are defined using the **neighbor remote-as** command in router configuration mode exchange only IPv4 unicast address prefixes. To exchange other address prefix types, such as IPv6 prefixes, neighbors must also be activated using the **neighbor activate** command in address family configuration mode for the other prefix types, such as IPv6 prefixes.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *autonomous-system-number***
4. **neighbor *ip-address* remote-as *autonomous-system-number***
5. **address-family ipv4 [unicast | multicast | vrf *vrf-name*]**
6. **neighbor *ip-address* activate**
7. **end**
8. **show ip bgp [network] [network-mask]**
9. **show ip bgp neighbors [*neighbor-address*]**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. • Enter your password if prompted.
	Example: Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example: Device# configure terminal	
Step 3	router bgp <i>autonomous-system-number</i>	Enters router configuration mode for the specified routing process.
	Example: Device(config)# router bgp 40000	
Step 4	neighbor <i>ip-address</i> remote-as <i>autonomous-system-number</i>	Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local device.
	Example: Device(config-router)# neighbor 192.168.1.1 remote-as 45000	

	Command or Action	Purpose
Step 5	address-family ipv4 [unicast multicast vrf <i>vrf-name</i>] Example: Device(config-router)# address-family ipv4 unicast	Specifies the IPv4 address family and enters address family configuration mode. <ul style="list-style-type: none">• The unicast keyword specifies the IPv4 unicast address family. By default, the device is placed in configuration mode for the IPv4 unicast address family if the unicast keyword is not specified with the address-family ipv4 command.• The multicast keyword specifies IPv4 multicast address prefixes.• The vrf keyword and <i>vrf-name</i> argument specify the name of the virtual routing and forwarding (VRF) instance to associate with subsequent IPv4 address family configuration mode commands.
Step 6	neighbor <i>ip-address</i> activate Example: Device(config-router-af)# neighbor 192.168.1.1 activate	Enables the neighbor to exchange prefixes for the IPv4 unicast address family with the local device.
Step 7	end Example: Device(config-router-af)# end	Exits address family configuration mode and returns to privileged EXEC mode.
Step 8	show ip bgp [network] [network-mask] Example: Device# show ip bgp	(Optional) Displays the entries in the BGP routing table. Note Only the syntax applicable to this task is used in this example. For more details, see the <i>Cisco IOS IP Routing: BGP Command Reference</i> .
Step 9	show ip bgp neighbors [<i>neighbor-address</i>] Example: Device(config-router-af)# show ip bgp neighbors 192.168.2.2	(Optional) Displays information about the TCP and BGP connections to neighbors. Note Only the syntax applicable to this task is used in this example. For more details, see the <i>Cisco IOS IP Routing: BGP Command Reference</i> .

Examples

The following sample output from the **show ip bgp** command shows the BGP routing table for Router A in the figure above after this task has been configured on Router A and Router B. You can now see an entry for the network 172.17.1.0 in autonomous system 45000.

```
BGP table version is 13, local router ID is 10.1.1.99
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
```

Network	Next Hop	Metric	LocPrf	Weight	Path
*> 10.1.1.0/24	0.0.0.0	0		32768	i
*> 172.17.1.0/24	192.168.1.1	0		0	45000 i

The following sample output from the **show ip bgp neighbors** command shows information about the TCP and BGP connections to the BGP neighbor 192.168.1.1 of Router A in the figure above after this task has been configured on Router A:

```
BGP neighbor is 192.168.1.1, remote AS 45000, external link
BGP version 4, remote router ID 172.17.1.99
BGP state = Established, up for 00:06:55
Last read 00:00:15, last write 00:00:15, hold time is 120, keepalive intervals
Configured hold time is 120,keepalive interval is 70 seconds, Minimum holdtims
Neighbor capabilities:
  Route refresh: advertised and received (old & new)
  Address family IPv4 Unicast: advertised and received
Message statistics:
  InQ depth is 0
  OutQ depth is 0
      Sent          Rcvd
  Opens:           1            1
  Notifications:  0            0
  Updates:        1            2
  Keepalives:     13           13
  Route Refresh:  0            0
  Total:          15           16
Default minimum time between advertisement runs is 30 seconds
For address family: IPv4 Unicast
  BGP table version 13, neighbor version 13/0
  Output queue size : 0
  Index 1, Offset 0, Mask 0x2
  1 update-group member
      Sent          Rcvd
  Prefix activity: -----
    Prefixes Current:   1            1 (Consumes 52 bytes)
    Prefixes Total:    1            1
    Implicit Withdraw: 0            0
    Explicit Withdraw: 0            0
    Used as bestpath:  n/a          1
    Used as multipath: n/a          0
      Outbound      Inbound
  Local Policy Denied Prefixes: -----
    AS_PATH loop:      n/a          1
    Bestpath from this peer: 1            n/a
    Total:             1            1
Number of NLRIIs in the update sent: max 0, min 0
Connections established 1; dropped 0
Last reset never
Connection state is ESTAB, I/O status: 1, unread input bytes: 0
Connection is ECN Disabled
Local host: 192.168.1.2, Local port: 179
Foreign host: 192.168.1.1, Foreign port: 37725
Enqueued packets for retransmit: 0, input: 0 mis-ordered: 0 (0 bytes)

```

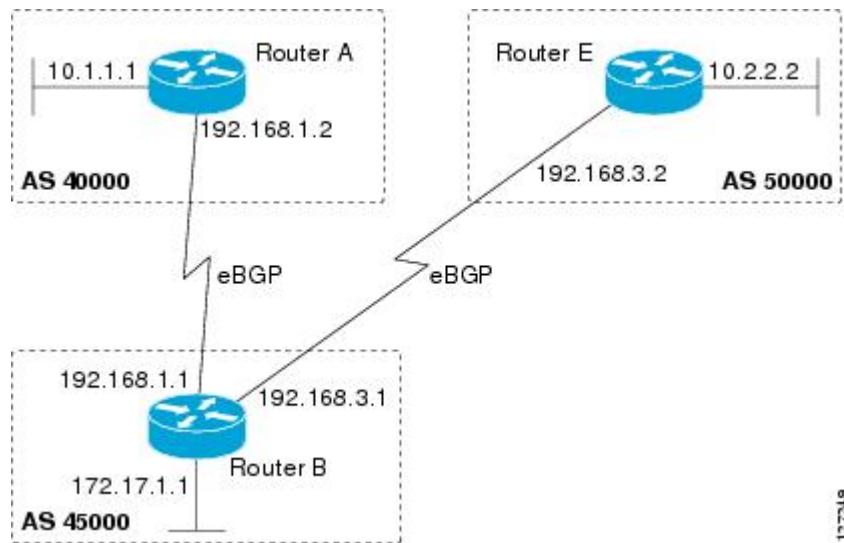

Troubleshooting Tips

Use the **ping** command to verify basic network connectivity between the BGP devices.

Configuring a BGP Peer for the IPv4 VRF Address Family

Perform this optional task to configure BGP between two IPv4 devices (peers) that must exchange IPv4 VRF information because they exist in a VPN. The address family configured here is the IPv4 VRF address family, and the configuration is done at Router B in the figure below with the neighbor 192.168.3.2 at Router E in autonomous system 50000. Remember to perform this task for any neighboring devices that are to be BGP IPv4 VRF address family peers.

Figure 3: BGP Topology for IPv4 VRF Address Family

12749

Before You Begin

Before you perform this task, perform the “Configuring a BGP Routing Process” task.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface *type number*
4. vrf forwarding *vrf-name*
5. ip address *ip-address mask* [secondary [vrf *vrf-name*]]
6. exit
7. ip vrf *vrf-name*
8. rd *route-distinguisher*
9. route-target {import | export | both} *route-target-ext-community*
10. exit
11. router bgp *autonomous-system-number*
12. address-family ipv4 [unicast | multicast | vrf *vrf-name*]
13. neighbor *ip-address* remote-as *autonomous-system-number*
14. neighbor {*ip-address* | peer-group-name} maximum-prefix *maximum* [*threshold*] [**restart** *restart-interval*] [**warning-only**]
15. neighbor *ip-address* activate
16. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>type number</i> Example: Device(config)# interface GigabitEthernet 0/0	Enters interface configuration mode.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-if)# vrf forwarding vpn1	Associates a VPN VRF instance with an interface or subinterface.

	Command or Action	Purpose
Step 5	ip address <i>ip-address mask</i> [secondary] [vrf <i>vrf-name</i>] Example: Device(config-if)# ip address 192.168.3.1 255.255.255.0	Sets an IP address for an interface.
Step 6	exit Example: Device(config-if)# exit	Exits interface configuration mode and enters global configuration mode.
Step 7	ip vrf <i>vrf-name</i> Example: Device(config)# ip vrf vpn1	Configures a VRF routing table and enters VRF configuration mode. <ul style="list-style-type: none">• Use the <i>vrf-name</i> argument to specify a name to be assigned to the VRF.
Step 8	rd <i>route-distinguisher</i> Example: Device(config-vrf)# rd 45000:5	Creates routing and forwarding tables and specifies the default route distinguisher for a VPN. <ul style="list-style-type: none">• Use the <i>route-distinguisher</i> argument to add an 8-byte value to an IPv4 prefix to create a unique VPN IPv4 prefix.
Step 9	route-target {import export both} <i>route-target-ext-community</i> Example: Device(config-vrf)# route-target both 45000:100	Creates a route target extended community for a VRF. <ul style="list-style-type: none">• Use the import keyword to import routing information from the target VPN extended community.• Use the export keyword to export routing information to the target VPN extended community.• Use the both keyword to import both import and export routing information to the target VPN extended community.• Use the <i>route-target-ext-community</i> argument to add the route target extended community attributes to the VRF's list of import, export, or both (import and export) route target extended communities.
Step 10	exit Example: Device(config-vrf)# exit	Exits VRF configuration mode and enters global configuration mode.

	Command or Action	Purpose
Step 11	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 45000	Enters router configuration mode for the specified routing process.
Step 12	address-family ipv4 [unicast multicast vrf <i>vrf-name</i>] Example: Device(config-router)# address-family ipv4 vrf vpn1	Specifies the IPv4 address family and enters address family configuration mode. <ul style="list-style-type: none"> • Use the unicast keyword to specify the IPv4 unicast address family. By default, the device is placed in configuration mode for the IPv4 unicast address family if the unicast keyword is not specified with the address-family ipv4 command. • Use the multicast keyword to specify IPv4 multicast address prefixes. • Use the vrf keyword and <i>vrf-name</i> argument to specify the name of the VRF instance to associate with subsequent IPv4 address family configuration mode commands.
Step 13	neighbor <i>ip-address</i> remote-as <i>autonomous-system-number</i> Example: Device(config-router-af)# neighbor 192.168.3.2 remote-as 50000	Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local device.
Step 14	neighbor {<i>ip-address</i> <i>peer-group-name</i>} maximum-prefix <i>maximum</i> [<i>threshold</i>] [<i>restart</i> <i>restart-interval</i>] [warning-only] Example: Device(config-router-af)# neighbor 192.168.3.2 maximum-prefix 10000 warning-only	Controls how many prefixes can be received from a neighbor. <ul style="list-style-type: none"> • Use the <i>maximum</i> argument to specify the maximum number of prefixes allowed from the specified neighbor. The number of prefixes that can be configured is limited only by the available system resources on a device. • Use the <i>threshold</i> argument to specify an integer representing a percentage of the maximum prefix limit at which the device starts to generate a warning message. • Use the warning-only keyword to allow the device to generate a log message when the maximum prefix limit is exceeded, instead of terminating the peering session.
Step 15	neighbor <i>ip-address</i> activate Example: Device(config-router-af)# neighbor 192.168.3.2 activate	Enables the neighbor to exchange prefixes for the IPv4 VRF address family with the local device.

	Command or Action	Purpose
Step 16	end Example: Device(config-router-af)# end	Exits address family configuration mode and enters privileged EXEC mode.

Troubleshooting Tips

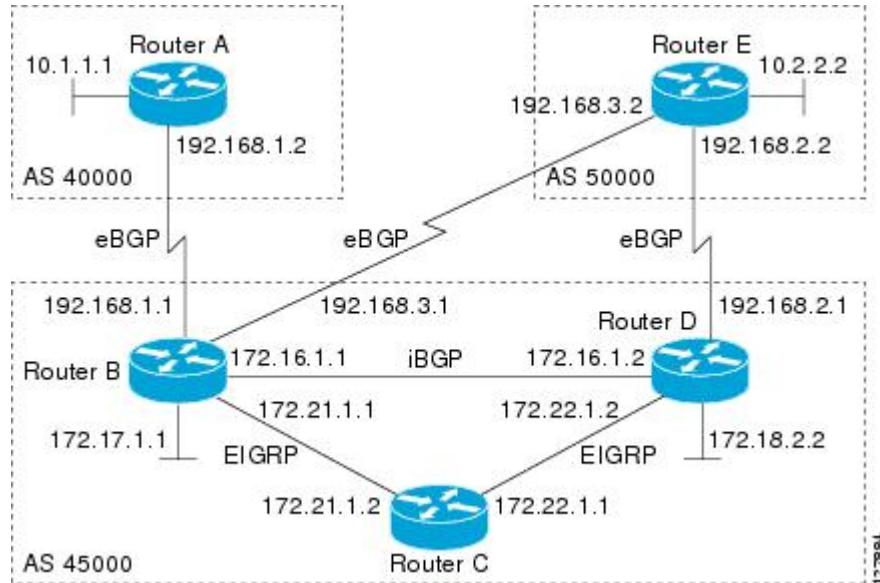

Use the **ping vrf** command to verify basic network connectivity between the BGP devices, and use the **show ip vrf** command to verify that the VRF instance has been created.

Customizing a BGP Peer

Perform this task to customize your BGP peers. Although many of the steps in this task are optional, this task demonstrates how the neighbor and address family configuration command relationships work. Using the example of the IPv4 multicast address family, neighbor address family-independent commands are configured before the IPv4 multicast address family is configured. Commands that are address family-dependent are then configured and the **exit address-family** command is shown. An optional step shows how to disable a neighbor.

The configuration in this task is done at Router B in the figure below and would need to be repeated with appropriate changes to the IP addresses, for example, at Router E to fully configure a BGP process between the two devices.

Figure 4: BGP Peer Topology

**Note**

By default, neighbors that are defined using the **neighbor remote-as** command in router configuration mode exchange only IPv4 unicast address prefixes. To exchange other address prefix types, such as IPv6 prefixes, neighbors must also be activated using the **neighbor activate** command in address family configuration mode for the other prefix types, such as IPv6 prefixes.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *autonomous-system-number***
4. **no bgp default ipv4-unicast**
5. **neighbor {ip-address | peer-group-name} remote-as *autonomous-system-number***
6. **neighbor {ip-address | peer-group-name} description *text***
7. **address-family ipv4 [unicast | multicast | vrf *vrf-name*]**
8. **network *network-number* [**mask *network-mask***] [**route-map *route-map-name***]**
9. **neighbor {ip-address | peer-group-name} activate**
10. **neighbor {ip-address | peer-group-name} advertisement-interval *seconds***
11. **neighbor {ip-address | peer-group-name} default-originate [**route-map *map-name***]**
12. **exit-address-family**
13. **neighbor {ip-address | peer-group-name} shutdown**
14. **end**
15. **show ip bgp ipv4 multicast [*command*]**
16. **show ip bgp neighbors [*neighbor-address*] [**received-routes | routes | advertised-routes | paths *regexp* | dampened-routes | received prefix-filter**]**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 45000	Enters router configuration mode for the specified routing process.
Step 4	no bgp default ipv4-unicast Example: Device(config-router)# no bgp default ipv4-unicast	Disables the IPv4 unicast address family for the BGP routing process. Note Routing information for the IPv4 unicast address family is advertised by default for each BGP routing session configured with the neighbor remote-as router configuration command unless you configure the no bgp default ipv4-unicast router configuration command before configuring the neighbor remote-as command. Existing neighbor configurations are not affected.
Step 5	neighbor {ip-address peer-group-name} remote-as <i>autonomous-system-number</i> Example: Device(config-router)# neighbor 192.168.3.2 remote-as 50000	Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local device.
Step 6	neighbor {ip-address peer-group-name} description <i>text</i> Example: Device(config-router)# neighbor 192.168.3.2 description finance	(Optional) Associates a text description with the specified neighbor.
Step 7	address-family ipv4 [unicast multicast vrf <i>vrf-name</i>] Example: Device(config-router)# address-family ipv4 multicast	Specifies the IPv4 address family and enters address family configuration mode. <ul style="list-style-type: none"> • The unicast keyword specifies the IPv4 unicast address family. By default, the device is placed in configuration mode for the IPv4 unicast address family if the unicast keyword is not specified with the address-family ipv4 command. • The multicast keyword specifies IPv4 multicast address prefixes. • The vrf keyword and <i>vrf-name</i> argument specify the name of the VRF instance to associate with subsequent IPv4 address family configuration mode commands.
Step 8	network <i>network-number</i> [mask <i>network-mask</i>] [route-map <i>route-map-name</i>]	(Optional) Specifies a network as local to this autonomous system and adds it to the BGP routing table.

	Command or Action	Purpose
	Example: <pre>Device(config-router-af) # network 172.17.1.0 mask 255.255.255.0</pre>	<ul style="list-style-type: none"> For exterior protocols the network command controls which networks are advertised. Interior protocols use the network command to determine where to send updates.
Step 9	neighbor {ip-address peer-group-name} activate	Enables the exchange of information with a BGP neighbor.
	Example: <pre>Device(config-router-af) # neighbor 192.168.3.2 activate</pre>	
Step 10	neighbor {ip-address peer-group-name} advertisement-interval seconds	(Optional) Sets the minimum interval between the sending of BGP routing updates.
	Example: <pre>Device(config-router-af) # neighbor 192.168.3.2 advertisement-interval 25</pre>	
Step 11	neighbor {ip-address peer-group-name} default-originate [route-map map-name]	(Optional) Permits a BGP speaker--the local device--to send the default route 0.0.0.0 to a peer for use as a default route.
	Example: <pre>Device(config-router-af) # neighbor 192.168.3.2 default-originate</pre>	
Step 12	exit-address-family	Exits address family configuration mode and enters router configuration mode.
	Example: <pre>Device(config-router-af) # exit-address-family</pre>	
Step 13	neighbor {ip-address peer-group-name} shutdown	(Optional) Disables a BGP peer or peer group. Note If you perform this step you will not be able to run either of the subsequent show command steps because you have disabled the neighbor.
	Example: <pre>Device(config-router) # neighbor 192.168.3.2 shutdown</pre>	
Step 14	end	Exits router configuration mode and enters privileged EXEC mode.
	Example: <pre>Device(config-router) # end</pre>	
Step 15	show ip bgp ipv4 multicast [command]	(Optional) Displays IPv4 multicast database-related information. <ul style="list-style-type: none"> Use the <i>command</i> argument to specify any multiprotocol BGP command that is supported. To see the supported commands, use the ? prompt on the CLI.
	Example: <pre>Device# show ip bgp ipv4 multicast</pre>	

	Command or Action	Purpose
Step 16	show ip bgp neighbors [neighbor-address] [received-routes routes advertised-routes paths regexp dampened-routes received prefix-filter]	(Optional) Displays information about the TCP and BGP connections to neighbors.

Example:

```
Device# show ip bgp neighbors 192.168.3.2
```

Examples

The following sample output from the **show ip bgp ipv4 multicast** command shows BGP IPv4 multicast information for Router B in the figure above after this task has been configured on Router B and Router E. Note that the networks local to each device that were configured under IPv4 multicast address family appear in the output table.

```
BGP table version is 3, local router ID is 172.17.1.99
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network          Next Hop          Metric LocPrf Weight Path
*> 10.2.2.0/24    192.168.3.2      0          0 50000 i
*> 172.17.1.0/24  0.0.0.0         0          32768 i
```

The following partial sample output from the **show ip bgp neighbors** command for neighbor 192.168.3.2 shows general BGP information and specific BGP IPv4 multicast address family information about the neighbor. The command was entered on Router B in the figure above after this task had been configured on Router B and Router E.

```
BGP neighbor is 192.168.3.2, remote AS 50000, external link
Description: finance
BGP version 4, remote router ID 10.2.2.99
BGP state = Established, up for 01:48:27
Last read 00:00:26, last write 00:00:26, hold time is 120, keepalive intervals
Configured hold time is 120,keepalive interval is 70 seconds, Minimum holdtims
Neighbor capabilities:
  Route refresh: advertised and received (old & new)
  Address family IPv4 Unicast: advertised
  Address family IPv4 Multicast: advertised and received
!
For address family: IPv4 Multicast
BGP table version 3, neighbor version 3/0
Output queue size : 0
Index 1, Offset 0, Mask 0x2
1 update-group member
  Uses NEXT_HOP attribute for MBGP_NLRIs
                Sent      Rcvd
Prefix activity:      ----      ----
  Prefixes Current:      1          1  (Consumes 48 bytes)
  Prefixes Total:        1          1
  Implicit Withdraw:    0          0
  Explicit Withdraw:    0          0
  Used as bestpath:     n/a        1
  Used as multipath:    n/a        0
                                Outbound      Inbound
Local Policy Denied Prefixes:  -----      -----
  Bestpath from this peer:        1          n/a
  Total:                          1          0
Number of NLRIs in the update sent: max 0, min 0
```

```

Minimum time between advertisement runs is 25 seconds
Connections established 8; dropped 7
Last reset 01:48:54, due to User reset
Connection state is ESTAB, I/O status: 1, unread input bytes: 0
Connection is ECN Disabled
Local host: 192.168.3.1, Local port: 13172
Foreign host: 192.168.3.2, Foreign port: 179
!

```

Removing BGP Configuration Commands Using a Redistribution

BGP CLI configuration can become quite complex even in smaller BGP networks. If you need to remove any CLI configuration, you must consider all the implications of removing the CLI. Analyze the current running configuration to determine the current BGP neighbor relationships, any address family considerations, and even other routing protocols that are configured. Many BGP CLI commands affect other parts of the CLI configuration.

Perform this task to remove all the BGP configuration commands used in a redistribution of BGP routes into EIGRP. A route map can be used to match and set parameters or to filter the redistributed routes to ensure that routing loops are not created when these routes are subsequently advertised by EIGRP. When removing BGP configuration commands you must remember to remove or disable all the related commands. In this example, if the **route-map** command is omitted, then the redistribution will still occur and possibly with unexpected results as the route map filtering has been removed. Omitting just the **redistribute** command would mean that the route map is not applied, but it would leave unused commands in the running configuration.

For more details on BGP CLI removal, see the “BGP CLI Removal Considerations” concept in the “Cisco BGP Overview” module.

To view the redistribution configuration before and after the CLI removal, see the “Examples: Removing BGP Configuration Commands Using a Redistribution Example” section.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no route-map *map-name***
4. **router eigrp *autonomous-system-number***
5. **no redistribute *protocol [as-number]***
6. **end**
7. **show running-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	no route-map map-name Example: Device(config)# no route-map bgp-to-eigrp	Removes a route map from the running configuration. <ul style="list-style-type: none">• In this example, a route map named bgp-to-eigrp is removed from the configuration.
Step 4	router eigrp autonomous-system-number Example: Device(config)# router eigrp 100	Enters router configuration mode for the specified routing process.
Step 5	no redistribute protocol [as-number] Example: Device(config-router)# no redistribute bgp 45000	Disables the redistribution of routes from one routing domain into another routing domain. <ul style="list-style-type: none">• In this example, the configuration of the redistribution of BGP routes into the EIGRP routing process is removed from the running configuration. Note If a route map was included in the original redistribute command configuration, remember to remove the route-map command configuration as in Step 3 in this example task. Note Only the syntax applicable to this task is used in this example. For more details, see the <i>Cisco IOS IP Routing: BGP Command Reference</i> .
Step 6	end Example: Device(config-router)# end	Exits router configuration mode and enters privileged EXEC mode.
Step 7	show running-config Example: Device# show running-config	(Optional) Displays the current running configuration on the router. <ul style="list-style-type: none">• Use this command to verify that the redistribute and route-map commands are removed from the router configuration.

Monitoring and Maintaining Basic BGP

The tasks in this section are concerned with the resetting and display of information about basic BGP processes and peer relationships. Once you have defined two devices to be BGP neighbors, they will form a BGP connection and exchange routing information. If you subsequently change a BGP filter, weight, distance, version, or timer, or make a similar configuration change, you may have to reset BGP connections for the configuration change to take effect.

Configuring Inbound Soft Reconfiguration When Route Refresh Capability Is Missing

Perform this task to configure inbound soft reconfiguration using the **bgp soft-reconfig-backup** command for BGP peers that do not support the route refresh capability. BGP peers that support the route refresh capability are unaffected by the configuration of this command. Note that the memory requirements for storing the inbound update information can become quite large.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *autonomous-system-number***
4. **bgp log-neighbor-changes**
5. **bgp soft-reconfig-backup**
6. **neighbor {ip-address | peer-group-name} remote-as *autonomous-system-number***
7. **neighbor {ip-address | peer-group-name} soft-reconfiguration [inbound]**
8. **neighbor {ip-address | peer-group-name} route-map *map-name* {in | out}**
9. Repeat Steps 6 through 8 for every peer that is to be configured with inbound soft reconfiguration.
10. **exit**
11. **route-map *map-name* [permit | deny] [*sequence-number*]**
12. **set ip next-hop *ip-address***
13. **end**
14. **show ip bgp neighbors [*neighbor-address*]**
15. **show ip bgp [*network*] [*network-mask*]**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 45000	Enters router configuration mode for the specified routing process.
Step 4	bgp log-neighbor-changes Example: Device(config-router)# bgp log-neighbor-changes	Enables logging of BGP neighbor resets.
Step 5	bgp soft-reconfig-backup Example: Device(config-router)# bgp soft-reconfig-backup	Configures a BGP speaker to perform inbound soft reconfiguration for peers that do not support the route refresh capability. <ul style="list-style-type: none"> This command is used to configure BGP to perform inbound soft reconfiguration for peers that do not support the route refresh capability. The configuration of this command allows you to configure BGP to store updates (soft reconfiguration) only as necessary. Peers that support the route refresh capability are unaffected by the configuration of this command.
Step 6	neighbor {ip-address peer-group-name} remote-as <i>autonomous-system-number</i> Example: Device(config-router)# neighbor 192.168.1.2 remote-as 40000	Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local device.
Step 7	neighbor {ip-address peer-group-name} soft-reconfiguration [inbound] Example: Device(config-router)# neighbor 192.168.1.2 soft-reconfiguration inbound	Configures the Cisco software to start storing updates. <ul style="list-style-type: none"> All the updates received from this neighbor will be stored unmodified, regardless of the inbound policy. When inbound soft reconfiguration is done later, the stored information will be used to generate a new set of inbound updates.
Step 8	neighbor {ip-address peer-group-name} route-map <i>map-name</i> {in out}	Applies a route map to incoming or outgoing routes. <ul style="list-style-type: none"> In this example, the route map named LOCAL will be applied to incoming routes.

	Command or Action	Purpose
	Example: Device(config-router)# neighbor 192.168.1.2 route-map LOCAL in	
Step 9	Repeat Steps 6 through 8 for every peer that is to be configured with inbound soft reconfiguration.	—
Step 10	exit Example: Device(config-router)# exit	Exits router configuration mode and enters global configuration mode.
Step 11	route-map map-name [permit deny] [sequence-number] Example: Device(config)# route-map LOCAL permit 10	Configures a route map and enters route-map configuration mode. • In this example, a route map named LOCAL is created.
Step 12	set ip next-hop ip-address Example: Device(config-route-map)# set ip next-hop 192.168.1.144	Specifies where output packets that pass a match clause of a route map for policy routing. • In this example, the ip address is set to 192.168.1.144.
Step 13	end Example: Device(config-route-map)# end	Exits route-map configuration mode and enters privileged EXEC mode.
Step 14	show ip bgp neighbors [neighbor-address] Example: Device# show ip bgp neighbors 192.168.1.2	(Optional) Displays information about the TCP and BGP connections to neighbors. Note Only the syntax applicable to this task is used in this example. For more details, see the <i>Cisco IOS IP Routing: BGP Command Reference</i> .
Step 15	show ip bgp [network] [network-mask] Example: Device# show ip bgp	(Optional) Displays the entries in the BGP routing table. Note Only the syntax applicable to this task is used in this example. For more details, see the <i>Cisco IOS IP Routing: BGP Command Reference</i> .

Examples

The following partial output from the **show ip bgp neighbors** command shows information about the TCP and BGP connections to the BGP neighbor 192.168.2.1. This peer supports route refresh.

```
BGP neighbor is 192.168.1.2, remote AS 40000, external link
  Neighbor capabilities:
    Route refresh: advertised and received(new)
```

The following partial output from the **show ip bgp neighbors** command shows information about the TCP and BGP connections to the BGP neighbor 192.168.3.2. This peer does not support route refresh so the soft-reconfig inbound paths for BGP peer 192.168.3.2 will be stored because there is no other way to update any inbound policy updates.

```
BGP neighbor is 192.168.3.2, remote AS 50000, external link
  Neighbor capabilities:
    Route refresh: advertised
```

The following sample output from the **show ip bgp** command shows the entry for the network 172.17.1.0. Both BGP peers are advertising 172.17.1.0/24, but only the received-only path is stored for 192.168.3.2.

```
BGP routing table entry for 172.17.1.0/24, version 11
Paths: (3 available, best #3, table Default-IP-Routing-Table, RIB-failure(4))
Flag: 0x820
  Advertised to update-groups:
    1
    50000
      192.168.3.2 from 192.168.3.2 (172.17.1.0)
        Origin incomplete, metric 0, localpref 200, valid, external
      50000, (received-only)
      192.168.3.2 from 192.168.3.2 (172.17.1.0)
        Origin incomplete, metric 0, localpref 100, valid, external
      40000
      192.168.1.2 from 192.168.1.2 (172.16.1.0)
        Origin incomplete, metric 0, localpref 200, valid, external, best
```

Resetting and Displaying Basic BGP Information

Perform this task to reset and display information about basic BGP processes and peer relationships.

SUMMARY STEPS

1. **enable**
2. **clear ip bgp { * | autonomous-system-number | neighbor-address } [soft [in | out]]**
3. **show ip bgp [network-address] [network-mask] [longer-prefixes] [prefix-list prefix-list-name | route-map route-map-name] [shorter prefixes mask-length]**
4. **show ip bgp neighbors [neighbor-address] [received-routes | routes | advertised-routes | paths regexp | dampened-routes | received prefix-filter]**
5. **show ip bgp paths**
6. **show ip bgp summary**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: Device> enable	• Enter your password if prompted.
Step 2	clear ip bgp {* autonomous-system-number neighbor-address} [soft [in out]] Example: Device# clear ip bgp *	Clears and resets BGP neighbor sessions: • In the example provided, all BGP neighbor sessions are cleared and reset.
Step 3	show ip bgp [network-address] [network-mask] [longer-prefixes] [prefix-list prefix-list-name route-map route-map-name] [shorter prefixes mask-length] Example: Device# show ip bgp 10.1.1.0 255.255.255.0	Displays all the entries in the BGP routing table: • In the example provided, the BGP routing table information for the 10.1.1.0 network is displayed.
Step 4	show ip bgp neighbors [neighbor-address] [received-routes routes advertised-routes paths regexp dampened-routes received prefix-filter] Example: Device# show ip bgp neighbors 192.168.3.2 advertised-routes	Displays information about the TCP and BGP connections to neighbors. • In the example provided, the routes advertised from the device to BGP neighbor 192.168.3.2 on another device are displayed.
Step 5	show ip bgp paths Example: Device# show ip bgp paths	Displays information about all the BGP paths in the database.
Step 6	show ip bgp summary Example: Device# show ip bgp summary	Displays information about the status of all BGP connections.

Aggregating Route Prefixes Using BGP

BGP peers exchange information about local networks, but this can quickly lead to large BGP routing tables. CIDR enables the creation of aggregate routes (or *supernets*) to minimize the size of routing tables. Smaller BGP routing tables can reduce the convergence time of the network and improve network performance.

Aggregated routes can be configured and advertised using BGP. Some aggregations advertise only summary

routes and other methods of aggregating routes allow more specific routes to be forwarded. Aggregation applies only to routes that exist in the BGP routing table. An aggregated route is forwarded if at least one more specific route of the aggregation exists in the BGP routing table. Perform one of the following tasks to aggregate routes within BGP:

Redistributing a Static Aggregate Route into BGP

Use this task to redistribute a static aggregate route into BGP. A static aggregate route is configured and then redistributed into the BGP routing table. The static route must be configured to point to interface null 0 and the prefix should be a superset of known BGP routes. When a device receives a BGP packet, it will use the more specific BGP routes. If the route is not found in the BGP routing table, then the packet will be forwarded to null 0 and discarded.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip route prefix mask {ip-address | interface-type interface-number [ip-address]} [distance] [name] [permanent | track number] [tag tag]**
4. **router bgp autonomous-system-number**
5. **redistribute static**
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip route prefix mask {ip-address interface-type interface-number [ip-address]} [distance] [name] [permanent track number] [tag tag] Example: Device(config)# ip route 172.0.0.0 255.0.0.0 null 0	Creates a static route.

	Command or Action	Purpose
Step 4	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 45000	Enters router configuration mode for the specified routing process.
Step 5	redistribute static Example: Device(config-router)# redistribute static	Redistributes routes into the BGP routing table.
Step 6	end Example: Device(config-router)# end	Exits router configuration mode and returns to privileged EXEC mode.

Configuring Conditional Aggregate Routes Using BGP

Use this task to create an aggregate route entry in the BGP routing table when at least one specific route falls into the specified range. The aggregate route is advertised as originating from your autonomous system. For more information, see the “BGP Route Aggregation Generating AS_SET Information” section.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *autonomous-system-number***
4. **aggregate-address *address mask [as-set]***
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 45000	Enters router configuration mode for the specified routing process.
Step 4	aggregate-address <i>address mask</i> [<i>as-set</i>] Example: Device(config-router)# aggregate-address 172.0.0.0 255.0.0.0 as-set	Creates an aggregate entry in a BGP routing table. <ul style="list-style-type: none"> • A specified route must exist in the BGP table. • Use the aggregate-address command with no keywords to create an aggregate entry if any more-specific BGP routes are available that fall in the specified range. • Use the as-set keyword to specify that the path advertised for this route is an AS_SET. Do not use the as-set keyword when aggregating many paths because this route is withdrawn and updated every time the reachability information for the aggregated route changes. Note Only partial syntax is used in this example. For more details, see the <i>Cisco IOS IP Routing: BGP Command Reference</i> .
Step 5	end Example: Device(config-router)# end	Exits router configuration mode and enters privileged EXEC mode.

Suppressing and Unsuppressing the Advertisement of Aggregated Routes Using BGP

Use this task to create an aggregate route, suppress the advertisement of routes using BGP, and subsequently unsuppress the advertisement of routes. Routes that are suppressed are not advertised to any neighbors, but it is possible to unsuppress routes that were previously suppressed to specific neighbors.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *autonomous-system-number***
4. **neighbor *ip-address* remote-as *autonomous-system-number***
5. Do one of the following:
 - **aggregate-address *address mask* [summary-only]**
 - **aggregate-address *address mask* [suppress-map *map-name*]**
6. **neighbor {*ip-address* | *peer-group-name*} unsuppress-map *map-name***
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 45000	Enters router configuration mode for the specified routing process.
Step 4	neighbor <i>ip-address</i> remote-as <i>autonomous-system-number</i> Example: Device(config-router)# neighbor 192.168.1.2 remote-as 40000	Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local device.
Step 5	Do one of the following: <ul style="list-style-type: none"> • aggregate-address <i>address mask</i> [summary-only] • aggregate-address <i>address mask</i> [suppress-map <i>map-name</i>] 	Creates an aggregate route. • Use the optional summary-only keyword to create the aggregate route (for example, 10.*.*.*) and also suppresses advertisements of more-specific routes to all neighbors.

	Command or Action	Purpose
	<p>Example:</p> <pre>Device(config-router)# aggregate-address 172.0.0.0 255.0.0.0 summary-only</pre> <p>Example:</p> <pre>Device(config-router)# aggregate-address 172.0.0.0 255.0.0.0 suppress-map map1</pre>	<ul style="list-style-type: none"> • Use the optional suppress-map keyword to create the aggregate route but suppress advertisement of specified routes. Routes that are suppressed are not advertised to any neighbors. You can use the match clauses of route maps to selectively suppress some more-specific routes of the aggregate and leave others unsuppressed. IP access lists and autonomous system path access lists match clauses are supported. <p>Note Only partial syntax is used in this example. For more details, see the <i>Cisco IOS IP Routing: BGP Command Reference</i>.</p>
Step 6	neighbor {ip-address peer-group-name} unsuppress-map map-name	<p>(Optional) Selectively advertises routes previously suppressed by the aggregate-address command.</p> <ul style="list-style-type: none"> • In this example, the routes previously suppressed in Step 5 are advertised to neighbor 192.168.1.2.
Step 7	end	Exits router configuration mode and enters privileged EXEC mode.
	<p>Example:</p> <pre>Device(config-router)# end</pre>	

Conditionally Advertising BGP Routes

Perform this task to conditionally advertise selected BGP routes. The routes or prefixes that will be conditionally advertised are defined in two route maps: an **advertise** map and either an **exist** map or **nonexist** map. The route map associated with the **exist** map or **nonexist** map specifies the prefix that the BGP speaker will track. The route map associated with the **advertise** map specifies the prefix that will be advertised to the specified neighbor when the condition is met.

- If a prefix is found to be present in the **exist** map by the BGP speaker, the prefix specified by the **advertise** map is advertised.
- If a prefix is found not to be present in the **nonexist** map by the BGP speaker, the prefix specified by the **advertise** map is advertised.

If the condition is not met, the route is withdrawn and conditional advertisement does not occur. All routes that may be dynamically advertised or not advertised must exist in the BGP routing table in order for conditional advertisement to occur. These routes are referenced from an access list or an IP prefix list.

SUMMARY STEPS

1. enable
2. configure terminal
3. router bgp *autonomous-system-number*
4. neighbor {*ip-address* | *peer-group-name*} remote-as *autonomous-system-number*
5. neighbor *ip-address* advertise-map *map-name* {exist-map *map-name* | non-exist-map *map-name*}
6. exit
7. route-map *map-tag* [permit | deny] [sequence-number]
8. match ip address {access-list-number [access-list-number... | access-list-name...] | access-list-name [access-list-number... | access-list-name] | prefix-list *prefix-list-name* [*prefix-list-name...*]}
9. exit
10. route-map *map-tag* [permit | deny] [sequence-number]
11. match ip address {access-list-number [access-list-number... | access-list-name...] | access-list-name [access-list-number... | access-list-name] | prefix-list *prefix-list-name* [*prefix-list-name...*]}
12. exit
13. access-list *access-list-number* {deny | permit} source [*source-wildcard*] [log]
14. access-list *access-list-number* {deny | permit} source [*source-wildcard*] [log]
15. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 45000	Enters router configuration mode for the specified routing process.

	Command or Action	Purpose
Step 4	neighbor {ip-address peer-group-name} remote-as autonomous-system-number Example: Device(config-router) # neighbor 192.168.1.2 remote-as 40000	Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local device.
Step 5	neighbor ip-address advertise-map map-name {exist-map map-name non-exist-map map-name} Example: Device(config-router) # neighbor 192.168.1.2 advertise-map map1 exist-map map2	Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local device. <ul style="list-style-type: none"> In this example, the prefix (172.17.0.0) matching the ACL in the advertise map (the route map named map1) will be advertised to the neighbor only when a prefix (192.168.50.0) matching the ACL in exist map (the route-map named map2) is in the local BGP table.
Step 6	exit Example: Device(config-router) # exit	Exits router configuration mode and enters global configuration mode.
Step 7	route-map map-tag [permit deny] [sequence-number] Example: Device(config)# route-map map1 permit 10	Configures a route map and enters route map configuration mode. <ul style="list-style-type: none"> In this example, a route map named map1 is created.
Step 8	match ip address {access-list-number [access-list-number... access-list-name...] access-list-name [access-list-number... access-list-name] prefix-list prefix-list-name [prefix-list-name...]} Example: Device(config-route-map) # match ip address 1	Configures the route map to match a prefix that is permitted by a standard access list, an extended access list, or a prefix list. <ul style="list-style-type: none"> In this example, the route map is configured to match a prefix permitted by access list 1.
Step 9	exit Example: Device(config-route-map) # exit	Exits route map configuration mode and enters global configuration mode.
Step 10	route-map map-tag [permit deny] [sequence-number]	Configures a route map and enters route map configuration mode.

	Command or Action	Purpose
	Example: Device(config)# route-map map2 permit 10	<ul style="list-style-type: none"> In this example, a route map named map2 is created.
Step 11	match ip address {access-list-number [access-list-number... access-list-name...] access-list-name [access-list-number... access-list-name] prefix-list prefix-list-name [prefix-list-name...]} Example: Device(config-route-map)# match ip address 2	<p>Configures the route map to match a prefix that is permitted by a standard access list, an extended access list, or a prefix list.</p> <ul style="list-style-type: none"> In this example, the route map is configured to match a prefix permitted by access list 2.
Step 12	exit Example: Device(config-route-map)# exit	Exits route map configuration mode and enters global configuration mode.
Step 13	access-list access-list-number {deny permit} source [source-wildcard] [log] Example: Device(config)# access-list 1 permit 172.17.0.0	<p>Configures a standard access list.</p> <ul style="list-style-type: none"> In this example, access list 1 permits advertising of the 172.17.0.0 prefix, depending on other conditions set by the neighbor advertise-map command.
Step 14	access-list access-list-number {deny permit} source [source-wildcard] [log] Example: Device(config)# access-list 2 permit 192.168.50.0	<p>Configures a standard access list.</p> <ul style="list-style-type: none"> In this example, access list 2 permits the 192.168.50.0 to be the prefix of the exist-map.
Step 15	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.

Originating BGP Routes

Route aggregation is useful to minimize the size of the BGP table, but there are situations when you want to add more specific prefixes to the BGP table. Route aggregation can hide more specific routes. Using the **network** command as shown in the “Configuring a BGP Routing Process” section originates routes, and the following optional tasks originate BGP routes for the BGP table for different situations.

Advertising a Default Route Using BGP

Perform this task to advertise a default route to BGP peers. The default route is locally originated. A default route can be useful to simplify configuration or to prevent the device from using too many system resources. If the device is peered with an Internet service provider (ISP), the ISP will carry full routing tables, so configuring a default route into the ISP network saves resources at the local device.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip prefix-list list-name [seq seq-value] {deny network / length | permit network / length} [ge ge-value] [le le-value]**
4. **route-map map-tag [permit | deny] [sequence-number]**
5. **match ip address {access-list-number [access-list-number... | access-list-name...] | access-list-name [access-list-number... | access-list-name] | prefix-list prefix-list-name [prefix-list-name...]}**
6. **exit**
7. **router bgp autonomous-system-number**
8. **neighbor {ip-address | peer-group-name} default originate [route-map map-name]**
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip prefix-list list-name [seq seq-value] {deny network / length permit network / length} [ge ge-value] [le le-value] Example: Device(config)# ip prefix-list DEFAULT permit 10.1.1.0/24	Configures an IP prefix list. • In this example, prefix list DEFAULT permits advertising of the 10.1.1.0/24. prefix depending on a match set by the match ip address command.

	Command or Action	Purpose
Step 4	route-map map-tag [permit deny] [sequence-number] Example: Device(config)# route-map ROUTE	Configures a route map and enters route map configuration mode. • In this example, a route map named ROUTE is created.
Step 5	match ip address {access-list-number [access-list-number... access-list-name...] access-list-name [access-list-number... access-list-name] prefix-list prefix-list-name [prefix-list-name...]} Example: Device(config-route-map)# match ip address prefix-list DEFAULT	Configures the route map to match a prefix that is permitted by a standard access list, an extended access list, or a prefix list. • In this example, the route map is configured to match a prefix permitted by prefix list DEFAULT.
Step 6	exit Example: Device(config-route-map)# exit	Exits route map configuration mode and enters global configuration mode.
Step 7	router bgp autonomous-system-number Example: Device(config)# router bgp 40000	Enters router configuration mode for the specified routing process.
Step 8	neighbor {ip-address peer-group-name} default-originate [route-map map-name] Example: Device(config-router)# neighbor 192.168.3.2 default-originate	(Optional) Permits a BGP speaker--the local device--to send the default route 0.0.0.0 to a peer for use as a default route.
Step 9	end Example: Device(config-router)# end	Exits router configuration mode and enters privileged EXEC mode.

Originating BGP Routes Using Backdoor Routes

Use this task to indicate to border devices which networks are reachable using a backdoor route. A backdoor network is treated the same as a local network, except that it is not advertised. For more information, see the BGP Backdoor Routes section.

Before You Begin

This task assumes that the IGP (EIGRP, in this example) is already configured for the BGP peers. The configuration is done at Router B in the “BGP Backdoor Routes” section, and the BGP peer is Router D.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *autonomous-system-number***
4. **neighbor *ip-address* remote-as *autonomous-system-number***
5. **network *ip-address* backdoor**
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 45000	Enters router configuration mode for the specified routing process.
Step 4	neighbor <i>ip-address</i> remote-as <i>autonomous-system-number</i> Example: Device(config-router)# neighbor 172.22.1.2 remote-as 45000	Adds the IP address of the neighbor in the specified autonomous system to the multiprotocol BGP neighbor table of the local device. • In this example, the peer is an internal peer as the autonomous system number specified for the peer is the same number specified in Step 3.
Step 5	network <i>ip-address</i> backdoor Example: Device(config-router)# network 172.21.1.0 backdoor	Indicates a network that is reachable through a backdoor route.

	Command or Action	Purpose
Step 6	end Example: <pre>Device (config-router) # end</pre>	Exits router configuration mode and returns to privileged EXEC mode.

Configuring a BGP Peer Group

This task explains how to configure a BGP peer group. Often, in a BGP speaker, many neighbors are configured with the same update policies (that is, the same outbound route maps, distribute lists, filter lists, update source, and so on). Neighbors with the same update policies can be grouped into peer groups to simplify configuration and, more importantly, to make updating more efficient. When you have many peers, this approach is highly recommended.

The three steps to configure a BGP peer group, described in the following task, are as follows:

- Creating the peer group
- Assigning options to the peer group
- Making neighbors members of the peer group

You can disable a BGP peer or peer group without removing all the configuration information using the **neighbor shutdown** router configuration command.

Note

By default, neighbors that are defined using the **neighbor remote-as** command in router configuration mode exchange only IPv4 unicast address prefixes. To exchange other address prefix types, such as IPv6 prefixes, neighbors must also be activated using the **neighbor activate** command in address family configuration mode for the other prefix types.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *autonomous-system-number***
4. **neighbor *peer-group-name* **peer-group****
5. **neighbor *ip-address* **remote-as** *autonomous-system-number***
6. **neighbor *ip-address* **peer-group** *peer-group-name***
7. **address-family ipv4 [unicast | multicast | vrf *vrf-name*]**
8. **neighbor *peer-group-name* **activate****
9. **neighbor *ip-address* **peer-group** *peer-group-name***
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 40000	Enters router configuration mode for the specified routing process.
Step 4	neighbor <i>peer-group-name</i> peer-group Example: Device(config-router)# neighbor fingroup peer-group	Creates a BGP peer group.
Step 5	neighbor <i>ip-address</i> remote-as <i>autonomous-system-number</i> Example: Device(config-router)# neighbor 192.168.1.1 remote-as 45000	Adds the IP address of the neighbor in the specified autonomous system to the multiprotocol BGP neighbor table of the local device.
Step 6	neighbor <i>ip-address</i> peer-group <i>peer-group-name</i> Example: Device(config-router)# neighbor 192.168.1.1 peer-group fingroup	Assigns the IP address of a BGP neighbor to a peer group.
Step 7	address-family ipv4 [unicast multicast vrf <i>vrf-name</i>] Example: Device(config-router)# address-family ipv4 multicast	Specifies the IPv4 address family and enters address family configuration mode. <ul style="list-style-type: none"> The unicast keyword specifies the IPv4 unicast address family. This is the default. The multicast keyword specifies that IPv4 multicast address prefixes will be exchanged. The vrf keyword and <i>vrf-name</i> argument specify that IPv4 VRF instance information will be exchanged.

	Command or Action	Purpose
Step 8	neighbor peer-group-name activate Example: Device(config-router-af)# neighbor fingroup activate	Enables the neighbor to exchange prefixes for the IPv4 address family with the local device. Note By default, neighbors that are defined using the neighbor remote-as command in router configuration mode exchange only unicast address prefixes. To allow BGP to exchange other address prefix types, such as multicast that is configured in this example, neighbors must also be activated using the neighbor activate command.
Step 9	neighbor ip-address peer-group peer-group-name Example: Device(config-router-af)# neighbor 192.168.1.1 peer-group fingroup	Assigns the IP address of a BGP neighbor to a peer group.
Step 10	end Example: Device(config-router-af)# end	Exits address family configuration mode and returns to privileged EXEC mode.

Configuration Examples for BGP 4

Example: Configuring a BGP Process and Customizing Peers

The following example shows the configuration for Router B in the above (in the “Customizing a BGP Peer” section) with a BGP process configured with two neighbor peers (at Router A and at Router E) in separate autonomous systems. IPv4 unicast routes are exchanged with both peers and IPv4 multicast routes are exchanged with the BGP peer at Router E.

Router B

```
router bgp 45000
bgp router-id 172.17.1.99
no bgp default ipv4-unicast
bgp log-neighbor-changes
timers bgp 70 120
neighbor 192.168.1.2 remote-as 40000
neighbor 192.168.3.2 remote-as 50000
neighbor 192.168.3.2 description finance
!
address-family ipv4
neighbor 192.168.1.2 activate
neighbor 192.168.3.2 activate
```

Examples: Removing BGP Configuration Commands Using a Redistribution Example

```

no auto-summary
no synchronization
network 172.17.1.0 mask 255.255.255.0
exit-address-family
!
address-family ipv4 multicast
neighbor 192.168.3.2 activate
neighbor 192.168.3.2 advertisement-interval 25
no auto-summary
no synchronization
network 172.17.1.0 mask 255.255.255.0
exit-address-family

```

Examples: Removing BGP Configuration Commands Using a Redistribution Example

The following examples show first the CLI configuration to enable the redistribution of BGP routes into EIGRP using a route map and then the CLI configuration to remove the redistribution and route map. Some BGP configuration commands can affect other CLI commands and this example demonstrates how the removal of one command affects another command.

In the first configuration example, a route map is configured to match and set autonomous system numbers. BGP neighbors in three different autonomous systems are configured and activated. An EIGRP routing process is started, and the redistribution of BGP routes into EIGRP using the route map is configured.

CLI to Enable BGP Route Redistribution Into EIGRP

```

route-map bgp-to-eigrp permit 10
match tag 50000
set tag 65000
exit
router bgp 45000
bgp log-neighbor-changes
address-family ipv4
neighbor 172.16.1.2 remote-as 45000
neighbor 172.21.1.2 remote-as 45000
neighbor 192.168.1.2 remote-as 40000
neighbor 192.168.3.2 remote-as 50000
neighbor 172.16.1.2 activate
neighbor 172.21.1.2 activate
neighbor 192.168.1.2 activate
neighbor 192.168.3.2 activate
network 172.17.1.0 mask 255.255.255.0
exit-address-family
exit
router eigrp 100
redistribute bgp 45000 metric 10000 100 255 1 1500 route-map bgp-to-eigrp
no auto-summary
exit

```

In the second configuration example, both the **route-map** command and the **redistribute** command are disabled. If only the route-map command is removed, it does not automatically disable the redistribution. The redistribution will now occur without any matching or filtering. To remove the redistribution configuration, the **redistribute** command must also be disabled.

CLI to Remove BGP Route Redistribution Into EIGRP

```

configure terminal
no route-map bgp-to-eigrp
router eigrp 100
no redistribute bgp 45000
end

```

Examples: BGP Soft Reset

The following examples show two ways to reset the connection for BGP peer 192.168.1.1.

Example: Dynamic Inbound Soft Reset

The following example shows the command used to initiate a dynamic soft reconfiguration in the BGP peer 192.168.1.1. This command requires that the peer support the route refresh capability.

```
clear ip bgp 192.168.1.1 soft in
```

Example: Inbound Soft Reset Using Stored Information

The following example shows how to enable inbound soft reconfiguration for the neighbor 192.168.1.1. All the updates received from this neighbor will be stored unmodified, regardless of the inbound policy. When inbound soft reconfiguration is performed later, the stored information will be used to generate a new set of inbound updates.

```
router bgp 100
neighbor 192.168.1.1 remote-as 200
neighbor 192.168.1.1 soft-reconfiguration inbound
```

The following example clears the session with the neighbor 192.168.1.1:

```
clear ip bgp 192.168.1.1 soft in
```

Example: Resetting and Displaying Basic BGP Information

The following example shows how to reset and display basic BGP information.

The **clear ip bgp *** command clears and resets all the BGP neighbor sessions. Specific neighbors or all peers in an autonomous system can be cleared by using the *neighbor-address* and *autonomous-system-number* arguments. If no argument is specified, this command will clear and reset all BGP neighbor sessions.

Note

The **clear ip bgp *** command also clears all the internal BGP structures, which makes it useful as a troubleshooting tool.

Device# **clear ip bgp ***

The **show ip bgp** command is used to display all the entries in the BGP routing table. The following example displays BGP routing table information for the 10.1.1.0 network:

```
Device# show ip bgp 10.1.1.0 255.255.255.0
```

```
BGP routing table entry for 10.1.1.0/24, version 2
Paths: (1 available, best #1, table Default-IP-Routing-Table)
      Advertised to update-groups:
        1
        40000
          192.168.1.2 from 192.168.1.2 (10.1.1.99)
            Origin IGP, metric 0, localpref 100, valid, external, best
```

The **show ip bgp neighbors** command is used to display information about the TCP and BGP connections to neighbors. The following example displays the routes that were advertised from Router B in the figure

Examples: Aggregating Prefixes Using BGP

above (in the “Configuring a BGP Peer for the IPv4 VRF Address Family” section) to its BGP neighbor 192.168.3.2 on Router E:

```
Device# show ip bgp neighbors 192.168.3.2 advertised-routes

BGP table version is 3, local router ID is 172.17.1.99
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network          Next Hop            Metric LocPrf Weight Path
*> 10.1.1.0/24    192.168.1.2        0          0 40000 i
*> 172.17.1.0/24  0.0.0.0           0          32768 i
Total number of prefixes 2
```

The **show ip bgp paths** command is used to display all the BGP paths in the database. The following example displays BGP path information for Router B in the figure above (in the “Customizing a BGP Peer” section):

```
Device# show ip bgp paths

Address      Hash Refcount Metric Path
0x2FB5DB0     0      5      0 i
0x2FB5C90     1      4      0 i
0x2FB5C00   1361     2      0 50000 i
0x2FB5D20   2625     2      0 40000 i
```

The **show ip bgp summary** command is used to display the status of all BGP connections. The following example displays BGP routing table information for Router B in the figure above (in the “Customizing a BGP Peer” section):

```
Device# show ip bgp summary

BGP router identifier 172.17.1.99, local AS number 45000
BGP table version is 3, main routing table version 3
2 network entries using 234 bytes of memory
2 path entries using 104 bytes of memory
4/2 BGP path/bestpath attribute entries using 496 bytes of memory
2 BGP AS-PATH entries using 48 bytes of memory
0 BGP route-map cache entries using 0 bytes of memory
0 BGP filter-list cache entries using 0 bytes of memory
BGP using 882 total bytes of memory
BGP activity 14/10 prefixes, 16/12 paths, scan interval 60 secs
Neighbor      V  AS MsgRcvd MsgSent TblVer InQ OutQ Up/Down State/PfxRcd
192.168.1.2   4  40000    667    672      3    0    0 00:03:49      1
192.168.3.2   4  50000    468    467      0    0    0 00:03:49 (NoNeg)
```

Examples: Aggregating Prefixes Using BGP

The following examples show how you can use aggregate routes in BGP either by redistributing an aggregate route into BGP or by using the BGP conditional aggregation routing feature.

In the following example, the **redistribute static** router configuration command is used to redistribute aggregate route 10.0.0.0:

```
ip route 10.0.0.0 255.0.0.0 null 0
!
router bgp 100
  redistribute static
```

The following configuration shows how to create an aggregate entry in the BGP routing table when at least one specific route falls into the specified range. The aggregate route will be advertised as coming from your autonomous system and has the atomic aggregate attribute set to show that information might be missing. (By

default, atomic aggregate is set unless you use the **as-set** keyword in the **aggregate-address** router configuration command.)

```
router bgp 100
  aggregate-address 10.0.0.0 255.0.0.0
```

The following example shows how to create an aggregate entry using the same rules as in the previous example, but the path advertised for this route will be an AS_SET consisting of all elements contained in all paths that are being summarized:

```
router bgp 100
  aggregate-address 10.0.0.0 255.0.0.0 as-set
```

The following example shows how to create the aggregate route for 10.0.0.0 and also suppress advertisements of more specific routes to all neighbors:

```
router bgp 100
  aggregate-address 10.0.0.0 255.0.0.0 summary-only
```

The following example configures BGP to not advertise inactive routes:

```
Device(config)# router bgp 50000
Device(config-router)# address-family ipv4 unicast
Device(config-router-af)# bgp suppress-inactive
Device(config-router-af)# end
```

The following example configures a maximum route limit in the VRF named RED and configures BGP to not advertise inactive routes through the VRF named RED:

```
Device(config)# ip vrf RED
Device(config-vrf)# rd 50000:10
Device(config-vrf)# maximum routes 1000 10
Device(config-vrf)# exit
Device(config)# router bgp 50000
Device(config-router)# address-family ipv4 vrf RED
Device(config-router-af)# bgp suppress-inactive
Device(config-router-af)# end
```

Example: Configuring a BGP Peer Group

The following example shows how to use an address family to configure a peer group so that all members of the peer group are both unicast- and multicast-capable:

```
router bgp 45000
neighbor 192.168.1.2 remote-as 40000
neighbor 192.168.3.2 remote-as 50000
address-family ipv4 unicast
  neighbor mygroup peer-group
  neighbor 192.168.1.2 peer-group mygroup
  neighbor 192.168.3.2 peer-group mygroup
router bgp 45000
neighbor 192.168.1.2 remote-as 40000
neighbor 192.168.3.2 remote-as 50000
address-family ipv4 multicast
  neighbor mygroup peer-group
  neighbor 192.168.1.2 peer-group mygroup
  neighbor 192.168.3.2 peer-group mygroup
  neighbor 192.168.1.2 activate
  neighbor 192.168.3.2 activate
```

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for BGP 4

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 2: Feature Information for BGP 4

Feature Name	Releases	Feature Information
BGP 4		BGP is an interdomain routing protocol designed to provide loop-free routing between separate routing domains that contain independent routing policies (autonomous systems). The Cisco software implementation of BGP Version 4 includes multiprotocol extensions to allow BGP to carry routing information for IP multicast routes and multiple Layer 3 protocol address families, including IP Version 4 (IPv4), IP Version 6 (IPv6), Virtual Private Networks version 4 (VPNv4), and Connectionless Network Services (CLNS).
