Configuring OSPF

This module describes how to configure Open Shortest Path First (OSPF). OSPF is an Interior Gateway Protocol (IGP) developed by the OSPF working group of the Internet Engineering Task Force (IETF). OSPF was designed expressly for IP networks and it supports IP subnetting and tagging of externally derived routing information. OSPF also allows packet authentication and uses IP multicast when sending and receiving packets.

Cisco supports RFC 1253, *OSPF Version 2 Management Information Base*, August 1991. The OSPF MIB defines an IP routing protocol that provides management information related to OSPF and is supported by Cisco routers.

For protocol-independent features that work with OSPF, see the "Configuring IP Routing Protocol-Independent Features" module.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Information About OSPF

- Cisco OSPF Implementation, page 2
- Router Coordination for OSPF, page 2
- Route Distribution for OSPF, page 2
Cisco OSPF Implementation

The Cisco implementation conforms to the OSPF Version 2 specifications detailed in the Internet RFC 2328. The list that follows outlines key features supported in the Cisco OSPF implementation:

- Stub areas--Definition of stub areas is supported.
- Route redistribution--Routes learned via any IP routing protocol can be redistributed into any other IP routing protocol. At the intradomain level, OSPF can import routes learned via Interior Gateway Routing Protocol (IGRP), Routing Information Protocol (RIP), and Intermediate System-to-Intermediate System (IS-IS). OSPF routes can also be exported into IGRP, RIP, and IS-IS. At the interdomain level, OSPF can import routes learned via Exterior Gateway Protocol (EGP) and Border Gateway Protocol (BGP). OSPF routes can be exported into BGP and EGP.
- Authentication--Plain text and message-digest algorithm 5 (MD5) authentication among neighboring routers within an area is supported.
- Routing interface parameters--Configurable parameters supported include interface output cost, retransmission interval, interface transmit delay, router priority, router "dead" and hello intervals, and authentication key.
- Virtual links--Virtual links are supported.
- OSPF over demand circuit--RFC 1793.

Router Coordination for OSPF

OSPF typically requires coordination among many internal routers: Area Border Routers (ABRs), which are routers connected to multiple areas, and Autonomous System Boundary Routers (ASBRs). At a minimum, OSPF-based routers or access servers can be configured with all default parameter values, no authentication, and interfaces assigned to areas. If you intend to customize your environment, you must ensure coordinated configurations of all routers.

Route Distribution for OSPF

You can specify route redistribution; see the task "Redistribute Routing Information" in the Network Protocols Configuration Guide, Part 1 for information on how to configure route redistribution.

The Cisco OSPF implementation allows you to alter certain interface-specific OSPF parameters, as needed. You are not required to alter any of these parameters, but some interface parameters must be consistent across all routers in an attached network. Those parameters are controlled by the `ip ospf hello-interval`, `ip ospf dead-interval`, and `ip ospf authentication-key` interface configuration commands. Therefore, be sure that if you do configure any of these parameters, the configurations for all routers on your network have compatible values.

OSPF classifies different media into the following three types of networks by default:

- Broadcast networks (Ethernet, Token Ring, and FDDI)
- Nonbroadcast multiaccess (NBMA) networks (Switched Multimegabit Data Service (SMDS), Frame Relay, and X.25)
- Point-to-point networks (High-Level Data Link Control [HDLC] and PPP)

You can configure your network as either a broadcast or an NBMA network.
X.25 and Frame Relay provide an optional broadcast capability that can be configured in the map to allow OSPF to run as a broadcast network. Refer to the x25 map and frame-relay map command descriptions in the Cisco IOS Wide-Area Networking Command Reference publication for more detail.

- OSPF Network Types, page 3
- Original LSA Behavior, page 7
- LSA Group Pacing with Multiple Timers, page 7

**OSPF Network Types**

You have the choice of configuring your OSPF network type as either broadcast or NBMA, regardless of the default media type. Using this feature, you can configure broadcast networks as NBMA networks when, for example, you have routers in your network that do not support multicast addressing. You also can configure NBMA networks (such as X.25, Frame Relay, and SMDS) as broadcast networks. This feature saves you from needing to configure neighbors, as described in the section "Configuring OSPF for Nonbroadcast Networks, page 13" later in this module.

Configuring NBMA networks as either broadcast or nonbroadcast assumes that there are virtual circuits (VCs) from every router to every router or fully meshed network. This is not true for some cases, for example, because of cost constraints, or when you have only a partially meshed network. In these cases, you can configure the OSPF network type as a point-to-multipoint network. Routing between two routers not directly connected will go through the router that has VCs to both routers. Note that you need not configure neighbors when using this feature.

An OSPF point-to-multipoint interface is defined as a numbered point-to-point interface having one or more neighbors. It creates multiple host routes. An OSPF point-to-multipoint network has the following benefits compared to NBMA and point-to-point networks:

- Point-to-multipoint is easier to configure because it requires no configuration of neighbor commands, it consumes only one IP subnet, and it requires no designated router election.
- It costs less because it does not require a fully meshed topology.
- It is more reliable because it maintains connectivity in the event of VC failure.

On point-to-multipoint, broadcast networks, there is no need to specify neighbors. However, you can specify neighbors with the `neighbor` router configuration command, in which case you should specify a cost to that neighbor.

Before the `point-to-multipoint` keyword was added to the `ip ospf network` interface configuration command, some OSPF point-to-multipoint protocol traffic was treated as multicast traffic. Therefore, the `neighbor` router configuration command was not needed for point-to-multipoint interfaces because multicast took care of the traffic. Hello, update, and acknowledgment messages were sent using multicast. In particular, multicast hello messages discovered all neighbors dynamically.

On any point-to-multipoint interface (broadcast or not), the Cisco IOS software assumed that the cost to each neighbor was equal. The cost was configured with the `ip ospf cost` interface configuration command. In reality, the bandwidth to each neighbor is different, so the cost should differ. With this feature, you can configure a separate cost to each neighbor. This feature applies to point-to-multipoint interfaces only.

Because many routers might be attached to an OSPF network, a designated router is selected for the network. Special configuration parameters are needed in the designated router selection if broadcast capability is not configured.

These parameters need only be configured in those devices that are themselves eligible to become the designated router or backup designated router (in other words, routers with a nonzero router priority value).

You can specify the following neighbor parameters, as required:
• Priority for a neighboring router
• Nonbroadcast poll interval

On point-to-multipoint, nonbroadcast networks, use the `neighbor` router configuration command to identify neighbors. Assigning a cost to a neighbor is optional.

Prior to Cisco IOS Release 12.0, some customers were using point-to-multipoint on nonbroadcast media (such as classic IP over ATM), so their routers could not dynamically discover their neighbors. This feature allows the `neighbor` router configuration command to be used on point-to-multipoint interfaces.

On any point-to-multipoint interface (broadcast or not), the Cisco IOS software assumed the cost to each neighbor was equal. The cost was configured with the `ip ospf cost` interface configuration command. In reality, the bandwidth to each neighbor is different, so the cost should differ. With this feature, you can configure a separate cost to each neighbor. This feature applies to point-to-multipoint interfaces only.

Our OSPF software allows you to configure several area parameters. These area parameters, shown in the following task table, include authentication, defining stub areas, and assigning specific costs to the default summary route. Authentication allows password-based protection against unauthorized access to an area.

Stub areas are areas into which information on external routes is not sent. Instead, there is a default external route generated by the ABR, into the stub area for destinations outside the autonomous system. To take advantage of the OSPF stub area support, `default routing` must be used in the stub area. To further reduce the number of LSAs sent into a stub area, you can configure the `no-summary` keyword of the `area stub` router configuration command on the ABR to prevent it from sending summary link advertisement (LSAs Type 3) into the stub area.

The OSPF NSSA feature is described by RFC 3101. In Cisco IOS Release 15.1(2)S and later releases, RFC 3101 replaces RFC 1587. RFC 3101 is backward compatible with RFC 1587. For a detailed list of differences between them, see Appendix F of RFC 3101. NSSA support was first integrated into Cisco IOS Release 11.2. OSPF NSSA is a nonproprietary extension of the existing OSPF stub area feature.

RFC 3101 support enhances both the Type 7 autonomous-system external routing calculation and the translation of Type 7 LSAs into Type 5 LSAs. For more information, see RFC 3101.

Use NSSA to simplify administration if you are an Internet service provider (ISP) or a network administrator that must connect a central site that is using OSPF to a remote site that is using a different routing protocol.

Prior to NSSA, the connection between the corporate site border router and the remote router could not be run as an OSPF stub area because routes for the remote site could not be redistributed into the stub area, and two routing protocols needed to be maintained. A simple protocol such as RIP was usually run and handled the redistribution. With NSSA, you can extend OSPF to cover the remote connection by defining the area between the corporate router and the remote router as an NSSA.

As with OSPF stub areas, NSSA areas cannot be injected with distributed routes via Type 5 LSAs. Route redistribution into an NSSA area is possible only with a special type of LSA that is known as Type 7 that can exist only in an NSSA area. An NSSA ASBR generates the Type 7 LSA so that the routes can be redistributed, and an NSSA ABR translates the Type 7 LSA into a Type 5 LSA, which can be flooded throughout the whole OSPF routing domain. Summarization and filtering are supported during the translation.

Cisco IOS Release 15.1(2)S and later releases support RFC 3101, which allows you to configure an NSSA ABR router as a forced NSSA LSA translator. This means that the NSSA ABR router will unconditionally assume the role of LSA translator, preempting the default behavior, which would only include it among the candidates to be elected as translator.
Even a forced translator might not translate all LSAs; translation depends on the contents of each LSA.

The figure below shows a network diagram in which OSPF Area 1 is defined as the stub area. The Enhanced Interior Gateway Routing Protocol (EIGRP) routes cannot be propagated into the OSPF domain because routing redistribution is not allowed in the stub area. However, once OSPF Area 1 is defined as an NSSA, an NSSA ASBR can inject the EIGRP routes into the OSPF NSSA by creating Type 7 LSAs.

Figure 1  OSPF NSSA

The redistributed routes from the RIP router will not be allowed into OSPF Area 1 because NSSA is an extension to the stub area. The stub area characteristics will still exist, including the exclusion of Type 5 LSAs.

Route summarization is the consolidation of advertised addresses. This feature causes a single summary route to be advertised to other areas by an ABR. In OSPF, an ABR will advertise networks in one area into another area. If the network numbers in an area are assigned in a way such that they are contiguous, you can configure the ABR to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

When routes from other protocols are redistributed into OSPF (as described in the module "Configuring IP Routing Protocol-Independent Features"), each route is advertised individually in an external LSA. However, you can configure the Cisco IOS software to advertise a single route for all the redistributed routes that are covered by a specified network address and mask. Doing so helps decrease the size of the OSPF link-state database.

In OSPF, all areas must be connected to a backbone area. If there is a break in backbone continuity, or the backbone is purposefully partitioned, you can establish a virtual link. The two endpoints of a virtual link are ABRs. The virtual link must be configured in both routers. The configuration information in each router consists of the other virtual endpoint (the other ABR) and the nonbackbone area that the two routers have in common (called the transit area). Note that virtual links cannot be configured through stub areas.

You can force an ASBR to generate a default route into an OSPF routing domain. Whenever you specifically configure redistribution of routes into an OSPF routing domain, the router automatically
becomes an ASBR. However, an ASBR does not, by default, generate a default route into the OSPF routing domain.

You can configure OSPF to look up Domain Naming System (DNS) names for use in all OSPF show EXEC command displays. You can use this feature to more easily identify a router, because the router is displayed by name rather than by its router ID or neighbor ID.

OSPF uses the largest IP address configured on the interfaces as its router ID. If the interface associated with this IP address is ever brought down, or if the address is removed, the OSPF process must recalculate a new router ID and resend all its routing information out its interfaces.

If a loopback interface is configured with an IP address, the Cisco IOS software will use this IP address as its router ID, even if other interfaces have larger IP addresses. Because loopback interfaces never go down, greater stability in the routing table is achieved.

OSPF automatically prefers a loopback interface over any other kind, and it chooses the highest IP address among all loopback interfaces. If no loopback interfaces are present, the highest IP address in the router is chosen. You cannot tell OSPF to use any particular interface.

In Cisco IOS Release 10.3 and later releases, by default OSPF calculates the OSPF metric for an interface according to the bandwidth of the interface. For example, a 64-kbps link gets a metric of 1562, and a T1 link gets a metric of 64.

The OSPF metric is calculated as the ref-bw value divided by the bandwidth value, with the ref-bw value equal to 108 by default, and the bandwidth value determined by the bandwidth interface configuration command. The calculation gives FDDI a metric of 1. If you have multiple links with high bandwidth, you might want to specify a larger number to differentiate the cost on those links.

An administrative distance is a rating of the trustworthiness of a routing information source, such as an individual router or a group of routers. Numerically, an administrative distance is an integer from 0 to 255. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored.

OSPF uses three different administrative distances: intra-area, interarea, and external. Routes within an area are intra-area; routes to another area are interarea; and routes from another routing domain learned via redistribution are external. The default distance for each type of route is 110.

Because simplex interfaces between two devices on an Ethernet represent only one network segment, for OSPF you must configure the sending interface to be a passive interface. This configuration prevents OSPF from sending hello packets for the sending interface. Both devices are able to see each other via the hello packet generated for the receiving interface.

You can configure the delay time between when OSPF receives a topology change and when it starts a shortest path first (SPF) calculation. You can also configure the hold time between two consecutive SPF calculations.

The OSPF on-demand circuit is an enhancement to the OSPF protocol that allows efficient operation over on-demand circuits such as ISDN, X.25 switched virtual circuits (SVCs), and dialup lines. This feature supports RFC 1793, Extending OSPF to Support Demand Circuits.

Prior to this feature, OSPF periodic hello and LSA updates would be exchanged between routers that connected the on-demand link, even when no changes occurred in the hello or LSA information.

With this feature, periodic hellos are suppressed and the periodic refreshes of LSAs are not flooded over the demand circuit. These packets bring up the link only when they are exchanged for the first time, or when a change occurs in the information they contain. This operation allows the underlying data link layer to be closed when the network topology is stable.

This feature is useful when you want to connect telecommuters or branch offices to an OSPF backbone at a central site. In this case, OSPF for on-demand circuits allows the benefits of OSPF over the entire domain,
without excess connection costs. Periodic refreshes of hello updates, LSA updates, and other protocol overhead are prevented from enabling the on-demand circuit when there is no "real" data to send.

Overhead protocols such as hellos and LSAs are transferred over the on-demand circuit only upon initial setup and when they reflect a change in the topology. This means that critical changes to the topology that require new SPF calculations are sent in order to maintain network topology integrity. Periodic refreshes that do not include changes, however, are not sent across the link.

The OSPF LSA group pacing feature allows the router to group OSPF LSAs and pace the refreshing, checksumming, and aging functions. The group pacing results in more efficient use of the router.

The router groups OSPF LSAs and paces the refreshing, checksumming, and aging functions so that sudden increases in CPU usage and network resources are avoided. This feature is most beneficial to large OSPF networks.

OSPF LSA group pacing is enabled by default. For typical customers, the default group pacing interval for refreshing, checksumming, and aging is appropriate and you need not configure this feature.

**Original LSA Behavior**

Each OSPF LSA has an age, which indicates whether the LSA is still valid. Once the LSA reaches the maximum age (1 hour), it is discarded. During the aging process, the originating router sends a refresh packet every 30 minutes to refresh the LSA. Refresh packets are sent to keep the LSA from expiring, whether there has been a change in the network topology or not. Checksumming is performed on all LSAs every 10 minutes. The router keeps track of LSAs it generates and LSAs it receives from other routers. The router refreshes LSAs it generated; it ages the LSAs it received from other routers.

Prior to the LSA group pacing feature, the Cisco IOS software would perform refreshing on a single timer, and checksumming and aging on another timer. In the case of refreshing, for example, the software would scan the whole database every 30 minutes, refreshing every LSA the router generated, no matter how old it was. The figure below illustrates all the LSAs being refreshed at once. This process wasted CPU resources because only a small portion of the database needed to be refreshed. A large OSPF database (several thousand LSAs) could have thousands of LSAs with different ages. Refreshing on a single timer resulted in the age of all LSAs becoming synchronized, which resulted in much CPU processing at once. Furthermore, a large number of LSAs could cause a sudden increase of network traffic, consuming a large amount of network resources in a short period of time.

**Figure 2  OSPF LSAs on a Single Timer Without Group Pacing**

![Figure 2](image)

**LSA Group Pacing with Multiple Timers**

Configuring each LSA to have its own timer avoids excessive CPU processing and sudden network-traffic increase. To again use the example of refreshing, each LSA gets refreshed when it is 30 minutes old, independent of other LSAs. So the CPU is used only when necessary. However, LSAs being refreshed at frequent, random intervals would require many packets for the few refreshed LSAs the router must send out, which would be inefficient use of bandwidth.

Therefore, the router delays the LSA refresh function for an interval of time instead of performing it when the individual timers are reached. The accumulated LSAs constitute a group, which is then refreshed and
sent out in one packet or more. Thus, the refresh packets are paced, as are the checksumming and aging. The pacing interval is configurable; it defaults to 4 minutes, which is randomized to further avoid synchronization.

The figure below illustrates the case of refresh packets. The first timeline illustrates individual LSA timers; the second timeline illustrates individual LSA timers with group pacing.

Figure 3  OSPF LSAs on Individual Timers with Group Pacing

Without group pacing, LSAs need to be refreshed frequently and at random intervals. Individual LSA timers require many refresh packets that contain few LSAs.

Individual LSA timers

20 LSAs, 1 packet
30 LSAs, 1 packet
15 LSAs, 1 packet

Individual LSA timers with group pacing

The group pacing interval is inversely proportional to the number of LSAs the router is refreshing, checksumming, and aging. For example, if you have approximately 10,000 LSAs, decreasing the pacing interval would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

The default value of pacing between LSA groups is 240 seconds (4 minutes). The range is from 10 seconds to 1800 seconds (30 minutes).

By default, OSPF floods new LSAs over all interfaces in the same area, except the interface on which the LSA arrives. Some redundancy is desirable, because it ensures robust flooding. However, too much redundancy can waste bandwidth and might destabilize the network due to excessive link and CPU usage in certain topologies. An example would be a fully meshed topology.

You can block OSPF flooding of LSAs two ways, depending on the type of networks:

- On broadcast, nonbroadcast, and point-to-point networks, you can block flooding over specified OSPF interfaces.
- On point-to-multipoint networks, you can block flooding to a specified neighbor.

The growth of the Internet has increased the importance of scalability in IGPs such as OSPF. By design, OSPF requires LSAs to be refreshed as they expire after 3600 seconds. Some implementations have tried to improve the flooding by reducing the frequency to refresh from 30 minutes to about 50 minutes. This solution reduces the amount of refresh traffic but requires at least one refresh before the LSA expires. The OSPF flooding reduction solution works by reducing unnecessary refreshing and flooding of already known and unchanged information. To achieve this reduction, the LSAs are now flooded with the higher bit set. The LSAs are now set as "do not age."

Cisco routers do not support LSA Type 6 Multicast OSPF (MOSPF), and they generate syslog messages if they receive such packets. If the router is receiving many MOSPF packets, you might want to configure the router to ignore the packets and thus prevent a large number of syslog messages.
The former OSPF implementation for sending update packets needed to be more efficient. Some update packets were getting lost in cases where the link was slow, a neighbor could not receive the updates quickly enough, or the router was out of buffer space. For example, packets might be dropped if either of the following topologies existed:

- A fast router was connected to a slower router over a point-to-point link.
- During flooding, several neighbors sent updates to a single router at the same time.

OSPF update packets are now automatically paced so they are not sent less than 33 milliseconds apart. Pacing is also added between resends to increase efficiency and minimize lost retransmissions. Also, you can display the LSAs waiting to be sent out an interface. The benefit of the pacing is that OSPF update and retransmission packets are sent more efficiently. There are no configuration tasks for this feature; it occurs automatically.

You can display specific statistics such as the contents of IP routing tables, caches, and databases. Information provided can be used to determine resource utilization and solve network problems. You can also display information about node reachability and discover the routing path that your device packets are taking through the network.

**How to Configure OSPF**

To configure OSPF, perform the tasks described in the following sections. The tasks in the Enabling OSPF section are required; the tasks in the remaining sections are optional, but might be required for your application. For information about the maximum number of interfaces, see the Restrictions, page 37.

Enabling OSPF

**SUMMARY STEPS**
1. enable
2. configure terminal
3. router ospf process-id
4. network ip-address wildcard-mask area area-id
5. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| **Example:** | |
| Router> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** | |
| Router# configure terminal | |
| **Step 3** router ospf process-id | Enables OSPF routing, which places the router in router configuration mode. |
| **Example:** | |
| Router> router ospf 109 | |
| **Step 4** network ip-address wildcard-mask area area-id | Defines an interface on which OSPF runs and defines the area ID for that interface. |
| **Example:** | |
| Router> network 192.168.129.16 0.0.0.3 area 20 | |
| **Step 5** end | Exits router configuration mode and returns to privileged EXEC mode. |
| **Example:** | |
| Router(config-router)# end | |
Configuring OSPF Interface Parameters

SUMMARY STEPS

1. enable
2. configure terminal
3. interface typenumber
4. ip ospf cost cost
5. ip ospf retransmit-interval seconds
6. ip ospf transmit-delay seconds
7. ip ospf priority number-value
8. ip ospf hello-interval seconds
9. ip ospf dead-interval seconds
10. ip ospf authentication-key key
11. ip ospf message-digest-key key md5 key
12. ip ospf authentication [message-digest | null]
13. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 interface typenumber</td>
<td>Configures an interface type and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; router ospf 109</td>
<td></td>
</tr>
<tr>
<td>Step 4 ip ospf cost cost</td>
<td>Explicitly specifies the cost of sending a packet on an OSPF interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip ospf cost 65</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 5**  
*ip ospf retransmit-interval* seconds | Specifies the number of seconds between link-state advertisement (LSA) retransmissions for adjacencies belonging to an OSPF interface.  
Example:  
Router(config-if)# ip ospf retransmit-interval 1 |
| **Step 6**  
*ip ospf transmit-delay* seconds | Sets the estimated number of seconds required to send a link-state update packet on an OSPF interface.  
Example:  
Router(config-if)# ip ospf transmit delay 1 |
| **Step 7**  
*ip ospf priority* number-value | Sets priority to help determine the OSPF designated router for a network.  
Example:  
Router(config-if)# ip ospf priority 1 |
| **Step 8**  
*ip ospf hello-interval* seconds | Specifies the length of time between the hello packets that the Cisco IOS software sends on an OSPF interface.  
Example:  
Router(config-if)# ip ospf hello-interval 1 |
| **Step 9**  
*ip ospf dead-interval* seconds | Sets the number of seconds that a device must wait before it declares a neighbor OSPF router down because it has not received a hello packet.  
Example:  
Router(config-if)# ip ospf dead-interval 1 |
| **Step 10**  
*ip ospf authentication-key* key | Assigns a password to be used by neighboring OSPF routers on a network segment that is using the OSPF simple password authentication.  
Example:  
Router(config-if)# ip ospf authentication-key 1 |
| **Step 11**  
*ip ospf message-digest-key* key md5 key | Enables OSPF MD5 authentication. The values for the key-id and key-arguments must match values specified for other neighbors on a network segment.  
Example:  
Router(config-if)# ip ospf message-digest-key 1 md5 23456789 |
### Configuring OSPF over Different Physical Networks

- Configuring Point-to-Multipoint Broadcast Networks, page 13
- Configuring OSPF for Nonbroadcast Networks, page 13

#### Configuring Point-to-Multipoint Broadcast Networks

**SUMMARY STEPS**

1. `ip ospf network point-to-multipoint`
2. `exit`
3. `router ospf process-id`
4. `neighbor ip-address cost number`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>ip ospf network point-to-multipoint</code></td>
<td>Configures an interface as point-to-multipoint for broadcast media.</td>
</tr>
<tr>
<td>Step 2 <code>exit</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3 <code>router ospf process-id</code></td>
<td>Configures an OSPF routing process and enters router configuration mode.</td>
</tr>
<tr>
<td>Step 4 <code>neighbor ip-address cost number</code></td>
<td>Specifies a neighbor and assigns a cost to the neighbor.</td>
</tr>
</tbody>
</table>

**Note**
Repeat this step for each neighbor if you want to specify a cost. Otherwise, neighbors will assume the cost of the interface, based on the `ip ospf cost` interface configuration command.

#### Configuring OSPF for Nonbroadcast Networks
SUMMARY STEPS

1. `ip ospf network point-to-multipoint non-broadcast`
2. `exit`
3. `router ospf process-id`
4. `neighbor ip-address [cost number]`

DETAILED STEPS

</tr>
</tbody>
</table>

**Configuring an NSSA ABR as a Forced NSSA LSA Translator**
In Cisco IOS Release 15.1(2)S and later releases, the output of the `show ip ospf` command shows whether the NSSA ABR is configured as a forced translator, and whether the router is running as RFC 3101 or RFC 1587 compatible.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router ospf process-id`
4. `area area-id nssa translate type7 always`
5. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 `enable`   | Enables privileged EXEC mode.  
|  
| Example:          | • Enter your password if prompted. |
|  
| Step 2 `configure terminal` | Enters global configuration mode.  
|  
| Example:          | |
|  
| Step 3 `router ospf process-id` | Enables OSPF routing and enters router configuration mode.  
|  
| Example:          | • The `process-id` argument identifies the OSPF process. |
|  
| Step 4 `area area-id nssa translate type7 always` | Configures an NSSA ABR router as a forced NSSA LSA translator.  
| Note | In Cisco IOS Release 15.1(2)S and later releases, RFC 3101 replaces RFC 1587, and you can use the `always` keyword in the `area nssa translate` command to configure an NSSA ABR router as a forced NSSA LSA translator. This command will work if RFC 3101 is disabled and RFC 1587 is being used.  
| Example: |  
|  
| Step 5 `end` | Exits router configuration mode and returns to privileged EXEC mode.  
|  
| Example: | |
# Disabling RFC 3101 Compatibility and Enabling RFC 1587 Compatibility

## Note
In Cisco IOS Release 15.1(2)S and later releases, the output of the `show ip ospf` command will indicate if the NSSA ABR is configured as RFC 3101 or RFC 1587 compatible.

## SUMMARY STEPS
1. `enable`
2. `configure terminal`
3. `router ospf` `process-id`
4. `compatible rfc1587`
5. `end`

## DETAILED STEPS

**Example:**

Router(config-router)# end

---

### Configuring OSPF NSSA Parameters

**Prerequisites**

Evaluate the following considerations before you implement this feature:

- You can set a Type 7 default route that can be used to reach external destinations. When configured, the router generates a Type 7 default into the NSSA or the NSSA ABR.
- Every router within the same area must agree that the area is NSSA; otherwise, the routers will not be able to communicate.

**Configuring OSPF NSSA Area Parameters**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router ospf process-id
4. area area-id nssa [no-redistribution] [default-information-originate]
5. summary-address prefix mask [not-advertise] [tag tag] nssa-only
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

SUMMARY STEPS

1.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>router ospf process-id</td>
<td>Enables OSPF operation.</td>
</tr>
<tr>
<td>interface type number</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>ip ospf demand-circuit</td>
<td>Configures OSPF over an on-demand circuit.</td>
</tr>
</tbody>
</table>

Note

You can prevent an interface from accepting demand-circuit requests from other routers to by specifying the ignore keyword in the ip ospf demand-circuit command.

• Prerequisites, page 28

Prerequisites

Evaluate the following considerations before implementing the On-Demand Circuits feature:
• Because LSAs that include topology changes are flooded over an on-demand circuit, we recommend that you put demand circuits within OSPF stub areas or within NSSAs to isolate the demand circuits from as many topology changes as possible.

• Every router within a stub area or NSSA must have this feature loaded in order to take advantage of the on-demand circuit functionality. If this feature is deployed within a regular area, all other regular areas must also support this feature before the demand circuit functionality can take effect because Type 5 external LSAs are flooded throughout all areas.

• Hub-and-spoke network topologies that have a point-to-multipoint (P2MP) OSPF interface type on a hub might not revert to nondemand circuit mode when needed. You must simultaneously reconfigure OSPF on all interfaces on the P2MP segment when reverting them from demand circuit mode to nondemand circuit mode.

• Do not implement this feature on a broadcast-based network topology because the overhead protocols (such as hello and LSA packets) cannot be successfully suppressed, which means the link will remain up.

• Configuring the router for an OSPF on-demand circuit with an asynchronous interface is not a supported configuration. The supported configuration is to use dialer interfaces on both ends of the circuit. For more information, refer to Why OSPF Demand Circuit Keeps Bringing Up the Link.

---

### Logging Neighbors Going Up or Down

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>log-adjacency-changes</td>
<td>Sends syslog message when an OSPF neighbor goes up or down.</td>
</tr>
<tr>
<td>(detail)</td>
<td></td>
</tr>
</tbody>
</table>

**Note**  Configure this command if you want to know about OSPF neighbors going up or down without turning on the `debug ip ospf adjacency` EXEC command. The `log-adjacency-changes` router configuration command provides a higher-level view of the peer relationship with less output. Configure the `log-adjacency-changes detail` command if you want to see messages for each state change.

<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; show ip ospf 1</td>
<td></td>
</tr>
</tbody>
</table>

Restrictions

On systems with a large number of interfaces, it may be possible to configure OSPF such that the number of links advertised in the router LSA causes the link state update packet to exceed the size of a "huge" Cisco IOS buffer. To resolve this problem, reduce the number of OSPF links or increase the huge buffer size by entering the buffers huge size size command.

A link state update packet containing a router LSA typically has a fixed overhead of 196 bytes, and an additional 12 bytes are required for each link description. With a huge buffer size of 18024 bytes there can be a maximum of 1485 link descriptions.

Because the maximum size of an IP packet is 65,535 bytes, there is still an upper bound on the number of links possible on a router.

**Example: OSPF Point-to-Multipoint**

In the figure below, the router named Router 1 uses data-link connection identifier (DLCI) 201 to communicate with the router named Router 2, DLCI 202 to the router named Router 4, and DLCI 203 to the router named Router 3. Router 2 uses DLCI 101 to communicate with Router 1 and DLCI 102 to communicate with Router 3. Router 3 communicates with Router 2 (DLCI 401) and Router 1 (DLCI 402). Router 4 communicates with Router 1 (DLCI 301). Configuration examples follow the figure.

![OSPF Point-to-Multipoint Example](image)

**Router 1 Configuration**

```plaintext
hostname Router 1
!
interface serial 1
  ip address 10.0.0.2 255.0.0.0
  ip ospf network point-to-multipoint
  encapsulation frame-relay
  frame-relay map ip 10.0.0.1 201 broadcast
  frame-relay map ip 10.0.0.3 202 broadcast
  frame-relay map ip 10.0.0.4 203 broadcast
!
router ospf 1
  network 10.0.0.0 0.0.0.255 area 0
```

**Router 2 Configuration**

```plaintext
hostname Router 2
!
interface serial 0
  ip address 10.0.0.1 255.0.0.0
  ip ospf network point-to-multipoint
  encapsulation frame-relay
  frame-relay map ip 10.0.0.2 101 broadcast
  frame-relay map ip 10.0.0.3 202 broadcast
  frame-relay map ip 10.0.0.4 203 broadcast
!
router ospf 1
  network 10.0.0.0 0.0.0.255 area 0
```

**Router 3 Configuration**

```plaintext
hostname Router 3
!
interface serial 3
  ip address 10.0.0.4 255.0.0.0
  ip ospf network point-to-multipoint
  encapsulation frame-relay
  clock rate 1000000
```
frame-relay map ip 10.0.0.1 401 broadcast
frame-relay map ip 10.0.0.2 402 broadcast
!
router ospf 1
network 10.0.0.0 0.0.0.255 area 0

Router 4 Configuration

hostname Router 4
!
interface serial 2
  ip address 10.0.0.3 255.0.0.0
  ip ospf network point-to-multipoint
  encapsulation frame-relay
clock rate 2000000
  frame-relay map ip 10.0.0.2 301 broadcast
!
router ospf 1
network 10.0.0.0 0.0.0.255 area 0

Example: OSPF Point-to-Multipoint with Broadcast

The following example illustrates a point-to-multipoint network with broadcast:

interface Serial0
  ip address 10.0.1.1 255.255.255.0
  encapsulation frame-relay
  ip ospf cost 100
  ip ospf network point-to-multipoint
  frame-relay map ip 10.0.1.3 202 broadcast
  frame-relay map ip 10.0.1.4 203 broadcast
  frame-relay map ip 10.0.1.5 204 broadcast
  frame-relay local-dlci 200
!
router ospf 1
network 10.0.1.0 0.0.0.255 area 0
neighbor 10.0.1.5 cost 5
neighbor 10.0.1.4 cost 10

The following example shows the configuration of the neighbor at 10.0.1.3:

interface serial 0
  ip address 10.0.1.3 255.255.255.0
  ip ospf network point-to-multipoint
  encapsulation frame-relay
  frame-relay local-dlci 301
  frame-relay map ip 10.0.1.1 300 broadcast
  no shutdown
!
router ospf 1
network 10.0.1.0 0.0.0.255 area 0

The output shown for neighbors in the first configuration is as follows:

Router# show ip ospf neighbor

<table>
<thead>
<tr>
<th>Neighbor ID</th>
<th>Pri</th>
<th>State</th>
<th>Dead Time</th>
<th>Address</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.16.1.1</td>
<td>1</td>
<td>FULL/</td>
<td>00:01:50</td>
<td>10.0.1.5</td>
<td>Serial0</td>
</tr>
<tr>
<td>172.16.1.4</td>
<td>1</td>
<td>FULL/</td>
<td>00:01:47</td>
<td>10.0.1.4</td>
<td>Serial0</td>
</tr>
<tr>
<td>172.16.1.8</td>
<td>1</td>
<td>FULL/</td>
<td>00:01:45</td>
<td>10.0.1.3</td>
<td>Serial0</td>
</tr>
</tbody>
</table>

The route information in the first configuration is as follows:

Router# show ip route

Codes:  C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
        D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
        E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
        i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, * - candidate default
Example: OSPF Point-to-Multipoint with Nonbroadcast

The following example illustrates a point-to-multipoint network with nonbroadcast:

interface Serial0
  ip address 10.0.1.1 255.255.255.0
  ip ospf network point-to-multipoint non-broadcast
  encapsulation frame-relay
  no keepalive
  frame-relay local-dlci 200
  frame-relay map ip 10.0.1.3 202
  frame-relay map ip 10.0.1.4 203
  frame-relay map ip 10.0.1.5 204
  no shutdown

  !
  router ospf 1
  network 10.0.1.0 0.0.0.255 area 0
  neighbor 10.0.1.3 cost 5
  neighbor 10.0.1.4 cost 10
  neighbor 10.0.1.5 cost 15

The following example is the configuration for the router on the other side:

interface Serial9/2
  ip address 10.0.1.3 255.255.255.0
  encapsulation frame-relay
  ip ospf network point-to-multipoint non-broadcast
  no ip mroute-cache
  no keepalive
  no fair-queue
  frame-relay local-dlci 301
  frame-relay map ip 10.0.1.1 300
  no shutdown

  !
  router ospf 1
  network 10.0.1.0 0.0.0.255 area 0

The output shown for neighbors in the first configuration is as follows:

Router# show ip ospf neighbor
Neighbor ID Pri State    Dead Time Address Interface
172.16.1.1 1    FULL/ - 00:01:52 10.0.1.5 Serial0
172.16.1.4 1    FULL/ - 00:01:52 10.0.1.4 Serial0
172.16.1.8 1    FULL/ - 00:01:52 10.0.1.3 Serial0

Example: Variable-Length Subnet Masks

OSPF, static routes, and IS-IS support variable-length subnet masks (VLSMs). With VLSMs, you can use different masks for the same network number on different interfaces, which allows you to conserve IP addresses and more efficiently use available address space.

In the following example, a 30-bit subnet mask is used, leaving two bits of address space reserved for serial line host addresses. There is sufficient host address space for two host endpoints on a point-to-point serial link.

interface ethernet 0
Example: OSPF NSSA

In the following example, an OSPF stub network is configured to include OSPF Area 0 and OSPF Area 1, using five routers. OSPF Area 1 is defined as an NSSA, with Router 3 configured to be the NSSA ASBR and Router 2 configured to be the NSSA ABR. Following is the configuration output for the five routers.

Router 1

hostname Router1
!
interface Loopback1

  ip ospf 1 area 0
! router ospf 1
! end

The figure below shows the OSPF stub network with NSSA Area 1. The redistributed routes that Router 4 is propagating from the two RIP networks will be translated into Type 7 LSAs by NSSA ASBR Router 3. Router 2, which is configured to be the NSSA ABR, will translate the Type 7 LSAs back to Type 5 so that they can be flooded through the rest of the OSPF stub network within OSPF Area 0.

Figure 5 OSPF NSSA Network with NSSA ABR and ASBR Routers

When the `show ip ospf` command is entered on Router 2, the output confirms that OSPF Area 1 is an NSSA area:

```
Router2# show ip ospf
Routing Process "ospf 1" with ID 10.1.0.2
Start time: 00:00:01.392, Time elapsed: 12:03:09.480
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports area transit capability
Router is not originating router-LSAs with maximum metric
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPF's 10000 msecs
Maximum wait time between two consecutive SPF's 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 0 normal 0 stub 1 nssa
Number of areas transit capable is 0
```
External flood list length 0
Area 1
Number of interfaces in this area is 2
! It is a NSSA area
Area has no authentication
SPF algorithm last executed 11:37:58.836 ago
SPF algorithm executed 3 times
Area ranges are
Number of LSA 7. Checksum Sum 0x045598

Entering the show ip ospf database data command displays additional information about redistribution between Type 5 and Type 7 LSAs for routes that have been injected into the NSSA area and then flooded through the OSPF network.

Router2# show ip ospf database data
OSPF Router with ID (10.1.0.2) (Process ID 1)
Area 1 database summary
LSA Type Count Delete Maxage
Router 3 0 0 0
Network 0 0 0 0
Summary Net 2 0 0 0
Summary ASBR 0 0 0 0
Type-7 Ext 2 0 0 0
Prefixes redistributed in Type-7 0
Opaque Link 0 0 0 0
Opaque Area 0 0 0 0
Subtotal 7 0 0 0
Process 1 database summary
LSA Type Count Delete Maxage
Router 3 0 0 0
Network 0 0 0 0
Summary Net 2 0 0 0
Summary ASBR 0 0 0 0
Type-7 Ext 2 0 0 0
Opaque Link 0 0 0 0
Opaque Area 0 0 0 0
Type-5 Ext 0 0 0 0
Prefixes redistributed in Type-5 0
Opaque AS 0 0 0 0
Total 7 0 0 0

Entering the show ip ospf database nssa command also displays detailed information for Type 7 to Type 5 translations:

Router2# show ip ospf database nssa
OSPF Router with ID (10.1.0.2) (Process ID 1)
Type-7 AS External Link States (Area 1)
Routing Bit Set on this LSA
LS age: 1903
Options: (No TOS-capability, Type 7/5 translation, DC)
LS Type: AS External Link
Link State ID: 192.168.3.0 (External Network Number)
Advertising Router: 10.1.0.3
LS Seq Number: 80000015
Checksum: 0x484F
Length: 36
Network Mask: /24
Metric Type: 2 (Larger than any link state path)
TOS: 0
Metric: 20
Forward Address: 192.168.14.3
External Route Tag: 0
Routing Bit Set on this LSA
LS age: 1903
! Options: (No TOS-capability, Type 7/5 translation, DC)
LS Type: AS External Link
Link State ID: 192.168.41.0 (External Network Number)
Advertising Router: 10.1.0.3
LS Seq Number: 80000015
Checksum: 0xA4CC
Length: 36
Network Mask: /24
Metric Type: 2 (Larger than any link state path)
TOS: 0
Metric: 20
Forward Address: 192.168.14.3
External Route Tag: 0

Router 3

Entering the `show ip ospf` command on Router 3 displays the information to confirm that Router 3 is acting as an ASBR and that OSPF Area 1 has been configured to be an NSSA area:

```
Router3# show ip ospf
Routing Process "ospf 1" with ID 10.1.0.3
Start time: 00:00:01.392, Time elapsed: 12:02:34.572
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
! It is an autonomous system boundary router
Redistributing External Routes from, rip, includes subnets in redistribution
Router is not originating router-LSAs with maximum metric
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPF's 10000 msecs
Maximum wait time between two consecutive SPF's 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 0 normal 0 stub 1 nssa
Number of areas transit capable is 0
External flood list length 0
Area 1

SPF algorithm last executed 11:38:13.368 ago
SPF algorithm executed 3 times
Area ranges are
Number of LSA 7. Checksum Sum 0x050CF7
Number of opaque link LSA 0. Checksum Sum 0x000000
Number of DCbitless LSA 0
Number of indication LSA 0
```
Example: OSPF NSSA Area with RFC 3101 Disabled and RFC 1587 Active

In the following example, the output for the `show ip ospf` and `show ip ospf database nssa` commands is for an OSPF NSSA area where RFC 3101 is disabled, RFC 1587 is active, and an NSSA ABR router is configured as a forced NSSA LSA translator. As described in the "Configuring OSPF NSSA", if RFC 3101 is disabled, the forced NSSA LSA translator remains inactive. The command output demonstrates this.

The "Supports NSSA (compatible with RFC 1587)" line in the output indicates that RFC 1587 is active or that the OSPF NSSA area is RFC 1587 compatible.

The "Configured to translate Type-7 LSAs, inactive (RFC3101 support disabled)" line indicates that the OSPF NSSA area has an ABR router configured to act as a forced translator of Type 7 LSAs, but it is inactive because RFC 3101 is disabled.
Advertising Router: 10.0.2.1
LS Seq Number: 80000004
Checksum: 0x5CA2
Length: 36
Area Border Router
AS Boundary Router
Unconditional NSSA translator
Number of Links: 1
Link connected to: a Stub Network
(Link ID) Network/subnet number: 192.0.2.5
(Link Data) Network Mask: 255.255.255.0
Number of MTID metrics: 0
TOS 0 Metrics: 10

The "Unconditional NSSA translator" line indicates that the status of the NSSA ASBR router is as a forced
NSSA LSA translator.

Example: OSPF Routing and Route Redistribution

OSPF typically requires coordination among many internal routers, ABRs, and ASBRs. At a minimum,
OSPF-based routers can be configured with all default parameter values, with no authentication, and with
interfaces assigned to areas.

Three types of examples follow:

• The first is a simple configuration illustrating basic OSPF commands.
• The second example illustrates a configuration for an internal router, ABR, and ASBRs within a
  single, arbitrarily assigned, OSPF autonomous system.
• The third example illustrates a more complex configuration and the application of various tools
  available for controlling OSPF-based routing environments.

• Example: Basic OSPF Configuration, page 47
• Example: Basic OSPF Configuration for Internal Router ABR and ASBRs, page 47
• Example: Complex Internal Router with ABR and ASBR, page 48
• Example: Complex OSPF Configuration for ABR, page 51

Example: Basic OSPF Configuration

The following example illustrates a simple OSPF configuration that enables OSPF routing process 9000,
attaches Ethernet interface 0 to area 0.0.0.0, and redistributes RIP into OSPF, and OSPF into RIP:

interface ethernet 0
  ip address 10.93.1.1 255.255.255.0
  ip ospf cost 1
!
interface ethernet 1
  ip address 10.94.1.1 255.255.255.0
!
routing ospf 9000
  network 10.93.0.0 0.0.255.255 area 0.0.0.0
  redistribute rip metric 1 subnets
!
routing rip
  network 10.94.0.0
  redistribute ospf 9000
default-metric 1

Example: Basic OSPF Configuration for Internal Router ABR and ASBRs
The following example illustrates the assignment of four area IDs to four IP address ranges. In the example, OSPF routing process 109 is initialized, and four OSPF areas are defined: 10.9.50.0, 2, 3, and 0. Areas 10.9.50.0, 2, and 3 mask specific address ranges, and area 0 enables OSPF for all other networks.

```
router ospf 109
  network 192.168.10.0 0.0.0.255 area 10.9.50.0
  network 192.168.20.0 0.0.255.255 area 2
  network 192.168.30.0 0.0.0.255 area 3
  network 192.168.40.0 255.255.255.255 area 0
  ! Interface Ethernet0 is in area 10.9.50.0:
  interface ethernet 0
    ip address 192.168.10.5 255.255.255.0
  ! Interface Ethernet1 is in area 2:
  interface ethernet 1
    ip address 192.168.20.5 255.255.255.0
  ! Interface Ethernet2 is in area 2:
  interface ethernet 2
    ip address 192.168.20.7 255.255.255.0
  ! Interface Ethernet3 is in area 3:
  interface ethernet 3
    ip address 192.169.30.5 255.255.255.0
  ! Interface Ethernet4 is in area 0:
  interface ethernet 4
    ip address 192.168.40.1 255.255.255.0
  ! Interface Ethernet5 is in area 0:
  interface ethernet 5
    ip address 192.168.40.12 255.255.0.0
```

Each network area router configuration command is evaluated sequentially, so the order of these commands in the configuration is important. The Cisco IOS software sequentially evaluates the address/wildcard-mask pair for each interface. See the network area command in the Cisco IOS IP Routing: OSPF Command Reference for more information.

Consider the first network area command. Area ID 10.9.50.0 is configured for the interface on which subnet 192.168.10.0 is located. Assume that a match is determined for Ethernet interface 0. Ethernet interface 0 is attached to area 10.9.50.0 only.

The second network area command is evaluated next. For area 2, the same process is then applied to all interfaces (except Ethernet interface 0). Assume that a match is determined for interface Ethernet 1. OSPF is then enabled for that interface and Ethernet interface 1 is attached to area 2.

This process of attaching interfaces to OSPF areas continues for all network area commands. Note that the last network area command in this example is a special case. With this command, all available interfaces (not explicitly attached to another area) are attached to area 0.

Example: Complex Internal Router with ABR and ASBR
The following example outlines a configuration for several routers within a single OSPF autonomous system. The figure below provides a general network map that illustrates this example configuration.

**Figure 6 Sample OSPF Autonomous System Network Map**

In this configuration, five routers are configured with OSPF:

- Router A and Router B are both internal routers within area 1.
- Router C is an OSPF ABR. Note that for Router C, Area 1 is assigned to E3 and area 0 is assigned to S0.
- Router D is an internal router in area 0 (backbone area). In this case, both `network` router configuration commands specify the same area (area 0, or the backbone area).
- Router E is an OSPF ASBR. Note that BGP routes are redistributed into OSPF and that these routes are advertised by OSPF.
You do not need to include definitions of all areas in an OSPF autonomous system in the configuration of all routers in the autonomous system. Only the directly connected areas must be defined. In the example that follows, routes in area 0 are learned by the routers in area 1 (Router A and Router B) when the ABR (Router C) injects summary LSAs into area 1.

The OSPF domain in BGP autonomous system 109 is connected to the outside world via the BGP link to the external peer at IP address 10.0.0.6. Example configurations follow.

Following is the sample configuration for the general network map shown in the figure above.

**Router A Configuration--Internal Router**

```
interface ethernet 1
 ip address 192.168.1.1 255.255.255.0
 router ospf 1
  network 192.168.0.0 0.0.255.255 area 1
```

**Router B Configuration--Internal Router**

```
interface ethernet 2
 ip address 192.168.1.2 255.255.255.0
 router ospf 202
  network 192.168.0.0 0.0.255.255 area 1
```

**Router C Configuration--ABR**

```
interface ethernet 3
 ip address 192.168.1.3 255.255.255.0
 interface serial 0
  ip address 192.168.2.3 255.255.255.0
 router ospf 999
  network 192.168.1.0 0.0.0.255 area 1
  network 192.168.2.0 0.0.0.255 area 0
```

**Router D Configuration--Internal Router**

```
interface ethernet 4
 ip address 10.0.0.4 255.0.0.0
 interface serial 1
  ip address 192.168.2.4 255.255.255.0
 router ospf 50
  network 192.168.2.0 0.0.0.255 area 0
  network 10.0.0.0 0.255.255.255 area 0
```

**Router E Configuration--ASBR**

```
interface ethernet 5
 ip address 10.0.0.5 255.0.0.0
 interface serial 2
  ip address 172.16.1.5 255.255.255.0
 router ospf 65001
  network 10.0.0.0 0.255.255.255 area 0
 redistribute bgp 109 metric 1 metric-type 1
 router bgp 109
  network 192.168.0.0
  network 10.0.0.0
  neighbor 172.16.1.6 remote-as 110
```
Example: Complex OSPF Configuration for ABR

The following example configuration accomplishes several tasks in setting up an ABR. These tasks can be split into two general categories:

- Basic OSPF configuration
- Route redistribution

The specific tasks outlined in this configuration are detailed briefly in the following descriptions. The figure below illustrates the network address ranges and area assignments for the interfaces.

The basic configuration tasks in this example are as follows:

- Configure address ranges for Ethernet interface 0 through Ethernet interface 3.
- Enable OSPF on each interface.
- Set up an OSPF authentication password for each area and network.
- Assign link-state metrics and other OSPF interface configuration options.
- Create a stub area with area ID 36.0.0.0. (Note that the authentication and stub options of the area router configuration command are specified with separate area command entries, but can be merged into a single area command.)
- Specify the backbone area (area 0).

Configuration tasks associated with redistribution are as follows:

- Redistribute IGRP and RIP into OSPF with various options set (including including metric-type, metric, tag, and subnet).
- Redistribute IGRP and OSPF into RIP.

The following is an example OSPF configuration:

```
interface ethernet 0
ip address 192.42.110.201 255.255.255.0
ip ospf authentication-key abcdefgh
ip ospf cost 10
```
interface ethernet 1
  ip address 172.19.251.202 255.255.255.0
  ip ospf authentication-key ijklmnop
  ip ospf cost 20
  ip ospf retransmit-interval 10
  ip ospf transmit-delay 2
  ip ospf priority 4

interface ethernet 2
  ip address 172.19.254.2 255.255.255.0
  ip ospf authentication-key abcdefgh
  ip ospf cost 10

interface ethernet 3
  ip address 10.56.0.0 255.255.0.0
  ip ospf authentication-key ijklmnop
  ip ospf cost 20
  ip ospf dead-interval 80

In the following configuration OSPF is on network 172.16.0.0:

router ospf 201
  network 10.10.0.0 0.255.255.255 area 10.10.0.0
  network 192.42.110.0 0.0.0.255 area 192.42.110.0
  network 172.16.0.0 0.0.255.255 area 0
  area 0 authentication
  area 10.10.0.0 stub
  area 10.10.0.0 authentication
  area 10.10.0.0 default-cost 20
  area 192.42.110.0 authentication
  area 10.10.0.0 range 10.10.0.0 255.0.0.0
  area 192.42.110.0 range 192.42.110.0 255.255.255.0
  area 0 range 172.16.251.0 255.255.255.0
  area 0 range 172.16.254.0 255.255.255.0
  redistribute igrp 200 metric-type 2 metric 1 tag 200 subnets
  redistribute rip metric-type 2 metric 1 tag 200

In the following configuration, IGRP autonomous system 200 is on 192.0.2.1:

router igrp 200
  network 172.31.0.0

! RIP for 192.168.110
!
router rip
  network 192.168.110.0
  redistribute igrp 200 metric 1
  redistribute ospf 201 metric 1

Examples: Route Map

The examples in this section illustrate the use of redistribution, with and without route maps. Examples from both the IP and Connectionless Network Service (CLNS) routing protocols are given.

The following example redistributes all OSPF routes into IGRP:

router igrp 109
  redistribute ospf 110

The following example redistributes RIP routes with a hop count equal to 1 into OSPF. These routes will be redistributed into OSPF as external LSAs with a metric of 5, a metric type of Type 1, and a tag equal to 1.

router ospf 109
  redistribute rip route-map rip-to-ospf

! route-map rip-to-ospf permit
  match metric 1
  set metric 5
set metric-type type1
set tag 1

The following example redistributes OSPF learned routes with tag 7 as a RIP metric of 15:

```
router rip
  redistribute ospf 109 route-map 5
  
  route-map 5 permit
  match tag 7
  set metric 15
```

The following example redistributes OSPF intra-area and interarea routes with next hop routers on serial interface 0 into BGP with an INTER_AS metric of 5:

```
router bgp 109
  redistribute ospf 109 route-map 10
  
  route-map 10 permit
  match route-type internal
  match interface serial 0
  set metric 5
```

The following example redistributes two types of routes into the integrated IS-IS routing table (supporting both IP and CLNS). The first type is OSPF external IP routes with tag 5; these routes are inserted into Level 2 IS-IS link state packets (LSPs) with a metric of 5. The second type is ISO-IGRP derived CLNS prefix routes that match CLNS access list 2000; these routes will be redistributed into IS-IS as Level 2 LSPs with a metric of 30.

```
router isis
  redistribute ospf 109 route-map 2
  redistribute iso-igrp nsfnet route-map 3
  
  route-map 2 permit
  match route-type external
  match tag 5
  set metric 5
  set level level-2
  
  route-map 3 permit
  match address 2000
  set metric 30
```

With the following configuration, OSPF external routes with tags 1, 2, 3, and 5 are redistributed into RIP with metrics of 1, 1, 5, and 5, respectively. The OSPF routes with a tag of 4 are not redistributed.

```
router rip
  redistribute ospf 109 route-map 1
  
  route-map 1 permit
  match tag 1 2
  set metric 1
  
  route-map 1 permit
  match tag 3
  set metric 5
  
  route-map 1 deny
  match tag 4
  
  route map 1 permit
  match tag 5
  set metric 5
```

In the following configuration, a RIP learned route for network 160.89.0.0 and an ISO-IGRP learned route with prefix 49.0001.0002 will be redistributed into an IS-IS Level 2 LSP with a metric of 5:

```
router isis
```
redistribute rip route-map 1
redistribute iso-igrp remote route-map 1
route-map 1 permit
match ip address 1
match clns address 2
set metric 5
set level level-2
access-list 1 permit 192.168.0.0 0.0.255.255
clns filter-set 2 permit 49.0001.0002...

The following configuration example illustrates how a route map is referenced by the default-information router configuration command. This type of reference is called conditional default origination. OSPF will originate the default route (network 0.0.0.0) with a Type 2 metric of 5 if 140.222.0.0 is in the routing table.

Note
Only routes external to the OSPF process can be used for tracking, such as non-OSPF routes or OSPF routes from a separate OSPF process.

route-map ospf-default permit
match ip address 1
set metric 5
set metric-type type-2
access-list 1 permit 172.16.0.0 0.0.255.255
router ospf 109
default-information originate route-map ospf-default

Example: Changing OSPF Administrative Distance
The following configuration changes the external distance to 200, making it less trustworthy. The figure below illustrates the example.

Figure 8 OSPF Administrative Distance

Example: Complex OSPF Configuration for ABR
Example: OSPF over On-Demand Routing

The following configuration allows OSPF over an on-demand circuit, as shown in the figure below. Note that the on-demand circuit is defined on one side only (BRI 0 on Router A); it is not required to be configured on both sides.

Router A Configuration

```
router ospf 1
    redistribute ospf 2 subnet
distance ospf external 200
! router ospf 2
    redistribute ospf 1 subnet
distance ospf external 200
```

Router B Configuration

```
router ospf 1
    redistribute ospf 2 subnet
distance ospf external 200
! router ospf 2
    redistribute ospf 1 subnet
distance ospf external 200
```

Example: OSPF over On-Demand Routing

Router A Configuration

```
username RouterB password 7 060C1A2F47
isdn switch-type basic-5ess
ip routing
!
interface TokenRing0
    ip address 192.168.50.5 255.255.255.0
    no shutdown
!
interface BRI0
    no cdp enable
description connected PBX 1485
    ip address 192.168.45.30 255.255.255.0
dialer-list 1 protocol ip permit
    encapsulation ppp
dialer map ip 140.10.10.6 name RouterB broadcast 61484
dialer-group 1
    ppp authentication chap
    no shutdown
!
router ospf 100
    network 192.168.45.0 0.0.0.255 area 0
    network 192.168.45.50 0.0.0.255 area 0
!```
Router B Configuration

username RouterA password 7 04511E0804

  network 192.168.45.0 0.0.0.255 area 0
  network 192.168.45.50 0.0.0.255 area 0
  dialer-list 1 protocol ip permit

Example: LSA Group Pacing

The following example changes the OSPF pacing between LSA groups to 60 seconds:

```plaintext
router ospf
timers pacing lsa-group 60
```

Example: Block LSA Flooding

The following example prevents flooding of OSPF LSAs to broadcast, nonbroadcast, or point-to-point networks reachable through Ethernet interface 0:

```plaintext
interface ethernet 0
ip ospf database-filter all out
```

The following example prevents flooding of OSPF LSAs to point-to-multipoint networks to the neighbor at IP address 10.10.10.45:

```plaintext
router ospf 109
neighbor 10.10.10.45 database-filter all out
```

Example: Ignore MOSPF LSA Packets

The following example configures the router to suppress the sending of syslog messages when it receives MOSPF packets:

```plaintext
router ospf 109
ignore lsa mospf
```

Feature Information for Configuring OSPF

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

## Feature Name | Releases | Feature Information
--- | --- | ---
OSPF Not-So-Stubby Areas | 11.2.1 | OSPF Nssa is a nonproprietary extension of the existing OSPF stub area feature. This feature is documented in the following sections:

OSPF Packet Pacing | 12.0(1)T | OSPF update packets are automatically paced so they are not sent less than 33 milliseconds apart. This feature is documented in the following section:

OSPF Support for NSSA RFC 3101 | 15.1(2)S, 15.0(1)SY, 15.2(2)T | This feature adds support for the OSPF Nssa specification described by RFC 3101. RFC3101 replaced RFC 1587 and is backward compatible with RFC1587. The following commands were introduced or modified: `area nssa translate, compatible rfc1587`.

OSPF - Demand Circuit Disable | 15.0(1)SY | The `ignore` keyword was added to the `ip ospf demand-circuit` command, allowing you to prevent an interface from accepting demand-circuit requests from other routers.

OSPF ABR Type 3 LSA Filtering

The OSPF ABR Type 3 LSA Filtering feature extends the ability of an ABR that is running the OSPF protocol to filter type 3 link-state advertisements (LSAs) that are sent between different OSPF areas. This feature allows only packets with specified prefixes to be sent from one area to another area and restricts all packets with other prefixes. This type of area filtering can be applied out of a specific OSPF area, into a specific OSPF area, or into and out of the same OSPF areas at the same time.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information
about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Benefits

The OSPF ABR Type 3 LSA Filtering feature gives the administrator improved control of route distribution between OSPF areas.

Restrictions

Only type 3 LSAs that originate from an ABR are filtered.

- Related Features and Technologies, page 62

Related Features and Technologies

This feature is an extension of the OSPF routing protocol. For more information about configuring OSPF and configuring route summarization and filtering, refer to the "OSPF" module of the Cisco IOS IP Configuration Guide, Release 12.4 and the Cisco IOS IP Routing Protocols Command Reference, Release 12.4T.

Configuration Tasks

See the following sections for configuration tasks for the OSPF ABR Type 3 LSA Filtering feature. Each task in the list is identified as either required or optional:

- Configuring OSPF ABR Type 3 LSA Filtering, page 62
- Configuring OSPF ABR Type 3 LSA Filtering, page 63
- Verifying OSPF ABR Type 3 LSA Filtering, page 63
- Monitoring and Maintaining OSPF ABR Type 3 LSA Filtering, page 64

Configuring OSPF ABR Type 3 LSA Filtering

SUMMARY STEPS

1. Router(config)# router ospf process-id
2. Router(config-router)# area area-id filter-list prefix prefix-list-name in
3. Router(config-router)# exit
4. Router(config)# ip prefix-list list-name [seq seq-value] deny | permit network/len [ge ge-value] [le le-value]
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Router(config)# router ospf process-id</td>
<td>Configures the router to run an OSPF process.</td>
</tr>
<tr>
<td>Step 2 Router(config-router)# area area-id filter-list prefix prefix-list-name in</td>
<td>Configures the router to filter interarea routes into the specified area.</td>
</tr>
<tr>
<td>Step 3 Router(config-router)# exit</td>
<td>Exits router configuration mode and returns to global configuration mode.</td>
</tr>
<tr>
<td>Step 4 Router(config)# ip prefix-list list-name [seq seq-value] deny</td>
<td>Creates a prefix list with the name specified for the list-name argument.</td>
</tr>
</tbody>
</table>

Verifying OSPF ABR Type 3 LSA Filtering

To verify that the OSPF ABR Type 3 LSA Filtering feature has been configured, use the show ip ospf command in the EXEC mode. The show ip ospf command will show that this feature has been enabled by listing the area filter as "in" or "out." The following is sample output from the show ip ospf command:

```
routerr# show ip ospf 1
Routing Process "ospf 1" with ID 172.16.0.1
Supports only single TOS(TOS0) routes
```
Supports opaque LSA
It is an area border router
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 2. 2 normal 0 stub 0 nssa
External flood list length 0
Area BACKBONE(0)
  Number of interfaces in this area is 2
  Area has no authentication
  SPF algorithm executed 6 times
  Area ranges are
    10.0.0.0/8 Passive Advertise
  Area-filter AREA_0_IN in
  Area-filter AREA_0_OUT out
  Number of LSA 5. Checksum Sum 0x29450
  Number of opaque link LSA 0. Checksum Sum 0x0
  Number of DCbitless LSA 0
  Number of indication LSA 0
  Number of DoNotAge LSA 0
  Flood list length 0
Area 1
  Number of interfaces in this area is 1
  Area has no authentication
  SPF algorithm executed 4 times
  Area ranges are
  Area-filter AREA_1_IN in
  Area-filter AREA_1_OUT out
  Number of LSA 6. Checksum Sum 0x30100
  Number of opaque link LSA 0. Checksum Sum 0x0
  Number of DCbitless LSA 0
  Number of indication LSA 0
  Number of DoNotAge LSA 0
  Flood list length 0

**Configuration Examples**

The following configuration example output shows interarea filtering that is applied to both incoming and outgoing routes:

```
Router(config)# router ospf 1
log-adjacency-changes
area 1 filter-list prefix AREA_1_OUT out
area 3 filter-list prefix AREA_3_IN in
network 10.0.0.0 0.255.255.255 area 3
network 172.16.1.0 0.0.0.255 area 0
network 192.168.0.0 0.255.255.255 area 1
ip prefix-list AREA_1_OUT seq 10 permit 10.25.0.0/8 ge 16
ip prefix-list AREA_1_OUT seq 20 permit 172.20.0.0/24
ip prefix-list AREA_3_IN seq 10 permit 172.31.0.0/16
```

**OSPF Stub Router Advertisement Functionality**

The OSPF Stub Router Advertisement feature allows you to bring a new router into a network without immediately routing traffic through the new router and allows you to gracefully shut down or reload a router without dropping packets that are destined for other networks. This feature introduces three
configuration options that allow you to configure a router that is running the Open Shortest Path First (OSPF) protocol to advertise a maximum or infinite metric to all neighbors.

When any of these three configuration options are enabled on a router, the router will originate link-state advertisements (LSAs) with a maximum metric (LSInfinity: 0xFFFF) through all nonstub links. The advertisement of a maximum metric causes other routers to assign a cost to the new router that is higher than the cost of using an alternate path. Because of the high cost assigned to paths that pass through the new router, other routers will not use a path through the new router as a transit path to forward traffic that is destined for other networks, which allows switching and routing functions to be up and running and routing tables to converge before transit traffic is routed through this router.

Note
Directly connected links in a stub network are not affected by the configuration of a maximum or infinite metric because the cost of a stub link is always set to the output interface cost.

Allowing Routing Tables to Converge

Two configuration options introduced by the OSPF Stub Router Advertisement feature allow you to bring a new router into a network without immediately routing traffic through the new router. These configuration options are useful because Interior Gateway Protocols (IGPs) converge very quickly upon a router during startup or after a reload, often before Border Gateway Protocol (BGP) routing tables have completely converged. If neighbor routers forward traffic through a router while that router is building BGP routing tables, packets that have been received for other destinations may be dropped. Advertising a maximum metric during startup will allow routing tables to converge before traffic that is destined for other networks is sent through the router. The following two configuration options enable a router to advertise a maximum metric at startup:

- You can configure a timer to advertise a maximum metric when the router is started or reloaded. When this option is configured, the router will advertise a maximum metric, which forces neighbor routers to select alternate paths until the timer expires. When the timer expires, the router will advertise accurate (normal) metrics, and other routers will send traffic to this router depending on the cost. The configurable range of the timer is from 5 to 86,400 seconds.
- You can configure a router to advertise a maximum metric at startup until BGP routing tables converge or until the default timer expires (600 seconds). Once BGP routing tables converge or the default timer expires, the router will advertise accurate (normal) metrics and other routers will send traffic to this router, depending on the cost.

Configuring a Graceful Shutdown

The third configuration option introduced by the OSPF Stub Router Advertisement feature allows you to gracefully remove a router from the network by advertising a maximum metric through all links, which allows other routers to select alternate paths for transit traffic to follow before the router is shut down. There are many situations where you may need to remove a router from the network. If a router is removed from a network and neighbor routers cannot detect that the physical interface is down, neighbors will need to wait for dead timers to expire before the neighbors will remove the adjacency and routing tables will reconverge. This situation may occur when there is a switch between other routers and the router that is shut down. Packets may be dropped while the neighbor routing tables reconverge.

When this third option is configured, the router advertises a maximum metric, which allows neighbor routers to select alternate paths before the router is shut down. This configuration option could also be used to remove a router that is in a critical condition from the network without affecting traffic that is destined for other networks.
Note
You should not save the running configuration of a router when it is configured for a graceful shutdown because the router will continue to advertise a maximum metric after it is reloaded.

Benefits of OSPF Stub Router Advertisement

Improved Stability and Availability
Advertising a maximum metric through all links at startup or during a reload will prevent neighbor routers from using a path through the router as a transit path, thereby reducing the number of packets that are dropped and improving the stability and availability of the network.

Graceful Removal from the Network
Advertising a maximum metric before shutdown allows other routers to select alternate paths before the transit path through a router becomes inaccessible.

Related Features and Technologies
The OSPF Stub Router Advertisement feature is an extension of the OSPF routing protocol. For more information about configuring OSPF and BGP, refer to the Cisco IOS IP Routing Configuration Guide and the Cisco IOS IP Routing Command Reference.

Supported Platforms
The OSPF Stub Router Advertisement feature is supported by the following platforms in Cisco IOS Release 12.2(14)S that support OSPF:

- Cisco 7200 series
- Cisco 7400 series
- Cisco 7500 series

Determining Platform Support Through Cisco Feature Navigator
Cisco IOS software is packaged in feature sets that support specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:
http://www.cisco.com/go/fn
Availability of Cisco IOS Software Images

Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

How to Configure OSPF Stub Router Advertisement

See the following sections for configuration tasks to configure OSPF to advertise a maximum metric. This feature has three different configuration options. All tasks are optional and should be individually configured.

- Configuring Advertisement on Startup, page 70
- Configuring Advertisement Until Routing Tables Converge, page 70
- Configuring Advertisement for a Graceful Shutdown, page 71
- Verifying the Advertisement of a Maximum Metric, page 71
- Monitoring and Maintaining OSPF Stub Router Advertisement, page 73

Configuring Advertisement on Startup

SUMMARY STEPS

1. Router(config)# router ospf process-id
2. Router(config-router)# max-metric router-lsa on-startup announce-time

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Router(config)# router ospf</td>
<td>Places the router in router configuration mode and enables an OSPF routing process.</td>
</tr>
<tr>
<td>process-id</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> Router(config-router)# max-metric</td>
<td>Configures OSPF to advertise a maximum metric during startup for a configured period of time. The announce-time argument is a configurable timer that must follow the on-startup keyword to be configured. There is no default timer value. The configurable time range is from 5 to 86,400 seconds.</td>
</tr>
<tr>
<td>router-lsa on-startup announce-time</td>
<td></td>
</tr>
</tbody>
</table>

Configuring Advertisement Until Routing Tables Converge

SUMMARY STEPS

1. Router(config)# router ospf process-id
2. Router(config-router)# max-metric router-lsa on-startup wait-for-bgp
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: Router(config)# router ospf process-id</td>
<td>Places the router in router configuration mode and enables an OSPF routing process.</td>
</tr>
<tr>
<td>Step 2: Router(config-router)# max-metric router-lsa on-startup wait-for-bgp</td>
<td>Configures OSPF to advertise a maximum metric until BGP routing tables have converged or until the default timer has expired. The <code>wait-for-bgp</code> keyword must follow the <code>on-startup</code> keyword to be configured. The default timer value is 600 seconds.</td>
</tr>
</tbody>
</table>

### Configuring Advertisement for a Graceful Shutdown

**SUMMARY STEPS**

1. Router(config)# router ospf process-id
2. Router(config-router)# max-metric router-lsa
3. Router(config-router)# exit
4. Router(config)# exit
5. Router# show ip ospf

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: Router(config)# router ospf process-id</td>
<td>Places the router in router configuration mode and enables an OSPF routing process.</td>
</tr>
<tr>
<td>Step 2: Router(config-router)# max-metric router-lsa</td>
<td>Configures OSPF to advertise a maximum metric until the router is shut down.</td>
</tr>
<tr>
<td>Step 3: Router(config-router)# exit</td>
<td>Exits router configuration mode.</td>
</tr>
<tr>
<td>Step 4: Router(config)# exit</td>
<td>Exits configuration mode and places the router in privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5: Router# show ip ospf</td>
<td>Displays general information about OSPF routing processes. The <code>show ip ospf</code> command is entered in order to verify that the <code>max-metric router-lsa</code> command has been enabled before the router is shut down or reloaded.</td>
</tr>
</tbody>
</table>

**Note**

You should not save the running configuration of a router when it is configured for a graceful shutdown because the router will continue to advertise a maximum metric after it is reloaded.

### Verifying the Advertisement of a Maximum Metric

To verify that the advertisement of a maximum metric has been configured correctly, use the `show ip ospf` command for `show ip ospf database` command.
The output of the `show ip ospf` command will display the condition, state, and remaining time delay of the advertisement of a maximum metric, depending on which options were configured with the `max-metric router-lsa` command.

The following sample output is similar to the output that will be displayed when the `on-startup` keyword and `announce-time` argument are configured with the `max-metric router-lsa` command:

```
Router# show ip ospf
Routing Process "ospf 1998" with ID 10.18.134.155
   Supports only single TOS(TOS0) routes
   Supports opaque LSA
   It is an area border and autonomous system boundary router
   Redistributing External Routes from,
      static, includes subnets in redistribution
   Originating router-LSAs with maximum metric, Time remaining: 00:01:18
      Condition: on startup for 300 seconds, State: active
      SPF schedule delay 5 secs, Hold time between two SPF's 10 secs
      Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
   Number of external LSA 7. Checksum Sum 0x47261
   Number of opaque AS LSA 0. Checksum Sum 0x0
   Number of DoNotAge external and opaque AS LSA 0
   Number of areas in this router is 2. 1 normal 0 stub 1 nssa
   External flood list length 0
      Area BACKBONE(0)
         Number of interfaces in this area is 1
         Area has no authentication
         SPF algorithm executed 3 times
         Area ranges are
         Number of LSA 8. Checksum Sum 0x474AE
         Number of opaque link LSA 0. Checksum Sum 0x0
```

The following sample output is similar to the output that will be displayed when the `on-startup` and `wait-for-bgp` keywords are configured with the `max-metric router-lsa` command:

```
Router# show ip ospf
Routing Process "ospf 1998" with ID 10.18.134.155
   Supports only single TOS(TOS0) routes
   Supports opaque LSA
   It is an area border and autonomous system boundary router
   Redistributing External Routes from,
      static, includes subnets in redistribution
   Originating router-LSAs with maximum metric, Time remaining: 00:01:18
      Condition: on startup while BGP is converging, State: active
      SPF schedule delay 5 secs, Hold time between two SPF's 10 secs
      Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
   Number of external LSA 7. Checksum Sum 0x47261
   Number of opaque AS LSA 0. Checksum Sum 0x0
   Number of DChitless external and opaque AS LSA 0
   Number of DoNotAge external and opaque AS LSA 0
   Number of areas in this router is 2. 1 normal 0 stub 1 nssa
   External flood list length 0
      Area BACKBONE(0)
         Number of interfaces in this area is 1
         Area has no authentication
         SPF algorithm executed 3 times
         Area ranges are
         Number of LSA 8. Checksum Sum 0x474AE
         Number of opaque link LSA 0. Checksum Sum 0x0
```

The following sample output is similar to the output that will be displayed when the `max-metric router-lsa` command is configured without any keywords or arguments:

```
Router# show ip ospf
Routing Process "ospf 1998" with ID 10.18.134.155
   Supports only single TOS(TOS0) routes
   Supports opaque LSA
   It is an area border and autonomous system boundary router
   Redistributing External Routes from,
      static, includes subnets in redistribution
   Originating router-LSAs with maximum metric, Time remaining: 00:01:18
   Condition: on startup for 300 seconds, State: active
   SPF schedule delay 5 secs, Hold time between two SPF's 10 secs
   Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
   Number of external LSA 7. Checksum Sum 0x47261
   Number of opaque AS LSA 0. Checksum Sum 0x0
   Number of DChitless external and opaque AS LSA 0
   Number of DoNotAge external and opaque AS LSA 0
   Number of areas in this router is 2. 1 normal 0 stub 1 nssa
   External flood list length 0
      Area BACKBONE(0)
         Number of interfaces in this area is 1
         Area has no authentication
         SPF algorithm executed 3 times
         Area ranges are
         Number of LSA 8. Checksum Sum 0x474AE
         Number of opaque link LSA 0. Checksum Sum 0x0
```
Monitoring and Maintaining OSPF Stub Router Advertisement

The output of the `show ip ospf database` command will display information about OSPF LSAs and indicate if the router is announcing maximum cost links. The following sample output is similar to the output that will be displayed when any form of the `max-metric router-lsa` command is configured:

```
Router# show ip ospf database
Exception Flag: Announcing maximum link costs
LS age: 68
Options: (No TOS-capability, DC)
LS Type: Router Links
Link State ID: 172.18.134.155
Advertising Router: 172.18.134.155
LS Seq Number: 80000002
Checksum: 0x175D
Length: 60
Area Border Router
AS Boundary Router
Number of Links: 3

  Link connected to: a Transit Network
    (Link ID) Designated Router address: 192.168.1.11
    (Link Data) Router Interface address: 192.168.1.14
    Number of TOS metrics: 0
      TOS 0 Metrics: 65535 (metric used for local calculation: 10)

  Link connected to: a Transit Network
    (Link ID) Designated Router address: 10.1.145.11
    (Link Data) Router Interface address: 10.1.145.14
    Number of TOS metrics: 0
      TOS 0 Metrics: 65535 (metric used for local calculation: 10)

  Link connected to: a Stub Network

### Configuration Examples of OSPF Stub Router Advertisement

- [Example Advertisement on Startup](#), page 74
- [Example Advertisement Until Routing Tables Converge](#), page 74
- [Example Graceful Shutdown](#), page 74

#### Example Advertisement on Startup

In the following example, a router that is running OSPF is configured to advertise a maximum metric at startup for 300 seconds:

```
Router(config)# router ospf 100
Router(config-router)# max-metric router-lsa on-startup 300
```

#### Example Advertisement Until Routing Tables Converge

In the following example, a router that is running OSPF is configured to advertise a maximum metric until BGP routing tables converge or until the default timer expires (600 seconds):

```
Router(config)# router ospf 100
Router(config-router)# max-metric router-lsa on-startup wait-for-bgp
```

#### Example Graceful Shutdown

In the following example, a router that is running OSPF is configured to advertise a maximum metric until the router is shut down:

```
Router(config)# router ospf 100
Router(config-router)# max-metric router-lsa
Router(config-router)# exit
Router(config)# exit
Router# `show ip ospf`
```

### Feature Information for OSPF Stub Router Advertisement

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

**Table 2 Feature Information for OSPF Stub Router Advertisement**

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| OSPF Stub Router Advertisement | 12.1(8)E 12.0(15)S 12.0(15)SC 12.0(16)ST 12.2(4)T 12.2(4)T3 12.2(14)S Cisco IOS XE 3.1.0 SG | The OSPF Stub Router Advertisement feature allows you to bring a new router into a network without immediately routing traffic through the new router and allows you to gracefully shut down or reload a router without dropping packets that are destined for other networks. The following commands are introduced or modified in the feature documented in this module:
  * max-metric router-lsa
  * show ip ospf |

OSPF Update Packet-Pacing Configurable Timers

This module describes the OSPF Update Packet-Pacing Configurable Timers feature, which allows you to configure the rate at which OSPF LSA flood pacing, retransmission pacing, and group pacing updates occur.

- Finding Feature Information, page 77
- Restrictions on OSPF Update Packet-Pacing Configurable Timers, page 77
- Information About OSPF Update Packet-Pacing Configurable Timers, page 78
- Supported Platforms, page 78
- How to Configure OSPF Packet-Pacing Timers, page 79
- Configuration Examples of OSPF Update Packet-Pacing, page 82
- Additional References, page 82
- Feature Information for OSPF Update Packet-Pacing Configurable Timers, page 84

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions on OSPF Update Packet-Pacing Configurable Timers

Do not change the packet pacing timers unless all other options to meet OSPF packet flooding requirements have been exhausted. Specifically, network operators should prefer summarization, stub area usage, queue tuning, and buffer tuning before changing the default timers. Furthermore, there are no guidelines for changing timer values; each OSPF deployment is unique and should be considered on a case-by-case basis. The network operator assumes risks associated with changing the default timer values.
Information About OSPF Update Packet-Pacing Configurable Timers

- Functionality of the OSPF Update Packet-Pacing Timers, page 78
- Benefits of OSPF Update Packet-Pacing Configurable Timers, page 78
- Related Features and Technologies, page 78

Functionality of the OSPF Update Packet-Pacing Timers

In rare situations, you might need to change Open Shortest Path First (OSPF) packet-pacing default timers to mitigate CPU or buffer utilization issues associated with flooding very large numbers of link-state advertisements (LSAs). The OSPF Update Packet-Pacing Configurable Timers feature allows you to configure the rate at which OSPF LSA flood pacing, retransmission pacing, and group pacing updates occur.

Configuring OSPF flood pacing timers allows you to control interpacket spacing between consecutive link-state update packets in the OSPF transmission queue. Configuring OSPF retransmission pacing timers allows you to control interpacket spacing between consecutive link-state update packets in the OSPF retransmission queue. Cisco IOS software groups the periodic refresh of LSAs to improve the LSA packing density for the refreshes in large topologies. The group timer controls the interval used for group LSA refreshment; however, this timer does not change the frequency that individual LSAs are refreshed (the default refresh occurs every 30 minutes).

Note

The default settings for OSPF packet pacing timers are suitable for the majority of OSPF deployments. You should change the default timers only as a last resort.

Benefits of OSPF Update Packet-Pacing Configurable Timers

The OSPF Update Packet-Pacing Configurable Timers feature provides the administrator with a mechanism to control the rate at which LSA updates occur in order to reduce high CPU or buffer utilization that can occur when an area is flooded with a very large number of LSAs.

Related Features and Technologies

The OSPF Update Packet-Pacing Configurable Timers feature is an extension of the OSPF routing protocol. For more information about configuring OSPF, packet pacing, area border router (ABR) and autonomous system boundary router (ASBR) summarization, and stub router configuration, refer to the "Configuring OSPF" module of the Cisco IOS IP Routing Configuration Guide and the Cisco IOS IP Routing: OSPF Command Reference.

Supported Platforms

The OSPF Update Packet-Pacing Configurable Timers feature is supported by the following platforms in Cisco IOS Release 12.2(14)S that support OSPF:

- Cisco 7200 series
Cisco 7400 series
Cisco 7500 series

Determining Platform Support Through Cisco Feature Navigator
Cisco IOS software is packaged in feature sets that support specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

http://www.cisco.com/go/fn

Availability of Cisco IOS Software Images
Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

How to Configure OSPF Packet-Pacing Timers

See the following sections for configuration tasks for the OSPF Update Packet-Pacing Configurable Timers feature. Each task in the list is identified as either required or optional:

- Configuring OSPF Packet-Pacing Timers, page 79
- Configuring a Group Packet Pacing Timer, page 80
- Verifying OSPF Packet-Pacing Timers, page 81
- Monitoring and Maintaining OSPF Packet-Pacing Timers, page 81

Configuring OSPF Packet-Pacing Timers

SUMMARY STEPS

1. Router(config)# router ospf process-id
2. Router(config-router)# timers pacing flood milliseconds

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config)# router ospf process-id</td>
</tr>
</tbody>
</table>
Configuring a Group Packet Pacing Timer

To configure a retransmission packet pacing timer, use the following commands beginning in router configuration mode:

**SUMMARY STEPS**

1. Router(config)# router ospf process-id
2. Router(config-router)# timers pacing lsa-group seconds

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Router(config)# router ospf process-id</td>
<td>Places the router in router configuration mode and enables an OSPF routing process.</td>
</tr>
<tr>
<td>Step 2 Router(config-router)# timers pacing lsa-group seconds</td>
<td>Configures an LSA group packet pacing timer delay (in seconds).</td>
</tr>
</tbody>
</table>

**Configuring a Group Packet Pacing Timer**

To configure a flood packet pacing timer delay (in milliseconds), use the following command:

```
Router(config-router)# timers pacing flood milliseconds
```

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2 Router(config-router)# timers pacing flood milliseconds</td>
<td>Configures a flood packet pacing timer delay (in milliseconds).</td>
</tr>
</tbody>
</table>
Verifying OSPF Packet-Pacing Timers

To verify that OSPF packet pacing has been configured, use the `show ip ospf` privileged EXEC command. The output of the `show ip ospf` command will display the type and delay time of the configurable pacing timers (flood, retransmission, group). The following example output is from the `show ip ospf` command:

```
Router# show ip ospf
Routing Process "ospf 1" with ID 10.0.0.1 and Domain ID 10.20.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPF's 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
LSA group pacing timer 100 secs
Interface flood pacing timer 55 msecs
Retransmission pacing timer 100 msecs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 2. 2 normal 0 stub 0 nssa
External flood list length 0
Area BACKBONE(0)
  Number of interfaces in this area is 2
  Area has message digest authentication
  SPF algorithm executed 4 times
  Area ranges are
  Number of LSA 4. Checksum Sum 0x29BE
  Number of opaque link LSA 0. Checksum Sum 0x0
  Number of DCbitless LSA 3
  Number of indication LSA 0
  Number of DoNotAge LSA 0
  Flood list length 0
Area 172.16.26.0
  Number of interfaces in this area is 0
  Area has no authentication
  SPF algorithm executed 1 times
  Area ranges are
    192.168.0.0/16 Passive Advertise
  Number of LSA 1. Checksum Sum 0x44FD
  Number of opaque link LSA 0. Checksum Sum 0x0
  Number of DCbitless LSA 1
  Number of indication LSA 1
  Number of DoNotAge LSA 0
  Flood list length 0
```

**Troubleshooting Tips, page 81**

Troubleshooting Tips

If the number of OSPF packet retransmissions rapidly increases, increase the value of the packet pacing timers. The number of OSPF packet retransmissions is displayed in the output of the `show ip ospf neighbor` command.

Monitoring and Maintaining OSPF Packet-Pacing Timers

### Configuration Examples of OSPF Update Packet-Pacing

- **Example Flood Pacing**, page 82
- **Example Retransmission Pacing**, page 82
- **Example Group Pacing**, page 82

#### Example Flood Pacing

The following example configures LSA flood pacing updates to occur in 50-millisecond intervals for OSPF routing process 1:

```plaintext
Router(config)# router ospf 1
Router(config-router)# timers pacing flood 50
```

#### Example Retransmission Pacing

The following example configures retransmission pacing updates to occur in 100-millisecond intervals for OSPF routing process 1:

```plaintext
Router(config)# router ospf 1
Router(config-router)# timers pacing retransmission 100
```

#### Example Group Pacing

The following example configures OSPF group pacing updates between LSA groups to occur in 75-second intervals for OSPF routing process 1:

```plaintext
Router(config)# router ospf 1
Router(config-router)# timers pacing lsa-group 75
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Feature Overview

- Using OSPF in PE-CE Router Connections, page 86
- Using a Sham-Link to Correct OSPF Backdoor Routing, page 86
- Sham-Link Configuration Example, page 89
- Benefits, page 91
- Restrictions, page 91
Using OSPF in PE-CE Router Connections

In an MPLS VPN configuration, the OSPF protocol is one way you can connect customer edge (CE) routers to service provider edge (PE) routers in the VPN backbone. OSPF is often used by customers that run OSPF as their intrasite routing protocol, subscribe to a VPN service, and want to exchange routing information between their sites using OSPF (during migration or on a permanent basis) over an MPLS VPN backbone.

The figure below shows an example of how VPN client sites that run OSPF can connect over an MPLS VPN backbone.

When OSPF is used to connect PE and CE routers, all routing information learned from a VPN site is placed in the VPN routing and forwarding (VRF) instance associated with the incoming interface. The PE routers that attach to the VPN use the Border Gateway Protocol (BGP) to distribute VPN routes to each other. A CE router can then learn the routes to other sites in the VPN by peering with its attached PE router. The MPLS VPN superbackbone provides an additional level of routing hierarchy to interconnect the VPN sites running OSPF.

When OSPF routes are propagated over the MPLS VPN backbone, additional information about the prefix in the form of BGP extended communities (route type, domain ID extended communities) is appended to the BGP update. This community information is used by the receiving PE router to decide the type of link-state advertisement (LSA) to be generated when the BGP route is redistributed to the OSPF PE-CE process. In this way, internal OSPF routes that belong to the same VPN and are advertised over the VPN backbone are seen as interarea routes on the remote sites.

For basic information about how to configure an MPLS VPN, refer to the "MPLS Virtual Private Networks Configuration" module.

Using a Sham-Link to Correct OSPF Backdoor Routing

Although OSPF PE-CE connections assume that the only path between two client sites is across the MPLS VPN backbone, backdoor paths between VPN sites (shown in grey in the figure below) may exist. If these
sites belong to the same OSPF area, the path over a backdoor link will always be selected because OSPF prefers intraarea paths to interarea paths. (PE routers advertise OSPF routes learned over the VPN backbone as interarea paths.) For this reason, OSPF backdoor links between VPN sites must be taken into account so that routing is performed based on policy.

For example, the figure above shows three client sites, each with backdoor links. Because each site runs OSPF within the same Area 1 configuration, all routing between the three sites follows the intraarea path across the backdoor links, rather than over the MPLS VPN backbone.

The following example shows BGP routing table entries for the prefix 10.3.1.7/32 in the PE-1 router in the figure above. This prefix is the loopback interface of the Winchester CE router. As shown in bold in this example, the loopback interface is learned via BGP from PE-2 and PE-3. It is also generated through redistribution into BGP on PE-1.

PE-1# show ip bgp vpnv4 all 10.3.1.7
BGP routing table entry for 100:251:10.3.1.7.32, version 58
Paths: (3 available, best #2)
  Advertised to non peer-group peers:
    10.3.1.2 10.3.1.5
Local
  10.3.1.5 (metric 30) from 10.3.1.5 (10.3.1.5)
    Origin incomplete, metric 22, localpref 100, valid, internal
    Extended Community: RT:1:793 OSPF DOMAIN ID:0.0.0.100 OSPF RT:1:2:0 OSPF 2
Local
  10.2.1.38 from 0.0.0.0 (10.3.1.6)
    Origin incomplete, metric 86, localpref 100, weight 32768, valid, sourced, best
    Extended Community: RT:1:793 OSPF DOMAIN ID:0.0.0.100 OSPF RT:1:2:0 OSPF 2
Local
  10.3.1.2 (metric 30) from 10.3.1.2 (10.3.1.2)
    Origin incomplete, metric 11, localpref 100, valid, internal
    Extended Community: RT:1:793 OSPF DOMAIN ID:0.0.0.100 OSPF RT:1:2:0 OSPF 2
Within BGP, the locally generated route (10.2.1.38) is considered to be the best route. However, as shown in bold in the next example, the VRF routing table shows that the selected path is learned via OSPF with a next hop of 10.2.1.38, which is the Vienna CE router.

```bash
PE-1# show ip route vrf ospf 10.3.1.7
Routing entry for 10.3.1.7/32
  Known via "ospf 100", distance 110, metric 86, type intra area
  Redistributing via bgp 215
  Advertised by bgp 215
  Last update from 10.2.1.38 on Serial0/0/0, 00:00:17 ago
  Routing Descriptor Blocks:
    * 10.2.1.38
      , from 10.3.1.7, 00:00:17 ago, via Serial0/0/0
      Route metric is 86, traffic share count is 1
```

This path is selected because:

- The OSPF intra-area path is preferred over the interarea path (over the MPLS VPN backbone) generated by the PE-1 router.
- OSPF has a lower administrative distance (AD) than internal BGP (BGP running between routers in the same autonomous system).

If the backdoor links between sites are used only for backup purposes and do not participate in the VPN service, then the default route selection shown in the preceding example is not acceptable. To reestablish the desired path selection over the MPLS VPN backbone, you must create an additional OSPF intra-area (logical) link between ingress and egress VRFs on the relevant PE routers. This link is called a sham-link.

A sham-link is required between any two VPN sites that belong to the same OSPF area and share an OSPF backdoor link. If no backdoor link exists between the sites, no sham-link is required.

The figure below shows a sample sham-link between PE-1 and PE-2. A cost is configured with each sham-link and is used to decide whether traffic will be sent over the backdoor path or the sham-link path. When a sham-link is configured between PE routers, the PEs can populate the VRF routing table with the OSPF routes learned over the sham-link.
Because the sham-link is seen as an intra-area link between PE routers, an OSPF adjacency is created and database exchange (for the particular OSPF process) occurs across the link. The PE router can then flood LSAs between sites from across the MPLS VPN backbone. As a result, the desired intra-area connectivity is created.

The section, “Creating a Sham-Link, page 93”, describes how to configure a sham-link between two PE routers. For more information about how to configure OSPF, refer to the “Configuring OSPF” module.

### Sham-Link Configuration Example

The example in this section is designed to show how a sham-link is used only to affect the OSPF intra-area path selection of the PE and CE routers. The PE router also uses the information received from MP-BGP to set the outgoing label stack of incoming packets, and to decide to which egress PE router to label switch the packets.

The figure below shows a sample MPLS VPN topology in which a sham-link configuration is necessary. A VPN client has three sites, each with a backdoor link. Two sham-links have been configured, one between PE-1 and PE-2, and another between PE-2 and PE-3. A sham-link between PE-1 and PE-3 is not necessary in this configuration because the Vienna and Winchester sites do not share a backdoor link.

The following example shows the forwarding that occurs between sites from the standpoint of how PE-1 views the 10.3.1.7/32 prefix, the loopback1 interface of the Winchester CE router in the figure above.

```
PE-1# show ip bgp vpnv4 all 10.3.1.7
BGP routing table entry for 100:251:10.3.1.7/32, version 124
Paths: (1 available, best #1)
  Local 10.3.1.2 (metric 30) from 10.3.1.2
  10.3.1.2 (metric 11, localpref 100, valid, internal, best)
  Origin incomplete, metric 11, localpref 100, valid, internal, best
  Extended Community: RT:1:793 OSPF DOMAIN ID:0.0.0.100 OSPF
  RT:1:2:0 OSPF 2
```
The next example shows forwarding information in which the next hop for the route, 10.3.1.2, is the PE-3 router rather than the PE-2 router (which is the best path according to OSPF). The reason the OSPF route is not redistributed to BGP on the PE is because the other end of the sham-link already redistributed the route to BGP and there is no need for duplication. The OSPF sham-link is used only to influence intra-area path selection. When sending traffic to a particular destination, the PE router uses the MP-BGP forwarding information.

If a prefix is learned across the sham-link and the path via the sham-link is selected as the best, the PE router does not generate an MP-BGP update for the prefix. It is not possible to route traffic from one sham-link over another sham-link.

In the following example, PE-2 shows how an MP-BGP update for the prefix is not generated. Although 10.3.1.7/32 has been learned via OSPF across the sham-link as shown in bold, no local generation of a route into BGP is performed. The only entry within the BGP table is the MP-BGP update received from PE-3 (the egress PE router for the 10.3.1.7/32 prefix).
The PE router uses the information received from MP-BGP to set the ongoing label stack of incoming packets, and to decide to which egress PE router to label switch the packets.

Benefits

Client Site Connection Across the MPLS VPN Backbone
A sham-link overcomes the OSPF default behavior for selecting an intra-area backdoor route between VPN sites instead of an interarea (PE-to-PE) route. A sham-link ensures that OSPF client sites that share a backdoor link can communicate over the MPLS VPN backbone and participate in VPN services.

Flexible Routing in an MPLS VPN Configuration
In an MPLS VPN configuration, the OSPF cost configured with a sham-link allows you to decide if OSPF client site traffic will be routed over a backdoor link or through the VPN backbone.

Restrictions
When OSPF is used as a protocol between PE and CE routers, the OSPF metric is preserved when routes are advertised over the VPN backbone. The metric is used on the remote PE routers to select the correct route. For this reason, you should not modify the metric value when OSPF is redistributed to BGP, and when BGP is redistributed to OSPF. If you modify the metric value, routing loops may occur.

Determining Platform Support Through Cisco Feature Navigator

Cisco IOS software is packaged in feature sets that support specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to quickly determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

http://www.cisco.com/go/fn

Supported Standards MIBs and RFCs

**Standards**

No new or modified standards are supported by this feature.

**MIBs**

No new or modified MIBs are supported by this feature.
To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at the following URL:

RFCs
No new or modified RFCs are supported by this feature.

Prerequisites
Before you can configure a sham-link in an MPLS VPN, you must first enable OSPF as follows:

• Create an OSPF routing process.
• Specify the range of IP addresses to be associated with the routing process.
• Assign area IDs to be associated with the range of IP addresses.

For more information on these OSPF configuration procedures, go to:

Configuration Tasks
See the following sections for configuration tasks for the sham-link feature. Each task in the list is identified as either required or optional.

• Creating a Sham-Link, page 93 (required)
• Verifying Sham-Link Creation, page 95 (optional)

Creating a Sham-Link
Before you create a sham-link between PE routers in an MPLS VPN, you must:

• Configure a separate /32 address on the remote PE so that OSPF packets can be sent over the VPN backbone to the remote end of the sham-link. The /32 address must meet the following criteria:
  ◦ Belong to a VRF.
  ◦ Not be advertised by OSPF.
  ◦ Be advertised by BGP.

You can use the /32 address for other sham-links.

• Associate the sham-link with an existing OSPF area.
### SUMMARY STEPS

1. Router1# configure terminal
2. Router1(config)# interface loopback interface-number
3. Router1(config-if)# ip vrf forwarding vrf-name
4. Router1(config-if)# ip address ip-address mask
5. Router1(config)# end
6. Router2# configure terminal
7. Router2(config)# interface loopback interface-number
8. Router2(config-if)# ip vrf forwarding vrf-name
9. Router2(config-if)# ip address ip-address mask
10. Router1(config)# end
11. Router1(config)# router ospf process-id vrf vrf-name
12. Router1(config-if)# area area-id sham-link source-address destination-address cost number
13. Router2(config)# router ospf process-id vrf vrf-name
14. Router2(config-if)# area area-id sham-link source-address destination-address cost number

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Router1# configure terminal</td>
<td>Enters global configuration mode on the first PE router.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Router1(config)# interface loopback interface-number</td>
<td>Creates a loopback interface to be used as an endpoint of the sham-link on PE-1 and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Router1(config-if)# ip vrf forwarding vrf-name</td>
<td>Associates the loopback interface with a VRF. Removes the IP address.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Router1(config-if)# ip address ip-address mask</td>
<td>Reconfigures the IP address of the loopback interface on PE-1.</td>
</tr>
<tr>
<td><strong>Step 5</strong> Router1(config)# end</td>
<td>Returns to EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> Router2# configure terminal</td>
<td>Enters global configuration mode on the second PE router.</td>
</tr>
<tr>
<td><strong>Step 7</strong> Router2(config)# interface loopback interface-number</td>
<td>Creates a loopback interface to be used as the endpoint of the sham-link on PE-2 and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> Router2(config-if)# ip vrf forwarding vrf-name</td>
<td>Associates the second loopback interface with a VRF. Removes the IP address.</td>
</tr>
<tr>
<td><strong>Step 9</strong> Router2(config-if)# ip address ip-address mask</td>
<td>Reconfigures the IP address of the loopback interface on PE-2.</td>
</tr>
<tr>
<td><strong>Step 10</strong> Router1(config)# end</td>
<td>Returns to EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 11</strong> Router1(config)# router ospf process-id vrf vrf-name</td>
<td>Configures the specified OSPF process with the VRF associated with the sham-link interface on PE-1 and enters interface configuration mode.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 12</strong> Router1(config-if)# area area-id sham-link source-address destination-address cost number</td>
<td>Configures the sham-link on the PE-1 interface within a specified OSPF area and with the loopback interfaces specified by the IP addresses as endpoints. <em>cost number</em> configures the OSPF cost for sending an IP packet on the PE-1 sham-link interface.</td>
</tr>
<tr>
<td><strong>Step 13</strong> Router2(config)# router ospf process-id vrf vrf-name</td>
<td>Configures the specified OSPF process with the VRF associated with the sham-link interface on PE-2 and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 14</strong> Router2(config-if)# area area-id sham-link source-address destination-address cost number</td>
<td>Configures the sham-link on the PE-2 interface within a specified OSPF area and with the loopback interfaces specified by the IP addresses as endpoints. <em>cost number</em> configures the OSPF cost for sending an IP packet on the PE-2 sham-link interface.</td>
</tr>
</tbody>
</table>

### Verifying Sham-Link Creation

To verify that the sham-link was successfully created and is operational, use the `show ip ospf sham-links` command in EXEC mode:

```
Router1# show ip ospf sham-links
Sham Link OSPF_SL0 to address 10.2.1.2 is up
Area 1 source address 10.2.1.1
Run as demand circuit
DoNotAge LSA allowed. Cost of using 40 State POINT_TO_POINT,
Timer intervals configured, Hello 10, Dead 40, Wait 40,
Hello due in 00:00:04
Adjacency State FULL (Hello suppressed)
Index 2/2, retransmission queue length 4, number of retransmission 0
First 0x63311F3C(205)/0x63311FE4(59) Next 0x63311F3C(205)/0x63311FE4(59)
Last retransmission scan length is 0, maximum is 0
Last retransmission scan time is 0 msec, maximum is 0 msec
Link State retransmission due in 360 msec
```

### Monitoring and Maintaining a Sham-Link

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router# show ip ospf sham-links</td>
<td>Displays the operational status of all sham-links configured for a router.</td>
</tr>
<tr>
<td>Router# show ip ospf data router ip-address</td>
<td>Displays information about how the sham-link is advertised as an unnumbered point-to-point connection between two PE routers.</td>
</tr>
</tbody>
</table>

### Configuration Examples

The following example shows how to configure a sham-link between two PE routers:

```
Router1(config)
```
# interface loopback 1
Router1(config-if)# ip vrf forwarding ospf
Router1(config-if)# ip address 10.2.1.1 255.255.255.255

Router2(config)# interface loopback 1
Router2(config-if)# ip vrf forwarding ospf
Router2(config-if)# ip address 10.2.1.2 255.255.255.255

Router1(config)# router ospf 100 vrf ospf
Router1(config-if)# area 1 sham-link 10.2.1.1 10.2.1.2 cost 40

Router2(config)# router ospf 100 vrf ospf
Router2(config-if)# area 1 sham-link 10.2.1.2 10.2.1.1 cost 40

Glossary

BGP --Border Gateway Protocol. Interdomain routing protocol that exchanges reachability information with other BGP systems. It is defined in RFC 1163.

CE router --customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router. CE routers are not aware of associated VPNs.

CEF -- Cisco Express Forwarding. An advanced Layer 3 IP switching technology. CEF optimizes network performance and scalability for networks with large and dynamic traffic patterns.

OSPF --Open Shortest Path First protocol.

IGP --Interior Gateway Protocol. An Internet protocol used to exchange routing information within an autonomous system. Examples of common IGPs include IGRP, OSPF, and RIP.

LSA --link-state advertisement. A broadcast packet used by link-state protocols. The LSA contains information about neighbors and path costs and is used by the receiving router to maintain a routing table.

MPLS --Multiprotocol Label Switching. Emerging industry standard upon which tag switching is based.

PE router --provider edge router. A router that is part of a service provider network connected to a customer edge (CE) router. All VPN processing occurs in the PE router.

SPF --shortest path first calculation.

VPN --Virtual Private Network. A secure IP-based network that shares resources on one or more physical networks. A VPN contains geographically dispersed sites that can communicate securely over a shared backbone.

VRF --VPN routing and forwarding instance. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a PE router.

OSPF Retransmissions Limit

Feature History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(11)T</td>
<td>This feature was introduced.</td>
</tr>
</tbody>
</table>

This feature module describes the change in how the Open Shortest Path First (OSPF) protocol handles retransmissions.

- Finding Feature Information, page 99
- Feature Overview, page 99
- Supported Platforms, page 100
- Configuration Tasks, page 101

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Feature Overview

Cisco IOS Release 12.2(4)T added a limit to the number of retransmissions of database exchange and update packets for both demand and non-demand circuits. The retransmission of these packets stops once this retry limit is reached, thus preventing unnecessary use of the link in continual retransmission of the packets if, for some reason, a neighbor is not responding during adjacency forming.

The limit for both demand circuit and non-demand circuit retransmissions is 24.

The limit-retransmissions command allows you to either remove (disable) the limit or change the maximum number of retransmissions to be a number from 1 to 255.

- Benefits, page 100
- Restrictions, page 100
- Related Features and Technologies, page 100
Benefits

The limit-retransmissions command provides for backward compatibility for previous or other releases of Cisco IOS or other routers that do not have this feature.

Restrictions

The limit to the number of retransmissions does not apply for update packets on nonbroadcast multiaccess (NBMA) point-to-multipoint direct circuits. In this situation, the dead timer is used to end communication with non-responding neighbors and thus stop the retransmissions.

Related Features and Technologies

This feature is an extension of the OSPF routing protocol. For more information about configuring OSPF and configuring route summarization and filtering, refer to the "Configuring OSPF" module of the Cisco IOS IP Routing Protocols Configuration Guide and the Cisco IOS IP Routing: OSPF Command Reference.

Supported Platforms

The limit-retransmissions command is supported for the following platforms in Cisco IOS Release 12.2(11)T:

- Cisco AS5300
- Cisco AS5400
- Cisco AS5800
- Cisco 1400 series
- Cisco 1600 series
- Cisco 1600R series
- Cisco 1710
- Cisco 1720
- Cisco 1721
- Cisco 1750
- Cisco 1751
- Cisco 2500 series
- Cisco 2600 series
- Cisco 3620
- Cisco 3631
- Cisco 3640
- Cisco 3725
- Cisco 3745
- Cisco 3660
- Cisco IGX 8400 Series URM
- Cisco MC3810
- Cisco 7100 series
- Cisco 7200 series
- Cisco 7500 series
- Cisco uBR7200 series
Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

OSPF Support for Multi-VRF on CE Routers

The OSPF Support for Multi-VRF on CE Routers feature provides the capability of suppressing provider edge (PE) checks that are needed to prevent loops when the PE is performing a mutual redistribution of packets between the OSPF and BGP protocols. When VPN routing and forward (VRF) is used on a router that is not a PE (that is, one that is not running BGP), the checks can be turned off to allow for correct population of the VRF routing table with routes to IP prefixes.

OSPF multi-VRF allows you to split the router into multiple virtual routers, where each router contains its own set of interfaces, routing table, and forwarding table.

- Finding Feature Information, page 103
- Information About OSPF Support for Multi-VRF on CE Routers, page 103
- How to Configure OSPF Support for Multi-VRF on CE Routers, page 104
- Configuration Examples for OSPF Support for Multi-VRF on CE Routers, page 105
- Additional References, page 107

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About OSPF Support for Multi-VRF on CE Routers

The OSPF Support for Multi-VRF on CE Routers feature provides the capability of suppressing provider edge (PE) checks that are needed to prevent loops when the PE is performing a mutual redistribution of packets between the OSPF and BGP protocols. When VPN routing and forward (VRF) is used on a router that is not a PE (that is, one that is not running BGP), the checks can be turned off to allow for correct population of the VRF routing table with routes to IP prefixes.

OSPF multi-VRF allows you to split the router into multiple virtual routers, where each router contains its own set of interfaces, routing table, and forwarding table. OSPF multi-VRF gives you the ability to segment parts of your network and configure those segments to perform specific functions, yet still maintain correct routing information.
## How to Configure OSPF Support for Multi-VRF on CE Routers

- Configuring the Multi-VRF Capability for OSPF Routing, page 104
- Verifying the OSPF Multi-VRF Configuration, page 105

### Configuring the Multi-VRF Capability for OSPF Routing

CEF must be running on the network.

#### SUMMARY STEPS

1. enable
2. show ip ospf [process-id]
3. configure terminal
4. router ospf process-id [vrf vpn-name]
5. capability vrf-lite

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables higher privilege levels, such as privileged EXEC mode.  
- Enter your password if prompted. |
| **Example:**  
Router> enable | |
| **Step 2** show ip ospf [process-id] | Displays the status of the router. If the display indicates that the router is connected to the VPN backbone, you can use the capability vrf-lite command to decouple the PE router from the VPN backbone. |
| **Example:**  
Router> show ip ospf 1 | |
| **Step 3** configure terminal | Enters global configuration mode. |
| **Example:**  
Router# configure terminal | |
| **Step 4** router ospf process-id [vrf vpn-name] | Enables OSPF routing and enters router configuration mode.  
- The process-id argument identifies the OSPF process.  
- Use the vrf keyword and vpn-name argument to identify a VPN. |
| **Example:**  
Router(config)# router ospf 1 vrf grc | |
Verifying the OSPF Multi-VRF Configuration

No specific `debug` or `show` commands are associated with this feature. You can verify the success of the OSPF multi-VRF configuration by using the `show ip ospf[process-id]` command to verify that the router is not connected to the VPN backbone.

This output from the `show ip ospf process` command indicates that the PE router is currently connected to the backbone.

```
Router# show ip ospf 12
Routing Process "ospf 12" with ID 151.1.1.1 and Domain ID 0.0.0.12
Supports only single TOS(TOS0) routes
Supports opaque LSA
Connected to MPLS VPN Superbackbone
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 0. 0 normal 0 stub 0 nssa
External flood list length 0
```

When the OSPF VRF process is configured with the `capability vrf-lite` command under the `router ospf` command, the "Connected to MPLS VPN Superbackbone" line will not be present in the display.

Configuration Examples for OSPF Support for Multi-VRF on CE Routers

- Example Configuring the Multi-VRF Capability, page 105
- Example Verifying the OSPF Multi-VRF Configuration, page 106

Example Configuring the Multi-VRF Capability

This example shows a basic OSPF network with a VRF named grc configured. The `capability vrf-lite` command is entered to suppress the PE checks.

```
! ip cef
ip vrf grc
 rd 1:1
interface Serial2/0
  ip vrf forwarding grc
  ip address 192.168.1.1 255.255.255.252
!```
Example Verifying the OSPF Multi-VRF Configuration

This example illustrates the output display from the `show ip ospf process` command after OSPF multi-VRF has been configured on the router.

```
Router# show ip ospf database external 172.16.0.0 self
OSPF Router with ID (10.0.0.1) (Process ID 100)
    Type-5 AS External Link States
    LS age: 175
    Options: (No TOS-capability, DC)
    LS Type: AS External Link
    Link State ID: 172.16.0.0 (External Network Number )
    Advertising Router: 10.0.0.1
    LS Seq Number: 80000001
    Checksum: 0xEA9E
    Length: 36
    Network Mask: /8
    Metric Type: 2 (Larger than any link state path)
    MTID: 0
    Metric: 20
    Forward Address: 0.0.0.0
    External Route Tag: 0
```

Glossary

**CE Router** -- Customer Edge router, an edge router in the C network, defined as a C router which attaches directly to a P router.

**C Network** -- Customer (enterprise or service provider) network.

**C Router** -- Customer router, a router in the C network.

**LSA** -- link-state advertisement. Broadcast packet used by link-state protocols that contains information about neighbors and path costs. LSAs are used by the receiving routers to maintain their routing tables.
**PE Router** --Provider Edge router, an edge router in the P network, defined as a P router which attaches directly to a C router.

**P Network** --MPLS-capable service provider core network. P routers perform MPLS.

**P Router** --Provider router, a router in the P network.

**SPF** --shortest path first. A routing algorithm that iterates on length of path to determine a shortest-path spanning tree.

**VPN** --Virtual Private Network. Enables IP traffic to travel securely over a public TCP/IP network by encrypting all traffic from one network to another.

**VRF** --VPN Routing and Forwarding.

OSPF Forwarding Address Suppression in Translated Type-5 LSAs

The OSPF Forwarding Address Suppression in Translated Type-5 LSAs feature causes a not-so-stubby area (NSSA) area border router (ABR) to translate Type-7 link state advertisements (LSAs) to Type-5 LSAs, but use the address 0.0.0.0 for the forwarding address instead of that specified in the Type-7 LSA. This feature causes routers that are configured not to advertise forwarding addresses into the backbone to direct forwarded traffic to the translating NSSA ABRs.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF Forwarding Address Suppression in Translated Type-5 LSAs

This document presumes you have OSPF configured on the networking device; it does not document other steps to configure OSPF.
Information About OSPF Forwarding Address Suppression in Translated Type-5 LSAs

- Benefits of OSPF Forwarding Address Suppression in Translated Type-5 LSAs, page 112
- When to Suppress OSPF Forwarding Address in Translated Type-5 LSAs, page 112

Benefits of OSPF Forwarding Address Suppression in Translated Type-5 LSAs

The OSPF Forwarding Address Suppression in Translated Type-5 LSAs feature causes an NSSA ABR to translate Type-7 LSAs to Type-5 LSAs, but use the 0.0.0.0 as the forwarding address instead of that specified in the Type-7 LSA. This feature causes routers that are configured not to advertise forwarding addresses into the backbone to direct forwarded traffic to the translating NSSA ASBRs.

When to Suppress OSPF Forwarding Address in Translated Type-5 LSAs

In the figure below, it would be advantageous to filter Area 2 addresses from Area 0 to minimize the number of routes introduced into the backbone (Area 0). However, using the area range command to consolidate and summarize routes at the area boundary--filtering the Area 2 addresses--will not work because the Area 2 addresses include forwarding addresses for Type-7 LSAs that are generated by the ASBR. If these Type-7 LSA forwarding addresses have been filtered out of Area 0, the backbone routers cannot reach the prefixes advertised in the translated Type-5 LSAs (autonomous system external LSAs).

Figure 10  OSPF Forwarding Address Suppression in Translated Type-5 LSAs
This problem is solved by suppressing the forwarding address on the ABR so that the forwarding address is set to 0.0.0.0 in the Type-5 LSAs that were translated from Type-7 LSAs. A forwarding address set to 0.0.0.0 indicates that packets for the external destination should be forwarded to the advertising OSPF router, in this case, the translating NSSA ABR.

Before configuring this feature, consider the following caution.

Caution
Configuring this feature causes the router to be noncompliant with RFC 1587. Also, suboptimal routing might result because there might be better paths to reach the destination’s forwarding address. This feature should not be configured without careful consideration and not until the network topology is understood.

How to Suppress OSPF Forwarding Address in Translated Type-5 LSAs

• Supressing OSPF Forwarding Address in Translated Type-5 LSAs, page 113

Supressing OSPF Forwarding Address in Translated Type-5 LSAs

Caution
Configuring this feature causes the router to be noncompliant with RFC 1587. Also, suboptimal routing might result because there might be better paths to reach the destination’s forwarding address. This feature should not be configured without careful consideration and not until the network topology is understood.

OSPF Inbound Filtering Using Route Maps with a Distribute List

The OSPF Inbound Filtering Using Route Maps with a Distribute List feature allows users to define a route map to prevent Open Shortest Path First (OSPF) routes from being added to the routing table. In the route map, the user can match on any attribute of the OSPF route.

Prerequisites for OSPF Inbound Filtering Using Route Maps with a Distribute List

It is presumed that you have OSPF configured in your network.

Information About OSPF Inbound Filtering Using Route Maps with a Distribute List

Users can define a route map to prevent OSPF routes from being added to the routing table. This filtering happens at the moment when OSPF is installing the route in the routing table. This feature has no effect on...
link-state advertisement (LSA) flooding. In the route map, the user can match on any attribute of the OSPF route. That is, the route map could be based on the following match options:

- match interface
- match ip address
- match ip next-hop
- match ip route-source
- match metric
- match route-type
- match tag

This feature can be useful during redistribution if the user tags prefixes when they get redistributed on Autonomous System Boundary Routers (ASBRs) and later uses the tag to filter the prefixes from being installed in the routing table on other routers.

**Filtering Based on Route Tag**

Users can assign tags to external routes when they are redistributed to OSPF. Then the user can deny or permit those routes in the OSPF domain by identifying that tag in the route-map and distribute-list in commands.

**Filtering Based on Route Type**

In OSPF, the external routes could be Type 1 or Type 2. Users can create route maps to match either Type 1 or Type 2 and then use the distribute-list in command to filter certain prefixes. Also, route maps can identify internal routes (interarea and intra-area) and then those routes can be filtered.

**Filtering Based on Route Source**

When a match is done on the route source, the route source represents the OSPF Router ID of the LSA originator of the LSA in which the prefix is advertised.

**Filtering Based on Interface**

When a match is done on the interface, the interface represents the outgoing interface for the route that OSPF is trying to install in the routing table.

**Filtering Based on Next Hop**

When a match is done on the next hop, the next hop represents the next hop for the route that OSPF is trying to install in the routing table.

---

The distribute-list in command can be configured to prevent routes from being installed in the global Routing Information Base (RIB). Prior to the implementation of OSPF local RIB (for feature information on OSPF local RIB, see OSPFv2 Local RIB), OSPF would attempt to install a less preferred route (e.g. an inter-area route when the intra-area path is filtered). With OSPF local RIB, only the best route is considered (because this is the only route the local RIB maintains). There is no concept of a "second-best" OSPF route. For more information on the routing algorithm used by Cisco OSPF routers, please refer to RFC 2328.
How to Configure OSPF Inbound Filtering Using Route Maps

- Configuring OSPF Route Map-Based Filtering, page 119

Configuring OSPF Route Map-Based Filtering

SUMMARY STEPS

1. enable
2. configure terminal
3. route-map map-tag [permit | deny] [sequence-number]
4. match tag tag-name
5. Repeat Steps 3 and 4 with other route-map and match commands.
6. exit
7. router ospf process-id
8. distribute-list route-map map-tag in
9. end

### Configuration Examples for OSPF Inbound Filtering Using Route Maps with a Distribute List

- Example OSPF Route Map-Based Filtering, page 121
Example OSPF Route Map-Based Filtering

In this example, OSPF external LSAs have a tag. The value of the tag is examined before the prefix is installed in the routing table. All OSPF external prefixes that have the tag value of 777 are filtered (prevented from being installed in the routing table). The permit statement with sequence number 20 has no match conditions, and there are no other route-map statements after sequence number 20, so all other conditions are permitted.

```bash
route-map tag-filter deny 10
  match tag 777
route-map tag-filter permit 20
!
router ospf 1
router-id 10.0.0.2
log-adjacency-changes
network 172.16.2.1 0.0.0.255 area 0
distribute-list route-map tag-filter in
```

OSPF Shortest Path First Throttling

The OSPF Shortest Path First Throttling feature makes it possible to configure SPF scheduling in millisecond intervals and to potentially delay shortest path first (SPF) calculations during network instability. SPF is scheduled to calculate the Shortest Path Tree (SPT) when there is a change in topology. One SPF run may include multiple topology change events.

The interval at which the SPF calculations occur is chosen dynamically and is based on the frequency of topology changes in the network. The chosen interval is within the boundary of the user-specified value ranges. If network topology is unstable, SPF throttling calculates SPF scheduling intervals to be longer until topology becomes stable.

- Additional References, page 130

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information
Information About OSPF SPF Throttling

- Shortest Path First Calculations, page 126

Shortest Path First Calculations

SPF calculations occur at the interval set by the `timers throttle spf` command. The wait interval indicates the amount of time to wait until the next SPF calculation occurs. Each wait interval after that calculation is twice as long as the previous one until the wait interval reaches the maximum wait time specified.

The SPF timing can be better explained using an example. In this example the start interval is set at 5 milliseconds (ms), the wait interval at 1000 milliseconds, and the maximum wait time is set at 90,000 milliseconds.

```
timers throttle spf 5 1000 90000
```

The figure below shows the intervals at which the SPF calculations occur so long as at least one topology change event is received in a given wait interval.

![SPF Calculation Intervals Set by the timers throttle spf Command](image)

Notice that the wait interval between SPF calculations doubles when at least one topology change event is received during the previous wait interval. Once the maximum wait time is reached, the wait interval remains the same until the topology stabilizes and no event is received in that interval.

If the first topology change event is received after the current wait interval, the SPF calculation is delayed by the amount of time specified as the start interval. The subsequent wait intervals continue to follow the dynamic pattern.

If the first topology change event occurs after the maximum wait interval begins, the SPF calculation is again scheduled at the start interval and subsequent wait intervals are reset according the parameters specified in the `timers throttle spf` command. Notice in the figure below that a topology change event was received after the start of the maximum wait time interval and that the SPF intervals have been reset.

![Timer Intervals Reset after Topology Change Event](image)
How to Configure OSPF SPF Throttling

**Verifying SPF Throttle Values**

To verify SPF throttle timer values, use the `show ip ospf` command. The values are displayed in the lines that begin, "Initial SPF schedule delay...," "Minimum hold time between two consecutive SPFs...," and "Maximum wait time between two consecutive SPFs..."

```
Router# show ip ospf
Routing Process "ospf 1" with ID 10.10.10.2 and Domain ID 0.0.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
```
It is an autonomous system boundary router
Redistributing External Routes from,
static, includes subnets in redistribution
Initial SPF schedule delay 5 msecs
Minimum hold time between two consecutive SPF's 1000 msecs
Maximum wait time between two consecutive SPF's 90000 msecs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 4. Checksum Sum 0x17445
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
Area BACKBONE(0)
  Number of interfaces in this area is 2
  Area has no authentication
  SPF algorithm last executed 19:11:15.140 ago
  SPF algorithm executed 28 times
  Area ranges are
  Number of LSA 4. Checksum Sum 0x2C1D4
  Number of opaque link LSA 0. Checksum Sum 0x0
  Number of DCbitless LSA 0
  Number of indication LSA 0
  Number of DoNotAge LSA 0
  Flood list length 0

## Configuration Examples for OSPF SPF Throttling

- [Throttle Timers Example](#), page 130

### Throttle Timers Example

This example shows a router configured with the start, hold, and maximum interval values for the timers throttle spf command set at 5, 1,000, and 90,000 milliseconds, respectively.

```
router ospf 1
router-id 10.10.10.2
log-adjacency-changes
timers throttle spf 5 1000 90000
redistribute static subnets
    network 21.21.21.0 0.0.0.255 area 0
    network 22.22.22.0 0.0.0.255 area 00
```

OSPF Support for Fast Hello Packets

The OSPF Support for Fast Hello Packets feature provides a way to configure the sending of hello packets in intervals less than 1 second. Such a configuration would result in faster convergence in an Open Shortest Path First (OSPF) network.

- Finding Feature Information, page 133
- Prerequisites for OSPF Support for Fast Hello Packets, page 133
- Information About OSPF Support for Fast Hello Packets, page 133
- How to Configure OSPF Fast Hello Packets, page 134

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF Support for Fast Hello Packets

OSPF must be configured in the network already or configured at the same time as the OSPF Support for Fast Hello Packets feature.

Information About OSPF Support for Fast Hello Packets

- OSPF Hello Interval and Dead Interval, page 134
- OSPF Fast Hello Packets, page 134
- Benefits of OSPF Fast Hello Packets, page 134
OSPF Hello Interval and Dead Interval

OSPF hello packets are packets that an OSPF process sends to its OSPF neighbors to maintain connectivity with those neighbors. The hello packets are sent at a configurable interval (in seconds). The defaults are 10 seconds for an Ethernet link and 30 seconds for a non broadcast link. Hello packets include a list of all neighbors for which a hello packet has been received within the dead interval. The dead interval is also a configurable interval (in seconds), and defaults to four times the value of the hello interval. The value of all hello intervals must be the same within a network. Likewise, the value of all dead intervals must be the same within a network.

These two intervals work together to maintain connectivity by indicating that the link is operational. If a router does not receive a hello packet from a neighbor within the dead interval, it will declare that neighbor to be down.

OSPF Fast Hello Packets

OSPF fast hello packets refer to hello packets being sent at intervals of less than 1 second. To understand fast hello packets, you should already understand the relationship between OSPF hello packets and the dead interval. See the section OSPF Hello Interval and Dead Interval, page 134.

OSPF fast hello packets are achieved by using the `ip ospf dead-interval` command. The dead interval is set to 1 second, and the hello-multiplier value is set to the number of hello packets you want sent during that 1 second, thus providing subsecond or "fast" hello packets.

When fast hello packets are configured on the interface, the hello interval advertised in the hello packets that are sent out this interface is set to 0. The hello interval in the hello packets received over this interface is ignored.

The dead interval must be consistent on a segment, whether it is set to 1 second (for fast hello packets) or set to any other value. The hello multiplier need not be the same for the entire segment as long as at least one hello packet is sent within the dead interval.

Benefits of OSPF Fast Hello Packets

The benefit of the OSPF Fast Hello Packets feature is that your OSPF network will experience faster convergence time than it would without fast hello packets. This feature allows you to detect lost neighbors within 1 second. It is especially useful in LAN segments, where neighbor loss might not be detected by the Open System Interconnection (OSI) physical layer and data-link layer.

How to Configure OSPF Fast Hello Packets

- Configuring OSPF Fast Hello Packets, page 135
Configuring OSPF Fast Hello Packets

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **ip ospf dead-interval minimal hello-multiplier multiplier**
5. **end**
6. **show ip ospf interface [interface-type interface-number]**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>

<td></td>
</tr>
<tr>
<td>• In the example, OSPF Support for Fast Hello Packets is enabled by specifying the <strong>minimal</strong> keyword and the <strong>hello-multiplier</strong> keyword and value. Because the multiplier is set to 5, five hello packets will be sent every second.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>(Optional) Saves configuration commands to the running configuration file, exits configuration mode, and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# end</td>
<td></td>
</tr>
<tr>
<td>• Use this command when you are ready to exit configuration mode and save the configuration to the running configuration file.</td>
<td></td>
</tr>
</tbody>
</table>
Command or Action | Purpose
--- | ---
**Step 6** `show ip ospf interface [interface-type interface-number]` | (Optional) Displays OSPF-related interface information.

- The relevant fields that verify OSPF fast hello packets are indicated in the sample output following this table.

**Example:**

```text
Router# show ip ospf interface ethernet 1/3
```

**Examples**

The following example output verifies that OSPF Support for Fast Hello Packets is configured. In the line that begins with "Timer intervals configured," the hello interval is 200 milliseconds, the dead interval is 1 second, and the next hello packet is due in 76 milliseconds.

```text
Router# show ip ospf interface ethernet 1/3
Ethernet1/3 is up, line protocol is up
    Internet Address 172.16.1.2/24, Area 0
    Process ID 1, Router ID 172.17.0.2, Network Type BROADCAST, Cost:1
    Transmit Delay is 1 sec, State DR, Priority 1
    Designated Router (ID) 172.17.0.2, Interface address 172.16.1.2
    Backup Designated router (ID) 172.16.0.1, Interface address 172.16.1.1
    Timer intervals configured, Hello 200 msec, Dead 1, Wait 1, Retransmit 5
    Hello due in 76 msec
    Index 2/2, flood queue length 0
    Next 0x0(0)/0x0(0)
    Last flood scan length is 2, maximum is 3
    Last flood scan time is 0 msec, maximum is 0 msec
    Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 172.16.0.1 (Backup Designated Router)
    Suppress hello for 0 neighbor(s)
```

**Configuration Examples for OSPF Support for Fast Hello Packets**

- Example OSPF Fast Hello Packets, page 136

**Example OSPF Fast Hello Packets**

The following example configures OSPF fast hello packets; the dead interval is 1 second and five hello packets are sent every second:

```text
interface ethernet 1
    ip ospf dead-interval minimal hello-multiplier 5
```

OSPF Incremental SPF

The Open Shortest Path First (OSPF) protocol can be configured to use an incremental SPF algorithm for calculating the shortest path first routes. Incremental SPF is more efficient than the full SPF algorithm, thereby allowing OSPF to converge faster on a new routing topology in reaction to a network event.

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information for OSPF Incremental SPF, page 142.

Prerequisites for OSPF Incremental SPF

It is presumed that you have OSPF configured in your network.

Information About OSPF Incremental SPF
OSPF uses Dijkstra’s SPF algorithm to compute the shortest path tree (SPT). During the computation of the SPT, the shortest path to each node is discovered. The topology tree is used to populate the routing table with routes to IP networks. When changes to a Type-1 or Type-2 link-state advertisement (LSA) occur in an area, the entire SPT is recomputed. In many cases, the entire SPT need not be recomputed because most of the tree remains unchanged. Incremental SPF allows the system to recompute only the affected part of the tree. Recomputing only a portion of the tree rather than the entire tree results in faster OSPF convergence and saves CPU resources. Note that if the change to a Type-1 or Type-2 LSA occurs in the calculating router itself, then the full SPT is performed.

Incremental SPF is scheduled in the same way as the full SPF. Routers enabled with incremental SPF and routers not enabled with incremental SPF can function in the same internetwork.

How to Enable OSPF Incremental SPF

• Enabling Incremental SPF, page 140

Enabling Incremental SPF

This section describes how to enable incremental SPF.

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf process-id
4. ispf
5. end

Open Shortest Path First (OSPF) supports a user-defined maximum number of prefixes (routes) that are allowed to be redistributed into OSPF from other protocols or other OSPF processes. Such a limit could help prevent the router from being flooded by too many redistributed routes.

- Finding Feature Information, page 145
- Prerequisites for OSPF Limit on Number of Redistributed Routes, page 145
- Information About OSPF Limit on Number of Redistributed Routes, page 145

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF Limit on Number of Redistributed Routes

It is presumed that you have OSPF configured in your network, along with another protocol or another OSPF process you are redistributing.

Information About OSPF Limit on Number of Redistributed Routes

If someone mistakenly injects a large number of IP routes into OSPF, perhaps by redistributing Border Gateway Protocol (BGP) into OSPF, the network can be severely flooded. Limiting the number of redistributed routes prevents this potential problem.
How to Configure OSPF Limit the Number of OSPF Redistributed Routes

This section contains the following procedures, which are mutually exclusive. That is, you cannot both limit redistributed prefixes and also choose to be warned.

- Limiting the Number of OSPF Redistributed Routes, page 146
- Requesting a Warning About the Number of Routes Redistributed into OSPF, page 148

Limiting the Number of OSPF Redistributed Routes

This task describes how to limit the number of OSPF redistributed routes. If the number of redistributed routes reaches the maximum value configured, no more routes will be redistributed.

The redistribution limit applies to all IP redistributed prefixes, including summarized ones. The redistribution limit does not apply to default routes or prefixes that are generated as a result of Type-7 to Type-5 translation.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router ospf process-id
4. redistribute protocol [process-id][as-number] [metric metric-value] [metric-type type-value] [match{internal | external 1 | external 2}][tag tag-value] [route-map map-tag] [subnets]
5. redistribute maximum-prefix maximum [threshold]
6. end
7. show ip ospf [process-id]

</tbody>
</table>

**Notes:**
- There is no default value for the *maximum* argument.
- The *threshold* value defaults to 75 percent.

If the **warning-only** keyword had been configured in this command, no limit would be enforced; a warning message is simply logged.
Requesting a Warning About the Number of Routes Redistributed into OSPF

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router ospf process-id`
4. `redistribute protocol [process-id||as-number] [metric metric-value] [metric-type type-value] [match {internal|external 1|external 2}] [tag tag-value] [route-map map-tag] [subnets]`
5. `redistribute maximum-prefix maximum [threshold] warning-only`
6. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** `enable` | Enables privileged EXEC mode.  
   - Enter your password if prompted. |
| **Example:** |  
   `Router> enable` |
| **Step 2** `configure terminal` | Enters global configuration mode. |
| **Example:** |  
   `Router# configure terminal` |
| **Step 3** `router ospf process-id` | Configures an OSPF routing process. |
| **Example:** |  
   `Router(config)# router ospf 1` |
| **Step 4** `redistribute protocol [process-id||as-number] [metric metric-value] [metric-type type-value] [match {internal|external 1|external 2}] [tag tag-value] [route-map map-tag] [subnets]` | Redistributes routes from one routing domain into another routing domain. |
| **Note** | The redistribution count applies to external IP prefixes, including summarized routes. Default routes and prefixes that are generated as a result of Type-7 to Type-5 translation are not considered. |
| **Example:** |  
   `Router(config-router)# redistribute eigrp 10` |
**Command or Action**

<table>
<thead>
<tr>
<th>Step 5 redistribute maximum-prefix maximum [threshold] warning-only</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Causes a warning message to be logged when the maximum number of IP prefixes has been redistributed into OSPF.</td>
<td></td>
</tr>
<tr>
<td>- Because the <code>warning-only</code> keyword is included, no limit is imposed on the number of redistributed prefixes into OSPF.</td>
<td></td>
</tr>
<tr>
<td>- There is no default value for the <code>maximum</code> argument.</td>
<td></td>
</tr>
<tr>
<td>- The <code>threshold</code> value defaults to 75 percent.</td>
<td></td>
</tr>
<tr>
<td>- This example causes two warnings: one at 80 percent of 1000 (800 routes redistributed) and another at 1000 routes redistributed.</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
Router(config-router)# redistribute maximum-prefix 1000 80 warning-only
```

**Step 6 end**

```
Router(config-router)# end
```

---

**Configuration Examples for OSPF Limit on Number of Redistributed Routes**

- Example OSPF Limit on Number of Redistributed Routes, page 149
- Example Requesting a Warning About the Number of Redistributed Routes, page 150

**Example OSPF Limit on Number of Redistributed Routes**

This example sets a maximum of 1200 prefixes that can be redistributed into OSPF process 1. Prior to reaching the limit, when the number of prefixes redistributed reaches 80 percent of 1200 (960 prefixes), a warning message is logged. Another warning is logged when the limit is reached and no more routes are redistributed.

```
router ospf 1
  router-id 10.0.0.1
domain-id 5.6.7.8
log-adjacency-changes
timers lsa-interval 2
  network 10.0.0.1 0.0.0.0 area 0
  network 10.1.5.1 0.0.0.0 area 0
  network 10.2.2.1 0.0.0.0 area 0
  redistribute static subnets
  redistribute maximum-prefix 1200 80
```
Example Requesting a Warning About the Number of Redistributed Routes

This example allows two warning messages to be logged, the first if the number of prefixes redistributed reaches 85 percent of 600 (510 prefixes), and the second if the number of redistributed routes reaches 600. However, the number of redistributed routes is not limited.

```
router ospf 1
    network 10.0.0.0 0.0.0.255 area 0
    redistribute eigrp 10 subnets
    redistribute maximum-prefix 600 85 warning-only
```

OSPF Link-State Advertisement Throttling

The OSPF Link-State Advertisement (LSA) Throttling feature provides a dynamic mechanism to slow down link-state advertisement (LSA) updates in OSPF during times of network instability. It also allows faster Open Shortest Path First (OSPF) convergence by providing LSA rate limiting in milliseconds.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.
Prerequisites for OSPF LSA Throttling

It is presumed that you have OSPF configured in your network.

Information About OSPF LSA Throttling

- Benefits of OSPF LSA Throttling, page 154
- How OSPF LSA Throttling Works, page 154

Benefits of OSPF LSA Throttling

Prior to the OSPF LSA Throttling feature, LSA generation was rate-limited for 5 seconds. That meant that changes in an LSA could not be propagated in milliseconds, so the OSPF network could not achieve millisecond convergence.

The OSPF LSA Throttling feature is enabled by default and allows faster OSPF convergence (in milliseconds). This feature can be customized. One command controls the generation (sending) of LSAs and another command controls the receiving interval. This feature also provides a dynamic mechanism to slow down the frequency of LSA updates in OSPF during times of network instability.

How OSPF LSA Throttling Works

The timers throttle lsa all command controls the generation (sending) of LSAs. The first LSA is always generated immediately upon an OSPF topology change, and the next LSA generated is controlled by the minimum start interval. The subsequent LSAs generated for the same LSA are rate-limited until the maximum interval is reached. The "same LSA" is defined as an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID.

The timers lsa arrival command controls the minimum interval for accepting the same LSA. If an instance of the same LSA arrives sooner than the interval that is set, the LSA is dropped. It is recommended that the arrival interval be less than or equal to the hold-time interval of the timers throttle lsa all command.

How to Customize OSPF LSA Throttling

- Customizing OSPF LSA Throttling, page 155
Customizing OSPF LSA Throttling

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router ospf process-id
4. timers throttle lsa all start-interval hold-interval max-interval
5. timers lsa arrival milliseconds
6. end
7. show ip ospf timers rate-limit
8. show ip ospf

OSPF Support for Unlimited Software VRFs per PE Router

In a Multiprotocol Label Switching--Virtual Private Network (MPLS-VPN) deployment, each VPN routing and forwarding instance (VRF) needs a separate Open Shortest Path First (OSPF) process when configured to run OSPF. The OSPF Support for Unlimited Software VRFs per Provider Edge (PE) Router feature addresses the scalability issue for OSPF VPNs by eliminating the OSPF VPN limit of 32 processes.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF Support for Unlimited Software VRFs per PE Router

You must have OSPF configured in your network.

Restrictions for OSPF Support for Unlimited Software VRFs per PE Router

Only 32 processes per VRF can be supported. For different VRF processes, there is no limit.

Information About OSPF Support for Unlimited Software VRFs per PE Router

Before Cisco IOS Releases 12.3(4)T and 12.0(27)S, a separate OSPF process was necessary for each VRF that receives VPN routes via OSPF. When VPNs are deployed, an MPLS Provider Edge (PE) router will be running both multiprotocol Border Gateway Protocol (BGP) for VPN distribution, and Interior Gateway Protocol (IGP) for PE-P connectivity. It is a common scenario when OSPF is used as the IGP between a customer edge (CE) router and a PE router. OSPF was not scalable in VPN deployment because of the limit of 32 processes. By default one process is used for connected routes and another process is used for static routes, therefore only 28 processes can be created for VRFs.

The OSPF Support for Unlimited Software VRFs per Provider Edge Router feature allows for an approximate range of 300 to 10,000 VRFs, depending on the particular platform and on the applications, processes, and protocols that are currently running on the platform.

How to Configure OSPF Support for Unlimited Software VRFs per PE Router

- Configuring and Verifying Unlimited Software VRFs per Provider Edge Router, page 165
# Configuring and Verifying Unlimited Software VRFs per Provider Edge Router

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router ospf process-id [vrf vpn-name]`
4. `end`
5. `show ip ospf [process-id]`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router&gt; enable</code></td>
<td></td>
</tr>

<td><strong>Example:</strong> <code>Router# show ip ospf 1</code></td>
<td></td>
</tr>
</tbody>
</table>
Example Configuring OSPF Support for Unlimited Software VRFs per PE Router

This example shows a basic OSPF configuration using the `router ospf` command to configure OSPF VRF processes for the VRFs first, second, and third:

```
Router> enable
Router# configure terminal
Router(config)# router ospf 12 vrf first
Router(config)# router ospf 13 vrf second
Router(config)# router ospf 14 vrf third
Router(config)# exit
```

Example Verifying OSPF Support for Unlimited Software VRFs per PE Router

This example illustrates the output display from the `show ip ospf` command to verify that the OSPF VRF process 12 has been created for the VRF named first. The output that relates to the VRF first appears in bold.

```
Router# show ip ospf 12
main ID type 0x0005, value 0.0.0.100
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Connected to MPLS VPN Superbackbone, VRF first
It is an area border router
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
Number of areas transit capable is 0
External flood list length 0
Area BACKBONE(0)
  Number of interfaces in this area is 1
  Area has no authentication
  SPF algorithm last executed 00:00:15.204 ago
  SPF algorithm executed 2 times
  Area ranges are
  Number of LSA 1. Checksum Sum 0xD9F3
  Number of opaque link LSA 0. Checksum Sum 0x0
  Number of DCbitless LSA 0
```

OSPFD Area Transit Capability

The OSPF Area Transit Capability feature provides an OSPF Area Border Router (ABR) with the ability to discover shorter paths through the transit area for forwarding traffic that would normally need to travel through the virtual-link path. This functionality allows Cisco IOS software to be compliant with RFC 2328.

- Information About OSPF Area Transit Capability, page 169
- How to Disable OSPF Area Transit Capability, page 169
- Additional References, page 170
- Feature Information for OSPF Area Transit Capability, page 171

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About OSPF Area Transit Capability

The OSPF Area Transit Capability feature is enabled by default. RFC 2328 defines OSPF area transit capability as the ability of the area to carry data traffic that neither originates nor terminates in the area itself. This capability enables the OSPF ABR to discover shorter paths through the transit area and forward traffic along those paths rather than using the virtual link or path, which are not as optimal.

For a detailed description of OSPF area transit capability, see RFC 2328, OSPF Version 2, at the following URL:

http://www.faqs.org/rfcs/rfc2328.html

How to Disable OSPF Area Transit Capability

- Disabling OSPF Area Transit Capability on an Area Border Router, page 170
Disabling OSPF Area Transit Capability on an Area Border Router

This task describes how to disable the OSPF Area Transit Capability feature on an OSPF ABR.

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf process-id [vrf vpn-name]
4. no capability transit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| Example:          |         |
| Router> enable    |         |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example:          |         |
| Router# configure terminal |         |
| **Step 3** router ospf process-id [vrf vpn-name] | Enables OSPF routing and enters router configuration mode.  
• The process-id argument identifies the OSPF process. |
| Example:          |         |
| Router(config)# router ospf 100 |         |
| **Step 4** no capability transit | Disables OSPF area capability transit on all areas for a router process. |
| Example:          |         |
| Router(config-router)# no capability transit |         |

OSPF Per-Interface Link-Local Signaling

The OSPF Per-Interface Link-Local Signaling feature allows you to selectively enable or disable Link-Local Signaling (LLS) for a specific interface regardless of the global (router level) setting that you have previously configured.

- Finding Feature Information, page 173
- Information About OSPF Per-Interface Link-Local Signaling, page 173

Information About OSPF Per-Interface Link-Local Signaling

- Benefits of the OSPF Per-Interface Link-Local Signaling Feature, page 173

Benefits of the OSPF Per-Interface Link-Local Signaling Feature

LLS allows for the extension of existing OSPF packets in order to provide additional bit space. The additional bit space enables greater information per packet exchange between OSPF neighbors. This functionality is used, for example, by the OSPF Nonstop Forwarding (NSF) Awareness feature that allows customer premises equipment (CPE) routers that are NSF-aware to help NSF-capable routers perform nonstop forwarding of packets.

When LLS is enabled at the router level, it is automatically enabled for all interfaces. The OSPF Per-Interface Link-Local Signaling feature allows you to selectively enable or disable LLS for a specific interface. You may want to disable LLS on a per-interface basis depending on your network design. For example, disabling LLS on an interface that is connected to a non-Cisco device that may be noncompliant
with RFC 2328 can prevent problems with the forming of Open Shortest Path First (OSPF) neighbors in the network.

How to Configure OSPF Per-Interface Link-Local Signaling

- Turning Off LLS on a Per-Interface Basis, page 174

Turning Off LLS on a Per-Interface Basis

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface type slot / port`
4. `ip address ip-address mask [secondary]`
5. `no ip directed-broadcast [access-list-number | extended access-list-number]`
6. `ip ospf message-digest-key key-id encryption-type md5 key`
7. `[no | default] ip ospf lls [disable]`

**What to Do Next**

To verify that LLS has been enabled or disabled for a specific interface, use the `show ip ospf interface` command. See the "Example: Configuring and Verifying the OSPF Per-Interface Link-Local Signaling Feature" section for an example of the information displayed.

**Configuration Examples for OSPF Per-Interface Link-Local Signaling**

- [Example OSPF Per-Interface Link-Local Signaling](#)
Example OSPF Per-Interface Link-Local Signaling

In the following example, LLS has been enabled on Ethernet interface 1/0 and disabled on Ethernet interface 2/0:

```plaintext
interface Ethernet1/0
  ip address 10.2.145.2 255.255.255.0
  no ip directed-broadcast
  ip ospf message-digest-key 1 md5 testing
  ip ospf lls

interface Ethernet2/0
  ip address 10.1.145.2 255.255.0.0
  no ip directed-broadcast
  ip ospf message-digest-key 1 md5 testing
  ip ospf lls disable

interface Ethernet3/0
  ip address 10.3.145.2 255.255.255.0
  no ip directed-broadcast

router ospf 1
  log-adjacency-changes detail
  area 0 authentication message-digest
  redistribute connected subnets
  network 10.0.0.0 0.255.255.255 area 1
  network 10.2.3.0 0.0.0.255 area 1
```

In the following example, the `show ip ospf interface` command has been entered to verify that LLS has been enabled for Ethernet interface 1/0 and disabled for interface Ethernet 2/0:

```
Router# show ip ospf interface
Ethernet1/0 is up, line protocol is up
  Internet Address 10.2.145.2/24, Area 1
  Process ID 1, Router ID 10.22.222.2, Network Type BROADCAST, Cost: 10
  Transmit Delay is 1 sec, State BDR, Priority 1

OSPF Link-State Database Overload Protection

The OSPF Link-State Database Overload Protection feature allows you to limit the number of nonself-generated link-state advertisements (LSAs) for a given Open Shortest Path First (OSPF) process. Excessive LSAs generated by other routers in the OSPF domain can substantially drain the CPU and memory resources of the router.

- Glossary, page 187
Prerequisites for OSPF Link-State Database Overload Protection

It is presumed you have OSPF running on your network.

Information About OSPF Link-State Database Overload Protection

- Benefits of Using OSPF Link-State Database Overload Protection, page 182
- How OSPF Link-State Database Overload Protection Works, page 182

Benefits of Using OSPF Link-State Database Overload Protection

The OSPF Link-State Database Overload Protection feature provides a mechanism at the OSPF level to limit the number of nonself-generated LSAs for a given OSPF process. When other routers in the network have been misconfigured, they may generate a high volume of LSAs, for instance, to redistribute large numbers of prefixes. This protection mechanism prevents routers from receiving a large number of LSAs and therefore experiencing CPU and memory shortages.

How OSPF Link-State Database Overload Protection Works

When the OSPF Link-State Database Overload Protection feature is enabled, the router keeps a count of the number of received (nonself-generated) LSAs it has received. When the configured threshold number of LSAs is reached, an error message is logged. When the configured maximum number of LSAs is exceeded, the router will send a notification. If the count of received LSAs is still higher than the configured maximum after one minute, the OSPF process takes down all adjacencies and clears the OSPF database. In this ignore state, all OSPF packets received on any interface that belongs to this OSPF process are ignored and no OSPF packets are generated on any of these interfaces. The OSPF process remains in the ignore state for the time configured by the ignore-time keyword of the max-lsa command. Each time the OSPF process gets into an ignore state a counter is incremented. If this counter exceeds the number counts configured by the ignore-count keyword, the OSPF process stays permanently in the same ignore state and manual intervention is required to get the OSPF process out of the ignore state. The ignore state counter is reset to 0 when the OSPF process remains in the normal state of operation for the amount of time that was specified by the reset-time keyword.
If the `warning-only` keyword of the `max-lsa` command has been configured, the OSPF process will send only a warning that the LSA maximum has been exceeded.

## How to Configure OSPF Link-State Database Overload Protection

- Limiting the Number of NonSelf-Generating LSAs for an OSPF Process, page 183

### Limiting the Number of NonSelf-Generating LSAs for an OSPF Process

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router ospf process-id`
4. `router-id ip-address`
5. `log -adjacency-changes [detail]`
6. `max-lsa maximum-number [threshold-percentage] [warning-only] [ignore-time minutes] [ignore-count count-number] [reset-time minutes]`
7. `network ip-address wildcard-mask area area-id`

- Verifying the Number of Nonself-Generated LSAs on a Router, page 184

### Verifying the Number of Nonself-Generated LSAs on a Router

The **show ip ospf** command is entered with the **database-summary** keyword to verify the actual number of nonself-generated LSAs on a router. This command can be used at any given point in time to display lists of information related to the OSPF database for a specific router.

```
Router# show ip ospf 2000 database database-summary
OSPF Router with ID (192.168.1.3) (Process ID 2000)
Area 0 database summary
LSA Type  Count  Delete  Maxage
Router      5       0       0
Network     2       0       0
Summary Net 8       2       2
Summary ASBR 0       0       0
Type-7 Ext  0       0       0
Prefixes redistributed in Type-7  0
Opaque Link 0       0       0
Opaque Area 0       0       0
Subtotal  15       2       2
Process 2000 database summary
LSA Type  Count  Delete  Maxage
Router      5       0       0
```
Configuration Examples for OSPF Link-State Database Overload Protection

- Example Setting a Limit for LSA Generation, page 185

Example Setting a Limit for LSA Generation

In the following example, the router is configured to not accept any more nonself-generated LSAs once a maximum of 14,000 has been exceeded:

Router(config)# router ospf 1
Router(config-router)# router-id 192.168.0.1
Router(config-router)# log-adjacency-changes
Router(config-router)# max-lsa 14000
Router(config-router)# area 33 nssa
Router(config-router)# network 192.168.0.1 0.0.0.0 area 1
Router(config-router)# network 192.168.5.1 0.0.0.0 area 1
Router(config-router)# network 192.168.2.1 0.0.0.0 area 0

In the following example, the show ip ospf command has been entered to confirm the configuration:

Router# show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Maximum number of non self-generated LSA allowed 14000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 10 minutes
  Ignore-count allowed 5, current ignore-count 0
It is an area border and autonomous system boundary router

In the following example, the following output appears when the show ip ospf command has been entered during the time when the router is in the ignore state:

Router# show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Maximum number of non self-generated LSA allowed 14000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 10 minutes
  Ignore-count allowed 5, current ignore-count 1
  Ignoring all neighbors due to max-lsa limit, time remaining: 00:04:52
It is an area border and autonomous system boundary router
The following output appears when the `show ip ospf` command has been entered after the router left the ignore state:

```
Router# show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Maximum number of non self-generated LSA allowed 14000
 Threshold for warning message 75%
 Ignore-time 5 minutes, reset-time 10 minutes
 Ignore-count allowed 5, current ignore-count 1 - time remaining: 00:09:51
 It is an area border and autonomous system boundary router
```

The following output appears when the `show ip ospf` command has been entered for a router that is permanently in the ignore state:

```
Router# show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Maximum number of non self-generated LSA allowed 14000
 Threshold for warning message 75%
 Ignore-time 5 minutes, reset-time 10 minutes
 Ignore-count allowed 5, current ignore-count 6
 Permanently ignoring all neighbors due to max-lsa limit
 It is an area border and autonomous system boundary router
```

OSPF Enhanced Traffic Statistics for OSPFv2 and OSPFv3

This document describes new and modified commands that provide enhanced OSPF traffic statistics for OSPFv2 and OSPFv3. The ability to collect and display more detailed traffic statistics increases high availability for the OSPF network by making the troubleshooting process more efficient.

New OSPF traffic statistics are collected and displayed to include the following information:

- OSPF Hello input queue and OSPF process queue status and statistics.
- Global OSPF traffic statistics.
- Per OSPF interface traffic statistics.
- Per OSPF process traffic statistics.

Finding Feature Information, page 189
Prerequisites for OSPF Enhanced Traffic Statistics, page 189
Information About OSPF Enhanced Traffic Statistics, page 190
How to Display and Clear OSPF Enhanced Traffic Statistics, page 190
Configuration Examples for OSPF Enhanced Traffic Commands, page 191
Additional References, page 195
Feature Information for OSPF Enhanced Traffic Statistics, page 196

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF Enhanced Traffic Statistics

OSPFv2 or OSPFv3 must be configured on the router.
Information About OSPF Enhanced Traffic Statistics

The OSPF enhanced traffic statistics are enabled by default and cannot be disabled. The detailed OSPF traffic statistics are especially beneficial for troubleshooting the following types of OSPF instabilities:

- OSPF process queue status and statistical information can help the network administrator determine if an OSPF process can handle the amount of traffic sent to OSPF.
- OSPF packet header errors and LSA errors statistics keep a record of different errors found in received OSPF packets.

OSPF enhanced traffic control statistics also monitor the amount of traffic control exchanged between OSPF processes—an important consideration in network environments with slow links and frequent topology changes.

How to Display and Clear OSPF Enhanced Traffic Statistics

- Displaying and Clearing OSPF Traffic Statistics for OSPFv2, page 190
- Displaying and Clearing OSPF Traffic Statistics for OSPFv3, page 191

Displaying and Clearing OSPF Traffic Statistics for OSPFv2

Your network must run IPv4 to collect, display and clear detailed traffic statistics for Hello output, process queue status, global OSPF traffic statistics, per OSPF interface traffic statistics and per OSPF process traffic statistics.

SUMMARY STEPS

1. enable
2. show ip ospf [process-id] traffic[interface-type interface-number]
3. clear ip ospf traffic

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong> show ip ospf [process-id] traffic[interface-type interface-number]</td>
<td>Displays OSPFv2 traffic statistics.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# show ip ospf traffic statistics</td>
</tr>
</tbody>
</table>
### Displaying and Clearing OSPF Traffic Statistics for OSPFv3

Your network must run IPv6 to collect, display and clear detailed traffic statistics for Hello output, process queue status, global OSPF traffic statistics, per OSPF interface traffic statistics and per OSPF process traffic statistics.

**SUMMARY STEPS**

1. **enable**
2. **show ipv6 ospf [process-id] traffic[interface-type interface-number]**
3. **clear ipv6 ospf traffic**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| Example:           |         |
| Router> enable     |         |
| **Step 2** show ipv6 ospf [process-id] traffic[interface-type interface-number] | Displays OSPFv3 traffic statistics. |
| Example:           |         |
| Router# show ipv6 ospf traffic statistics |         |
| **Step 3** clear ipv6 ospf traffic | Clears OSPFv3 traffic statistics. |
| Example:           |         |
| Router# clear ipv6 ospf traffic |         |

### Configuration Examples for OSPF Enhanced Traffic Commands
Displaying and Clearing Enhanced Traffic Statistics for OSPFv2 Example

The following example shows display output for the `show ip ospf traffic` command for OSPFv2:

```
Router# show ip ospf traffic
OSPF statistics:
Rcvd: 55 total, 0 checksum errors
    22 hello, 7 database desc, 2 link state req
    6 link state updates, 6 link state acks
Sent: 68 total
    45 hello, 7 database desc, 2 link state req
    10 link state updates, 4 link state acks
    OSPF Router with ID (10.1.1.1) (Process ID 8)
OSPF queues statistic for process ID 8:
    OSPF Hello queue size 0, no limit, drops 0, max size 0
    OSPF Router queue size 0, limit 200, drops 0, max size 0
Interface statistics:
    Interface Ethernet0/0.1
    OSPF packets received/sent
        Type          Packets              Bytes
        RX Invalid    0                    0
        RX Hello      0                    0
        RX DB des     0                    0
        RX LS req     0                    0
        RX LS upd     0                    0
        RX LS ack     0                    0
        RX Total      0                    0

  RX LS ack     6                    344
  RX Total      45                   2296
  TX Failed     0                    0
  TX Hello      31                   2448
  TX DB des     7                    528
  TX LS req     2                    112
  TX LS upd     10                   1048
  TX LS ack     4                    256
The network administrator can issue the `clear ip ospf traffic` command to reset all counters and restart all statistics collections:

```
Router# clear ip ospf traffic
```

### Displaying and Clearing Enhanced Traffic Statistics for OSPFv3 Example

The following example shows display output for the `show ipv6 ospf traffic` command for OSPFv3:

```
Router# show ipv6 ospf traffic

OSPFv3 statistics:
  Rcvd: 32 total, 0 checksum errors
    10 hello, 7 database desc, 2 link state req
    9 link state updates, 4 link state acks
    0 LSA ignored
  Sent: 45 total, 0 failed
    17 hello, 12 database desc, 2 link state req
    8 link state updates, 6 link state acks
OSPFv3 queues statistic for process ID 6
  Hello queue size 0, no limit, max size 2
  Router queue size 0, limit 200, drops 0, max size 2
Interface statistics:
  Interface Serial2/0
    OSPFv3 packets received/sent
    Type          Packets              Bytes

Feature Information for OSPF Enhanced Traffic Statistics

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

OSPF MIB Support of RFC 1850 and Latest Extensions

The OSPF MIB Support of RFC 1850 and Latest Extensions feature introduces the capability for Simple Network Management Protocol (SNMP) monitoring on the Open Shortest Path First (OSPF) routing protocol. Users have an improved ability to constantly monitor the changing state of an OSPF network by use of MIB objects to gather information relating to protocol parameters and trap notification objects that can signal the occurrence of significant network events such as transition state changes. The protocol information collected by the OSPF MIB objects and trap objects can be used to derive statistics that will help monitor and improve overall network performance.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF MIB Support of RFC 1850 and Latest Extensions

- OSPF must be configured on the router.
• Simple Network Management Protocol (SNMP) must be enabled on the router before notifications (traps) can be configured or before SNMP GET operations can be performed.

Restrictions for OSPF MIB Support of RFC 1850 and Latest Extensions

For routers that are running Cisco IOS Release 12.0(26)S, 12.2(25)S, 12.2(27)SBC, 12.2(31)SB2 and later releases, the OSPF MIB and CISCO OSPF MIB will be supported only for the first OSPF process (except for MIB objects that are related to virtual links and sham links, and in cases where support for multiple topologies is provided). SNMP traps will be generated for OSPF events that are related to any of the OSPF processes. There is no workaround for this situation.

Information About OSPF MIB Support of RFC 1850 and Latest Extensions

The following sections contain information about MIB objects standardized as part of RFC 1850 and defined in OSPF-MIB and OSPF-TRAP-MIB. In addition, extensions to RFC 1850 objects are described as defined in the two Cisco private MIBs, CISCO-OSPF-MIB and CISCO-OSPF-TRAP-MIB.

• CISCO OSPF MIB, page 202
• CISCO OSPF TRAP MIB, page 203

OSPF MIB

This section describes the new MIB objects that are provided by RFC 1850 definitions. These OSPF MIB definitions provide additional capacity that is not provided by the standard OSPF MIB that supported the previous RFC 1253. To see a complete set of OSPF MIB objects, see the OSPF-MIB file.

The table below shows the new OSPF-MIB objects that are provided by RFC 1850 definitions. The objects are listed in the order in which they appear within the OSPF-MIB file, per the tables that describe them.

## OSPF TRAP MIB

This section describes scalar objects and MIB objects that are provided to support FRC 1850. The following scalar objects are added to OSPF-TRAP-MIB and are listed in the order in which they appear in the OSPF-TRAP-MIB file:

- OspfExtLsdbLimit
- OspfMulticastExtensions
- OspfExitOverflowInterval
- OspfDemandExtensions

The ospfSetTrap control MIB object contains the OSPF trap MIB objects that enable and disable OSPF traps in the IOS CLI. These OSPF trap MIB objects are provided by the RFC 1850 standard OSPF MIB.

**CISCO OSPF MIB**

This section describes scalar and Cisco-specific OSPF MIB objects that are provided as extensions to
support the RFC 1850 OSPF MIB definitions, to provide capability that the standard MIB cannot provide.

The following scalar objects are added to CISCO-OSPF-MIB:

- cospfRFC1583Compatibility
- cospfOpaqueLsaSupport
- cospfOpaqueASLsaCount
- cospfOpaqueASLsaCksumSum

For each of the following table entries, the new Cisco-specific MIB objects that are provided as extensions
to support the RFC 1850 OSPF MIB definitions are listed. To see the complete set of objects for the Cisco-
specific OSPF MIB, refer to the CISCO-OSPF-MIB file.

The table below shows the new CISCO-OSPF-MIB objects that are provided by RFC 1850 definitions. The
objects are listed in the order in which they appear within the CISCO-OSPF-MIB file, per the tables that
describe them.
### New CISCO-OSPF-MIB Objects

<table>
<thead>

                          | • cospfVirtLocalLsdbSequence   
                          | • cospfVirtLocalLsdbAge        
                          | • cospfVirtLocalLsdbChecksum   
                          | • cospfVirtLocalLsdbAdvertisement |

### CISCO OSPF TRAP MIB

The `cospfSetTrapMIB` object represents trap events in CISCO-OSPF-TRAP-MIB. This is a bit map, where the first bit represents the first trap. The following MIB objects are TRAP events that have been added to OSPF MIB Support of RFC 1850 and Latest Extensions.
support RFC 1850. To see a complete set of Cisco OSPF Trap MIB objects, see the CISCO-OSPF-TRAP-MIB file.

The table below shows the trap events described within the cospfSetTrap MIB object in the CISCO-OSPF-TRAP-MIB:

<table>
<thead>
<tr>
<th>CISCO-OSPF-TRAP-MIB Trap Events</th>
<th>Trap Event Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cospfIfConfigError</td>
<td>This trap is generated for mismatched MTU parameter errors that occur when nonvirtual OSPF neighbors are forming adjacencies.</td>
</tr>
<tr>
<td>cospfVirtIfConfigError</td>
<td>This trap is generated for mismatched MTU parameter errors when virtual OSPF neighbors are forming adjacencies.</td>
</tr>
<tr>
<td>cospfTxRetransmit</td>
<td>This trap is generated in the case of opaque LSAs when packets are sent by a nonvirtual interface. An opaque link-state advertisement (LSA) is used in MPLS traffic engineering to distribute attributes such as capacity and topology of links in a network. The scope of this LSA can be confined to the local network (Type 9, Link-Local), OSPF area (Type 20, Area-Local), or autonomous system (Type 11, AS scope). The information in an opaque LSA can be used by an external application across the OSPF network.</td>
</tr>
<tr>
<td>cospfVirtIfTxRetransmit</td>
<td>This trap is generated in the case of opaque LSAs when packets are sent by a virtual interface.</td>
</tr>
<tr>
<td>cospfOriginateLsa</td>
<td>This trap is generated when a new opaque LSA is originated by the router when a topology change has occurred.</td>
</tr>
<tr>
<td>cospfMaxAgeLsa</td>
<td>The trap is generated in the case of opaque LSAs.</td>
</tr>
<tr>
<td>cospfNssaTranslatorStatusChange</td>
<td>The trap is generated if there is a change in the ability of a router to translate OSPF type-7 LSAs into OSPF type-5 LSAs.</td>
</tr>
</tbody>
</table>

For information about how to enable OSPF MIB traps, see the How to Enable OSPF MIB Support of RFC 1850 and Latest Extensions, page 205.

Benefits of the OSPF MIB

The OSPF MIBs (OSPF-MIB and OSPF-TRAP-MIB) and Cisco private OSPF MIBs (CISCO-OSPF-MIB and CISCO-OSPF-TRAP-MIB) allow network managers to more effectively monitor the OSPF routing protocol through the addition of new table objects and trap notification objects that previously were not supported by the RFC 1253 OSPF MIB.
New CLI commands have been added to enable SNMP notifications for OSPF MIB support objects, Cisco-specific errors, retransmission and state-change traps. The SNMP notifications are provided for errors and other significant event information for the OSPF network.

How to Enable OSPF MIB Support of RFC 1850 and Latest Extensions

- Enabling OSPF MIB Support, page 205
- Enabling Specific OSPF Traps, page 207
- Verifying OSPF MIB Traps on the Router, page 209

Enabling OSPF MIB Support

Before the OSPF MIB Support of RFC 1850 and Latest Extensions feature can be used, the SNMP server for the router must be configured.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `snmp-server community string1 ro`
4. `snmp-server community string2 rw`
5. `snmp-server host {hostname | ip-address} [vrf vrf-name] [traps | informs] [version {1 | 2c | 3 [auth | noauth | priv]}] community-string [udp-port port] [notification-type]`
6. `snmp-server enable traps ospf`
7. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 3</strong> snmp-server community string1 ro</td>
<td>Enables read access to all objects in the MIB, but does not allow access to the community strings.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# snmp-server community public ro</td>
</tr>
<tr>
<td><strong>Step 4</strong> snmp-server community string2 rw</td>
<td>Enables read and write access to all objects in the MIB, but does not allow access to the community strings.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# snmp-server community private rw</td>
</tr>
<tr>
<td><strong>Step 5</strong> snmp-server host {hostname</td>
<td>ip-address} [vrf vrf-name] [traps</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# snmp-server host 172.20.2.162 version 2c public ospf</td>
</tr>
<tr>
<td><strong>Step 6</strong> snmp-server enable traps ospf</td>
<td>Enables all SNMP notifications defined in the OSPF MIBs.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# snmp-server enable traps ospf</td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Ends your configuration session and exits global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# end</td>
</tr>
</tbody>
</table>

**What to Do Next**

If you did not want to enable all OSPF traps, follow the steps in the following section to selectively enable one or more type of OSPF trap:
Enabling Specific OSPF Traps

**SUMMARY STEPS**

1. enable
2. configure terminal
3. snmp-server enable traps ospf cisco-specific errors [config-error] [virt-config-error]
4. snmp-server enable traps ospf cisco-specific retransmit [packets] [virt-packets]
5. snmp-server enable traps ospf cisco-specific state-change [nssa-trans-change] [shamlink-state-change]
6. snmp-server enable traps ospf cisco-specific lsa [lsa-maxage] [lsa-originate]
7. snmp-server enable traps ospf errors [authentication-failure] [bad-packet] [config-error] [virt-authentication-failure] [virt-config-error]
8. snmp-server enable traps ospf lsa [lsa-maxage] [lsa-originate]
9. snmp-server enable traps ospf rate-limit seconds trap-number
10. snmp-server enable traps ospf retransmit [packets] [virt-packets]
11. snmp-server enable traps ospf state-change [if-state-change] [neighbor-state-change] [virtif-state-change] [virtneighbor-state-change]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. • Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> snmp-server enable traps ospf cisco-specific errors [config-error] [virt-config-error]</td>
<td>Enables SNMP notifications for Cisco-specific OSPF configuration mismatch errors. • Entering the <code>snmp-server enable traps ospf cisco-specific errors</code> command with the optional <code>virt-config-error</code> keyword enables only the SNMP notifications for configuration mismatch errors on virtual interfaces.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# snmp-server enable traps ospf cisco-specific errors config-error</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

| Step 4 | snmp-server enable traps ospf cisco-specific retransmit [packets] [virt-packets] |
| Purpose | Enables error traps for Cisco-specific OSPF errors that involve re-sent packets. |
| | • Entering the `snmp-server enable traps ospf cisco-specific retransmit` command with the optional `virt-packets` keyword enables only the SNMP notifications for packets that are re-sent on virtual interfaces. |

### Example:

```
Router(config)# snmp-server enable traps ospf cisco-specific retransmit packets virt-packets
```  

| Step 5 | snmp-server enable traps ospf cisco-specific state-change [nssa-trans-change] [shamlink-state-change] |
| Purpose | Enables all error traps for Cisco-specific OSPF transition state changes. |

### Example:

```
Router(config)# snmp-server enable traps ospf cisco-specific state-change
```  

| Step 6 | snmp-server enable traps ospf cisco-specific lsa [lsa-maxage] [lsa-originate] |
| Purpose | Enables error traps for opaque LSAs. |

### Example:

```
Router(config)# snmp-server enable traps ospf cisco-specific lsa
```  

| Step 7 | snmp-server enable traps ospf errors [authentication-failure] [bad-packet] [config-error] [virt-authentication-failure] [virt-config-error] |
| Purpose | Enables error traps for OSPF configuration errors. |
| | • Entering the `snmp-server enable traps ospf errors` command with the optional `virt-config-error` keyword enables only the SNMP notifications for OSPF configuration errors on virtual interfaces. |

### Example:

```
Router(config)# snmp-server enable traps ospf errors virt-config-error
```  

| Step 8 | snmp-server enable traps ospf lsa [lsa-maxage] [lsa-originate] |
| Purpose | Enables error traps for OSPF LSA errors. |

### Example:

```
Router(config)# snmp-server enable traps ospf lsa
```  

| Step 9 | snmp-server enable traps ospf rate-limit `seconds trap-number` |
| Purpose | Sets the rate limit for how many SNMP OSPF notifications are sent in each OSPF SNMP notification rate-limit window. |

### Example:

```
Router(config)# snmp-server enable traps ospf rate-limit 20 20
```
### Verifying OSPF MIB Traps on the Router

**SUMMARY STEPS**

1. enable
2. `show running-config options`

Configuration Examples for OSPF MIB Support of RFC 1850 and Latest Extensions

- Example Enabling and Verifying OSPF MIB Support Traps, page 210

Example Enabling and Verifying OSPF MIB Support Traps

The following example enables all OSPF traps.

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# snmp-server enable traps ospf
Router(config)# end

The show running-config command is entered to verify that the traps are enabled:

Router# show running-config | include traps
snmp-server enable traps ospf

Where to Go Next

For more information about SNMP and SNMP operations, see the "Configuring SNMP Support" chapter of the Cisco IOS Configuration Fundamentals and Network Management Configuration Guide, Release 12.2.

SNMP ifIndex Value for Interface ID in OSPFv2 and OSPFv3 Data Fields

This document describes the configuration command that allows you to use either the current interface number or the SNMP MIB-II interface index (ifIndex) value for the interface ID in OSPFv2 and OSPFv3 data fields. The advantage to using the SNMP MIB-II ifIndex value is that this number corresponds to the number that the user will see reported by SNMP.

- Finding Feature Information, page 213
- Prerequisites for Interface ID in Data Fields, page 213
- Information About Interface ID in Data Fields, page 213
- How to Configure the Interface ID in Data Fields, page 214
- Configuration Examples for the Interface ID in Data Fields, page 216
- Additional References, page 220

- Glossary, page 221

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Interface ID in Data Fields

OSPF must be configured on the router.

Information About Interface ID in Data Fields

Before choosing to switch from the current interface numbers to the SNMP MIB-II interface ID numbers, you should understand the following concepts:

- Benefits of Choosing to Identify Interfaces by the SNMP MIB-II ifIndex Value, page 214
- How OSPFv2 and OSPFv3 Use the SNMP MIB-II ifIndex Value, page 214
Benefits of Choosing to Identify Interfaces by the SNMP MIB-II ifIndex Value

If you use Simple Network Management Protocol (SNMP) for your OSPF network, configuring the OSPF: SNMP ifIndex Value for Interface ID in OSPFv2 and OSPFv3 Data Fields feature can be beneficial for the following reasons:

- Using the SNMP MIB-II ifIndex (interface index) identification numbers to identify OSPF interfaces makes it easier for network administrators to identify interfaces because the numbers will correspond to the numbers that they will see reported by SNMP.
- When examining link-state advertisements (LSAs), the value used in fields that have the interface ID will be the same as the value that is reported by SNMP.
- When looking at the output of the `show ipv6 ospf interface` command, the interface ID number will have the same value that is reported by SNMP.
- Using the SNMP MIB-II IfIndex is also suggested, but not required, by the OSPF RFC 2328 for OSPFv2 and the RFC 2740 for OSPFv3.

How OSPFv2 and OSPFv3 Use the SNMP MIB-II ifIndex Value

The user chooses for OSPF interfaces to use the SNMP MIB-II ifIndex number by entering the `interface-id snmp-if-index` command for a specific OSPF process. If an interface under the specific OSPF process does not have an SNMP ifIndex number, OSPF will not be enabled on that interface.

For OSPFv2, the ifIndex number is used for the Link Data field in the Router LSA for unnumbered point-to-point interfaces and sham links. When the `interface-id snmp-if-index` command is entered, the affected LSAs will immediately be reoriginated.

For OSPFv3, the ifIndex number is used for the interface ID in router LSAs, as the LSID in Network and Link LSAs, and also as the interface ID in Hello packets. Intra-Area-Prefix LSAs that reference Network LSAs have the network LSAs LSID in the Referenced LSID field, so they will also be updated when the `interface-id snmp-if-index` command is entered. The old Network, Link and Intra-Area-Prefix LSAs that are associated with a Network LSA will be flushed.

For both OSPFv2 and OSPFv3, adjacencies are not flapped, except for affected OSPFv3 demand circuits (including virtual links) with full adjacencies.

For both OSPFv2 and OSPFv3, if an interface does not have an SNMP ifIndex number and an interface ID is needed (for OSPFv2 this applies only to unnumbered interfaces and sham links), an error message will be generated and the interface will be disabled. The interface will be reenabled if the no `interface-id snmp-if-index` command is entered.

How to Configure the Interface ID in Data Fields

- Using SNMP MIB-II ifIndex Numbers, page 214

Using SNMP MIB-II ifIndex Numbers

Follow the steps in this task to configure OSPF interfaces to use the SNMP MIB-II ifIndex numbers. These steps work for both OSPFv2 and OSPFv3. All OSPF interfaces must use the SNMP MIB-II ifIndex...
numbers or the interfaces will not be enabled for OSPF. Therefore, repeat the steps within this task for each OSPF process for which you want the interfaces to use the SNMP MIB-II ifIndex numbers.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. Do one of the following:
   - `router ospf process-id [vrf vpn-name]`
   - `ipv6 router ospf process-id`
4. interface-id snmp-if-index
5. end
6. show snmp mib ifmib ifindex [interface-type] [slot l][port-adapter l][port]

**DETAILED STEPS**

### Command or Action

**Step 4** interface-id snmp-if-index

**Example:**

```
Router(config-router)# interface-id snmp-if-index
```

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures OSPF interfaces with the SNMP interface index identification numbers (ifIndex values).</td>
</tr>
</tbody>
</table>

**Step 5** end

**Example:**

```
Router(config-router)# end
```

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Step 6** show snmp mib ifmib ifindex [interface-type] [slot ]/ [port-adapter ]/ [port ]

**Example:**

```
Router# show snmp mib ifmib ifindex Ethernet 0/1
```

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays SNMP interface index identification numbers (ifIndex values) for all the system interfaces or the specified system interface.</td>
</tr>
</tbody>
</table>

### Configuration Examples for the Interface ID in Data Fields

- Configuring the SNMP ifIndex Value for Interface ID for OSPFv2 Example, page 216
- Configuring the SNMP ifIndex Value for Interface ID for OSPFv3 Example, page 217

### Configuring the SNMP ifIndex Value for Interface ID for OSPFv2 Example

The following example configures the OSPF interfaces to use the SNMP ifIndex values for the interfaces IDs. The `show snmp mib ifmib ifindex` command confirms that the SNMP MIB-II ifIndex values are used for the Interface ID values in the OSPFv2 data fields.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# router ospf 1
Router(config-router)# interface-id snmp-if-index
Router(config-router)# *Z
Router# show ip ospf 1 1 data router self
OSPF Router with ID (172.16.0.1) (Process ID 1)
    Router Link States (Area 1)
    LS age: 6
    Options: (No TOS-capability, DC)
    LS Type: Router Links
    Link State ID: 172.16.0.1
    Advertising Router: 172.16.0.1
    LS Seq Number: 80000007
    Checksum: 0x63AF
    Length: 48
    Area Border Router
    Number of Links: 2
    Link connected to: another Router (point-to-point)
    (Link ID) Neighboring Router ID: 172.17.0.1
```
Configuring the SNMP ifIndex Value for Interface ID for OSPFv3 Example

The following example configures the OSPFv3 interfaces to use the SNMP ifIndex values for the interface IDs.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ipv6 router ospf 1
Router(config-router)# interface-id snmp-if-index
```

The output from the `show snmp mib ifmib ifindex` command confirms that the SNMP MIB-II ifIndex values are being used for the Interface ID values in the OSPFv3 data fields.

```
Router# show snmp mib ifmib ifindex Ethernet1/0
Ethernet1/0: Ifindex = 5
Router#
Router# show ipv6 ospf int

Glossary

SNMP --Simple Network Management Protocol (SNMP) is an application layer protocol that facilitates the exchange of management information between network devices. It is part of the Transmission Control Protocol/Internet Protocol (TCP/IP) protocol suite.

OSPF RFC 3623 Graceful Restart Helper Mode

This document focuses on Nonstop Forwarding (NSF) helper mode for OSPFv2 in Cisco IOS software, using IETF standardized graceful restart helper mode functionality as described in RFC 3623, Graceful OSPF Restart. Graceful restart helper mode functionality, which is enabled by default, is useful for multiplatform network environments where helper mode routers on some platforms can assist restarting routers on mixed platforms that support OSPF graceful restart mode as well as helper mode.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF RFC 3623 Graceful Restart Helper Mode

- OSPF must be configured on the router.

Restrictions for OSPF RFC 3623 Graceful Restart Helper Mode

- IETF Graceful Restart is not supported over sham-links.
Information About OSPF RFC 3623 Graceful Restart Helper Mode

- Cisco NSF Routing and Forwarding Operation, page 224
- Cisco Express Forwarding for NSF, page 224
- OSPF Graceful Restart Helper Mode Functionality per RFC 3623, page 225

Cisco NSF Routing and Forwarding Operation

Prior to RFC 3623 Cisco implemented the Cisco proprietary NSF referred to as Cisco NSF. Users can configure either Cisco or RFC 3623 IETF NSF, depending on which versions are supported by the Cisco IOS software version running on the network. If the software version supports both types of NSF, you need to configure all routers with the same type of NSF.

Cisco NSF is supported by the BGP, EIGRP, OSPF, and IS-IS protocols for routing and by Cisco Express Forwarding (CEF) for forwarding. The BGP, EIGRP, OSPF, and IS-IS routing protocols have been enhanced with NSF capability and awareness, which means that routers that run these protocols can detect a switchover and take the necessary actions to continue forwarding network traffic and to recover route information from the neighbor routers.

In this document, a networking device is said to be NSF-aware if it is running NSF-compatible software. A device is said to be NSF-capable if it has been configured to support NSF; therefore, it would rebuild routing information from NSF-aware or NSF-capable neighbors. The NSF router mode of operation common to the Cisco and IETF NSF implementations is as follows:

- Restarting Mode--Also known as IETF NSF-restarting mode or graceful-restarting mode. In this mode, the OSPF router process is performing non-stop forwarding recovery because of an RP switchover; this may result from an RP crash or a software upgrade on the active RP.
- Helper Mode--Also known as IETF NSF-awareness. In this mode, the neighboring router is restarting and helping in the NSF recovery.

For more information about OSPF RFC 3623 Graceful Restart, see http://www.ietf.org/rfc/rfc3623.txt.

Cisco Express Forwarding for NSF

A key element of NSF is packet forwarding. The OSPF protocol depends on CEF to continue forwarding packets during switchover while the routing protocols rebuild the Routing Information Base (RIB) tables. Once OSPF has converged, CEF updates the Forwarding Information Base (FIB) table and removes stale route entries. CEF then updates the line cards with the new FIB information. CEF maintains the FIB and uses the FIB information that was current at the time of a switchover to continue forwarding packets during the switchover. This feature reduces traffic interruption during the switchover.

During normal NSF operation, CEF on the active RP synchronizes its current FIB and adjacency databases with the FIB and adjacency databases on the standby RP. Upon switchover of the active RP, the standby RP initially has FIB and adjacency databases that are mirror images of those that were current on the active RP. For platforms with intelligent line cards, the line cards maintain the current forwarding information over a switchover; for platforms with forwarding engines, CEF keeps the forwarding engine on the standby RP current with changes that are sent to it by CEF on the active RP. In this way, the line cards or forwarding engines can continue forwarding after a switchover as soon as the interfaces and a data path are available.
As the OSPF routing protocol starts to repopulate the RIB on a prefix-by-prefix basis, the updates in turn cause prefix-by-prefix updates that CEF uses to update the FIB and adjacency databases. Existing and new entries receive the new version number, indicating that they have been refreshed. The forwarding information is updated on the line cards or forwarding engines during convergence. The RP signals when the RIB has converged. The software removes all FIB and adjacency entries that have an epoch older than the current switchover epoch. The FIB now represents the newest routing protocol forwarding information.

The OSPF routing protocol runs on only the active RP, and OSPF receives routing updates from OSPF neighbor routers. The OSPF routing protocol does not run on the standby RP. Following a switchover, OSPF requests that the NSF-aware neighbor devices send state information to help rebuild the routing tables.

Note
For NSF operation, OSPF depends on CEF to continue forwarding packets while OSPF rebuilds the routing information.

OSPF Graceful Restart Helper Mode Functionality per RFC 3623

Helper Mode Initiation
When a neighbor router that is on the same network segment as the restarting router receives a grace-LSA from the restarting router, the neighbor enters helper mode as long as the following criteria are met:

- The neighbor must have a full adjacency with the restarting router over the associated network segment.
- There have been no changes to the link-state database since the restarting router began restarting.
- The grace period has not yet expired.
- Local policy allows the neighbor router to act as a helper router.
- The neighbor router must not be in its own graceful restart process.
- Helper mode for this router has not been disabled by the network administrator.

Helper Mode Exit
The helper router stops performing helper mode for its neighbor when one of the following events occur:

- The grace-LSA that was originated by the restarting router is flushed, to signify that the restarting router has exited the graceful restart process successfully.
- The grace period of the grace-LSA expires.
- A change in link-state database contents indicates a network topology change, forcing the termination of the graceful restart process.

For complete information about graceful restart functionality, see RFC 3623 at http://www.ietf.org/rfc/rfc3623.txt.

The OSPF RFC 3623 Graceful Restart Helper Mode feature is enabled by default. Disabling this feature is not recommended because the disabled neighbor will detect the lost adjacency and the graceful restart process will be terminated on the restarting neighbor router.

The strict LSA checking feature allows a helper router to terminate the graceful restart process if it detects a changed LSA that would cause flooding during the graceful restart process. Strict LSA checking is disabled by default. You can enable strict LSA checking when there is a change to an LSA that would be flooded to the restarting router. You can configure strict LSA checking on both NSF-aware and NSF-capable routers; however, it becomes effective only when the router is in helper mode.
How to Use OSPF RFC 3623 Graceful Restart Helper Mode

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf process-id [vrf vpn-name]
4. nsf ietf helper disable
5. nsf ietf helper strict-lsa-checking
6. end
7. show ip ospf [process-id]

OSPF Mechanism to Exclude Connected IP Prefixes from LSA Advertisements

This document describes the Open Shortest Path First (OSPF) mechanism to exclude IP prefixes of connected networks from link-state advertisements (LSAs). When OSPF is deployed in large networks, limiting the number of IP prefixes that are carried in the OSPF LSAs can speed up OSPF convergence. This feature can also be utilized to enhance the security of an OSPF network by allowing the network administrator to prevent IP routing toward internal nodes.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Excluding Connected IP Prefixes from LSAs

Before you can use the mechanism to exclude IP prefixes from LSAs, the OSPF routing protocol must be configured.

Information About Excluding Connected IP Prefixes from LSAs

One way to improve OSPF network convergence is to limit the number of IP prefixes carried in LSAs.
• Previous Methods to Limit the Number of IP Prefixes Carried in LSAs, page 232
• Feature Overview, page 232

Previous Methods to Limit the Number of IP Prefixes Carried in LSAs

Configuring interfaces as unnumbered limits IP prefixes. However, for network management and the ease of identifying and troubleshooting numbered interfaces, you might want to have numbered interfaces and also want to limit the number of IP advertisements.

Feature Overview

The OSPF mechanism to exclude connected IP prefixes from LSAs allows network administrators to control what IP prefixes are installed into LSAs. This functionality is implemented for router and network LSAs in the following manner:

• For the router LSA, to exclude prefixes, the feature excludes link type 3 (stub link).
• For the network LSA, the OSPF Designated Router (DR) generates LSAs with a special /32 network mask (0xFFFFFFFF).

Note Previous versions of Cisco IOS software that do not have this feature will install the /32 prefix into the routing table.

Globally Suppressing IP Prefix Advertisements per OSPF Process

You can reduce OSPF convergence time by configuring the OSPF process on a router to prevent the advertisement of all IP prefixes by using the `prefix-suppression` command in router configuration mode.

Note Prefixes that are associated with loopbacks, secondary IP addresses, and passive interfaces are excluded because typical network designs require those to remain reachable.

Suppressing IP Prefix Advertisements on a Per-Interface Basis

You can explicitly configure an OSPF interface not to advertise its IP network to its neighbors by using the `ip ospf prefix-suppression` command in interface configuration mode.

Note If you have globally suppressed IP prefixes from connected IP networks by configuring the `prefix-suppression` router configuration command, the interface configuration command takes precedence over the router configuration mode command.

How to Exclude Connected IP Prefixes from OSPF LSAs

This section describes how to configure two alternative methods to suppress IP prefix advertisements. You can suppress IP prefix advertisements per OSPF process or per interface. This section also explains how you can troubleshoot IP prefix suppression.
### Excluding IP Prefixes per OSPF Process

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router ospf process-id [vrf vpn-name]`
4. `prefix-suppression`
5. `end`
6. `show ip ospf`

**DETAILED STEPS**

<table>
<thead>
<tr>

</table>
### Command or Action | Purpose
--- | ---
Step 5 end | Returns to privileged EXEC mode.

**Example:**

```
Router(config-router)# end
```

Step 6 show ip ospf | Displays general information about OSPF routing processes.

**Example:**

```
Router# show ip ospf
```

**Note** Use this command to verify that IP prefix suppression has been enabled.

### Examples

In the following example, output from the `show ip ospf` command shows that IP prefix advertisement has been suppressed for OSPF process 1.

```
Router# show ip ospf
Routing Process "ospf 1" with ID 10.0.0.6
Start time: 00:00:04.912, Time elapsed: 00:02:35.184
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
It is an area border router
Router is not originating router-LSAs with maximum metric
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPF s 10000 msecs
Maximum wait time between two consecutive SPF s 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 2. Checksum Sum 0x0132C8
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Number of areas transit capable is 1
External flood list length 0
IETF NSF helper support enabled
Cisco NSF helper support enabled
Prefix-suppression is enabled
```
Excluding IP Prefixes on a Per-Interface Basis

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `ip ospf prefix-suppression [disable]`
5. `end`
6. `show ip ospf interface`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1 enable</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2 configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3 interface type number</strong></td>
<td>Configures an interface type and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# interface serial 0/0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4 ip ospf prefix-suppression [disable]</strong></td>
<td>Prevents OSPF from advertising IP prefixes that belong to a specific interface, except those that are associated with secondary IP addresses.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip ospf prefix-suppression</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> When you enter the <code>ip ospf prefix-suppression</code> command in interface configuration mode, it takes precedence over the <code>prefix-suppression</code> command that is entered in router configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5 end</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
**Step 6**  show ip ospf interface | Displays OSPF-related interface information.  
**Note** Use this command to verify that IP prefix suppression has been enabled for a specific interface.

**Example:**
```
Router# show ip ospf interface
```

### Examples
In the following example, the output from the `show ip ospf interface` command verifies that prefix suppression has been enabled for Ethernet interface 0/0.

```
Router# show ip ospf interface
Ethernet0/0 is up, line protocol is up  
Internet Address 192.168.130.2/24, Area 2  
Process ID 1, Router ID 10.0.0.6, Network Type BROADCAST, Cost: 10  
Prefix-suppression is enabled
```

### Troubleshooting IP Prefix Suppression

#### SUMMARY STEPS

1. enable  
2. debug ip ospf lsa-generation  
3. debug condition interface interface-type interface-number [dlci dlci] [vc {vci | vpi | vci}]  
4. show debugging  
5. show logging [slot slot-number | summary]

#### DETAILED STEPS

| Command or Action | Purpose |
--- | ---|
**Step 1**  enable | Enables privileged EXEC mode.  
• Enter your password if prompted.

**Example:**
```
Router> enable
```

**Step 2**  debug ip ospf lsa-generation | Displays informations about each OSPF LSA generated.

**Example:**
```
Router# debug ip ospf lsa-generation
```
### Command or Action

| Step 3 | debug condition interface interface-type interface-number [dlci dlci] [vc {vci | vpi | vci}] |
|---|---|
| Purpose | Limits output for some debug commands on the basis of the interface or virtual circuit. |

**Example:**

Router# debug interface serial 0/0

<table>
<thead>
<tr>
<th>Step 4</th>
<th>show debugging</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>Displays information about the types of debugging that are enabled for your router.</td>
</tr>
</tbody>
</table>

**Example:**

Router# show debugging

| Step 5 | show logging [slot slot-number | summary] |
|---|---|
| Purpose | Displays the state of syslog and the contents of the standard system logging buffer. |

**Example:**

Router# show logging

**Examples**

The following sample output from the debug ip ospf lsa-generation command verifies that for the Ethernet interface 0/0, IP prefixes from the connected network 192.168.131.0 are excluded.

**Router# debug ip ospf lsa-generation**

OSPF summary lsa generation debugging is on
Condition 1 set
Router# show debugging

**IP routing:**
- OSPF summary lsa generation debugging is on
- Condition 1: interface Et0/0 (1 flags triggered)
- Flags: Et0/0

Router# show logging
*Jun 5 21:54:47.295: OSPF: Suppressing 192.168.131.0/24 on Ethernet1/0 from router LSA
*Jun 5 21:54:52.355: OSPF: Suppressing 192.168.131.0/24 on Ethernet1/0 from router LSA

**Configuration Examples for Excluding Connected IP Prefixes from LSAs**

- Excluding IP Prefixes from LSAs for an OSPF Process Example, page 238
- Excluding IP Prefixes from LSAs for a Specified Interface Example, page 238
Excluding IP Prefixes from LSAs for an OSPF Process Example

The following example configures IP prefix suppression for OSPF routing process 23.

```
router ospf 23
  prefix-suppression
end
```

When the `show ip ospf` command is entered, the displayed output verifies that IP prefix suppression has been enabled for OSPF process 23.

```
Router# show ip ospf
outgoing Process "ospf 23" with ID 10.0.0.6
Start time: 00:00:04.912, Time elapsed: 00:02:35.184
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
It is an area border router
Router is not originating router-LSAs with maximum metric
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 2. Checksum Sum 0x0132C8
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Number of areas transit capable is 1
External flood list length 0
IETF NSF helper support enabled
Cisco NSF helper support enabled
Prefix-suppression is enabled

```

Excluding IP Prefixes from LSAs for a Specified Interface Example

The following example configures the suppression of all IP prefixes that are associated with Ethernet interface 0/0:

```
interface Ethernet 0/0
  ip ospf prefix-suppression
end
```

When the `show ip ospf interface` command is entered, the displayed output verifies that IP prefix suppression is enabled for Ethernet interface 0/0.

```
Router# show ip ospf interface
Ethernet0/0 is up, line protocol is up
  Internet Address 192.168.130.2/24, Area 2
  Process ID 1, Router ID 10.0.0.6, Network Type BROADCAST, Cost: 10
  Prefix-suppression is enabled
```

Excluding IP Prefixes from LSAs for an OSPF Process Example

**Glossary**

**network LSA** --The link-state advertisement created by the designated router (DR) or pseudonode that represents a group of routers on the same interface. The network LSA advertises summary information to represent the group of routers on the network.

**router LSA** --The link-state advertisement that is generated by a router. The router LSA advertises routing information (connected routes) for the router.

OSPFv2 Local RIB

With the OSPFv2 Local RIB feature, each OSPF protocol instance has its own local Routing Information Base (RIB). The OSPF local RIB serves as the primary state for OSPF SPF route computation. The global RIB is not updated with intermediate results during the SPF. Instead, the global RIB is updated only when routes are added, deleted, or changed, thereby reducing global RIB computation. This reduced update activity may result in fewer dropped packets.

This feature is enabled by default and does not need to be configured. This document describes some optional configuration tasks to modify how the global and local RIBs function, although it is recommended to keep the default settings.

- Finding Feature Information, page 241
- Prerequisites for OSPFv2 Local RIB, page 241
- Restrictions for OSPFv2 Local RIB, page 241
- Information About OSPFv2 Local RIB, page 242
- How to Configure the OSPFv2 Local RIB Feature, page 242
- Configuration Examples for the OSPFv2 Local RIB Feature, page 246
- Additional References, page 246

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPFv2 Local RIB

Before this feature is configured, the OSPF routing protocol must be configured.

Restrictions for OSPFv2 Local RIB

This feature is available only for IP Version 4 networks.
Information About OSPFv2 Local RIB

- Function of the OSPF Local RIB, page 242

Function of the OSPF Local RIB

A router that is running OSPFv2 maintains a local RIB in which it stores all routes to destinations that it has learned from its neighbors. At the end of each SPF, OSPF attempts to install the best (that is, the least-cost) routes to a destination present in the local RIB into the global IPv4 routing table. The global RIB will be updated only when routes are added, deleted, or changed. Routes in the local RIB and Forwarding Information Base (FIB) will not compute when intermediate results are computed during SPF, resulting in fewer dropped packets in some circumstances.

By default, OSPF installs discard routes to null0 for any area range (internal) or summary-address (external) prefixes that it advertises to other routers. Installation of a discard route can prevent routing loops in cases where portions of a summary do not have a more specific route in the RIB. Normally, internal discard routes are installed with an administrative distance of 110, while external discard routes have an administrative distance of 254.

There may be rare circumstances, however, when some other values are needed. For example, if one OSPF process installs a route that exactly matches an area range configured on another OSPF process, the internal discard routes for the second OSPF process could be given a higher (less desirable) administrative distance. By default, the contents of the global RIB are used to compute inter-area summaries, NSSA translation, and forwarding addresses for type-5 and type-7 LSAs. Each of these functions can be configured to use the contents of the OSPF local RIB instead of the global RIB for their computation. Using the local RIB for the computation may be slightly faster in some circumstances, but because the local RIB has information for only a particular instance of OSPF, using it for the computation may yield incorrect results. Potential problems that may occur include routing loops and black-hole routes.

How to Configure the OSPFv2 Local RIB Feature

Although it is recommended to keep the default settings for the commands described in the following sections, it is optional to change the defaults settings. This section describes the following optional tasks:

- Changing the Default Local RIB Criteria, page 242
- Changing the Administrative Distance for Discard Routes, page 244

Changing the Default Local RIB Criteria

Note

It is recommended that you not change the default values because they are conservative and preserve the current global RIB behavior.
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router ospf process-id [vrf vpn-name]`
4. `local-rib-criteria [forwarding-address] [inter-area-summary] [nssa-translation]`
5. `end`
6. `show ip ospf process-id rib [redistribution] [network-prefix] [network-mask] [detail]`

### DETAILED STEPS

</tbody>
</table>
Command or Action | Purpose
--- | ---
**Step 6**  
`show ip ospf process-id rib [redistribution] [network-prefix] [network-mask] [detail]` | Displays information for the OSPF local RIB or locally redistributed routes.

**Example:**

```
Router# show ip ospf 23 rib
```

---

### Changing the Administrative Distance for Discard Routes

**Note**  
It is recommended to keep the default settings, but you can follow the steps in this section to change the administrative distance for discard routes.

---

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router ospf process-id [vrf vpn-name]`
4. `discard-route [external [distance]] [internal [distance]]`
5. `end`
6. `show ip route [ip-address [mask] [longer-prefixes] [protocol [process-id]] [list [access-list-number | access-list-name] | static download]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** `enable` | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Example:**

```
Router> enable
```

| **Step 2** `configure terminal` | Enters global configuration mode. |
| **Example:**

```
Router# configure terminal
```
### Command or Action

<table>
<thead>
<tr>
<th>Step 3</th>
<th>router ospf process-id [vrf vpn-name]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# router ospf 23</td>
</tr>
</tbody>
</table>

**Purpose:** Configures an OSPFv2 routing process and enters router configuration mode.

<table>
<thead>
<tr>
<th>Step 4</th>
<th>discard-route [external [distance]] [internal [distance]]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-router)# discard-route external 150</td>
</tr>
</tbody>
</table>

**Purpose:** Reinstalls either an external or internal discard route that was previously removed.

**Note:** You can now specify the administrative distance for internal and external discard routes.

<table>
<thead>
<tr>
<th>Step 5</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-router)# end</td>
</tr>
</tbody>
</table>

**Purpose:** Returns to privileged EXEC mode.

| Step 6 | show ip route [ip-address [mask] [longer-prefixes] [protocol [process-id] | list [access-list-number | access-list-name] | static download] |
|--------|-------------------------------------------------|
| **Example:** | Router# show ip route ospf 23 |

**Purpose:** Displays the current state of the routing table.

**Note:** Entering the `show ip route` command will verify the changed administrative distance values for external and internal discard routes.

---

**Examples**

The sample output displayed for the `show ip route` command confirms that the administrative distance for the IP route 192.168.0.0 255.255.255.0 is 110.

```
Router# show ip route 192.168.0.0 255.255.255.0
```

Routing entry for 192.168.0.0/24

**Known via "ospf 1", distance 110, metric 0, type intra area**

Routing Descriptor Blocks:

- directly connected, via Null0
  - Route metric is 0, traffic share count is 1

- **Troubleshooting Tips, page 245**

---

**Troubleshooting Tips**

You can research the output from the `debug ip ospf rib` command to learn about the function of the local RIB and the interaction between the route redistribution process and the global RIB. For example, you can learn why the routes that OSPF placed in the global RIB are not the same ones that you anticipated.
Configuration Examples for the OSPFv2 Local RIB Feature

- Example: Changing the Default Local RIB Criteria, page 246
- Example: Changing the Administrative Distance for Discard Routes, page 246

Example: Changing the Default Local RIB Criteria

In the following example, the `local-rib-criteria` command is entered without any keywords to specify that the local RIB will be used as criteria for all of the following options: forwarding address, inter-area summary, and NSSA translation.

```
router ospf 1
router-id 10.0.0.6
local-rib-criteria
```

Example: Changing the Administrative Distance for Discard Routes

In the following example, the administrative distance for external and internal discard routes is set to 25 and 30, respectively.

```
router ospf 1
router-id 10.0.0.6
log-adjacency-changes
discard-route external 25 internal 30
area 4 range 10.2.0.0 255.255.0.0
summary-address 192.168.130.2 255.255.255.0
redistribute static subnets
    network 192.168.129.2 0.255.255.255 area 0
network 192.168.130.12 0.255.255.255 area 0
```

The output from the `show ip route` command verifies that the administrative distance for the internal route 10.2.0.0/16 is set to 30.

```
Router# show ip route 10.2.0.0 255.255.0.0
Routing entry for 10.2.0.0/16
Known via "ospf 1", distance 30, metric 1, type intra area
  Routing Descriptor Blocks:
* directly connected, via Null0
   Route metric is 1, traffic share count is 1
```

The output from the `show ip route` command verifies that the administrative distance for the external route 192.168.130.2/24 is set to 25.

```
Router# show ip route 192.168.130.2 255.255.255.0
Routing entry for 192.168.130.2/24
Known via "ospf 1", distance 25, metric 20, type intra area
  Routing Descriptor Blocks:
* directly connected, via Null0
   Route metric is 20, traffic share count is 1
```

## Feature Information for the OSPFv2 Local RIB Feature

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software
release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
