

IPv6 Routing: IS-IS Support for IPv6

This module describes how to configure Integrated Intermediate System-to-Intermediate System (IS-IS) for IPv6. IS-IS is an Interior Gateway Protocol (IGP) that advertises link-state information throughout the network to create a picture of the network topology. IS-IS is an Open Systems Interconnection (OSI) hierarchical routing protocol that designates an intermediate system as a Level 1 or Level 2 device. Level 2 devices route between Level 1 areas to create an intradomain routing backbone. Integrated IS-IS uses a single routing algorithm to support several network address families, such as IPv6, IPv4, and OSI.

- Feature Information for IPv6 Routing: IS-IS Support for IPv6, on page 13

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About IPv6 Routing: IS-IS Support for IPv6

IS-IS Enhancements for IPv6

IS-IS in IPv6 functions the same and offers many of the same benefits as IS-IS in IPv4. IPv6 enhancements to IS-IS allow IS-IS to advertise IPv6 prefixes in addition to IPv4 and OSI routes. Extensions to the IS-IS command-line interface (CLI) allow configuration of IPv6-specific parameters. IPv6 IS-IS extends the address families supported by IS-IS to include IPv6, in addition to OSI and IPv4.

IS-IS in IPv6 supports either single-topology mode or multiple topology mode.

IS-IS Single-Topology Support for IPv6

Single-topology support for IPv6 allows IS-IS for IPv6 to be configured on interfaces along with other network protocols (for example, IPv4 and Connectionless Network Service [CLNS]). All interfaces must be configured with the identical set of network address families. In addition, all routers in the IS-IS area (for Level 1 routing) or the domain (for Level 2 routing) must support the identical set of network layer address families on all interfaces.

When single-topology support for IPv6 is being used, either old- or new-style TLVs may be used. However, the TLVs used to advertise reachability to IPv6 prefixes use extended metrics. Cisco routers do not allow an interface metric to be set to a value greater than 63 if the configuration is not set to support only new-style TLVs for IPv4. In single-topology IPv6 mode, the configured metric is always the same for both IPv4 and IPv6.

IPv6 IS-IS Local RIB

A router that is running IS-IS IPv6 maintains a local RIB in which it stores all routes to destinations it has learned from its neighbors. At the end of each SPF, IS-IS attempts to install the best (that is, the least-cost) routes to a destination present in the local RIB in the global IPv6 routing table.

How to Configure IPv6 Routing: IS-IS Support for IPv6

Configuring Single-Topology IS-IS for IPv6

Configuring IS-IS comprises two activities. The first activity creates an IS-IS routing process and is performed using protocol-independent IS-IS commands. The second activity in configuring IPv6 IS-IS configures the operation of the IS-IS protocol on an interface.

Before you begin

Before configuring the router to run IPv6 IS-IS, globally enable IPv6 using the **ipv6 unicast-routing** global configuration command.

Note

If you are using IS-IS single-topology support for IPv6, IPv4, or both IPv6 and IPv4, you may configure both IPv6 and IPv4 on an IS-IS interface for Level 1, Level 2, or both Level 1 and Level 2. However, if both IPv6 and IPv4 are configured on the same interface, they must be running the same IS-IS level. That is, IPv4 cannot be configured to run on IS-IS Level 1 only on a specified GigabitEthernet or FastEthernet interface while IPv6 is configured to run IS-IS Level 2 only on the same GigabitEthernet or FastEthernet interface.

>

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. router isis area-tag
- **4. net** *network-entity-title*

- 5. exit
- **6. interface** *type number*
- $\textbf{7.} \quad \textbf{ipv6 address} \ \textit{\{ipv6-address \mid prefix-length \mid prefix-name \ sub-bits/prefix-length \ \}}$
- 8. ipv6 router isis area-name

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	router isis area-tag	Enables IS-IS for the specified IS-IS routing process, and
	Example:	enters router configuration mode.
	Router(config) # router isis area2	
Step 4	net network-entity-title	Configures an IS-IS network entity title (NET) for the
	Example:	routing process.
	Router(config-router)# net 49.0001.0000.0000.000c.00	• The <i>network-entity-title</i> argument defines the area addresses for the IS-IS area and the system ID of the router.
Step 5	exit	Exits router configuration mode and enters global
	Example:	configuration mode.
	Router(config-router)# exit	
Step 6	interface type number	Specifies the interface type and number, and enters interface
	Example:	configuration mode.
	Router(config) # interface GigabitEthernet 0/0/1	
Step 7	ipv6 address {ipv6-address / prefix-length prefix-name sub-bits/prefix-length	Specifies the IPv6 network assigned to the interface and enables IPv6 processing on the interface.
	Example:	Note Refer to the Implementing IPv6 Addressing and
	Router(config-if)# ipv6 address 2001:DB8::3/64	Basic Connectivity module for more informati on configuring IPv6 addresses.
Step 8	ipv6 router isis area-name	Enables the specified IPv6 IS-IS routing process on an
	Example:	interface.

Command or Action	Purpose
Router(config-if)# ipv6 router isis area2	

Customizing IPv6 IS-IS

Perform this task to configure a new administrative distance for IPv6 IS-IS, configure the maximum number of equal-cost paths that IPv6 IS-IS will support, configure summary prefixes for IPv6 IS-IS, and configure an IS-IS instance to advertise the default IPv6 route (::/0). It also explains how to configure the hold-down period between partial route calculations (PRCs) and how often Cisco IOS XE software performs the SPF calculation when using multitopology IS-IS.

You can customize IS-IS multitopology for IPv6 for your network, but you likely will not need to do so. The defaults for this feature are set to meet the requirements of most customers and features. If you change the defaults, refer to the IPv4 configuration guide and the IPv6 command reference to find the appropriate syntax.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. router isis area-tag
- 4. address-family ipv6 [unicast | multicast]
- **5. default-information originate** [route-map map-name]
- 6. distance value
- **7. maximum-paths** *number-paths*
- 8. **summary-prefix** *ipv6-prefix prefix-length* **level-1** | **level-1-2**| **level-2**]
- 9. prc-interval seconds [initial-wait] [secondary-wait
- **10. spf-interval** [**level-1** | **level-2**] *seconds initial-wait*] [*secondary-wait*
- **11**. exit
- **12. interface** *type number*
- 13. isis ipv6 metric metric-value [level-1 | level-2 | level-1-2

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	router isis area-tag	Enables IS-IS for the specified IS-IS routing process, and
	Example:	enters router configuration mode.

	Command or Action	Purpose
	Router(config) # router isis area2	
Step 4	address-family ipv6 [unicast multicast] Example:	Specifies the IPv6 address family, and enters address family configuration mode.
	Router(config-router)# address-family ipv6	 The unicast keyword specifies the unicast IPv6 unicast address family. By default, the router is placed in configuration mode for the unicast IPv6 address family if the unicast keyword is not specified with the address-family ipv6 command.
Step 5	default-information originate [route-map map-name] Example:	(Optional) Injects a default IPv6 route into an IS-IS routing domain.
	Router(config-router-af)# default-information originate	• The route-map keyword and <i>map-name</i> argument specify the conditions under which the IPv6 default route is advertised.
		• If the route map keyword is omitted, then the IPv6 default route will be unconditionally advertised at Level 2.
Step 6	distance value	(Optional) Defines an administrative distance for IPv6
	Example:	IS-IS routes in the IPv6 routing table.
	Router(config-router-af)# distance 90	• The <i>value</i> argument is an integer from 10 to 254. (The values 0 to 9 are reserved for internal use).
Step 7	maximum-paths number-paths Example:	(Optional) Defines the maximum number of equal-cost routes that IPv6 IS-IS can support.
	Router(config-router-af)# maximum-paths 3	• This command also supports IPv6 Border Gateway Protocol (BGP) and Routing Information Protocol (RIP).
		• The <i>number-paths</i> argument is an integer from 1 to 64. The default for BGP is one path; the default for IS-IS and RIP is 16 paths.
Step 8	summary-prefix ipv6-prefix prefix-length level-1 level-1-2 level-2	(Optional) Allows a Level 1-2 router to summarize Level 1 prefixes at Level 2, instead of advertising the Level 1
	Example:	prefixes directly when the router advertises the summary.
	Router(config-router-af)# summary-prefix 2001:DB8::/24	• The <i>ipv6-prefix</i> argument in the summary-prefix command must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		• The <i>prefix-length</i> argument is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network

	Command or Action	Purpose
		portion of the address). A slash mark must precede the decimal value.
Step 9	prc-interval seconds [initial-wait] [secondary-wait Example:	(Optional) Configures the hold-down period between PRCs for multitopology IS-IS for IPv6.
	Router(config-router-af)# prc-interval 20	
Step 10	spf-interval [level-1 level-2] seconds initial-wait] [secondary-wait	(Optional) Configures how often Cisco IOS XE software performs the SPF calculation for multitopology IS-IS for
	Example:	IPv6.
	Router(config-router-af)# spf-interval 30	
Step 11	exit Example:	Exits address family configuration mode, and returns the router to router configuration mode.
	Router(config-router-af)# exit	Repeat this step to exit router configuration mode and return the router to global configuration mode.
Step 12	interface type number	Specifies the interface type and number, and enters
	Example:	interface configuration mode.
	Router(config-router)# interface GigabitEthernet 0/0/1	
Step 13	isis ipv6 metric metric-value [level-1 level-2 level-1-2 Example:	(Optional) Configures the value of an multitopology IS-IS for IPv6 metric.
	Router(config-if)# isis ipv6 metric 20	

Disabling IPv6 Protocol-Support Consistency Checks

Perform this task to disable protocol-support consistency checks in IPv6 single-topology mode.

For single-topology IS-IS IPv6, routers must be configured to run the same set of address families. IS-IS performs consistency checks on hello packets and will reject hello packets that do not have the same set of configured address families. For example, a router running IS-IS for both IPv4 and IPv6 will not form an adjacency with a router running IS-IS for IPv4 or IPv6 only. In order to allow adjacency to be formed in mismatched address-families network, the **adjacency-check** command in IPv6 address family configuration mode must be disabled.

Note

Entering the **no adjacency-check** command can adversely affect your network configuration. Enter the **no adjacency-check** command only when you are running IPv4 IS-IS on all your routers and you want to add IPv6 IS-IS to your network but you need to maintain all your adjacencies during the transition. When the IPv6 IS-IS configuration is complete, remove the **no adjacency-check** command from the configuration.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. router isis area-tag
- 4. address-family ipv6 [unicast | multicast]
- 5. no adjacency-check

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	router isis area-tag	Enables IS-IS for the specified IS-IS routing process, and
	Example:	enters router configuration mode.
	Device(config)# router isis area2	
Step 4	address-family ipv6 [unicast multicast]	Specifies the IPv6 address family, and enters address family
	Example:	configuration mode.
	Device(config-router)# address-family ipv6	 The unicast keyword specifies the unicast IPv6 unicast address family. By default, the router is placed in configuration mode for the unicast IPv6 address family if the unicast keyword is not specified with the address-family ipv6 command.
Step 5	no adjacency-check	Disables the IPv6 protocol-support consistency checks
	Example:	performed on hello packets, allowing IPv6 to be introduced into an IPv4-only network without disrupting existing
	Device(config-router-af)# no adjacency-check	adjacencies. • The adjacency-checkcommand is enabled by default.

Disabling IPv4 Subnet Consistency Checks

Perform this task to disable IPv4 subnet consistency checking when forming adjacencies. software historically makes checks on hello packets to ensure that the IPv4 address is present and has a consistent subnet with the neighbor from which the hello packets are received. To disable this check, use the **no adjacency-check** command in the router configuration mode. However, if multitopology IS-IS is configured, this check is

automatically suppressed, because multitopology IS-IS requires routers to form an adjacency regardless of whether or not all routers on a LAN support a common protocol.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. router isis area-tag
- 4. no adjacency-check

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	router isis area-tag	Enables IS-IS for the specified IS-IS routing process, and
	Example:	enters router configuration mode.
	Device(config)# router isis area2	
Step 4	no adjacency-check	Disables the IPv6 protocol-support consistency checks
	Example:	performed on hello packets, allowing IPv6 to be introduced into an IPv4-only network without disrupting existing
	Device(config-router-af) # no adjacency-check	adjacencies.
		The adjacency-checkcommand is enabled by default.

Verifying IPv6 IS-IS Configuration and Operation

SUMMARY STEPS

- 1. enable
- 2. show ipv6 protocols [summary]
- 3. show isis [process-tag] [ipv6 | *] topology
- **4. show clns** [process-tag] **neighbors** interface-type interface-number] [area] [detail]
- **5. show clns** *area-tag* **is-neighbors** [type number] [**detail**]
- 6. show isis [process-tag] database [level-1] [level-2] [l1] [l2] [detail] [lspid]
- 7. show isis ipv6 rib [ipv6-prefix]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	show ipv6 protocols [summary]	Displays the parameters and current state of the active IPv6
	Example:	routing processes.
	Device# show ipv6 protocols	
Step 3	show isis [process-tag] [ipv6 *] topology	Displays a list of all connected routers running IS-IS in all
	Example:	areas.
	Device# show isis topology	
Step 4	show clns [process-tag] neighbors interface-type interface-number] [area] [detail]	Displays end system (ES), intermediate system (IS), and multitopology IS-IS (M-ISIS) neighbors.
	Example:	
	Device# show clns neighbors detail	
Step 5	show clns area-tag is-neighbors [type number] [detail]	Displays IS-IS adjacency information for IS-IS neighbors.
	Example:	• Use the detail keyword to display the IPv6 link-local addresses of the neighbors.
	Device# show clns is-neighbors detail	addresses of the neighbors.
Step 6	show isis [process-tag] database [level-1] [level-2] [l1]	Displays the IS-IS link-state database.
	[12] [detail] [lspid]	In this example, the contents of each LSP are display
	Example:	using the detail keyword.
	Device# show isis database detail	
Step 7	show isis ipv6 rib [ipv6-prefix]	Displays the IPv6 local RIB.
	Example:	
	Device# show isis ipv6 rib	
	, L	I

Configuration Examples for IPv6 Routing: IS-IS Support for IPv6

Example: Customizing IPv6 IS-IS

The following example advertises the IPv6 default route (::/0)--with an origin of GigabitEthernet interface 0/0/1--with all other routes in router updates sent on GigabitEthernet interface 0/0/1. This example also sets

an administrative distance for IPv6 IS-IS to 90, defines the maximum number of equal-cost paths that IPv6 IS-IS will support as 3, and configures a summary prefix of 2001:DB8::/24 for IPv6 IS-IS.

```
router isis
address-family ipv6
default-information originate
distance 90
maximum-paths 3
summary-prefix 2001:DB8::/24
exit.
```

Example: Disabling IPv6 Protocol-Support Consistency Checks

The following example disables the **adjacency-check** command to allow a network administrator to configure IPv6 IS-IS on the router without disrupting the existing adjacencies:

```
router isis
  address-family ipv6
  no adjacency-check
```

Example: Configuring IS-IS for IPv6

In the following example, output information about the parameters and current state of that active IPv6 routing processes is displayed using the **show ipv6 protocols**command:

```
Device# show ipv6 protocols
IPv6 Routing Protocol is "connected"
IPv6 Routing Protocol is "static"
IPv6 Routing Protocol is "isis"
 Interfaces:
   GigabitEthernet0/0/3
   GigabitEthernet0/0/1
   Serial1/0/1
    Loopback1 (Passive)
   Loopback2 (Passive)
   Loopback3 (Passive)
   Loopback4 (Passive)
   Loopback5 (Passive)
  Redistribution:
   Redistributing protocol static at level 1
  Address Summarization:
   L2: 2001:DB8:33::/16 advertised with metric 0
   L2: 2001:DB8:44::/16 advertised with metric 20
    L2: 2001:DB8:66::/16 advertised with metric 10
   L2: 2001:DB8:77::/16 advertised with metric 10
```

In the following example, output information about all connected routers running IS-IS in all areas is displayed using the **show isis topology**command:

```
Device# show isis topology
IS-IS paths to level-1 routers
System Id Metric Next-Hop Interface SNPA
0000.0000.0000C
0000.0000.000D 20 0000.0000.00AA Se1/0/1 *HDLC*
0000.0000.000F 10 0000.0000F GE0/0/1 0050.e2e5.d01d
0000.0000.00AA 10 0000.0000.00AA Se1/0/1 *HDLC*
```

```
IS-IS paths to level-2 routers
System Id
          Metric Next-Hop
                                     Interface
                                                    SNPA
0000.0000.000A 10 0000.0000.000A GEO/0/3
                                                    0010.f68d.f063
0000.0000.000B 20
                      0000.0000.000A GE0/0/3
                                                    0010.f68d.f063
0000.0000.000C --
0000.0000.000D 30
                      0000.0000.000A GE0/0/3
                                                    0010.f68d.f063
0000.0000.000E 30
                      0000.0000.000A GE0/0/3
                                                    0010.f68d.f063
```

In the following example, output information to confirm that the local router has formed all the necessary IS-IS adjacencies with other IS-IS neighbors is displayed using the **show clns is-neighbors**command. To display the IPv6 link-local addresses of the neighbors, specify the **detail** keyword.

```
Device# show clns is-neighbors detail
System Id Interface State Type Priority Circuit Id
                                                                     Format

The following example shows output from the **show isis ipv6 rib** command. An asterisk (*) indicates prefixes that have been installed in the master IPv6 RIB as IS-IS routes. Following each prefix is a list of all paths in order of preference, with optimal paths listed first and suboptimal paths listed after optimal paths.

Device# show isis ipv6 rib

```
IS-IS IPv6 process "", local RIB

The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	

Feature Information for IPv6 Routing: IS-IS Support for IPv6

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for IPv6 Routing: IS-IS Support for IPv6

Feature Name	Releases	Feature Information
IPv6 Routing: IS-IS Support for IPv6	Cisco IOS XE Release 2.4	IPv6 enhancements to IS-IS allow IS-IS to advertise IPv6 prefixes in addition to IPv4 and OSI routes.
		The following commands were introduced or modified: address-family ipv6 (IS-IS), adjacency-check, default-information originate (IPv6 IS-IS), distance (IPv6), ipv6 router isis, isis ipv6 metric, maximum-paths (IPv6), prc-interval (IPv6), router isis, show clns neighbors, show ipv6 protocols, show isis database, show isis topology, spf-interval, summary-prefix (IPv6 IS-IS).
IPv6 ISIS Local RIB	Cisco IOS XE Release 2.6	A router that is running IS-IS IPv6 maintains a local RIB in which it stores all routes to destinations it has learned from its neighbors. The following command was introduced: show isis ipv6 rib.
