Configuring EIGRP

The Enhanced Interior Gateway Routing Protocol (EIGRP) is an enhanced version of the Interior Gateway Routing Protocol (IGRP) developed by Cisco. The convergence properties and the operating efficiency of EIGRP have improved substantially over IGRP, and IGRP is now obsolete.

The convergence technology of EIGRP is based on an algorithm referred to as the Diffusing Update Algorithm (DUAL). The algorithm guarantees loop-free operation at every instant throughout a route computation and allows all devices involved in a topology change to synchronize. Devices that are not affected by topology changes are not involved in recomputations.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Information About Configuring EIGRP

EIGRP Features

• Increased network width—With IP Routing Information Protocol (RIP), the largest possible width of your network is 15 hops. When EIGRP is enabled, the largest possible width is increased to 255 hops, and the EIGRP metric is large enough to support thousands of hops. The default maximum number of EIGRP hops is 100.

• Fast convergence—The DUAL algorithm allows routing information to converge quickly.

• Partial updates—EIGRP sends incremental updates (instead of sending the entire contents of the routing table) when the state of a destination changes. This feature minimizes the bandwidth required for EIGRP packets.

• Neighbor discovery mechanism—This is a simple, protocol-independent hello mechanism used to learn about neighboring devices.

• Variable-Length Subnet Masks (VLSMs).

• Arbitrary route summarization.

• Scaling—EIGRP scales to large networks.

EIGRP Autonomous System Configuration

Configuring the `router eigrp` command with the `autonomous-system-number` argument creates an EIGRP configuration called the EIGRP autonomous system configuration, or EIGRP classic mode. The EIGRP autonomous system configuration creates an EIGRP routing instance that can be used for exchanging routing information.

In EIGRP autonomous system configurations, EIGRP VPNs can be configured only under IPv4 address family configuration mode. A virtual routing and forwarding (VRF) instance and a route distinguisher must be defined before the address family session can be created.

When the address family is configured, we recommend that you configure an autonomous system number either by using the `autonomous-system-number` argument with the `address-family` command or by using the `autonomous-system` command.

EIGRP Named Configuration

Configuring the `router eigrp` command with the `virtual-instance-name` argument creates an EIGRP configuration referred to as the EIGRP named configuration or EIGRP named mode. An EIGRP named configuration does not create an EIGRP routing instance by itself; it is a base configuration that is required to define address-family configurations that are used for routing.

In EIGRP named configurations, EIGRP VPNs can be configured in IPv4 and IPv6 named configurations. A VRF instance and a route distinguisher must be defined before the address family session can be created.
A single EIGRP routing process can support multiple VRFs. The number of VRFs that can be configured is limited only by the available system resources on the device, which is determined by the number running processes and available memory. However, only a single VRF can be supported by each VPN, and redistribution between different VRFs is not supported.

**EIGRP Neighbor Relationship Maintenance**

Neighborhood relationship maintenance is the process that devices use to dynamically learn of other devices on their directly attached networks. Devices must also discover when their neighbors become unreachable or inoperative. Neighborhood relationship maintenance is achieved with low overhead by devices when they periodically send small hello packets to each other. As long as hello packets are received, the Cisco software can determine whether a neighbor is alive and functioning. After the status of the neighbor is determined, neighboring devices can exchange routing information.

The reliable transport protocol is responsible for the guaranteed, ordered delivery of Enhanced Interior Gateway Routing Protocol (EIGRP) packets to all neighbors. The reliable transport protocol supports intermixed transmission of multicast and unicast packets. Some EIGRP packets (such as updates) must be sent reliably; this means that the packets require acknowledgment from the destination. For efficiency, reliability is provided only when necessary. For example, on a multiaccess network that has multicast capabilities, hello packets need not be sent reliably to all neighbors individually. Therefore, EIGRP sends a single multicast hello packet with an indication in the packet informing receivers that the packet need not be acknowledged. The reliable transport protocol can send multicast packets quickly when unacknowledged packets are pending, thereby ensuring that the convergence time remains low in the presence of varying speed links.

Some EIGRP remote unicast-listen (any neighbor that uses unicast to communicate) and remote multicast-group neighbors may peer with any device that sends a valid hello packet, thus causing security concerns. By authenticating the packets that are exchanged between neighbors, you can ensure that a device accepts packets only from devices that know the preshared authentication key.

**Neighbor Authentication**

The authentication of packets being sent between neighbors ensures that a device accepts packets only from devices that have the same preshared key. If this authentication is not configured, you can intentionally or accidentally add another device to the network or send packets with different or conflicting route information onto the network, resulting in topology corruption and denial of service (DoS).

Enhanced Interior Gateway Routing Protocol (EIGRP) authentication is configurable on a per-interface basis; packets exchanged between neighbors connected through an interface are authenticated. EIGRP supports message digest algorithm 5 (MD5) authentication to prevent the introduction of unauthorized information from unapproved sources. MD5 authentication is defined in RFC 1321.

**DUAL Finite State Machine**

The DUAL finite state machine embodies the decision process for all route computations. It tracks all routes advertised by all neighbors. DUAL uses the distance information (known as the metric) to select efficient, loop-free paths. DUAL selects routes to be inserted into a routing table based on feasible successors. A successor is a neighboring device (used for packet forwarding) that has the least-cost path to a destination that is guaranteed not to be part of a routing loop. When there are no feasible successors but only neighbors advertising the destination, a recomputation must occur to determine a new successor. The time required to recompute the route affects the convergence time. Recomputation is processor-intensive, and unnecessary
recomputation must be avoided. When a topology change occurs, DUAL will test for feasible successors. If there are feasible successors, DUAL will use any feasible successors it finds to avoid unnecessary recomputation.

Protocol-Dependent Modules

Protocol-dependent modules are responsible for network-layer protocol-specific tasks. An example is the EIGRP module, which is responsible for sending and receiving EIGRP packets that are encapsulated in the IP. The EIGRP module is also responsible for parsing EIGRP packets and informing DUAL about the new information received. EIGRP asks DUAL to make routing decisions, but the results are stored in the IP routing table. Also, EIGRP is responsible for redistributing routes learned from other IP routing protocols.

Goodbye Message

The goodbye message is a feature designed to improve EIGRP network convergence. The goodbye message is broadcast when an EIGRP routing process is shut down to inform adjacent peers about an impending topology change. This feature allows supporting EIGRP peers to synchronize and recalculate neighbor relationships more efficiently than would occur if the peers discovered the topology change after the hold timer expired.

The following message is displayed by devices that run a supported release when a goodbye message is received:

```
*Apr 26 13:48:42.523: %DUAL-5-NBRCHANGE: IP-EIGRP(0) 1: Neighbor 10.1.1.1 (Ethernet0/0) is down: Interface Goodbye received
```

A Cisco device that runs a software release that does not support the goodbye message can misinterpret the message as a K-value mismatch and display the following error message:

```
*Apr 26 13:48:41.811: %DUAL-5-NBRCHANGE: IP-EIGRP(0) 1: Neighbor 10.1.1.1 (Ethernet0/0) is down: K-value mismatch
```

The receipt of a goodbye message by a nonsupporting peer does not disrupt normal network operation. The nonsupporting peer terminates the session when the hold timer expires. The sending and receiving devices reconverge normally after the sender reloads.

Routing Metric Offset Lists

An offset list is a mechanism for increasing incoming and outgoing metrics to routes learned via EIGRP. Optionally, you can limit the offset list with either an access list or an interface.

Offset lists are available only in IPv4 configurations. IPv6 configurations do not support offset lists.
EIGRP Cost Metrics

When EIGRP receives dynamic raw radio link characteristics, it computes a composite EIGRP cost metric based on a proprietary formula. To avoid churn in the network as a result of a change in the link characteristics, a tunable dampening mechanism is used.

EIGRP uses metric weights along with a set of vector metrics to compute the composite metric for local RIB installation and route selections. The EIGRP composite cost metric is calculated using the formula:

\[
\text{EIGRP composite cost metric} = 256\times((K1\times Bw) + (K2\times Bw)/(256 - \text{Load}) + (K3\times \text{Delay})\times(K5/(\text{Reliability} + K4)))
\]

EIGRP uses one or more vector metrics to calculate the composite cost metric. The table below lists EIGRP vector metrics and their descriptions.

Table 1: EIGRP Vector Metrics

<table>
<thead>
<tr>
<th>Vector Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bandwidth</td>
<td>The minimum bandwidth of the route, in kilobits per second. It can be 0 or any positive integer. The bandwidth for the formula is scaled and inverted by the following formula: ((10^7/\text{minimum bandwidth (Bw) in kilobits per second}))</td>
</tr>
<tr>
<td>delay</td>
<td>Route delay, in tens of microseconds.</td>
</tr>
<tr>
<td>delay reliability</td>
<td>The likelihood of successful packet transmission, expressed as a number between 0 and 255, where 255 means 100 percent reliability and 0 means no reliability.</td>
</tr>
<tr>
<td>load</td>
<td>The effective load of the route, expressed as a number from 0 to 255 (255 is 100 percent loading).</td>
</tr>
<tr>
<td>mtu</td>
<td>The minimum maximum transmission unit (MTU) size of the route, in bytes. It can be 0 or any positive integer.</td>
</tr>
</tbody>
</table>

EIGRP monitors metric weights on an interface to allow the tuning of EIGRP metric calculations and indicate the type of service (ToS). The table below lists the K values and their defaults.

Table 2: EIGRP K-Value Defaults

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>K1</td>
<td>1</td>
</tr>
<tr>
<td>K2</td>
<td>0</td>
</tr>
</tbody>
</table>
Most configurations use the delay and bandwidth metrics, with bandwidth taking precedence. The default formula of $256 \times (Bw + \text{Delay})$ is the EIGRP metric. The bandwidth for the formula is scaled and inverted by the following formula:

\[(10^7 / \text{minimum Bw in kilobits per second})\]

You can change the weights, but these weights must be the same on all devices.

For example, look at a link whose bandwidth to a particular destination is 128 k and the delay is 84,000 microseconds.

By using a cut-down formula, you can simplify the EIGRP metric calculation to $256 \times (Bw + \text{Delay})$, thus resulting in the following value:

Metric = $256 \times (10^7 / 128 + 84000 / 10) = 256 \times 86525 = 22150400$

To calculate route delay, divide the delay value by 10 to get the true value in tens of microseconds.

When EIGRP calculates the delay for Mobile Ad Hoc Networks (MANET) and the delay is obtained from a device interface, the delay is always calculated in tens of microseconds. In most cases, when using MANET, you will not use the interface delay, but rather the delay that is advertised by the radio. The delay you will receive from the radio is in microseconds, so you must adjust the cut-down formula as follows:

Metric = $(256 \times (10^7 / 128) + (84000 \times 256) / 10) = 20000000 + 2150400 = 22150400$

### Route Summarization

You can configure EIGRP to perform automatic summarization of subnet routes into network-level routes. For example, you can configure subnet 172.16.1.0 to be advertised as 172.16.0.0 over interfaces that have been configured with subnets of 192.168.7.0. Automatic summarization is performed when two or more network router configuration or address family configuration commands are configured for an EIGRP process. This feature is enabled by default.

Route summarization works in conjunction with the `ip summary-address eigrp` command available in interface configuration mode for autonomous system configurations and with the `summary-address` (EIGRP) command for named configurations. You can use these commands to perform additional summarization. If automatic summarization is in effect, there usually is no need to configure network-level summaries using the `ip summary-address eigrp` command.
Summary Aggregate Addresses

You can configure a summary aggregate address for a specified interface. If there are specific routes in the routing table, EIGRP will advertise the summary address of the interface with a metric equal to the minimum metric of the specific routes.

Floating Summary Routes

A floating summary route is created by applying a default route and an administrative distance at the interface level or address family interface level. You can use a floating summary route when configuring the `ip summary-address eigrp` command for autonomous system configurations or the `summary-address` command for named configurations. The following scenarios illustrate the behavior of floating summary routes.

The figure below shows a network with three devices, Device-A, Device-B, and Device-C. Device-A learns a default route from elsewhere in the network and then advertises this route to Device-B. Device-B is configured so that only a default summary route is advertised to Device-C. The default summary route is applied to serial interface 0/1 on Device-B with the following autonomous system configuration:

```
Device-B(config)# interface Serial 0/1
Device-B(config-if)# ip summary-address eigrp 100 0.0.0.0 0.0.0.0
```

The default summary route is applied to serial interface 0/1 on Device-B with the following named configuration:

```
Device-B(config)# Router eigrp virtual-name1
Device-B(config-router)# address-family ipv4 unicast vrf vrf1 autonomous-system 1
Device-B(config-router-af)# interface serial 0/1
Device-B(config-router-af-interface)# summary-address 192.168.0.0 255.255.0.0 95
```

**Figure 1: Floating Summary Route Applied to Device-B**

The configuration of the default summary route on Device-B sends a 0.0.0.0/0 summary route to Device-C and blocks all other routes, including the 10.1.1.0/24 route, from being advertised to Device-C. However, this configuration also generates a local discard route—a route for 0.0.0.0/0 on the null 0 interface with an administrative distance of 5—on Device-B. When this route is created, it overrides the EIGRP-learned default
route. Device-B will no longer be able to reach destinations that it would normally reach through the 0.0.0.0/0 route.

This problem is resolved by applying a floating summary route to the interface on Device-B that connects to Device-C. The floating summary route is applied by configuring an administrative distance for the default summary route on the interface of Device-B with the following statement for an autonomous system configuration:

```
Device-B(config-if)# ip summary-address eigrp 100 0.0.0.0 0.0.0.0 250
```

The floating summary route is applied by configuring an administrative distance for the default summary route on the interface of Device-B with the following statement for a named configuration:

```
Device-B(config)# router eigrp virtual-name1
Device-B(config-router)# address-family ipv4 unicast vrf vrf1 autonomous-system 1
Device-B(config-router-af)# af-interface serial0/1
Device-B(config-router-af-interface)# summary-address eigrp 100 0.0.0.0 0.0.0.0 250
```

The administrative distance of 250, applied in the `summary-address` command, is now assigned to the discard route generated on Device-B. The 0.0.0.0/0, from Device-A, is learned through EIGRP and installed in the local routing table. Routing to Device-C is restored.

If Device-A loses the connection to Device-B, Device-B will continue to advertise a default route to Device-C, which allows traffic to continue to reach destinations attached to Device-B. However, traffic destined to networks connected to Device-A or behind Device-A will be dropped when the traffic reaches Device-B.

The figure below shows a network with two connections from the core, Device-A and Device-D. Both Device-B and Device-E have floating summary routes configured on the interfaces connected to Device-C. If the connection between Device-E and Device-C fails, the network will continue to operate normally. All traffic will flow from Device-C through Device-B to hosts attached to Device-A and Device-D.

![Figure 2: Floating Summary Route Applied for Dual-Homed Remotes](image-url)
However, if the link between Device-A and Device-B fails, the network may incorrectly direct traffic because Device-B will continue to advertise the default route (0.0.0.0/0) to Device-C. In this scenario, Device-C still forwards traffic to Device-B, but Device-B drops the traffic. To avoid this problem, you should configure the summary address with an administrative distance only on single-homed remote devices or areas that have only one exit point between two segments of the network. If two or more exit points exist (from one segment of the network to another), configuring the floating default route can result in the formation of a black hole route (a route that has quick packet dropping capabilities).

**Hello Packets and the Hold-Time Intervals**

You can adjust the interval between hello packets and the hold time. Hello packets and hold-time intervals are protocol-independent parameters that work for IP and Internetwork Packet Exchange (IPX).

Routing devices periodically send hello packets to each other to dynamically learn of other devices on their directly attached networks. This information is used to discover neighbors and to learn when neighbors become unreachable or inoperative.

By default, hello packets are sent every 5 seconds. The exception is on low-speed, nonbroadcast multiaccess (NBMA) media, where the default hello interval is 60 seconds. Low speed is considered to be a rate of T1 or slower, as specified with the `bandwidth` interface configuration command. The default hello interval remains 5 seconds for high-speed NBMA networks. Note that for the purposes of EIGRP, Frame Relay and Switched Multimegabit Data Service (SMDS) networks may or may not be considered to be NBMA. These networks are considered NBMA only if the interface has not been configured to use physical multicasting.

You can configure the hold time on a specified interface for a particular EIGRP routing process designated by the autonomous system number. The hold time is advertised in hello packets and indicates to neighbors the length of time they should consider the sender valid. The default hold time is three times the hello interval or 15 seconds. For slow-speed NBMA networks, the default hold time is 180 seconds.

On very congested and large networks, the default hold time might not be sufficient for all devices to receive hello packets from their neighbors. In such cases, you may want to increase the hold time.

---

**Note**

Do not adjust the hold time without informing your technical support personnel.

---

**Split Horizon**

Split horizon controls the sending of EIGRP update and query packets. Split horizon is a protocol-independent parameter that works for IP and IPX. When split horizon is enabled on an interface, update and query packets are not sent to destinations for which this interface is the next hop. Controlling update and query packets in this manner reduces the possibility of routing loops.

By default, split horizon is enabled on all interfaces.

Split horizon blocks route information from being advertised by a device out of any interface from which that information originated. This behavior usually optimizes communications among multiple routing devices, particularly when links are broken. However, with nonbroadcast networks (such as Frame Relay and SMDS), situations can arise for which this behavior is less than ideal. In such situations and in networks that have EIGRP configured, you may want to disable split horizon.
Link Bandwidth Percentage

By default, EIGRP packets consume a maximum of 50 percent of the link bandwidth when configured with the `bandwidth` interface configuration command for autonomous system configurations and with the `bandwidth-percent` command for named configurations. You might want to change the bandwidth value if a different level of link utilization is required or if the configured bandwidth does not match the actual link bandwidth (which may have been configured to influence route metric calculations). This is a protocol-independent parameter that works for IP and IPX.

EIGRP Stub Routing Leak Map Support

In EIGRP stub routing configurations where there is a remote site with more than one device, only one of the remote devices can be configured as the stub device. If you have two distribution layer devices and two devices at a remote site, there is no way to declare both remote devices as stub devices. If one remote device is configured as a stub device, the other remote device can neither learn routes towards the network core if the link between the stub device and the distribution layer device fails nor route around the failed link.

The stub device cannot readvertise routes learned from any neighboring EIGRP device. To resolve this issue, a leak map configuration that allows a selected set of learned routes to be readvertised to other peers can be added to the EIGRP stub routing feature. The set of routes allowed through the stub device are specified using a standard route map so that routes can be matched based on tags, prefixes, or interfaces. These routes are marked using the site-of-origin code mechanism, which prevents routes permitted through the stub from being readvertised into the core of the network.

Use the `eigrp stub leak-map` command to configure the EIGRP stub routing feature to reference a leak map that identifies routes that are allowed to be advertised on an EIGRP stub device that would normally have been suppressed.

How to Configure EIGRP

Enabling EIGRP Autonomous System Configuration

Perform this task to enable EIGRP and create an EIGRP routing process. EIGRP sends updates to interfaces in specified networks. If you do not specify the network of an interface, the interface will not be advertised in any EIGRP update.

Configuring the `router eigrp autonomous-system-number` command creates an EIGRP autonomous system configuration that creates an EIGRP routing instance, which can be used for tagging routing information.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router eigrp autonomous-system-number`
4. `network network-number`
5. `end`
### Detailed Steps

</table>

### Enabling the EIGRP Named Configuration

Perform this task to enable EIGRP and to create an EIGRP routing process. EIGRP sends updates to interfaces in specified networks. If you do not specify the network of an interface, the interface will not be advertised in any EIGRP update.

Configuring the `router eigrp virtual-instance-name` command creates an EIGRP named configuration. The EIGRP named configuration does not create an EIGRP routing instance by itself. The EIGRP named configuration is the base configuration, which is required to define address family configurations used for routing.
SUMMARY STEPS

1. enable
2. configure terminal
3. router eigrp virtual-instance-name
4. Enter one of the following:
   - address-family ipv4 [multicast] [unicast] [vrf vrf-name] autonomous-system autonomous-system-number
   - address-family ipv6 [unicast] [vrf vrf-name] autonomous-system autonomous-system-number
5. network ip-address [wildcard-mask]
6. end

### Configuring Optional EIGRP Parameters in an Autonomous System Configuration

Perform this task to configure optional EIGRP parameters, which include applying offsets to routing metrics, adjusting EIGRP metrics, and disabling automatic summarization in an EIGRP autonomous system configuration.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router eigrp autonomous-system`
4. `network ip-address [wildcard-mask]`
5. `passive-interface [default] [interface-type interface-number]`
6. `offset-list [access-list-number | access-list-name] {in | out} offset [interface-type interface-number]`
7. `metric weights tos k1 k2 k3 k4 k5`
8. `no auto-summary`
9. `end`

</table>
### Configuring Optional EIGRP Parameters in a Named Configuration

Perform this task to configure optional EIGRP named configuration parameters, which includes applying offsets to routing metrics, adjusting EIGRP metrics, setting the RIB-scaling factor, and disabling automatic summarization.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **router eigrp** virtual-instance-name
4. Enter one of the following:
   - `address-family ipv4 [unicast] [vrf vrf-name] [multicast] autonomous-system autonomous-system-number`
   - `address-family ipv6 [unicast] [vrf vrf-name] autonomous-system autonomous-system-number`
5. **network** ip-address [wildcard-mask]
6. **metric weights** tos k1 k2 k3 k4 k5 k6
7. **af-interface** interface-type interface-number
8. **passive-interface**
9. **bandwidth-percent** maximum-bandwidth-percentage
10. **exit-af-interface**
11. **topology** {base | topology-name tid number}
12. **offset-list** [access-list-number | access-list-name] [in | out] offset [interface-type interface-number]
13. **no auto-summary**
14. **end**

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> Device(config-router)# no auto-summary</td>
<td><strong>Note</strong> Automatic summarization is enabled by default.</td>
</tr>
<tr>
<td><strong>Step 9</strong> end</td>
<td>Exits router configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Step 9**

Example:

Device(config-router)# end
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| Example: | Device> enable |
| Step 2 | configure terminal | Enters global configuration mode. |
| Example: | Device# configure terminal |
| Step 3 | router eigrp virtual-instance-name | Enables an EIGRP routing process and enters router configuration mode. |
| Example: | Device(config)# router eigrp virtual-name1 |
| Step 4 | Enter one of the following: | Enters address family configuration mode to configure an EIGRP IPv4 or IPv6 routing instance. |
| - address-family ipv4 [unicast] [vrf vrf-name] [multicast] autonomous-system autonomous-system-number |  |
| - address-family ipv6 [unicast] [vrf vrf-name] autonomous-system autonomous-system-number |  |
| Example: | Device(config-router)# address-family ipv4 autonomous-system 45000  
Device(config-router)# address-family ipv6 autonomous-system 45000 |
| Step 5 | network ip-address [wildcard-mask] | Specifies a network for the EIGRP routing process. |
| Example: | Device(config-router-af)# network 172.16.0.0 |
| Step 6 | metric weights tos k1 k2 k3 k4 k5 k6 | (Optional) Adjusts the EIGRP metric or K value. |
| Example: | Device(config-router-af)# metric weights 0 2 0 0 0 0 |

**EIGRP**

- EIGRP uses the following formula to determine the total 32-bit metric to the network:
  \[
  EIGRP\ Metric = 256*[(K1*Bw) + (K2*Bw)/(256-Load) + (K3*Delay)*(K5/(Reliability + K4))]
  \]

- EIGRP uses the following formula to determine the total 64-bit metric to the network:
  \[
  EIGRP\ Metric = 256*[(K1*Throughput) + (K2*Throughput)/(256-Load) + (K3*Latency) + (K6*Extended\ Attributes)*(K5/(Reliability + K4))]
  \]

</table>
Configuring the EIGRP Redistribution Autonomous System Configuration

Perform this task to configure redistribution of non-EIGRP protocol metrics into EIGRP metrics and to configure the EIGRP administrative distance in an EIGRP autonomous system configuration.

You must use a default metric to redistribute a protocol into EIGRP, unless you use the `redistribute` command.

**Note**

Metric defaults have been carefully set to work for a wide variety of networks. Take great care when changing these values.

Default metrics are supported only when you are redistributing from EIGRP or static routes.

An administrative distance is a rating of the trustworthiness of a routing information source, such as an individual router or a group of routers. Numerically, an administrative distance is an integer from 0 to 255. In general, the higher the value the lower the trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router eigrp autonomous-system
4. network ip-address [wildcard-mask]
5. redistribute protocol
6. distance eigrp internal-distance external-distance
7. default-metric bandwidth delay reliability loading mtu
8. end

**DETAILED STEPS**

</table>
| **Example:**  
Device(config)# router eigrp 1 | |
| **Step 4** network ip-address [wildcard-mask] | Associates networks with an EIGRP routing process. |
| **Example:**  
Device(config-router)# network 172.16.0.0 | |
| **Step 5** redistribute protocol | Redistributes routes from one routing domain into another routing domain. |
| **Example:**  
Device(config-router)# redistribute rip | |
| **Step 6** distance eigrp internal-distance external-distance | Allows the use of two administrative distances—internal and external. |
| **Example:**  
Device(config-router)# distance eigrp 80 130 | |
| **Step 7** default-metric bandwidth delay reliability loading mtu | Sets metrics for EIGRP. |
| **Example:**  
Device(config-router)# default-metric 1000 100 250 100 1500 | |
| **Step 8** end | Exits router configuration mode and returns to privileged EXEC mode. |
| **Example:**  
Device(config-router)# end | |

**Configuring the EIGRP Route Summarization Autonomous System Configuration**

Perform this task to configure EIGRP to perform automatic summarization of subnet routes into network-level routes in an EIGRP autonomous system configuration.
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router eigrp autonomous-system`
4. `no auto-summary`
5. `exit`
6. `interface type number`
7. `no switchport`
8. `bandwidth kbps`
9. `ip summary-address eigrp as-number ip-address mask [admin-distance] [leak-map name]`
10. `ip bandwidth-percent eigrp as-number percent`
11. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
  Example:  
  Device> enable  
  • Enter your password if prompted. |
| Step 2 | `configure terminal` | Enters global configuration mode.  
  Example:  
  Device# configure terminal |
| Step 3 | `router eigrp autonomous-system` | Enables an EIGRP routing process and enters router configuration mode.  
  Example:  
  Device(config)# router eigrp 101  
  • A maximum of 30 EIGRP routing processes can be configured. |
| Step 4 | `no auto-summary` | Disables automatic summarization of subnet routes into network-level routes  
  Example:  
  Device(config-router)# no auto-summary |
| Step 5 | `exit` | Exits router configuration mode.  
  Example:  
  Device(config-router)# exit |
### Configuring the EIGRP Route Summarization Named Configuration

<td></td>
</tr>
</tbody>
</table>

**Step 5**

**topology** `{base | topology-name tid number}`

**Example:**

Device(config-router-af)# topology base

Configures an EIGRP process to route IP traffic under the specified topology instance and enters address family topology configuration mode.

**Step 6**

**traffic-share balanced**

**Example:**

Device(config-router-af-topology)# traffic-share balanced

Controls how traffic is distributed among routes when multiple routes for the same destination network have different costs.

**Step 7**

**maximum-paths number-of-paths**

**Example:**

Device(config-router-af-topology)# maximum-paths 5

Controls the maximum number of parallel routes that an IP routing protocol can support.

**Step 8**

**variance multiplier**

**Example:**

Device(config-router-af-topology)# variance 1

Controls load balancing in an internetwork based on EIGRP.

**Step 9**

**end**

**Example:**

Device(config-router-af-topology)# end

Exits address family topology configuration mode and returns to privileged EXEC mode.

---

**Adjusting the Interval Between Hello Packets and the Hold Time in an Autonomous System Configuration**

**Note**

Cisco recommends not to adjust the hold time.
SUMMARY STEPS

1. enable
2. configure terminal
3. router eigrp autonomous-system-number
4. exit
5. interface type number
6. no switchport
7. ip hello-interval eigrp autonomous-system-number seconds
8. ip hold-time eigrp autonomous-system-number seconds
9. end

**Adjusting the Interval Between Hello Packets and the Hold Time in a Named Configuration**

**Note**

Do not adjust the hold time without consulting your technical support personnel.

---

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router eigrp virtual-instance-name
4. Enter one of the following:
   - `address-family ipv4 [multicast] [unicast] [vrf vrf-name] autonomous-system autonomous-system-number`
   - `address-family ipv6 [unicast] [vrf vrf-name] autonomous-system autonomous-system-number`
5. af-interface {default | interface-type interface-number}
6. hello-interval seconds
7. hold-time seconds
8. end
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  
  Example:  
  ```console
  Device> enable
  ```  
  - Enter your password if prompted. |
| 2    | configure terminal | Enters global configuration mode.  
  Example:  
  ```console
  Device# configure terminal
  ``` |
| 3    | router eigrp virtual-instance-name | Enables an EIGRP routing process and enters router configuration mode.  
  Example:  
  ```console
  Device(config)# router eigrp virtual-name1
  ``` |
| 4    | Enter one of the following:  
  - address-family ipv4 [multicast] [unicast] [vrf vrf-name] autonomous-system autonomous-system-number  
  - address-family ipv6 [unicast] [vrf vrf-name] autonomous-system autonomous-system-number | Enters address family configuration mode to configure an EIGRP IPv4 or IPv6 routing instance.  
  Example:  
  ```console
  Device(config-router)# address-family ipv4 autonomous-system 45000  
  Device(config-router)# address-family ipv6 autonomous-system 45000
  ``` |
| 5    | af-interface {default | interface-type interface-number} | Enters address family interface configuration mode and configures interface-specific EIGRP commands.  
  Example:  
  ```console
  Device(config-router-af)# af-interface gigabitethernet 0/0/1
  ``` |
| 6    | hello-interval seconds | Configures the hello interval for an EIGRP address family named configuration.  
  Example:  
  ```console
  Device(config-router-af-interface)# hello-interval 10
  ``` |
Disabling the Split Horizon Autonomous System Configuration

Split horizon controls the sending of EIGRP updates and query packets. When split horizon is enabled on an interface, updates and query packets are not sent for destinations for which this interface is the next hop. Controlling updates and query packets in this manner reduces the possibility of routing loops.

By default, split horizon is enabled on all interfaces.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. no ip split-horizon eigrp autonomous-system-number
5. end

DETAILED STEPS

</tbody>
</table>
### Disabling the Split Horizon and Next-Hop-Self Named Configuration

EIGRP, by default, sets the next-hop value to the local outbound interface address for routes that it is advertising, even when advertising those routes back from the same interface from where they were learned. Perform this task to change this default setting and configure EIGRP to use the received next-hop value when advertising these routes. Disabling next-hop-self is primarily useful in DMVPN spoke-to-spoke topologies.

By default, split horizon is enabled on all interfaces.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. router eigrp virtual-instance-name
4. Enter one of the following:
   - `address-family ipv4 [multicast] [unicast] [vrf vrf-name] autonomous-system autonomous-system-number`
   - `address-family ipv6 [unicast] [vrf vrf-name] autonomous-system autonomous-system-number`
5. `af-interface {default | interface-type interface-number}`
6. no split-horizon
7. no next-hop-self [no-ecmp-mode]
8. end
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
|       | **Example:**  
  Device> `enable` | |
| Step 2 | `configure terminal` | Enters global configuration mode. |
|       | **Example:**  
  Device# `configure terminal` | |
| Step 3 | `router eigrp virtual-instance-name` | Enables an EIGRP routing process and enters router configuration mode. |
|       | **Example:**  
  Device(config)# `router eigrp virtual-name1` | |
| Step 4 | Enter one of the following:  
  - `address-family ipv4 [multicast] [unicast] [vrf vrf-name] autonomous-system autonomous-system-number`  
  - `address-family ipv6 [unicast] [vrf vrf-name] autonomous-system autonomous-system-number` | Enters address family configuration mode to configure an EIGRP IPv4 or IPv6 routing instance. |
|       | **Example:**  
  Device(config-router)# `address-family ipv4 autonomous-system 45000`  
  Device(config-router)# `address-family ipv6 autonomous-system 45000` | |
| Step 5 | `af-interface {default | interface-type interface-number}` | Enters address family interface configuration mode and configures interface-specific EIGRP commands. |
|       | **Example:**  
  Device(config-router-sf)# `af-interface gigabitethernet 0/0/1` | |
| Step 6 | `no split-horizon` | Disables EIGRP split horizon. |
|       | **Example:**  
  Device(config-router-sf-interface)# `no split-horizon` | |
### Step 7

**Command or Action:**

<table>
<thead>
<tr>
<th>Command</th>
<th>Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>no next-hop-self [no-ecmp-mode]</td>
<td></td>
<td>(Optional) Instructs an EIGRP router to use the received next hop rather than the local outbound interface address as the next hop.</td>
</tr>
</tbody>
</table>

**Example:**

```
Device(config-router-af-interface)# no next-hop-self no-ecmp-mode
```

- The `no-ecmp-mode` keyword is an enhancement to the `no next-hop-self` command. When this optional keyword is enabled, all paths to a network in the EIGRP table are evaluated to check whether routes advertised from an interface were learned on the same interface.

### Step 8

**Command or Action:**

<table>
<thead>
<tr>
<th>Command</th>
<th>Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td></td>
<td>Exits address family interface configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Device(config-router-af-interface)# end
```

### Monitoring and Maintaining the EIGRP Autonomous System Configuration

This task is optional. Use the commands in any order desired to monitor and maintain EIGRP autonomous system configuration.

### SUMMARY STEPS

1. **enable**
2. **show ip eigrp [vrf {vrf-name | *}] [autonomous-system-number] accounting**
3. **show ip eigrp events [starting-event-number ending-event-number] [type]**
4. **show ip eigrp interfaces [vrf {vrf-name | *}] [autonomous-system-number] [type number] [detail]**
5. **show ip eigrp [vrf {vrf-name | *}] [autonomous-system-number] topology [ip-address [mask]] | [name] [active | all-links | detail-links | pending | summary | zero-successors]**
6. **show ip eigrp [vrf {vrf-name | *}] [autonomous-system-number] topology [ip-address [mask]] | [name] [active | all-links | detail-links | pending | summary | zero-successors]**
7. **show ip eigrp [vrf {vrf-name | *}] [autonomous-system-number] traffic**

### DETAILED STEPS

**Step 1**

**Command or Action:**

<table>
<thead>
<tr>
<th>Command</th>
<th>Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
</tbody>
</table>
Example:
```
Device# enable
```

Step 2 show ip eigrp [vrf {vrf-name | *}] [autonomous-system-number] accounting
Displays prefix accounting information for EIGRP processes.

Example:
```
Device# show ip eigrp vrf VRF1 accounting
```

Step 3 show ip eigrp events [starting-event-number ending-event-number] [type]
Displays information about interfaces that are configured for EIGRP.

Example:
```
Device# show ip eigrp events
```

Step 4 show ip eigrp interfaces [vrf {vrf-name | *}] [autonomous-system-number] [type number] [detail]
Displays neighbors discovered by EIGRP.

Example:
```
Device# show ip eigrp interfaces
```

Step 5 show ip eigrp [vrf {vrf-name | *}] [autonomous-system-number] topology [ip-address [mask]] | [name] | [active] | [all-links] | [detail-links] | [pending] | [summary] | [zero-successors]
Displays neighbors discovered by EIGRP.

Example:
```
Device# show ip eigrp neighbors
```

Step 6 show ip eigrp [vrf {vrf-name | *}] [autonomous-system-number] topology [ip-address [mask]] | [name] | [active] | [all-links] | [detail-links] | [pending] | [summary] | [zero-successors]
Displays entries in the EIGRP topology table.

Example:
```
Device# show ip eigrp topology
```

Step 7 show ip eigrp [vrf {vrf-name | *}] [autonomous-system-number] traffic
Displays the number of EIGRP packets sent and received.

Example:
```
Device# show ip eigrp traffic
```
Monitoring and Maintaining the EIGRP Named Configuration

This task is optional. Use the commands in any order desired to monitor and maintain the EIGRP named configuration.

SUMMARY STEPS

1. **enable**
2. **show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] accounting**
3. **show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] events [starting-event-number ending-event-number] [errmsg [starting-event-number ending-event-number]] [sia [starting-event-number ending-event-number]] [type]
4. **show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] interfaces [detail] [interface-type interface-number]
5. **show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] neighbors [static] [detail] [interface-type interface-number]
6. **show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] timers**
7. **show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] topology [topology-name] [ip-address] [active] [all-links] [detail-links] [pending] [summary] [zero-successors] [route-type {connected | external | internal | local | redistributed | summary | vpn}]
8. **show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] traffic**
9. **show eigrp plugins [plugin-name] [detailed]**
10. **show eigrp protocols [vrf vrf-name]**

DETAILLED STEPS

**Step 1**
**enable**
Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

Device# enable

**Step 2**
**show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] accounting**
Displays prefix accounting information for EIGRP processes.

**Example:**

Device# show eigrp address-family ipv4 22 accounting

**Step 3**
**show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] events [starting-event-number ending-event-number] [errmsg [starting-event-number ending-event-number]] [sia [starting-event-number ending-event-number]] [type]
Displays information about EIGRP address-family events.**
Example:
Device# show eigrp address-family ipv4 3 events

Step 4  show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] interfaces [detail]
[interface-type interface-number]
Displays information about interfaces that are configured for EIGRP.

Example:
Device# show eigrp address-family ipv4 4453 interfaces

Step 5  show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] neighbors [static]
[detail] [interface-type interface-number]
Displays the neighbors that are discovered by EIGRP.

Example:
Device# show eigrp address-family ipv4 4453 neighbors

Step 6  show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] timers
Displays information about EIGRP timers and expiration times.

Example:
Device# show eigrp address-family ipv4 4453 timers

Step 7  show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] topology
[topology-name] [ip-address] [active] [all-links] [detail-links] [pending] [summary] [zero-successors] [route-type
{connected | external | internal | local | redistributed | summary | vpn}]
Displays entries in the EIGRP topology table.

Example:
Device# show eigrp address-family ipv4 4453 topology

Step 8  show eigrp address-family {ipv4 | ipv6} [vrf vrf-name] [autonomous-system-number] [multicast] traffic
Displays the number of EIGRP packets that are sent and received.

Example:
Device# show eigrp address-family ipv4 4453 traffic

Step 9  show eigrp plugins [plugin-name] [detailed]
Displays general information, including the versions of the EIGRP protocol features that are currently running on the device.
Example:

```
Device# show eigrp plugins
```

**Step 10**
```
show eigrp protocols [vrf vrf-name]
```
Displays further information about EIGRP protocols that are currently running on a device.

Example:
```
Device# show eigrp protocols
```

---

**Configuration Examples for EIGRP**

**Example: Enabling EIGRP—Autonomous System Configuration**

```
Device> enable
Device# configure terminal
Device(config)# router eigrp 1
Device(config-router)# network 172.16.0.0
```

**Example: Enabling EIGRP—Named Configuration**

```
Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 45000
Device(config-router-af)# network 172.16.0.0
```

**Example: EIGRP Parameters—Autonomous System Configuration**

The following example shows how to configure optional EIGRP autonomous system configuration parameters, including applying offsets to routing metrics, adjusting EIGRP metrics, and disabling automatic summarization:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp 1
Device(config-router)# network 172.16.0.0
Device(config-router)# passive-interface
Device(config-router)# offset-list 21 in 10 ethernet 0
Device(config-router)# metric weights 0 2 0 2 0 0
Device(config-router)# no auto-summary
Device(config-router)# exit
```
Example: EIGRP Parameters—Named Configuration

The following example shows how to configure optional EIGRP named configuration parameters, including applying offsets to routing metrics, adjusting EIGRP metrics, setting RIB-scaling factor, and disabling automatic summarization.

```
Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 45000
Device(config-router-af)# network 172.16.0.0
Device(config-router-af)# metric weights 0 2 0 2 0 0 0
Device(config-router-af)# metric rib-scale 100
Device(config-router-af)# af-interface gigabitethernet 0/0/1
Device(config-router-af)# passive-interface
Device(config-router-af)# bandwidth-percent 75
Device(config-router-af)# exit-af-interface
Device(config-router-af-topology)# offset-list 21 in 10 gigabitethernet 0/0/1
Device(config-router-af-topology)# no auto-summary
Device(config-router-af-topology)# exit-af-topology
```

Example: EIGRP Redistribution—Autonomous System Configuration

The following example shows how to configure redistribution of non-EIGRP protocol metrics into EIGRP metrics and configure the EIGRP administrative distance in an EIGRP autonomous system configuration:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp 1
Device(config-router)# network 172.16.0.0
Device(config-router)# redistribute rip
Device(config-router)# distance eigrp 80 130
Device(config-router)# default-metric 1000 100 250 100 1500
```

Example: EIGRP Route Summarization—Autonomous System Configuration

The following example shows how to configure route summarization on an interface and configure the automatic summary feature for an EIGRP autonomous system configuration. The following configuration causes EIGRP to summarize the network from Ethernet interface 0/0.

```
Device> enable
Device# configure terminal
Device(config)# router eigrp 101
Device(config-router)# no auto-summary
Device(config-router)# exit
Device(config)# interface Gigabitethernet 1/0/1
Device(config-if)# no switchport
Device(config-if)# ip summary-address eigrp 100 0.0.0.0 0.0.0.0
Device(config-if)# ip bandwidth-percent eigrp 209 75
```
You should not use the `ip summary-address eigrp` summarization command to generate the default route (0.0.0.0) from an interface because this creates an EIGRP summary default route to the null 0 interface with an administrative distance of 5. The low administrative distance of this default route can cause this route to displace default routes learned from other neighbors through the routing table. If the default route learned from the neighbors is displaced by the summary default route, or if the summary route is the only default route present, all traffic destined for the default route will not leave the router; instead, traffic will be sent to the null 0 interface, where it is dropped. The recommended way to send only the default route out of a given interface is to use the `distribute-list` command. You can configure this command to filter all outbound route advertisements sent out from the interface with the exception of the default (0.0.0.0).

Example: EIGRP Route Summarization—Named Configuration

The following example shows how to configure route summarization on an interface and configure the automatic summary feature for an EIGRP named configuration. This configuration causes EIGRP to summarize network 192.168.0.0 only from Ethernet interface 0/0.

```plaintext
Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 45000
Device(config-router-af)# af-interface ethernet 0/0
Device(config-router-af-interface)# summary-address 192.168.0.0 255.255.0.0
Device(config-router-af-interface)# exit-af-interface
Device(config-router-af)# topology base
Device(config-router-af-topology)# summary-metric 192.168.0.0/16 10000 10 255 1 1500
```

Example: EIGRP Event Logging—Autonomous System Configuration

The following example shows how to configure EIGRP event logging parameters, including setting the size of the EIGRP event log for an EIGRP autonomous system configuration:

```plaintext
Device> enable
Device# configure terminal
Device(config)# router eigrp 1
Device(config-router)# eigrp event-log-size 5000
Device(config-router)# eigrp log-neighbor-changes
Device(config-router)# eigrp log-neighbor-warnings 300
```

Example: EIGRP Event Logging—Named Configuration

The following example shows how to configure EIGRP event logging parameters, including setting the size of the EIGRP event log for an EIGRP named configuration:

```plaintext
Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 45000
Device(config-router-af)# eigrp log-neighbor-warnings 300
Device(config-router-af)# eigrp log-neighbor-changes
Device(config-router-af)# topology base
Device(config-router-af-topology)# eigrp event-log-size 10000
```
Example: Equal and Unequal Cost Load Balancing—Autonomous System Configuration

The following example shows how to configure traffic distribution among routes, the maximum number of parallel routes, and load balancing in an EIGRP named configuration network:

Device> enable
Device# configure terminal
Device(config)# router eigrp 1
Device(config-router)# traffic-share balanced
Device(config-router)# maximum-paths 5
Device(config-router)# variance 1

Example: Equal and Unequal Cost Load Balancing—Named Configuration

The following example shows how to configure traffic distribution among routes, the maximum number of parallel routes, and load balancing in an EIGRP named configuration network:

Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 45000
Device(config-router-af)# topology base
Device(config-router-af-topology)# traffic-share balanced
Device(config-router-af-topology)# maximum-paths 5
Device(config-router-af-topology)# variance 1

Example: Adjusting the Interval Between Hello Packets and the Hold Time—Autonomous System Configuration

Device> enable
Device# configure terminal
Device(config)# router eigrp 1
Device(config-router)# exit
Device(config)# interface Gigabitethernet 1/0/9
Device(config-if)# no switchport
Device(config-if)# ip hello-interval eigrp 109 10
Device(config-if)# ip hold-time eigrp 109 40

Example: Adjusting the Interval Between Hello Packets and the Hold Time—Named Configuration

Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 45000
Device(config-router-af)# af-interface ethernet 0/0
Device(config-router-af-interface)# hello-interval 10
Device(config-router-af-interface)# hold-time 50
Example: Disabling the Split Horizon—Autonomous System Configuration

Split horizon is enabled on all interfaces by default. The following example shows how to disable split horizon for an EIGRP autonomous system configuration:

Device> enable
Device# configure terminal
Device(config)# router eigrp 1
Device(config-router)# exit
Device(config)# interface Ethernet 0/1
Device(config-if)# no ip split-horizon eigrp 101

Example: Disabling the Split Horizon and Next-Hop-Self—Named Configuration

Split horizon is enabled on all interfaces by default. The following example shows how to disable split horizon in an EIGRP named configuration.

EIGRP, by default, sets the next-hop value to the local outbound interface address for routes that it advertises, even when advertising those routes back out of the same interface from where they were learned. The following example shows how to change this default to instruct EIGRP to use the received next-hop value when advertising these routes in an EIGRP named configuration. Disabling the next-hop-self command is primarily useful in DMVPN spoke-to-spoke topologies.

Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 45000
Device(config-router-af)# af-interface ethernet 0/0
Device(config-router-af-interface)# no split-horizon
Device(config-router-af-interface)# no next-hop-self no-ecmp-mode

Example: Monitoring and Maintaining the EIGRP Autonomous System Configuration

The show ip eigrp command displays prefix accounting information for EIGRP processes. The following is sample output from this command:

Device# show ip eigrp vrf VRF1 accounting
EIGRP-IPv4 Accounting for AS(100)/ID(10.0.2.1) VRF(VRF1)
Total Prefix Count: 4 States: A-Adjacency, P-Pending, D-Down
State Address/Source Interface Prefix Restart Restart/
          Count Count Reset(s)
P    Redistributed    ---    0    3    211
A   10.0.1.2    Gi0/0    2    0    84
P   10.0.2.4    Se2/0    0    2    114
D   10.0.1.3    Gi0/0    0    3    0

The show ip eigrp events command displays the EIGRP event log. The following is sample output from this command:

Device# show ip eigrp events
1  02:37:58.171 NSF stale rt scan, peer: 10.0.0.0
2  02:37:58.167 Metric set: 10.0.0.1/24 284700416
3  02:37:58.167 FC sat rhmet/succmet: 284700416 0
**Example: Monitoring and Maintaining the EIGRP Autonomous System Configuration**

```

The **show ip eigrp neighbors** command displays neighbors discovered by EIGRP. The following is sample output from this command:

```plaintext
Device# show ip eigrp neighbors

H Address    Interface  Hold Uptime  SRTT  RTO  Q  Seq
            (sec)       (ms)       (sec) (ms) (ms) (ms)
0 10.1.1.2   Gi0/0     13:00:00:03 1996 5000 0 5
2 10.1.1.9   Gi0/0     14:00:02:24 206 5000 0 5
1 10.1.2.3   Gi0/1     11:00:20:39 2202 5000 0 5
```

The **show ip eigrp topology** command displays entries in the EIGRP topology table. The following is sample output from this command:

```plaintext
Device# show ip eigrp topology

EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)

Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply, r - Reply status, s - sia status

P 10.0.0.0/8, 1 successors, FD is 409600
  via 10.0.0.1 (409600/128256), GigabitEthernet0/0
P 172.16.1.0/24, 1 successors, FD is 409600
  via 10.0.0.1 (409600/128256), GigabitEthernet0/0
P 10.0.0.0/8, 1 successors, FD is 281600
  via Summary (281600/0), Null0
P 10.0.1.0/24, 1 successors, FD is 281600
  via Connected, GigabitEthernet0/0
```

The **show ip eigrp traffic** command displays the number of EIGRP packets sent and received. The following is sample output from this command:

```plaintext
Device# show ip eigrp traffic

EIGRP-IPv4 Traffic Statistics for AS(60)

Updates sent/received: 22/17
Queries sent/received: 0/0
Replies sent/received: 0/0
Acks sent/received: 16/13
SIA-Queries sent/received: 0/0
SIA-Replies sent/received: 0/0
Hello Process ID: 204
PDM Process ID: 203
Socket Queue: 0/0 (current/max/highest/drops)
Input Queue: 0/0 (current/max/highest/drops)
```
Example: Monitoring and Maintaining the EIGRP Named Configuration

In this example, the `show eigrp address-family` command displays prefix accounting information for EIGRP processes:

```
Device# show eigrp address-family ipv4 22 accounting

EIGRP-IPv4 VR(Virtual-name) Accounting for AS(22)/ID(10.0.0.1)
Total Prefix Count: 3 States: A-Adjacency, P-Pending, D-Down
State Address/Source Interface Prefix Restart Restart/Count Count Count
  A  10.0.0.2 Gi0/0 2 0 0
  P  10.0.2.4 Se2/0 0 2 114
  D  10.0.1.3 Gi0/0 0 3 0
```

In this example, the `show eigrp address-family` command displays information about EIGRP address-family events:

```
Device# show eigrp address-family ipv4 3 events

Event information for AS 3:
 1 15:37:47.015 Change queue emptied, entries: 1
 2 15:37:47.015 Metric set: 10.0.0.0/24 307200
 3 15:37:47.015 Update reason, delay: new if 4294967295
 4 15:37:47.015 Update sent, Rd: 10.0.0.0/24 4294967295
 5 15:37:47.015 Update reason, delay: metric chg 4294967295
 6 15:37:47.015 Update sent, Rd: 10.0.0.0/24 4294967295
 7 15:37:47.015 Route installed: 10.0.0.0/24 10.0.1.2
 8 15:37:47.015 Route installing: 10.0.0.0/24 10.0.1.2
```

In this example, the `show eigrp address-family` command displays information about interfaces that are configured for EIGRP:

```
Device# show eigrp address-family ipv4 4453 interfaces

EIGRP-IPv4 VR(Virtual-name) Address-family Neighbors for AS(4453)
    Xmit Queue Mean Pacing Time Multicast Pending
Interface Peers Un/Reliable SRTT Un/Reliable Flow Timer Services
Se0 1 0/0 28 0/15 127 0
Se1 1 0/0 44 0/15 211 0
```

In this example, the `show eigrp address-family` command displays information about the neighbors that are discovered by EIGRP:

```
Device# show eigrp address-family ipv4 4453 neighbors

EIGRP-IPv4 VR(Virtual-name) Address-family Neighbors for AS(4453)
    Address Interface Hold Uptime SRTT RTO Q Seq
                    (sec) (ms) (ms) Cnt Num
172.16.81.28  GigabitEthernet1/1/1 13 0:00:41 0 11 4 20
172.16.80.28  GigabitEthernet0/0/1 14 0:02:01 0 10 12 24
```

In this example, the `show eigrp address-family` command displays information about EIGRP timers and expiration times:

```
Device# show eigrp address-family ipv4 4453 timers

EIGRP-IPv4 VR(Virtual-name) Address-family Timers for AS(4453)
Hello Process
    Expiration Type
    | 1.022 (parent)
    | 1.022 Hello (Et0/0)
Update Process
    Expiration Type
    | 14.984 (parent)
    | 14.984 (parent)
    | 14.984 Peer holding
SIA Process
    Expiration Type for Topo(base)
    | 0.000 (parent)
```
In this example, the `show eigrp address-family` command displays entries in the EIGRP topology table:

```
Device# show eigrp address-family ipv4 4453 topology

EIGRP-IPv4 VR(Virtual-name) Topology Table for AS(4453)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply, 
       r - Reply status, s - sia Status

P  10.17.17.0/24, 1 successors, FD is 409600
   via 10.10.10.2 (409600/128256), GigabitEthernet3/0/1

P  172.16.19.0/24, 1 successors, FD is 409600
   via 10.10.10.2 (409600/128256), GigabitEthernet3/0/1

P  192.168.10.0/24, 1 successors, FD is 281600
   via Connected, GigabitEthernet3/0/1

P  10.10.10.0/24, 1 successors, FD is 281600
   via Redistributed (281600/0)
```

In this example, the `show eigrp address-family` command displays information about the number of EIGRP packets that are sent and received:

```
Device# show eigrp address-family ipv4 4453 traffic

EIGRP-IPv4 VR(virtual-name) Address-family Traffic Statistics for AS(4453)
  Hellos sent/received: 122/122
  Updates sent/received: 3/1
  Queries sent/received: 0/0
  Replies sent/received: 0/0
  Acks sent/received: 0/3
  SIA-Queries sent/received: 0/0
  SIA-Replies sent/received: 0/0
  Hello Process ID: 128
  PDM Process ID: 191
  Socket Queue: 0/2000/1/0 (current/max/highest/drops)
  Input Queue: 0/2000/1/0 (current/max/highest/drops)
```

In this example, the `show eigrp plugins` command displays general information, including the versions of the EIGRP protocol features that are currently running on the device:

```
Device# show eigrp plugins

EIGRP feature plugins:::
eigrp-release : 5.00.00 : Portable EIGRP Release
   : 19.00.00 : Source Component Release(rel5)
igrp2 : 3.00.00 : Reliable Transport/Dual Database
bdf : 1.01.00 : BFD Platform Support
mtr : 1.00.01 : Multi-Topology Routing(MTR)
eigrp-pfr : 1.00.01 : Performance Routing Support
ipv4-af : 2.01.01 : Routing Protocol Support
ipv4-sf : 1.01.00 : Service Distribution Support
external-client : 1.02.00 : Service Distribution Client Support
ipv6-af : 2.01.01 : Routing Protocol Support
ipv6-sf : 1.01.00 : Service Distribution Support
snmp-agent : 1.01.01 : SNMP/SNMPv2 Agent Support
```

In this example, the `show eigrp protocols` command displays general information about EIGRP protocols that are currently running on a device:

```
Device# show eigrp protocols

EIGRP-IPv4 Protocol for AS(10)
  Metric weight K1=1, K2=0, K3=1, K4=0, K5=0
  NSF-aware route hold timer is 240
  Router-ID: 10.0.1.1
  Topology : 0 (base)
  Active Timer: 3 min
  Distance: internal 90 external 170
  Maximum path: 4
  Maximum hopcount 100
  Maximum metric variance 1
EIGRP-IPv4 Protocol for AS(5) VRF(VRF1)
  Metric weight K1=1, K2=0, K3=1, K4=0, K5=0
  NSF-aware route hold timer is 240
  Router-ID: 10.1.2.1
  Topology : 0 (base)
  Active Timer: 3 min
```

## Feature Information for EIGRP

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.
