Configuring OSPF

Last Updated: June 24, 2011

This module describes how to configure Open Shortest Path First (OSPF). OSPF is an Interior Gateway Protocol (IGP) developed by the OSPF working group of the Internet Engineering Task Force (IETF). OSPF was designed expressly for IP networks and it supports IP subnetting and tagging of externally derived routing information. OSPF also allows packet authentication and uses IP multicast when sending and receiving packets.

Cisco supports RFC 1253, OSPF Version 2 Management Information Base, August 1991. The OSPF MIB defines an IP routing protocol that provides management information related to OSPF and is supported by Cisco routers.

For protocol-independent features that work with OSPF, see the "Configuring IP Routing Protocol-Independent Features" module.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Information About OSPF

- Cisco OSPF Implementation, page 2
- Router Coordination for OSPF, page 2
- Route Distribution for OSPF, page 2

Cisco OSPF Implementation

The Cisco implementation conforms to the OSPF Version 2 specifications detailed in the Internet RFC 2328. The list that follows outlines key features supported in the Cisco OSPF implementation:

- Stub areas--Definition of stub areas is supported.
- Route redistribution--Routes learned via any IP routing protocol can be redistributed into any other IP routing protocol. At the intradomain level, OSPF can import routes learned via Interior Gateway Routing Protocol (IGRP), Routing Information Protocol (RIP), and Intermediate System-to-Intermediate System (IS-IS). OSPF routes can also be exported into IGRP, RIP, and IS-IS. At the interdomain level, OSPF can import routes learned via Exterior Gateway Protocol (EGP) and Border Gateway Protocol (BGP). OSPF routes can be exported into BGP and EGP.
- Authentication--Plain text and message-digest algorithm 5 (MD5) authentication among neighboring routers within an area is supported.
- Routing interface parameters--Configurable parameters supported include interface output cost, retransmission interval, interface transmit delay, router priority, router "dead" and hello intervals, and authentication key.
- Virtual links--Virtual links are supported.
- OSPF over demand circuit--RFC 1793.

Router Coordination for OSPF

OSPF typically requires coordination among many internal routers: Area Border Routers (ABRs), which are routers connected to multiple areas, and Autonomous System Boundary Routers (ASBRs). At a minimum, OSPF-based routers or access servers can be configured with all default parameter values, no authentication, and interfaces assigned to areas. If you intend to customize your environment, you must ensure coordinated configurations of all routers.

Route Distribution for OSPF

You can specify route redistribution; see the task "Redistribute Routing Information" in the Network Protocols Configuration Guide, Part 1 for information on how to configure route redistribution.

The Cisco OSPF implementation allows you to alter certain interface-specific OSPF parameters, as needed. You are not required to alter any of these parameters, but some interface parameters must be consistent across all routers in an attached network. Those parameters are controlled by the `ip ospf hello-interval`, `ip ospf dead-interval`, and `ip ospf authentication-key` interface configuration commands. Therefore, be sure that if you do configure any of these parameters, the configurations for all routers on your network have compatible values.

OSPF classifies different media into the following three types of networks by default:
• Broadcast networks (Ethernet, Token Ring, and FDDI)
• Nonbroadcast multiaccess (NBMA) networks (Switched Multimegabit Data Service (SMDS), Frame Relay, and X.25)
• Point-to-point networks (High-Level Data Link Control [HDLC] and PPP)

You can configure your network as either a broadcast or an NBMA network.

X.25 and Frame Relay provide an optional broadcast capability that can be configured in the map to allow OSPF to run as a broadcast network. Refer to the x25 map and frame-relay map command descriptions in the Cisco IOS Wide-Area Networking Command Reference publication for more detail.

• Configuring Your OSPF Network Type, page 3
• Original LSA Behavior, page 7
• LSA Group Pacing with Multiple Timers, page 7

Configuring Your OSPF Network Type

You have the choice of configuring your OSPF network type as either broadcast or NBMA, regardless of the default media type. Using this feature, you can configure broadcast networks as NBMA networks when, for example, you have routers in your network that do not support multicast addressing. You also can configure NBMA networks (such as X.25, Frame Relay, and SMDS) as broadcast networks. This feature saves you from needing to configure neighbors, as described in the section "Configuring OSPF for Nonbroadcast Networks, page 12" later in this module.

Configuring NBMA networks as either broadcast or nonbroadcast assumes that there are virtual circuits (VCs) from every router to every router or fully meshed network. This is not true for some cases, for example, because of cost constraints, or when you have only a partially meshed network. In these cases, you can configure the OSPF network type as a point-to-multipoint network. Routing between two routers not directly connected will go through the router that has VCs to both routers. Note that you need not configure neighbors when using this feature.

An OSPF point-to-multipoint interface is defined as a numbered point-to-point interface having one or more neighbors. It creates multiple host routes. An OSPF point-to-multipoint network has the following benefits compared to NBMA and point-to-point networks:

• Point-to-multipoint is easier to configure because it requires no configuration of neighbor commands, it consumes only one IP subnet, and it requires no designated router election.
• It costs less because it does not require a fully meshed topology.
• It is more reliable because it maintains connectivity in the event of VC failure.

On point-to-multipoint, broadcast networks, there is no need to specify neighbors. However, you can specify neighbors with the neighbor router configuration command, in which case you should specify a cost to that neighbor.

Before the point-to-multipoint keyword was added to the ip ospf network interface configuration command, some OSPF point-to-multipoint protocol traffic was treated as multicast traffic. Therefore, the neighbor router configuration command was not needed for point-to-multipoint interfaces because multicast took care of the traffic. Hello, update, and acknowledgment messages were sent using multicast. In particular, multicast hello messages discovered all neighbors dynamically.

• On any point-to-multipoint interface (broadcast or not), the Cisco IOS software assumed that the cost to each neighbor was equal. The cost was configured with the ip ospf cost interface configuration command. In reality, the bandwidth to each neighbor is different, so the cost should differ. With this feature, you can configure a separate cost to each neighbor. This feature applies to point-to-multipoint interfaces only.
Because many routers might be attached to an OSPF network, a designated router is selected for the network. Special configuration parameters are needed in the designated router selection if broadcast capability is not configured.

These parameters need only be configured in those devices that are themselves eligible to become the designated router or backup designated router (in other words, routers with a nonzero router priority value).

You can specify the following neighbor parameters, as required:

- Priority for a neighboring router
- Nonbroadcast poll interval

On point-to-multipoint, nonbroadcast networks, use the neighbor router configuration command to identify neighbors. Assigning a cost to a neighbor is optional.

Prior to Cisco IOS Release 12.0, some customers were using point-to-multipoint on nonbroadcast media (such as classic IP over ATM), so their routers could not dynamically discover their neighbors. This feature allows the neighbor router configuration command to be used on point-to-multipoint interfaces.

On any point-to-multipoint interface (broadcast or not), the Cisco IOS software assumed the cost to each neighbor was equal. The cost was configured with the ip ospf cost interface configuration command. In reality, the bandwidth to each neighbor is different, so the cost should differ. With this feature, you can configure a separate cost to each neighbor. This feature applies to point-to-multipoint interfaces only.

Our OSPF software allows you to configure several area parameters. These area parameters, shown in the following task table, include authentication, defining stub areas, and assigning specific costs to the default summary route. Authentication allows password-based protection against unauthorized access to an area.

Stub areas are areas into which information on external routes is not sent. Instead, there is a default external route generated by the ABR, into the stub area for destinations outside the autonomous system. To take advantage of the OSPF stub area support, default routing must be used in the stub area. To further reduce the number of LSAs sent into a stub area, you can configure the no-summary keyword of the area stub router configuration command on the ABR to prevent it from sending summary link advertisement (LSAs Type 3) into the stub area.

The OSPF NSSA feature is described by RFC 3101. In Cisco IOS Release 15.1(2)S and later releases, RFC 3101 replaces RFC 1587. RFC 3101 is backward compatible with RFC 1587. For a detailed list of differences between them, see Appendix F of RFC 3101. NSSA support was first integrated into Cisco IOS Release 11.2. OSPF NSSA is a nonproprietary extension of the existing OSPF stub area feature.

RFC 3101 support enhances both the Type 7 autonomous-system external routing calculation and the translation of Type 7 LSAs into Type 5 LSAs. For more information, see RFC 3101.

Use NSSA to simplify administration if you are an Internet service provider (ISP) or a network administrator that must connect a central site that is using OSPF to a remote site that is using a different routing protocol.

Prior to NSSA, the connection between the corporate site border router and the remote router could not be run as an OSPF stub area because routes for the remote site could not be redistributed into the stub area, and two routing protocols needed to be maintained. A simple protocol such as RIP was usually run and handled the redistribution. With NSSA, you can extend OSPF to cover the remote connection by defining the area between the corporate router and the remote router as an NSSA.

As with OSPF stub areas, NSSA areas cannot be injected with distributed routes via Type 5 LSAs. Route redistribution into an NSSA area is possible only with a special type of LSA that is known as Type 7 that can exist only in an NSSA area. An NSSA ASBR generates the Type 7 LSA so that the routes can be redistributed, and an NSSA ABR translates the Type 7 LSA into a Type 5 LSA, which can be flooded throughout the whole OSPF routing domain. Summarization and filtering are supported during the translation.
Cisco IOS Release 15.1(2)S and later releases support RFC 3101, which allows you to configure an NSSA ABR router as a forced NSSA LSA translator. This means that the NSSA ABR router will unconditionally assume the role of LSA translator, preempting the default behavior, which would only include it among the candidates to be elected as translator.

Even a forced translator might not translate all LSAs; translation depends on the contents of each LSA.

The figure below shows a network diagram in which OSPF Area 1 is defined as the stub area. The Enhanced Interior Gateway Routing Protocol (EIGRP) routes cannot be propagated into the OSPF domain because routing redistribution is not allowed in the stub area. However, once OSPF Area 1 is defined as an NSSA, an NSSA ASBR can inject the EIGRP routes into the OSPF NSSA by creating Type 7 LSAs.

The redistributed routes from the RIP router will not be allowed into OSPF Area 1 because NSSA is an extension to the stub area. The stub area characteristics will still exist, including the exclusion of Type 5 LSAs.

Route summarization is the consolidation of advertised addresses. This feature causes a single summary route to be advertised to other areas by an ABR. In OSPF, an ABR will advertise networks in one area into another area. If the network numbers in an area are assigned in a way such that they are contiguous, you can configure the ABR to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

When routes from other protocols are redistributed into OSPF (as described in the module "Configuring IP Routing Protocol-Independent Features"), each route is advertised individually in an external LSA. However, you can configure the Cisco IOS software to advertise a single route for all the redistributed routes that are covered by a specified network address and mask. Doing so helps decrease the size of the OSPF link-state database.

In OSPF, all areas must be connected to a backbone area. If there is a break in backbone continuity, or the backbone is purposefully partitioned, you can establish a virtual link. The two endpoints of a virtual link are ABRs. The virtual link must be configured in both routers. The configuration information in each router
consists of the other virtual endpoint (the other ABR) and the nonbackbone area that the two routers have in common (called the transit area). Note that virtual links cannot be configured through stub areas.

You can force an ASBR to generate a default route into an OSPF routing domain. Whenever you specifically configure redistribution of routes into an OSPF routing domain, the router automatically becomes an ASBR. However, an ASBR does not, by default, generate a **default route** into the OSPF routing domain.

You can configure OSPF to look up Domain Naming System (DNS) names for use in all OSPF `show` EXEC command displays. You can use this feature to more easily identify a router, because the router is displayed by name rather than by its router ID or neighbor ID.

OSPF uses the largest IP address configured on the interfaces as its router ID. If the interface associated with this IP address is ever brought down, or if the address is removed, the OSPF process must recalculate a new router ID and resend all its routing information out its interfaces.

If a loopback interface is configured with an IP address, the Cisco IOS software will use this IP address as its router ID, even if other interfaces have larger IP addresses. Because loopback interfaces never go down, greater stability in the routing table is achieved.

OSPF automatically prefers a loopback interface over any other kind, and it chooses the highest IP address among all loopback interfaces. If no loopback interfaces are present, the highest IP address in the router is chosen. You cannot tell OSPF to use any particular interface.

In Cisco IOS Release 10.3 and later releases, by default OSPF calculates the OSPF metric for an interface according to the bandwidth of the interface. For example, a 64-kbps link gets a metric of 1562, and a T1 link gets a metric of 64.

The OSPF metric is calculated as the `ref-bw` value divided by the `bandwidth` value, with the `ref-bw` value equal to 108 by default, and the `bandwidth` value determined by the `bandwidth` interface configuration command. The calculation gives FDDI a metric of 1. If you have multiple links with high bandwidth, you might want to specify a larger number to differentiate the cost on those links.

An administrative distance is a rating of the trustworthiness of a routing information source, such as an individual router or a group of routers. Numerically, an administrative distance is an integer from 0 to 255. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored.

OSPF uses three different administrative distances: intra-area, interarea, and external. Routes within an area are intra-area; routes to another area are interarea; and routes from another routing domain learned via redistribution are external. The default distance for each type of route is 110.

Because simplex interfaces between two devices on an Ethernet represent only one network segment, for OSPF you must configure the sending interface to be a passive interface. This configuration prevents OSPF from sending hello packets for the sending interface. Both devices are able to see each other via the hello packet generated for the receiving interface.

You can configure the delay time between when OSPF receives a topology change and when it starts a shortest path first (SPF) calculation. You can also configure the hold time between two consecutive SPF calculations.

The OSPF on-demand circuit is an enhancement to the OSPF protocol that allows efficient operation over on-demand circuits such as ISDN, X.25 switched virtual circuits (SVCs), and dialup lines. This feature supports RFC 1793, Extending OSPF to Support Demand Circuits.

Prior to this feature, OSPF periodic hello and LSA updates would be exchanged between routers that connected the on-demand link, even when no changes occurred in the hello or LSA information.

With this feature, periodic hellos are suppressed and the periodic refreshes of LSAs are not flooded over the demand circuit. These packets bring up the link only when they are exchanged for the first time, or
when a change occurs in the information they contain. This operation allows the underlying data link layer to be closed when the network topology is stable.

This feature is useful when you want to connect telecommuters or branch offices to an OSPF backbone at a central site. In this case, OSPF for on-demand circuits allows the benefits of OSPF over the entire domain, without excess connection costs. Periodic refreshes of hello updates, LSA updates, and other protocol overhead are prevented from enabling the on-demand circuit when there is no "real" data to send.

Overhead protocols such as hellos and LSAs are transferred over the on-demand circuit only upon initial setup and when they reflect a change in the topology. This means that critical changes to the topology that require new SPF calculations are sent in order to maintain network topology integrity. Periodic refreshes that do not include changes, however, are not sent across the link.

The OSPF LSA group pacing feature allows the router to group OSPF LSAs and pace the refreshing, checksumming, and aging functions. The group pacing results in more efficient use of the router. The router groups OSPF LSAs and paces the refreshing, checksumming, and aging functions so that sudden increases in CPU usage and network resources are avoided. This feature is most beneficial to large OSPF networks.

OSPF LSA group pacing is enabled by default. For typical customers, the default group pacing interval for refreshing, checksumming, and aging is appropriate and you need not configure this feature.

**Original LSA Behavior**

Each OSPF LSA has an age, which indicates whether the LSA is still valid. Once the LSA reaches the maximum age (1 hour), it is discarded. During the aging process, the originating router sends a refresh packet every 30 minutes to refresh the LSA. Refresh packets are sent to keep the LSA from expiring, whether there has been a change in the network topology or not. Checksumming is performed on all LSAs every 10 minutes. The router keeps track of LSAs it generates and LSAs it receives from other routers. The router refreshes LSAs it generated; it ages the LSAs it received from other routers.

Prior to the LSA group pacing feature, the Cisco IOS software would perform refreshing on a single timer, and checksumming and aging on another timer. In the case of refreshing, for example, the software would scan the whole database every 30 minutes, refreshing every LSA the router generated, no matter how old it was. The figure below illustrates all the LSAs being refreshed at once. This process wasted CPU resources because only a small portion of the database needed to be refreshed. A large OSPF database (several thousand LSAs) could have thousands of LSAs with different ages. Refreshing on a single timer resulted in the age of all LSAs becoming synchronized, which resulted in much CPU processing at once. Furthermore, a large number of LSAs could cause a sudden increase of network traffic, consuming a large amount of network resources in a short period of time.

**Figure 2** OSPF LSAs on a Single Timer Without Group Pacing

All LSAs refreshed, 120 external LSAs on Ethernet need three packets

30 minutes 30 minutes 30 minutes

Prior to pacing, all LSAs refreshed at once

**LSA Group Pacing with Multiple Timers**

Configuring each LSA to have its own timer avoids excessive CPU processing and sudden network-traffic increase. To again use the example of refreshing, each LSA gets refreshed when it is 30 minutes old, independent of other LSAs. So the CPU is used only when necessary. However, LSAs being refreshed at
frequent, random intervals would require many packets for the few refreshed LSAs the router must send out, which would be inefficient use of bandwidth.

Therefore, the router delays the LSA refresh function for an interval of time instead of performing it when the individual timers are reached. The accumulated LSAs constitute a group, which is then refreshed and sent out in one packet or more. Thus, the refresh packets are paced, as are the checksumming and aging. The pacing interval is configurable; it defaults to 4 minutes, which is randomized to further avoid synchronization.

The figure below illustrates the case of refresh packets. The first timeline illustrates individual LSA timers; the second timeline illustrates individual LSA timers with group pacing.

**Figure 3**  
**OSPF LSAs on Individual Timers with Group Pacing**

Without group pacing, LSAs need to be refreshed frequently and at random intervals. Individual LSA timers require many refresh packets that contain few LSAs.

The group pacing interval is inversely proportional to the number of LSAs the router is refreshing, checksumming, and aging. For example, if you have approximately 10,000 LSAs, decreasing the pacing interval would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

The default value of pacing between LSA groups is 240 seconds (4 minutes). The range is from 10 seconds to 1800 seconds (30 minutes).

By default, OSPF floods new LSAs over all interfaces in the same area, except the interface on which the LSA arrives. Some redundancy is desirable, because it ensures robust flooding. However, too much redundancy can waste bandwidth and might destabilize the network due to excessive link and CPU usage in certain topologies. An example would be a fully meshed topology.

You can block OSPF flooding of LSAs two ways, depending on the type of networks:

- On broadcast, nonbroadcast, and point-to-point networks, you can block flooding over specified OSPF interfaces.
- On point-to-multipoint networks, you can block flooding to a specified neighbor.

The growth of the Internet has increased the importance of scalability in IGPs such as OSPF. By design, OSPF requires LSAs to be refreshed as they expire after 3600 seconds. Some implementations have tried to improve the flooding by reducing the frequency to refresh from 30 minutes to about 50 minutes. This solution reduces the amount of refresh traffic but requires at least one refresh before the LSA expires. The OSPF flooding reduction solution works by reducing unnecessary refreshing and flooding of already...
known and unchanged information. To achieve this reduction, the LSAs are now flooded with the higher bit set. The LSAs are now set as "do not age."

Cisco routers do not support LSA Type 6 Multicast OSPF (MOSPF), and they generate syslog messages if they receive such packets. If the router is receiving many MOSPF packets, you might want to configure the router to ignore the packets and thus prevent a large number of syslog messages.

The former OSPF implementation for sending update packets needed to be more efficient. Some update packets were getting lost in cases where the link was slow, a neighbor could not receive the updates quickly enough, or the router was out of buffer space. For example, packets might be dropped if either of the following topologies existed:

- A fast router was connected to a slower router over a point-to-point link.
- During flooding, several neighbors sent updates to a single router at the same time.

OSPF update packets are now automatically paced so they are not sent less than 33 milliseconds apart. Pacing is also added between resends to increase efficiency and minimize lost retransmissions. Also, you can display the LSAs waiting to be sent out an interface. The benefit of the pacing is that OSPF update and retransmission packets are sent more efficiently. There are no configuration tasks for this feature; it occurs automatically.

You can display specific statistics such as the contents of IP routing tables, caches, and databases. Information provided can be used to determine resource utilization and solve network problems. You can also display information about node reachability and discover the routing path that your device packets are taking through the network.

How to Configure OSPF

To configure OSPF, perform the tasks described in the following sections. The tasks in the first section are required; the tasks in the remaining sections are optional, but might be required for your application. For information about the maximum number of interfaces, see the Restrictions, page 24.

Enabling OSPF

SUMMARY STEPS

1. Router(config)# router ospf process-id
2. Router(config-router)# network ip-address wildcard-mask area area-id

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Router(config)# router ospf process-id</td>
<td>Enables OSPF routing, which places the router in router configuration mode.</td>
</tr>
<tr>
<td>Step 2 Router(config-router)# network ip-address wildcard-mask area area-id</td>
<td>Defines an interface on which OSPF runs and defines the area ID for that interface.</td>
</tr>
</tbody>
</table>

Configuring OSPF Interface Parameters

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-if)# ip ospf cost cost</td>
<td>Explicitly specifies the cost of sending a packet on an OSPF interface.</td>
</tr>
<tr>
<td>Router(config-if)# ip ospf retransmit-interval seconds</td>
<td>Specifies the number of seconds between link-state advertisement (LSA) retransmissions for adjacencies belonging to an OSPF interface.</td>
</tr>
<tr>
<td>Router(config-if)# ip ospf transmit-delay seconds</td>
<td>Sets the estimated number of seconds required to send a link-state update packet on an OSPF interface.</td>
</tr>
<tr>
<td>Router(config-if)# ip ospf priority number-value</td>
<td>Sets priority to help determine the OSPF designated router for a network.</td>
</tr>
<tr>
<td>Router(config-if)# ip ospf hello-interval seconds</td>
<td>Specifies the length of time between the hello packets that the Cisco IOS software sends on an OSPF interface.</td>
</tr>
<tr>
<td>Router(config-if)# ip ospf dead-interval seconds</td>
<td>Sets the number of seconds that a device must wait before it declares a neighbor OSPF router down because it has not received a hello packet.</td>
</tr>
</tbody>
</table>
## Configuring OSPF over Different Physical Networks

### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Router(config-if)# ip ospf authentication-key key</code></td>
<td>Assigns a password to be used by neighboring OSPF routers on a network segment that is using the OSPF simple password authentication.</td>
</tr>
<tr>
<td><code>Router(config-if)# ip ospf message-digest-key key-id md5 key</code></td>
<td>Enables OSPF MD5 authentication. The values for the <code>key-id</code> and <code>key</code> arguments must match values specified for other neighbors on a network segment.</td>
</tr>
<tr>
<td>`Router(config-if)# ip ospf authentication [message-digest</td>
<td>null]`</td>
</tr>
</tbody>
</table>

### Configuring Point-to-Multipoint Broadcast Networks

**SUMMARY STEPS**

1. `Router(config-if)# ip ospf network point-to-multipoint`
2. `Router(config-if)# exit`
3. `Router(config)# router ospf process-id`
4. `Router(config-router)# neighbor ip-address cost number`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Configures an interface as point-to-multipoint for broadcast media.</td>
</tr>
<tr>
<td><code>Router(config-if)# ip ospf network point-to-multipoint</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>Router(config-if)# exit</code></td>
<td></td>

<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> router ospf process-id</td>
<td>Enables OSPF routing and enters router configuration mode.</td>
</tr>
</tbody>
</table>
### Command or Action

**Step 4**  
redistribute protocol [process-id] {level-1 | level-1-2 | level-2} [autonomous-system-number] [metric {metric-value | transparent}] [metric-type type-value] [match {internal | external 1 | external 2}] [tag tag-value] [route-map map-tag] [subnets] [nssa-only]  

<table>
<thead>
<tr>
<th>Purpose</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Redistributes routes from one routing domain into another routing domain.</td>
<td></td>
</tr>
<tr>
<td>• The example causes RIP subnets to be redistributed into the OSPF domain.</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**  
Router(config-router)# redistribute rip subnets

**Step 5**  
network ip-address wildcard-mask area area-id  

**Example:**  
Router(config-router)# network 172.19.92.0 0.0.0.255 area 1  

**Step 6**  
area area-id nssa [no-redistribution] [default-information-originate [metric] [metric-type]] [no-summary] [nssa-only]  

**Example:**  
Router(config-router)# area 1 nssa

---

### Configuring an NSSA ABR as a Forced NSSA LSA Translator

**Note**  
In Cisco IOS Release 15.1(2)S and later releases, the output of the show ip ospf command shows whether the NSSA ABR is configured as a forced translator, and whether the router is running as RFC 3101 or RFC 1587 compatible.

### SUMMARY STEPS

1. enable  
2. configure terminal  
3. router ospf process-id  
4. area area-id nssa translate type7 [ always ]  
5. end
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:** Router> enable |
| **Step 2** configure terminal | Enters global configuration mode.  
  
  **Example:**  
  Router# configure terminal |
| **Step 3** router ospf process-id | Enables OSPF routing and enters router configuration mode.  
  - The *process-id* argument identifies the OSPF process.  
  
  **Example:**  
  Router(config)# router ospf 1 |
| **Step 4** area area-id nssa translate type7 [ always ] | Configures an NSSA ABR router as a forced NSSA LSA translator.  
  **Note** In Cisco IOS Release 15.1(2)S and later releases, RFC 3101 replaces RFC 1587, and you can use the *always* keyword in the *area nssa translate* command to configure an NSSA ABR router as a forced NSSA LSA translator. This command will work if RFC 3101 is disabled and RFC 1587 is being used.  
  
  **Example:**  
  Router(config-router)# area 10 nssa translate type7 always |
| **Step 5** end | Exits router configuration mode and returns to privileged EXEC mode.  
  
  **Example:**  
  Router(config-router)# end |

### Disabling RFC 3101 Compatibility and Enabling RFC 1587 Compatibility

**Note** In Cisco IOS Release 15.1(2)S and later releases, the output of the *show ip ospf* command will indicate if the NSSA ABR is configured as RFC 3101 or RFC 1587 compatible.
SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf \textit{process-id}
4. compatible rfc1587
5. end

**Configuring OSPF NSSA Parameters**

- Prerequisites, page 17
Prerequisites

Evaluate the following considerations before you implement this feature:

- You can set a Type 7 default route that can be used to reach external destinations. When configured, the router generates a Type 7 default into the NSSA or the NSSA ABR.
- Every router within the same area must agree that the area is NSSA; otherwise, the routers will not be able to communicate.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# area area-id nssa [no redistribution] [default-information originate]</td>
<td>Defines an area to be an NSSA.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# summary-address prefix mask [not advertise] [tag tag] nssa-only</td>
<td>Controls the summarization and filtering during the translation and limits the summary to NSSA areas.</td>
</tr>
</tbody>
</table>

### Configuring Route Summarization Between OSPF Areas

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# area area-id range ip-address mask [advertise] [not advertise] [cost cost]</td>
<td>Specifies an address range for which a single route will be advertised.</td>
</tr>
</tbody>
</table>

### Configuring Route Summarization When Redistributing Routes into OSPF

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# summary-address ip-address mask [prefix mask] [not advertise] [tag tag]</td>
<td>Specifies an address and mask that covers redistributed routes, so only one summary route is advertised. Use the optional not advertise keyword to filter out a set of routes.</td>
</tr>
</tbody>
</table>
Establishing Virtual Links

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# area area-id virtual-link router-id [authentication [message-digest</td>
<td>Establishes a virtual link.</td>
</tr>
<tr>
<td></td>
<td>null]] [hello-interval seconds] [retransmit-</td>
</tr>
<tr>
<td></td>
<td>interval seconds] [transmit-delay seconds]</td>
</tr>
<tr>
<td></td>
<td>[dead-interval seconds] [authentication-key key</td>
</tr>
<tr>
<td></td>
<td>message-digest-key key-id md5 key]</td>
</tr>
</tbody>
</table>

Generating a Default Route

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# default-information</td>
<td>Forces the ASBR to generate a default route</td>
</tr>
<tr>
<td>originate [always] [metric metric-value]</td>
<td>into the OSPF routing domain.</td>
</tr>
<tr>
<td>[metric-type type-value] [route-map map-</td>
<td></td>
</tr>
<tr>
<td>name]</td>
<td></td>
</tr>
</tbody>
</table>

Note The always keyword includes the following exception when the route map is used. When a route map is used, the origination of the default route by OSPF is not bound to the existence of a default route in the routing table.

Configuring Lookup of DNS Names

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# ip ospf name-lookup</td>
<td>Configures DNS name lookup.</td>
</tr>
</tbody>
</table>

Forcing the Router ID Choice with a Loopback Interface

**SUMMARY STEPS**

1. Router(config)# interface loopback 0
2. Router(config-if)# ip address ip-address mask

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Router(config)# interface loopback 0</td>
<td>Creates a loopback interface, which places the router in interface configuration mode.</td>
</tr>
<tr>
<td>Step 2 Router(config-if)# ip address ip-address mask</td>
<td>Assigns an IP address to this interface.</td>
</tr>
</tbody>
</table>
Controlling Default Metrics

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# <code>auto-cost reference-bandwidth ref-bw</code></td>
<td>Differentiates high-bandwidth links.</td>
</tr>
</tbody>
</table>

Changing the OSPF Administrative Distances

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# `distance ospf (intra-area</td>
<td>inter-area</td>
</tr>
</tbody>
</table>

Configuring OSPF on Simplex Ethernet Interfaces

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# <code>passive-interface interface-type interface-number</code></td>
<td>Suppresses the sending of hello packets through the specified interface.</td>
</tr>
</tbody>
</table>

Configuring Route Calculation Timers

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# <code>timers spf spf-delay spf-holdtime</code></td>
<td>Configures route calculation timers.</td>
</tr>
</tbody>
</table>

Configuring OSPF over On-Demand Circuits

**SUMMARY STEPS**

1. Router(config)# `router ospf process-id`
2. Router(config)# `interface interface-type interface-number`
3. Router(config-if)# `ip ospf demand-circuit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Router(config)# <code>router ospf process-id</code></td>
<td>Enables OSPF operation.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Router(config)# <code>interface interface-type interface-number</code></td>
<td>Enters interface configuration mode.</td>
</tr>
</tbody>
</table>
### Prerequisites

Evaluate the following considerations before implementing this feature:

- Because LSAs that include topology changes are flooded over an on-demand circuit, we recommend that you put demand circuits within OSPF stub areas or within NSSAs to isolate the demand circuits from as many topology changes as possible.
- Every router within a stub area or NSSA must have this feature loaded in order to take advantage of the on-demand circuit functionality. If this feature is deployed within a regular area, all other regular areas must also support this feature before the demand circuit functionality can take effect because Type 5 external LSAs are flooded throughout all areas.
- Hub-and-spoke network topologies that have a point-to-multipoint (p2mp) OSPF interface type on a hub might not revert to nondemand circuit mode when needed. You must simultaneously reconfigure OSPF on all interfaces on the p2mp segment when reverting them from demand circuit mode to nondemand circuit mode.
- Do not implement this feature on a broadcast-based network topology because the overhead protocols (such as hello and LSA packets) cannot be successfully suppressed, which means the link will remain up.
- Configuring the router for an OSPF on-demand circuit with an asynchronous interface is not a supported configuration. The supported configuration is to use dialer interfaces on both ends of the circuit. For more information, refer to Why OSPF Demand Circuit Keeps Bringing Up the Link.

---

### Command or Action

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td>Router(config-if)# <code>ip ospf demand-circuit</code></td>
<td>Configures OSPF over an on-demand circuit.</td>
</tr>
</tbody>
</table>

**Note**

You can prevent an interface from accepting demand-circuit requests from other routers to by specifying the `ignore` keyword in the `ip ospf demand-circuit` command.

- Prerequisites, page 20
Logging Neighbors Going Up or Down

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# <strong>log-adjacency-changes</strong> (detail)</td>
<td>Sends syslog message when an OSPF neighbor goes up or down. Note Configure this command if you want to know about OSPF neighbors going up or down without turning on the <strong>debug ip ospf adjacency</strong> EXEC command. The <strong>log-adjacency-changes</strong> router configuration command provides a higher-level view of the peer relationship with less output. Configure the <strong>log-adjacency-changes detail</strong> command if you want to see messages for each state change.</td>
</tr>
</tbody>
</table>

- Changing the LSA Group Pacing Interval, page 21

Changing the LSA Group Pacing Interval

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# <strong>timers pacing lsa-group seconds</strong></td>
<td>Changes the group pacing of LSAs.</td>
</tr>
</tbody>
</table>

Blocking OSPF LSA Flooding

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-if)# <strong>ip ospf database-filter all out</strong></td>
<td>Blocks the flooding of OSPF LSA packets to the interface.</td>
</tr>
</tbody>
</table>

On point-to-multipoint networks, to block flooding of OSPF LSAs, use the following command in router configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-router)# <strong>neighbor ip-address database-filter all out</strong></td>
<td>Blocks the flooding of OSPF LSA packets to the specified neighbor.</td>
</tr>
</tbody>
</table>
Reducing LSA Flooding

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Router(config-if)# ip ospf flood-reduction</code></td>
<td>Suppresses the unnecessary flooding of LSAs in stable topologies.</td>
</tr>
</tbody>
</table>

Ignoring MOSPF LSA Packets

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Router(config-router)# ignore lsa mospf</code></td>
<td>Prevents the router from generating syslog messages when it receives MOSPF LSA packets.</td>
</tr>
</tbody>
</table>

Displaying OSPF Update Packet Pacing

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Router# show ip ospf flood-list interface-type interface-number</code></td>
<td>Displays a list of LSAs waiting to be flooded over an interface.</td>
</tr>
</tbody>
</table>

Monitoring and Maintaining OSPF

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Router# show ip ospf [process-id]</code></td>
<td>Displays general information about OSPF routing processes.</td>
</tr>
<tr>
<td><code>Router# show ip ospf border-routers</code></td>
<td>Displays the internal OSPF routing table entries to the ABR and ASBR.</td>
</tr>
</tbody>
</table>

Changing the LSA Group Pacing Interval

22
<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router# <code>show ip ospf [process-id] [area-id] database</code></td>
<td>Displays lists of information related to the OSPF database.</td>

<tr>
<td>Router# <code>show ip ospf [process-id] [area-id] database [external] [link-state-id]</code></td>
<td></td>
</tr>
<tr>
<td>Router# <code>show ip ospf [process-id] [area-id] database [nssa-external] [link-state-id]</code></td>
<td></td>
</tr>
<tr>
<td>Router# <code>show ip ospf [process-id] [area-id] database [opaque-link] [link-state-id]</code></td>
<td></td>
</tr>
<tr>
<td>Router# <code>show ip ospf [process-id]</code></td>
<td></td>
</tr>
</tbody>
</table>
Changing the LSA Group Pacing Interval

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>[area-id] database [opaque-area] [link-state-id]</td>
<td></td>
</tr>
</tbody>
</table>

Router# show ip ospf [process-id]
[area-id] database [opaque-as] [link-state-id]  
Displays a list of LSAs waiting to be flooded over an interface (to observe OSPF packet pacing).

Router# show ip ospf flood-list interface  
interface-type  
Displays OSPF-related interface information.

Router# show ip ospf interface [interface-type]
[interface-number]  
Displays OSPF neighbor information on a per-interface basis.

Router# show ip ospf neighbor [interface-name] [neighbor-id] detail  
Displays a list of all LSAs requested by a router.

Router# show ip ospf request-list [neighbor]
[interface] [interface-neighbor]  
Displays a list of all LSAs waiting to be re-sent.

Router# show ip ospf retransmission-list  
[neighbor] [interface] [interface-neighbor]  
Displays a list of all summary address redistribution information configured under an OSPF process.

Router# show ip ospf virtual-links  
Displays OSPF-related virtual links information.

To restart an OSPF process, use the following command in EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Router# clear ip ospf [pid] [process] redistribution | clears redistribution based on the OSPF routing process ID. If the pid option is not specified, all OSPF processes are cleared.  
| counters [neighbor] [neighbor-id] [interface] | |

Restrictions

On systems with a large number of interfaces, it may be possible to configure OSPF such that the number of links advertised in the router LSA causes the link state update packet to exceed the size of a "huge" Cisco IOS buffer. To resolve this problem, reduce the number of OSPF links or increase the huge buffer size by entering the: buffers huge size command.

A link state update packet containing a router LSA typically has a fixed overhead of 196 bytes, and an additional 12 bytes are required for each link description. With a huge buffer size of 18024 bytes there can be a maximum of 1485 link descriptions.
Because the maximum size of an IP packet is 65,535 bytes, there is still an upper bound on the number of
links possible on a router.

Example OSPF Point-to-Multipoint

In the figure below, the router named Router 1 uses data-link connection identifier (DLCI) 201 to
communicate with the router named Router 2, DLCI 202 to the router named Router 4, and DLCI 203 to
the router named Router 3. Router 2 uses DLCI 101 to communicate with Router 1 and DLCI 102 to
communicate with Router 3. Router 3 communicates with Router 2 (DLCI 401) and Router 1 (DLCI 402).
Router 4 communicates with Router 1 (DLCI 301). Configuration examples follow the figure.

Figure 4  OSPF Point-to-Multipoint Example

Router 1 Configuration

hostname Router 1
!
interface serial 1
ip address 10.0.0.2 255.0.0.0
ip ospf network point-to-multipoint
encapsulation frame-relay
frame-relay map ip 10.0.0.1 201 broadcast
frame-relay map ip 10.0.0.3 202 broadcast
frame-relay map ip 10.0.0.4 203 broadcast
router ospf 1
   network 10.0.0.0 0.0.0.255 area 0

**Router 2 Configuration**

hostname Router 2
!
interface serial 0
   ip address 10.0.0.1 255.0.0.0
   ip ospf network point-to-multipoint
   encapsulation frame-relay
   frame-relay map ip 10.0.0.2 101 broadcast
   frame-relay map ip 10.0.0.4 102 broadcast
!
router ospf 1
   network 10.0.0.0 0.0.0.255 area 0

**Router 3 Configuration**

hostname Router 3
!
interface serial 3
   ip address 10.0.0.4 255.0.0.0
   ip ospf network point-to-multipoint
   encapsulation frame-relay
   clock rate 1000000
   frame-relay map ip 10.0.0.1 401 broadcast
   frame-relay map ip 10.0.0.2 402 broadcast
!
router ospf 1
   network 10.0.0.0 0.0.0.255 area 0

**Router 4 Configuration**

hostname Router 4
!
interface serial 2
   ip address 10.0.0.3 255.0.0.0
   ip ospf network point-to-multipoint
   encapsulation frame-relay
   clock rate 2000000
   frame-relay map ip 10.0.0.2 301 broadcast
!
router ospf 1
   network 10.0.0.0 0.0.0.255 area 0

**Example OSPF Point-to-Multipoint with Broadcast**

The following example illustrates a point-to-multipoint network with broadcast:

interface Serial0
   ip address 10.0.1.1 255.255.255.0
   encapsulation frame-relay
   ip ospf cost 100
   ip ospf network point-to-multipoint
   frame-relay map ip 10.0.1.3 202 broadcast
   frame-relay map ip 10.0.1.4 203 broadcast
   frame-relay map ip 10.0.1.5 204 broadcast
   frame-relay local-dlci 200
!
router ospf 1
   network 10.0.1.0 0.0.0.255 area 0
neighbor 10.0.1.5 cost 5
neighbor 10.0.1.4 cost 10

The following example shows the configuration of the neighbor at 10.0.1.3:

interface serial 0
ip address 10.0.1.3 255.255.255.0
ip ospf network point-to-multipoint
encapsulation frame-relay
frame-relay local-dlci 301
frame-relay map ip 10.0.1.1 300 broadcast
no shutdown
!
routing ospf 1
network 10.0.1.0 0.0.0.255 area 0

The output shown for neighbors in the first configuration is as follows:

```
Router# show ip ospf neighbor
Neighbor ID Pri State Dead Time Address Interface
172.16.1.1 1 FULL/ 00:01:50 10.0.1.5 Serial0
172.16.1.4 1 FULL/ 00:01:47 10.0.1.4 Serial0
172.16.1.8 1 FULL/ 00:01:45 10.0.1.3 Serial0
```

The route information in the first configuration is as follows:

```
Router# show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
        D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
        E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
        i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, * - candidate default
        U - per-user static route, o - ODR
Gateway of last resort is not set
C    1.0.0.0/8 is directly connected, Loopback0
S 10.0.0.0/8 is directly connected, Serial0
C 10.0.1.0/24 is directly connected, Serial0
O 10.0.1.3/32 [110/100] via 10.0.1.3, 00:39:08, Serial0
O 10.0.1.4/32 [110/100] via 10.0.1.4, 00:39:08, Serial0
```

**Example OSPF Point-to-Multipoint with Nonbroadcast**

The following example illustrates a point-to-multipoint network with nonbroadcast:

```
interface Serial0
ip address 10.0.1.1 255.255.255.0
ip ospf network point-to-multipoint non-broadcast
encapsulation frame-relay
no keepalive
frame-relay local-dlci 200
frame-relay map ip 10.0.1.3 202
frame-relay map ip 10.0.1.4 203
frame-relay map ip 10.0.1.5 204
no shutdown
!
routing ospf 1
network 10.0.1.0 0.0.0.255 area 0
neighbor 10.0.1.3 cost 5
neighbor 10.0.1.4 cost 10
neighbor 10.0.1.5 cost 15
```

The following example is the configuration for the router on the other side:

```
interface Serial9/2
ip address 10.0.1.1 255.255.255.0
encapsulation frame-relay
ip ospf network point-to-multipoint non-broadcast
no ip mroute-cache
```
no keepalive
no fair-queue
frame-relay local-dlci 301
frame-relay map ip 10.0.1.1 300
no shutdown
!
router ospf 1
network 10.0.1.0 0.0.0.255 area 0

The output shown for neighbors in the first configuration is as follows:

```
Router# show ip ospf neighbor
Neighbor ID     Pri   State           Dead Time   Address         Interface
172.16.1.1           1   FULL/  -        00:01:52    10.0.1.5        Serial0
172.16.1.4           1   FULL/  -        00:01:52    10.0.1.4        Serial0
172.16.1.8           1   FULL/  -        00:01:52    10.0.1.3        Serial0
```

### Example Variable-Length Subnet Masks

OSPF, static routes, and IS-IS support variable-length subnet masks (VLSMs). With VLSMs, you can use different masks for the same network number on different interfaces, which allows you to conserve IP addresses and more efficiently use available address space.

In the following example, a 30-bit subnet mask is used, leaving two bits of address space reserved for serial line host addresses. There is sufficient host address space for two host endpoints on a point-to-point serial link.

```
interface ethernet 0
  ip address 172.16.10.1 255.255.255.0
  ! 8 bits of host address space reserved for ethernets
interface serial 0
  ip address 172.16.20.1 255.255.255.252
  ! 2 bits of address space reserved for serial lines
! Router is configured for OSPF and assigned AS 107
router ospf 107
! Specifies network directly connected to the router
  network 172.16.0.0 0.0.255.255 area 0.0.0.0
```

### Example OSPF NSSA

In the following example, an OSPF stub network is configured to include OSPF Area 0 and OSPF Area 1, using five routers. OSPF Area 1 is defined as an NSSA, with Router 3 configured to be the NSSA ASBR and Router 2 configured to be the NSSA ABR. Following is the configuration output for the five routers.

#### Router 1

```
hostname Router1
!
interface Loopback1
  ip address 10.1.0.1 255.255.255.255
!
interface Ethernet0/0
  ip address 192.168.0.1 255.255.255.0
  ip ospf 1 area 0
  no cdp enable
!
interface Serial10/0
  description Router2 interface s11/0

router rip
  version 2
  redistribute ospf 1 metric 15
  network 192.168.3.0
end

Router 4

hostname Router4
interface Loopback1
  ip address 10.1.0.4 255.255.255.255
!
interface Ethernet3/0
  ip address 192.168.3.4 255.255.255.0
  no cdp enable
!
interface Ethernet4/1
  ip address 192.168.41.4 255.255.255.0
!
router rip
  version 2
  network 192.168.3.0
  network 192.168.41.0
!
end

Router 5

hostname Router5
!
interface Loopback1
  ip address 10.1.0.5 255.255.255.255
!
interface Ethernet0/0
  ip address 192.168.0.10 255.255.255.0
  ip ospf 1 area 0
  no cdp enable
!
interface Ethernet1/1
  ip address 192.168.11.10 255.255.255.0
  ip ospf 1 area 0
!
router ospf 1
!
end

The figure below shows the OSPF stub network with NSSA Area 1. The redistributed routes that Router 4 is propagating from the two RIP networks will be translated into Type 7 LSAs by NSSA ASBR Router 3. Router 2, which is configured to be the NSSA ABR, will translate the Type 7 LSAs back to Type 5 so that they can be flooded through the rest of the OSPF stub network within OSPF Area 0.

Figure 5  OSPF NSSA Network with NSSA ABR and ASBR Routers
When the `show ip ospf` command is entered on Router 2, the output confirms that OSPF Area 1 is an NSSA area:

```
Router2# show ip ospf
Routing Process "ospf 1" with ID 10.1.0.2
Start time: 00:00:01.392, Time elapsed: 12:03:09.480
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Router is not originating router-LSAs with maximum metric
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPF s 10000 msecs
Maximum wait time between two consecutive SPF s 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 msecs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 0 normal 0 stub 1 nssa
Number of areas transit capable is 0
External flood list length 0
Area 1
   Number of interfaces in this area is 2
   ! It is a NSSA area
   Area has no authentication
   SPF algorithm last executed 11:37:58.836 ago
   SPF algorithm executed 3 times
   Area ranges are
   Number of LSA 7. Checksum Sum 0x045598
   Number of opaque link LSA 0. Checksum Sum 0x000000
   Number of DCbitless LSA 0
   Number of indication LSA 0
   Number of DoNotAge LSA 0
   Flood list length 0
```

Entering the `show ip ospf database` command displays additional information about redistribution between Type 5 and Type 7 LSAs for routes that have been injected into the NSSA area and then flooded through the OSPF network.

```
Router2# show ip ospf database
OSPF Router with ID (10.1.0.2) (Process ID 1)
Area 1 database summary
   LSA Type  Count  Delete  Maxage
   Router    3       0       0
   Network   0       0       0
   Summary Net  2      0      0
   Summary ASBR  0     0      0
   Type-7 Ext  2      0      0
   Prefixes redistributed in Type-7  0
   Opaque Link  0     0      0
```
<table>

Entering the `show ip ospf database nssa` command also displays detailed information for Type 7 to Type 5 translations:

```
Router2# show ip ospf database nssa
OSPF Router with ID (10.1.0.2) (Process ID 1)
  Type-7 AS External Link States (Area 1)
  Routing Bit Set on this LSA
  LS age: 1903
  Options: (No TOS-capability, Type 7/5 translation, DC)
  LS Type: AS External Link
  Link State ID: 192.168.3.0 (External Network Number)
  Advertising Router: 10.1.0.3
  LS Seq Number: 80000015
  Checksum: 0x484F
  Length: 36
  Network Mask: /24
  Metric Type: 2 (Larger than any link state path)
  TOS: 0
  Metric: 20
  Forward Address: 192.168.14.3
  External Route Tag: 0
  Routing Bit Set on this LSA
  LS age: 1903
  Options: (No TOS-capability, Type 7/5 translation, DC)
  LS Type: AS External Link
  Link State ID: 192.168.41.0 (External Network Number)
  Advertising Router: 10.1.0.3
  LS Seq Number: 80000015
  Checksum: 0xA4CC
  Length: 36
  Network Mask: /24
  Metric Type: 2 (Larger than any link state path)
  TOS: 0
  Metric: 20
  Forward Address: 192.168.14.3
  External Route Tag: 0
```

**Router 3**

Entering the `show ip ospf` command on Router 3 displays the information to confirm that Router 3 is acting as an ASBR and that OSPF Area 1 has been configured to be an NSSA area:

```
Router3# show ip ospf
Routing Process "ospf 1" with ID 10.1.0.3
  Start time: 00:00:01.392, Time elapsed: 12:02:34.572
  Supports only single TOS(TOS0) routes
  Supports opaque LSA
  Supports Link-local Signaling (LLS)
  Supports area transit capability
  It is an autonomous system boundary router
  Redistributing External Routes from,
    rip, includes subnets in redistribution
  Router is not originating router-LSAs with maximum metric
  Initial SPF schedule delay 5000 msecs
  Minimum hold time between two consecutive SPFs 10000 msecs
```
Example OSPF NSSA Area with RFC 3101 Disabled and RFC 1587 Active

In the following example, the output for the `show ip ospf` and `show ip ospf database nssa` commands is for an OSPF NSSA area where RFC 3101 is disabled, RFC 1587 is active, and an NSSA ABR router is configured as a forced NSSA LSA translator. As described in the "Configuring OSPF NSSA", if RFC 3101 is disabled, the forced NSSA LSA translator remains inactive. The command output demonstrates this.

```
Router# show ip ospf
Routing Process "ospf 1" with ID 10.0.2.1
Start time: 00:00:25.512, Time elapsed: 00:01:02.200
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Supports NSSSA (compatible with RFC 1587)
Event-log enabled, Maximum number of events: 1000, Mode: cyclic
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 0 normal 0 stub 1 nssa
Number of areas transit capable is 0
External flood list length 0
Area 1
  Number of interfaces in this area is 1
    It is a NSSA area
    Area has no authentication
    SPF algorithm last executed 11:38:13.368 ago
    SPF algorithm executed 3 times
    Area ranges are
    Number of LSA 7. Checksum Sum 0x050CF7
    Number of opaque link LSA 0. Checksum Sum 0x000000
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0
```

Example OSPF NSSA Area with RFC 3101 Disabled and RFC 1587 Active

- Maximum wait time between two consecutive SPFs: 10000 msecs
- Incremental-SPF disabled
- Minimum LSA interval: 5 secs
- Minimum LSA arrival: 1000 msecs
- LSA group pacing timer: 240 secs
- Interface flood pacing timer: 33 msecs
- Retransmission pacing timer: 66 msecs
- Number of external LSA: 0
- Number of opaque AS LSA: 0
- Number of DCbitless external and opaque AS LSA: 0
- Number of DoNotAge external and opaque AS LSA: 0
- Number of areas in this router: 1
- Number of areas transit capable: 0
- External flood list length: 0
- Area 1: Number of interfaces in this area: 1
- It is a NSSA area
- Configured to translate Type-7 LSAs, inactive (RFC3101 support disabled)
- Area has no authentication
The "Supports NSSA (compatible with RFC 1587)" line in the output indicates that RFC 1587 is active or that the OSPF NSSA area is RFC 1587 compatible.

The "Configured to translate Type-7 LSAs, inactive (RFC3101 support disabled)" line indicates that the OSPF NSSA area has an ABR router configured to act as a forced translator of Type 7 LSAs, but it is inactive because RFC 3101 is disabled.

The "Unconditional NSSA translator" line indicates that the status of the NSSA ASBR router is as a forced NSSA LSA translator.

Example OSPF Routing and Route Redistribution

OSPF typically requires coordination among many internal routers, ABRs, and ASBRs. At a minimum, OSPF-based routers can be configured with all default parameter values, with no authentication, and with interfaces assigned to areas.

Three types of examples follow:

- The first is a simple configuration illustrating basic OSPF commands.
- The second example illustrates a configuration for an internal router, ABR, and ASBRs within a single, arbitrarily assigned, OSPF autonomous system.
- The third example illustrates a more complex configuration and the application of various tools available for controlling OSPF-based routing environments.

- Example Basic OSPF Configuration, page 34
- Example Basic OSPF Configuration for Internal Router ABR and ASBRs, page 35
- Example Complex Internal Router with ABR and ASBR, page 36
- Example Complex OSPF Configuration for ABR, page 38
The following example illustrates a simple OSPF configuration that enables OSPF routing process 9000, attaches Ethernet interface 0 to area 0.0.0.0, and redistributes RIP into OSPF, and OSPF into RIP:

```bash
interface ethernet 0
  ip address 10.93.1.1 255.255.255.0
  ip ospf cost 1

interface ethernet 1
  ip address 10.94.1.1 255.255.255.0

router ospf 9000
  network 10.93.0.0 0.0.255.255 area 0.0.0.0
  redistribute rip metric 1 subnets

router rip
  network 10.94.0.0
  redistribute ospf 9000
default-metric 1
```

Example Basic OSPF Configuration for Internal Router ABR and ASBRs

The following example illustrates the assignment of four area IDs to four IP address ranges. In the example, OSPF routing process 109 is initialized, and four OSPF areas are defined: 10.9.50.0, 2, 3, and 0. Areas 10.9.50.0, 2, and 3 mask specific address ranges, and area 0 enables OSPF for all other networks.

```bash
router ospf 109
  network 192.168.10.0 0.0.0.255 area 10.9.50.0
  network 192.168.20.0 0.0.255.255 area 2
  network 192.168.30.0 0.0.255.255 area 3
  network 192.168.40.0 255.255.255.255 area 0

  ! Interface Ethernet0 is in area 10.9.50.0:
  interface ethernet 0
    ip address 192.168.10.5 255.255.255.0

  ! Interface Ethernet1 is in area 2:
  interface ethernet 1
    ip address 192.168.20.5 255.255.255.0

  ! Interface Ethernet2 is in area 2:
  interface ethernet 2
    ip address 192.168.20.7 255.255.255.0

  ! Interface Ethernet3 is in area 3:
  interface ethernet 3
    ip address 192.169.30.5 255.255.255.0

  ! Interface Ethernet4 is in area 0:
  interface ethernet 4
    ip address 192.168.40.1 255.255.255.0

  ! Interface Ethernet5 is in area 0:
  interface ethernet 5
    ip address 192.168.40.12 255.255.0.0
```

Each network area router configuration command is evaluated sequentially, so the order of these commands in the configuration is important. The Cisco IOS software sequentially evaluates the address/wildcard-mask pair for each interface. See the network area command in the Cisco IOS IP Routing: OSPF Command Reference for more information.

Consider the first network area command. Area ID 10.9.50.0 is configured for the interface on which subnet 192.168.10.0 is located. Assume that a match is determined for Ethernet interface 0. Ethernet interface 0 is attached to area 10.9.50.0 only.
The second `network area` command is evaluated next. For area 2, the same process is then applied to all interfaces (except Ethernet interface 0). Assume that a match is determined for interface Ethernet 1. OSPF is then enabled for that interface and Ethernet interface 1 is attached to area 2.

This process of attaching interfaces to OSPF areas continues for all `network area` commands. Note that the last `network area` command in this example is a special case. With this command, all available interfaces (not explicitly attached to another area) are attached to area 0.

**Example Complex Internal Router with ABR and ASBR**

The following example outlines a configuration for several routers within a single OSPF autonomous system. The figure below provides a general network map that illustrates this example configuration.

**Figure 6 Sample OSPF Autonomous System Network Map**

In this configuration, five routers are configured with OSPF:

- Router A and Router Bare both internal routers within area 1.
- Router C is an OSPF ABR. Note that for Router C, Area 1 is assigned to E3 and area 0 is assigned to S0.
- Router D is an internal router in area 0 (backbone area). In this case, both `network` router configuration commands specify the same area (area 0, or the backbone area).
• Router E is an OSPF ASBR. Note that BGP routes are redistributed into OSPF and that these routes are advertised by OSPF.

Note

You do not need to include definitions of all areas in an OSPF autonomous system in the configuration of all routers in the autonomous system. Only the directly connected areas must be defined. In the example that follows, routes in area 0 are learned by the routers in area 1 (Router A and Router B) when the ABR (Router C) injects summary LSAs into area 1.

The OSPF domain in BGP autonomous system 109 is connected to the outside world via the BGP link to the external peer at IP address 10.0.0.6. Example configurations follow.

Following is the sample configuration for the general network map shown in the figure above.

**Router A Configuration--Internal Router**

```plaintext
deif interface ethernet 1
   ip address 192.168.1.1 255.255.255.0
router ospf 1
   network 192.168.0.0 0.0.255.255 area 1
```

**Router B Configuration--Internal Router**

```plaintext
deif interface ethernet 2
   ip address 192.168.1.2 255.255.255.0
router ospf 202
   network 192.168.0.0 0.0.255.255 area 1
```

**Router C Configuration--ABR**

router ospf 65001
   network 10.0.0.0 0.255.255.255 area 0
   redistribute bgp 109 metric 1 metric-type 1
   router bgp 109
   network 192.168.0.0
```
network 10.0.0.0
neighbor 172.16.1.6 remote-as 110

Example Complex OSPF Configuration for ABR

The following example configuration accomplishes several tasks in setting up an ABR. These tasks can be split into two general categories:

- Basic OSPF configuration
- Route redistribution

The specific tasks outlined in this configuration are detailed briefly in the following descriptions. The figure below illustrates the network address ranges and area assignments for the interfaces.

![Interface and Area Specifications for OSPF Example Configuration](image)

The basic configuration tasks in this example are as follows:

- Configure address ranges for Ethernet interface 0 through Ethernet interface 3.
- Enable OSPF on each interface.
- Set up an OSPF authentication password for each area and network.
- Assign link-state metrics and other OSPF interface configuration options.
- Create a **stub area** with area ID 36.0.0.0. (Note that the **authentication** and **stub** options of the **area** router configuration command are specified with separate **area** command entries, but can be merged into a single **area** command.)
- Specify the backbone area (area 0).

Configuration tasks associated with redistribution are as follows:

- Redistribute IGRP and RIP into OSPF with various options set (including **metric-type**, **metric**, **tag**, and **subnet**).
- Redistribute IGRP and OSPF into RIP.

The following is an example OSPF configuration:

```
interface ethernet 0
  ip address 192.42.110.201 255.255.255.0
  ip ospf authentication-key abcdefgh
```
ip ospf cost 10
!
interface ethernet 1
 ip address 172.19.251.202 255.255.255.0
 ip ospf authentication-key ijklmnop
 ip ospf cost 20
 ip ospf retransmit-interval 10
 ip ospf transmit-delay 2
 ip ospf priority 4
!
interface ethernet 2
 ip address 172.19.254.2 255.255.255.0
 ip ospf authentication-key abcdefgh
 ip ospf cost 10
!
interface ethernet 3
 ip address 10.56.0.0 255.255.0.0
 ip ospf authentication-key ijklmnop
 ip ospf cost 20
 ip ospf dead-interval 80

In the following configuration OSPF is on network 172.16.0.0:

router ospf 201
 network 10.10.0.0 0.255.255.255 area 10.10.0.0
 network 192.42.110.0 0.0.0.255 area 192.42.110.0
 network 172.16.0.0 0.0.255.255 area 0
 area 0 authentication
 area 10.10.0.0 stub
 area 10.10.0.0 authentication
 area 10.10.0.0 default-cost 20
 area 192.42.110.0 authentication
 area 10.10.0.0 range 10.10.0.0 255.0.0.0
 area 192.42.110.0 range 192.42.110.0 255.255.255.0
 area 0 range 172.16.251.0 255.255.255.0
 area 0 range 172.16.254.0 255.255.255.0
 redistribute igrp 200 metric-type 2 metric 1 tag 200 subnets
 redistribute rip metric-type 2 metric 1 tag 200

In the following configuration, IGRP autonomous system 200 is on 192.0.2.1:

router igrp 200
 network 172.31.0.0
!
! RIP for 192.168.110
!
router rip
 network 192.168.110.0
 redistribute igrp 200 metric 1
 redistribute ospf 201 metric 1

Examples Route Map

The examples in this section illustrate the use of redistribution, with and without route maps. Examples from both the IP and Connectionless Network Service (CLNS) routing protocols are given.

The following example redistributes all OSPF routes into IGRP:

router igrp 109
 redistribute ospf 110

The following example redistributes RIP routes with a hop count equal to 1 into OSPF. These routes will be redistributed into OSPF as external LSAs with a metric of 5, a metric type of Type 1, and a tag equal to 1.

router ospf 109
 redistribute rip route-map rip-to-ospf
!
route-map rip-to-ospf permit
match metric 1
set metric 5
set metric-type typel
set tag 1

The following example redistributes OSPF learned routes with tag 7 as a RIP metric of 15:

router rip
  redistribute ospf 109 route-map 5
  !
  route-map 5 permit
  match tag 7
  set metric 15

The following example redistributes OSPF intra-area and interarea routes with next hop routers on serial interface 0 into BGP with an INTER_AS metric of 5:

router bgp 109
  redistribute ospf 109 route-map 10
  !
  route-map 10 permit
  match route-type internal
  match interface serial 0
  set metric 5

The following example redistributes two types of routes into the integrated IS-IS routing table (supporting both IP and CLNS). The first type is OSPF external IP routes with tag 5; these routes are inserted into Level 2 IS-IS link state packets (LSPs) with a metric of 5. The second type is ISO-IGRP derived CLNS prefix routes that match CLNS access list 2000; these routes will be redistributed into IS-IS as Level 2 LSPs with a metric of 30.

router isis
  redistribute ospf 109 route-map 2
  redistribute iso-igrp nsfnet route-map 3
  !
  route-map 2 permit
  match route-type external
  match tag 5
  set metric 5
  set level level-2
  !
  route-map 3 permit
  match address 2000
  set metric 30

With the following configuration, OSPF external routes with tags 1, 2, 3, and 5 are redistributed into RIP with metrics of 1, 1, 5, and 5, respectively. The OSPF routes with a tag of 4 are not redistributed.

router rip
  redistribute ospf 109 route-map 1
  !
  route-map 1 permit
  match tag 1 2
  set metric 1
  !
  route-map 1 permit
  match tag 3
  set metric 5
  !
  route-map 1 deny
  match tag 4
  !
  route map 1 permit
  match tag 5
  set metric 5
In the following configuration, a RIP learned route for network 160.89.0.0 and an ISO-IGRP learned route with prefix 49.0001.0002 will be redistributed into an IS-IS Level 2 LSP with a metric of 5:

```
router isis
    redistribute rip route-map 1
    redistribute iso-igrp remote route-map 1
    !
    route-map 1 permit
        match ip address 1
        match clns address 2
        set metric 5
        set level level-2
    !
    access-list 1 permit 192.168.0.0 0.0.255.255
    clns filter-set 2 permit 49.0001.0002...
```

The following configuration example illustrates how a route map is referenced by the `default-information` router configuration command. This type of reference is called **conditional default origination**. OSPF will originate the default route (network 0.0.0.0) with a Type 2 metric of 5 if 140.222.0.0 is in the routing table.

---

**Note**

Only routes external to the OSPF process can be used for tracking, such as non-OSPF routes or OSPF routes from a separate OSPF process.

```
route-map ospf-default permit
    match ip address 1
    set metric 5
    set metric-type type-2
    !
    access-list 1 permit 172.16.0.0 0.0.255.255
    !
    router ospf 109
    default-information originate route-map ospf-default
```
Example Changing OSPF Administrative Distance

The following configuration changes the external distance to 200, making it less trustworthy. The figure below illustrates the example.

**Figure 8** OSPF Administrative Distance

![OSPF Administrative Distance Diagram]

**Router A Configuration**

```
router ospf 1
    redistribute ospf 2 subnet
distance ospf external 200
```

**Router B Configuration**

```
router ospf 1
    redistribute ospf 2 subnet
distance ospf external 200
```

```
Example OSPF over On-Demand Routing

The following configuration allows OSPF over an on-demand circuit, as shown in the figure below. Note that the on-demand circuit is defined on one side only (BRI 0 on Router A); it is not required to be configured on both sides.

**Figure 9** OSPF over On-Demand Circuit

**Router A Configuration**

```
username RouterB password 7 060C1A2F47
isdn switch-type basic-5ess
ip routing

interface TokenRing0
  ip address 192.168.50.5 255.255.255.0
  no shutdown

interface BRI0
  no cdp enable
description connected PBX 1485
  ip address 192.168.45.30 255.255.255.0
e encapsulation ppp
dialer map ip 140.10.10.6 name RouterB broadcast 61484
dialer-group 1
  ppp authentication chap
  no shutdown

router ospf 100
  network 192.168.45.0 0.0.0.255 area 0
  network 192.168.45.50 0.0.0.255 area 0
```

**Router B Configuration**

```
username RouterB password 7 04511E0804
isdn switch-type basic-5ess
ip routing

interface Ethernet0
  ip address 192.168.50.16 255.255.255.0
  no shutdown

interface BRI0
  no cdp enable
description connected PBX 1484
  ip address 192.168.45.17 255.255.255.0
e encapsulation ppp
dialer map ip 192.168.45.19 name RouterA broadcast 61485
dialer-group 1
  ppp authentication chap
  no shutdown

router ospf 100
  network 192.168.45.0 0.0.0.255 area 0
  network 192.168.45.50 0.0.0.255 area 0
```
Example LSA Group Pacing

The following example changes the OSPF pacing between LSA groups to 60 seconds:

```
dialer-list 1 protocol ip permit
router ospf
timers pacing lsa-group 60
```

Example Block LSA Flooding

The following example prevents flooding of OSPF LSAs to broadcast, nonbroadcast, or point-to-point networks reachable through Ethernet interface 0:

```
interface ethernet 0
   ip ospf database-filter all out
```

The following example prevents flooding of OSPF LSAs to point-to-multipoint networks to the neighbor at IP address 10.10.10.45:

```
router ospf 109
   neighbor 10.10.10.45 database-filter all out
```

Example Ignore MOSPF LSA Packets

The following example configures the router to suppress the sending of syslog messages when it receives MOSPF packets:

```
router ospf 109
   ignore lsa mospf
```

Feature Information for Configuring OSPF

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software
release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
