Chapter 1

Configuring OSPF

This module describes how to configure Open Shortest Path First (OSPF). OSPF is an Interior Gateway Protocol (IGP) developed by the OSPF working group of the Internet Engineering Task Force (IETF). OSPF was designed expressly for IP networks and it supports IP subnetting and tagging of externally derived routing information. OSPF also allows packet authentication and uses IP multicast when sending and receiving packets.

Cisco supports RFC 1253, OSPF Version 2 Management Information Base, August 1991. The OSPF MIB defines an IP routing protocol that provides management information related to OSPF and is supported by Cisco routers.

For protocol-independent features that work with OSPF, see the "Configuring IP Routing Protocol-Independent Features" module.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Information About OSPF

Cisco OSPF Implementation

The Cisco implementation conforms to the OSPF Version 2 specifications detailed in the Internet RFC 2328. The following list outlines key features supported in the Cisco OSPF implementation:

• Stub areas—The definition of stub areas is supported.

• Route redistribution—Routes learned via any IP routing protocol can be redistributed into any other IP routing protocol. At the intradomain level, OSPF can import routes learned via Interior Gateway Routing Protocol (IGRP), Routing Information Protocol (RIP), and Intermediate System-to-Intermediate System (IS-IS). OSPF routes can also be exported into IGRP, RIP, and IS-IS. At the interdomain level, OSPF can import routes learned via Exterior Gateway Protocol (EGP) and Border Gateway Protocol (BGP). OSPF routes can be exported into EGP and BGP.

• Authentication—Plain text and message-digest algorithm 5 (MD5) authentication among neighboring routers within an area is supported.

• Routing interface parameters—Configurable parameters supported include interface output cost, retransmission interval, interface transmit delay, router priority, router "dead" and hello intervals, and authentication key.

• Virtual links—Virtual links are supported.

• Not-so-stubby area (NSSA)—RFC 3101, which replaces and is backward compatible with RFC 1587.

• OSPF over demand circuit—RFC 1793.

Router Coordination for OSPF

OSPF typically requires coordination among many internal routers: Area Border Routers (ABRs), which are routers connected to multiple areas, and Autonomous System Boundary Routers (ASBRs). At a minimum, OSPF-based routers or access servers can be configured with all default parameter values, no authentication, and interfaces assigned to areas. If you intend to customize your environment, you must ensure coordinated configurations of all routers.

Route Distribution for OSPF

You can specify route redistribution; see the task "Redistribute Routing Information" in the Network Protocols Configuration Guide, Part 1, for information on how to configure route redistribution.

The Cisco OSPF implementation allows you to alter certain interface-specific OSPF parameters, as needed. You are not required to alter any of these parameters, but some interface parameters must be consistent across all routers in an attached network. Those parameters are controlled by the `ip ospf hello-interval`, `ip ospf dead-interval`, and `ip ospf authentication-key` interface configuration commands. Therefore, if you do configure any of these parameters, ensure that the configurations for all routers on your network have compatible values.

By default, OSPF classifies different media into the following three types of networks:
• Broadcast networks (Ethernet, Token Ring, and FDDI)
• Nonbroadcast multiaccess (NBMA) networks (Switched Multimegabit Data Service [SMDS], Frame Relay, and X.25)
• Point-to-point networks (High-Level Data Link Control [HDLC] and PPP)

You can configure your network as either a broadcast or an NBMA network.

X.25 and Frame Relay provide an optional broadcast capability that can be configured in the map to allow OSPF to run as a broadcast network. See the x25 map and frame-relay map command pages in the Cisco IOS Wide-Area Networking Command Reference publication for more detail.

**OSPF Network Types**

You have the choice of configuring your OSPF network type as either broadcast or NBMA, regardless of the default media type. Using this feature, you can configure broadcast networks as NBMA networks when, for example, you have routers in your network that do not support multicast addressing. You also can configure NBMA networks (such as X.25, Frame Relay, and SMDS) as broadcast networks. This feature saves you from needing to configure neighbors, as described in the "Configuring OSPF for Nonbroadcast Networks" section later in this module.

Configuring NBMA networks as either broadcast or nonbroadcast assumes that there are virtual circuits (VCs) from every router to every router or fully meshed network. This is not true for some cases, for example, because of cost constraints, or when you have only a partially meshed network. In these cases, you can configure the OSPF network type as a point-to-multipoint network. Routing between two routers not directly connected will go through the router that has VCs to both routers. Note that you need not configure neighbors when using this feature.

An OSPF point-to-multipoint interface is defined as a numbered point-to-point interface having one or more neighbors. It creates multiple host routes. An OSPF point-to-multipoint network has the following benefits compared to NBMA and point-to-point networks:

• Point-to-multipoint is easier to configure because it requires no configuration of neighbor commands, it consumes only one IP subnet, and it requires no designated router election.

• It costs less because it does not require a fully meshed topology.

• It is more reliable because it maintains connectivity in the event of VC failure.

On point-to-multipoint, broadcast networks, there is no need to specify neighbors. However, you can specify neighbors with the **neighbor** router configuration command, in which case you should specify a cost to that neighbor.

Before the **point-to-multipoint** keyword was added to the **ip ospf network** interface configuration command, some OSPF point-to-multipoint protocol traffic was treated as multicast traffic. Therefore, the **neighbor** router configuration command was not needed for point-to-multipoint interfaces because multicast took care of the traffic. Hello, update, and acknowledgment messages were sent using multicast. In particular, multicast hello messages discovered all neighbors dynamically.

On any point-to-multipoint interface (broadcast or not), the Cisco IOS software assumed that the cost to each neighbor was equal. The cost was configured with the **ip ospf cost** interface configuration command. In reality, the bandwidth to each neighbor is different, so the cost should differ. With this feature, you can configure a separate cost to each neighbor. This feature applies to point-to-multipoint interfaces only.
Because many routers might be attached to an OSPF network, a designated router is selected for the network. Special configuration parameters are needed in the designated router selection if broadcast capability is not configured.

These parameters need only be configured in those devices that are themselves eligible to become the designated router or backup designated router (in other words, routers with a nonzero router priority value).

You can specify the following neighbor parameters, as required:

- Priority for a neighboring router
- Nonbroadcast poll interval

On point-to-multipoint, nonbroadcast networks, use the **neighbor** router configuration command to identify neighbors. Assigning a cost to a neighbor is optional.

Prior to Cisco IOS Release 12.0, some customers were using point-to-multipoint on nonbroadcast media (such as classic IP over ATM), so their routers could not dynamically discover their neighbors. This feature allows the **neighbor** router configuration command to be used on point-to-multipoint interfaces.

On any point-to-multipoint interface (broadcast or not), the Cisco IOS software assumed the cost to each neighbor was equal. The cost was configured with the **ip ospf cost** interface configuration command. In reality, the bandwidth to each neighbor is different, so the cost should differ. With this feature, you can configure a separate cost to each neighbor. This feature applies to point-to-multipoint interfaces only.

Our OSPF software allows you to configure several area parameters. These area parameters, shown in the following task table, include authentication, defining stub areas, and assigning specific costs to the default summary route. Authentication allows password-based protection against unauthorized access to an area.

Stub areas are areas into which information on external routes is not sent. Instead, there is a default external route generated by the ABR, into the stub area for destinations outside the autonomous system. To take advantage of the OSPF stub area support, default routing must be used in the stub area. To further reduce the number of LSAs sent into a stub area, you can configure the no-summary keyword of the **area stub** router configuration command on the ABR to prevent it from sending summary link advertisement (LSAs Type 3) into the stub area.

The OSPF NSSA feature is described by RFC 3101. In Cisco IOS Release 15.1(2)S and later releases, RFC 3101 replaces RFC 1587. RFC 3101 is backward compatible with RFC 1587. For a detailed list of differences between them, see Appendix F of RFC 3101. NSSA support was first integrated into Cisco IOS Release 11.2. OSPF NSSA is a nonproprietary extension of the existing OSPF stub area feature.

RFC 3101 support enhances both the Type 7 autonomous-system external routing calculation and the translation of Type 7 LSAs into Type 5 LSAs. For more information, see RFC 3101.

Use NSSA to simplify administration if you are an Internet service provider (ISP) or a network administrator that must connect a central site that is using OSPF to a remote site that is using a different routing protocol.

Prior to NSSA, the connection between the corporate site border router and the remote router could not be run as an OSPF stub area because routes for the remote site could not be redistributed into the stub area, and two routing protocols needed to be maintained. A simple protocol such as RIP was usually run and handled the redistribution. With NSSA, you can extend OSPF to cover the remote connection by defining the area between the corporate router and the remote router as an NSSA.

As with OSPF stub areas, NSSA areas cannot be injected with distributed routes via Type 5 LSAs. Route redistribution into an NSSA area is possible only with a special type of LSA that is known as Type 7 that can exist only in an NSSA area. An NSSA ASBR generates the Type 7 LSA so that the routes can be redistributed, and an NSSA ABR translates the Type 7 LSA into a Type 5 LSA, which can be flooded throughout the whole OSPF routing domain. Summarization and filtering are supported during the translation.
Cisco IOS Release 15.1(2)S and later releases support RFC 3101, which allows you to configure an NSSA ABR router as a forced NSSA LSA translator. This means that the NSSA ABR router will unconditionally assume the role of LSA translator, preempting the default behavior, which would only include it among the candidates to be elected as translator.

**Note**

Even a forced translator might not translate all LSAs; translation depends on the contents of each LSA.

The figure below shows a network diagram in which OSPF Area 1 is defined as the stub area. The Enhanced Interior Gateway Routing Protocol (EIGRP) routes cannot be propagated into the OSPF domain because routing redistribution is not allowed in the stub area. However, once OSPF Area 1 is defined as an NSSA, an NSSA ASBR can inject the EIGRP routes into the OSPF NSSA by creating Type 7 LSAs.

*Figure 1: OSPF NSSA*

The redistributed routes from the RIP router will not be allowed into OSPF Area 1 because NSSA is an extension to the stub area. The stub area characteristics will still exist, including the exclusion of Type 5 LSAs. Route summarization is the consolidation of advertised addresses. This feature causes a single summary route to be advertised to other areas by an ABR. In OSPF, an ABR will advertise networks in one area into another area. If the network numbers in an area are assigned in a way such that they are contiguous, you can configure the ABR to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

When routes from other protocols are redistributed into OSPF (as described in the module “Configuring IP Routing Protocol-Independent Features”), each route is advertised individually in an external LSA. However, you can configure the Cisco IOS software to advertise a single route for all the redistributed routes that are covered by a specified network address and mask. Doing so helps decrease the size of the OSPF link-state database.

In OSPF, all areas must be connected to a backbone area. If there is a break in backbone continuity, or the backbone is purposefully partitioned, you can establish a virtual link. The two endpoints of a virtual link are ABRs. The virtual link must be configured in both routers. The configuration information in each router
consists of the other virtual endpoint (the other ABR) and the nonbackbone area that the two routers have in common (called the transit area). Note that virtual links cannot be configured through stub areas.

You can force an ASBR to generate a default route into an OSPF routing domain. Whenever you specifically configure redistribution of routes into an OSPF routing domain, the router automatically becomes an ASBR. However, an ASBR does not, by default, generate a default route into the OSPF routing domain.

You can configure OSPF to look up Domain Naming System (DNS) names for use in all OSPF show EXEC command displays. You can use this feature to more easily identify a router, because the router is displayed by name rather than by its router ID or neighbor ID.

OSPF uses the largest IP address configured on the interfaces as its router ID. If the interface associated with this IP address is ever brought down, or if the address is removed, the OSPF process must recalculate a new router ID and resend all its routing information out its interfaces.

If a loopback interface is configured with an IP address, the Cisco IOS software will use this IP address as its router ID, even if other interfaces have larger IP addresses. Because loopback interfaces never go down, greater stability in the routing table is achieved.

OSPF automatically prefers a loopback interface over any other kind, and it chooses the highest IP address among all loopback interfaces. If no loopback interfaces are present, the highest IP address in the router is chosen. You cannot tell OSPF to use any particular interface.

In Cisco IOS Release 10.3 and later releases, by default OSPF calculates the OSPF metric for an interface according to the bandwidth of the interface. For example, a 64-kbps link gets a metric of 1562, and a T1 link gets a metric of 64.

The OSPF metric is calculated as the ref-bw value divided by the bandwidth value, with the ref-bw value equal to 108 by default, and the bandwidth value determined by the bandwidth interface configuration command. The calculation gives FDDI a metric of 1. If you have multiple links with high bandwidth, you might want to specify a larger number to differentiate the cost on those links.

An administrative distance is a rating of the trustworthiness of a routing information source, such as an individual router or a group of routers. Numerically, an administrative distance is an integer from 0 to 255. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored.

OSPF uses three different administrative distances: intra-area, interarea, and external. Routes within an area are intra-area; routes to another area are interarea; and routes from another routing domain learned via redistribution are external. The default distance for each type of route is 110.

Because simplex interfaces between two devices on an Ethernet represent only one network segment, for OSPF you must configure the sending interface to be a passive interface. This configuration prevents OSPF from sending hello packets for the sending interface. Both devices are able to see each other via the hello packet generated for the receiving interface.

You can configure the delay time between when OSPF receives a topology change and when it starts a shortest path first (SPF) calculation. You can also configure the hold time between two consecutive SPF calculations.

The OSPF on-demand circuit is an enhancement to the OSPF protocol that allows efficient operation over on-demand circuits such as ISDN, X.25 switched virtual circuits (SVCs), and dialup lines. This feature supports RFC 1793, Extending OSPF to Support Demand Circuits.

Prior to this feature, OSPF periodic hello and LSA updates would be exchanged between routers that connected the on-demand link, even when no changes occurred in the hello or LSA information.

With this feature, periodic hellos are suppressed and the periodic refreshes of LSAs are not flooded over the demand circuit. These packets bring up the link only when they are exchanged for the first time, or when a
change occurs in the information they contain. This operation allows the underlying data link layer to be closed when the network topology is stable.

This feature is useful when you want to connect telecommuters or branch offices to an OSPF backbone at a central site. In this case, OSPF for on-demand circuits allows the benefits of OSPF over the entire domain, without excess connection costs. Periodic refreshes of hello updates, LSA updates, and other protocol overhead are prevented from enabling the on-demand circuit when there is no "real" data to send.

Overhead protocols such as hellos and LSAs are transferred over the on-demand circuit only upon initial setup and when they reflect a change in the topology. This means that critical changes to the topology that require new SPF calculations are sent in order to maintain network topology integrity. Periodic refreshes that do not include changes, however, are not sent across the link.

The OSPF LSA group pacing feature allows the router to group OSPF LSAs and pace the refreshing, checksumming, and aging functions. The group pacing results in more efficient use of the router.

The router groups OSPF LSAs and paces the refreshing, checksumming, and aging functions so that sudden increases in CPU usage and network resources are avoided. This feature is most beneficial to large OSPF networks.

OSPF LSA group pacing is enabled by default. For typical customers, the default group pacing interval for refreshing, checksumming, and aging is appropriate and you need not configure this feature.

**Original LSA Behavior**

Each OSPF LSA has an age, which indicates whether the LSA is still valid. Once the LSA reaches the maximum age (1 hour), it is discarded. During the aging process, the originating router sends a refresh packet every 30 minutes to refresh the LSA. Refresh packets are sent to keep the LSA from expiring, whether there has been a change in the network topology or not. Checksumming is performed on all LSAs every 10 minutes. The router keeps track of LSAs that it generates and LSAs that it receives from other routers. The router refreshes LSAs that it generated; it ages the LSAs that it received from other routers.

Prior to the LSA group pacing feature, the Cisco software would perform refreshing on a single timer and checksumming and aging on another timer. In the case of refreshing, for example, the software would scan the whole database every 30 minutes, refreshing every LSA that the router generated, no matter how old it was. The figure below illustrates all the LSAs being refreshed at once. This process wasted CPU resources because only a small portion of the database needed to be refreshed. A large OSPF database (several thousand LSAs) could have thousands of LSAs with different ages. Refreshing on a single timer resulted in the age of all LSAs becoming synchronized, which resulted in much CPU processing at once. Furthermore, a large number of LSAs could cause a sudden increase of network traffic, consuming a large amount of network resources in a short time.

**Figure 2: OSPF LSAs on a Single Timer Without Group Pacing**

All LSAs refreshed, 120 external LSAs on Ethernet need three packets

Prior to pacing, all LSAs refreshed at once
**LSA Group Pacing with Multiple Timers**

Configuring each LSA to have its own timer avoids excessive CPU processing and sudden network-traffic increase. To again use the example of refreshing, each LSA gets refreshed when it is 30 minutes old, independent of other LSAs. So the CPU is used only when necessary. However, LSAs being refreshed at frequent, random intervals would require many packets for the few refreshed LSAs that the router must send, which would be inefficient use of bandwidth.

Therefore, the router delays the LSA refresh function for an interval of time instead of performing it when the individual timers are reached. The accumulated LSAs constitute a group, which is then refreshed and sent out in one packet or more. Thus, the refresh packets are paced, as are the checksumming and aging. The pacing interval is configurable; it defaults to 4 minutes, which is randomized to further avoid synchronization.

The figure below illustrates the case of refresh packets. The first timeline illustrates individual LSA timers; the second timeline illustrates individual LSA timers with group pacing.

*Figure 3: OSPF LSAs on Individual Timers with Group Pacing*

The group pacing interval is inversely proportional to the number of LSAs that the router is refreshing, checksumming, and aging. For example, if you have approximately 10,000 LSAs, decreasing the pacing interval would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

The default value of pacing between LSA groups is 240 seconds (4 minutes). The range is from 10 seconds to 1800 seconds (30 minutes).

By default, OSPF floods new LSAs over all interfaces in the same area, except the interface on which the LSA arrives. Some redundancy is desirable, because it ensures robust flooding. However, too much redundancy can waste bandwidth and might destabilize the network due to excessive link and CPU usage in certain topologies. An example would be a fully meshed topology.

You can block OSPF flooding of LSAs in two ways, depending on the type of networks:

- On broadcast, nonbroadcast, and point-to-point networks, you can block flooding over specified OSPF interfaces.
- On point-to-multipoint networks, you can block flooding to a specified neighbor.
The growth of the Internet has increased the importance of scalability in IGPs such as OSPF. By design, OSPF requires LSAs to be refreshed as they expire after 3600 seconds. Some implementations have tried to improve the flooding by reducing the frequency to refresh from 30 minutes to about 50 minutes. This solution reduces the amount of refresh traffic but requires at least one refresh before the LSA expires. The OSPF flooding reduction solution works by reducing unnecessary refreshing and flooding of already known and unchanged information. To achieve this reduction, the LSAs are now flooded with the higher bit set. The LSAs are now set as "do not age."

Cisco routers do not support LSA Type 6 Multicast OSPF (MOSPF), and they generate syslog messages if they receive such packets. If the router is receiving many MOSPF packets, you might want to configure the router to ignore the packets and thus prevent a large number of syslog messages.

The former OSPF implementation for sending update packets needed to be more efficient. Some update packets were getting lost in cases where the link was slow, a neighbor could not receive the updates quickly enough, or the router was out of buffer space. For example, packets might be dropped if either of the following topologies existed:

- A fast router was connected to a slower router over a point-to-point link.
- During flooding, several neighbors sent updates to a single router at the same time.

OSPF update packets are now automatically paced so they are not sent less than 33 milliseconds apart. Pacing is also added between retransmits to increase efficiency and minimize lost retransmissions. Also, you can display the LSAs waiting to be sent out an interface. The benefit of pacing is that OSPF update and retransmission packets are sent more efficiently. There are no configuration tasks for this feature; it occurs automatically.

You can display specific statistics such as the contents of IP routing tables, caches, and databases. Information provided can be used to determine resource utilization and solve network problems. You can also display information about node reachability and discover the routing path that your device packets are taking through the network.

### Restrictions for OSPF

On systems with a large number of interfaces, it may be possible to configure OSPF such that the number of links advertised in the router LSA causes the link-state update packet to exceed the size of a "huge" Cisco buffer. To resolve this problem, reduce the number of OSPF links or increase the huge buffer size by entering the `buffers huge size` command.

A link-state update packet containing a router LSA typically has a fixed overhead of 196 bytes, and an additional 12 bytes are required for each link description. With a huge buffer size of 18024 bytes, there can be a maximum of 1485 link descriptions.

Because the maximum size of an IP packet is 65,535 bytes, there is still an upper bound on the number of links possible on a router.

### How to Configure OSPF

To configure OSPF, perform the tasks described in the following sections. The tasks in the “Enabling OSPF” section are required; the tasks in the remaining sections are optional, but might be required for your application. For information about the maximum number of interfaces, see the “Restrictions for OSPF” section.
Enabling OSPF

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf process-id
4. network ip-address wildcard-mask area area-id
5. end

</tbody>
</table>
Configuring OSPF NSSA Parameters

Prerequisites
Evaluate the following considerations before you implement this feature:

- You can set a Type 7 default route that can be used to reach external destinations. When configured, the device generates a Type 7 default into the Not-So-Stubby Area (NSSA or the NSSA Area Border Router (ABR)).
- Every device within the same area must agree that the area is NSSA; otherwise, the devices cannot communicate.

Configuring OSPF NSSA Area Parameters

SUMMARY STEPS
1. enable
2. configure terminal
3. router ospf process-id
4. area area-id nssa [no-redistribution] [default-information-originate]
5. summary-address prefix mask [not-advertise] [tag tag ] [nssa-only]
6. end

### Configuring OSPF over On-Demand Circuits

#### SUMMARY STEPS

1. `router ospf process-id`
2. `interface type number`
3. `ip ospf demand-circuit`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>router ospf process-id</td>
<td>Enables OSPF operation.</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface type number</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>ip ospf demand-circuit</td>
<td>Configures OSPF over an on-demand circuit.</td>
</tr>
</tbody>
</table>

## What to Do Next

You can prevent an interface from accepting demand-circuit requests from other routers to by specifying the `ignore` keyword in the `ip ospf demand-circuit` command.

## Prerequisites

Evaluate the following considerations before implementing the On-Demand Circuits feature:

- Because LSAs that include topology changes are flooded over an on-demand circuit, we recommend that you put demand circuits within OSPF stub areas or within NSSAs to isolate the demand circuits from as many topology changes as possible.

- Every router within a stub area or NSSA must have this feature loaded in order to take advantage of the on-demand circuit functionality. If this feature is deployed within a regular area, all other regular areas must also support this feature before the demand circuit functionality can take effect because Type 5 external LSAs are flooded throughout all areas.

- Hub-and-spoke network topologies that have a point-to-multipoint (P2MP) OSPF interface type on a hub might not revert to non-demand circuit mode when needed. You must simultaneously reconfigure OSPF on all interfaces on the P2MP segment when reverting them from demand circuit mode to non-demand circuit mode.

- Do not implement this feature on a broadcast-based network topology because the overhead protocols (such as hello and LSA packets) cannot be successfully suppressed, which means the link will remain up.

- Configuring the router for an OSPF on-demand circuit with an asynchronous interface is not a supported configuration. The supported configuration is to use dialer interfaces on both ends of the circuit. For more information, refer to Why OSPF Demand Circuit Keeps Bringing Up the Link.
# Logging Neighbors Going Up or Down

## SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf process-id
4. log-adjacency-changes [detail]
5. end

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted.  
  **Example:**  
  Device> enable |
| **Step 2** configure terminal | Enters global configuration mode.  
  **Example:**  
  Device# configure terminal |
| **Step 3** router ospf process-id | Enables OSPF routing and enters router configuration mode.  
  **Example:**  
  Device(config)# router ospf 109 |
| **Step 4** log-adjacency-changes [detail] | Changes the group pacing of LSAs.  
  **Note** Configure the log-adjacency-changes command if you want to know about OSPF neighbors going up or down without turning on the debug ip ospf adjacency EXEC command because the log-adjacency-changes command provides a higher-level view of the peer relationship with less output.  
  Configure the log-adjacency-changes detail command if you want to see messages for each state change.  
  **Example:**  
  Device(config-router)# log-adjacency-changes detail |
| **Step 5** end | Exits router configuration mode and returns to privileged EXEC mode.  
  **Example:**  
  Device(config-router)# end |
Changing the LSA Group Pacing Interval

## Monitoring and Maintaining OSPF

### SUMMARY STEPS

1. **enable**
2. `show ip ospf [process-id]`
3. `show ip ospf border-routers`
4. `show ip ospf [process-id [area-id]] database`
5. `show ip ospf [process-id [area-id]] database [database-summary]`
6. `show ip ospf [process-id [area-id]] database [router] [self-originate]`
7. `show ip ospf [process-id [area-id]] database [router] [adv-router [ip-address]]`
8. `show ip ospf [process-id [area-id]] database [router] [link-state-id]`
9. `show ip ospf [process-id [area-id]] database [network] [link-state-id]`
10. `show ip ospf [process-id [area-id]] database [summary] [link-state-id]`
11. `show ip ospf [process-id [area-id]] database [asbr-summary] [link-state-id]`
12. `show ip ospf [process-id [area-id]] database [external] [link-state-id]`
13. `show ip ospf [process-id [area-id]] database [nssa-external] [link-state-id]`
14. `show ip ospf [process-id [area-id]] database [opaque-link] [link-state-id]`
15. `show ip ospf [process-id [area-id]] database [opaque-area] [link-state-id]`
16. `show ip ospf [process-id [area-id]] database [opaque-as] [link-state-id]`
17. `show ip ospf flood-list interface-type interface-number`
18. `show ip ospf flood-list interface-type interface-number`
19. `show ip ospf interface interface-type interface-number`
20. `show ip ospf neighbor [interface-type interface-number] [neighbor-id] [detail]`
21. `show ip ospf request-list [neighbor] [interface] [interface-neighbor]`
22. `show ip ospf retransmission-list [neighbor] [interface] [interface-neighbor]`
23. `show ip ospf process-id summary-address [neighbor] [interface] [interface-neighbor]`
24. `show ip ospf virtual-links`
25. `clear ip ospf [process-id {process | redistribution | counters [neighbor [neighbor-interface] [neighbor-id]]}]`

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip ospf flood-list interface-type interface-number</code></td>
<td>Displays a list of LSAs waiting to be flooded over an interface.</td>
</tr>
</tbody>
</table>

**Example:**

```
Device# show ip ospf flood-list ethernet 1
```

<tr>
<td>Step 16</td>
<td><code>show ip ospf [process-id [area-id]] database [opaque-as] [link-state-id]</code></td>
<td>Displays lists of information related to the OSPF database.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; show ip ospf 1 1 database opaque-as 172.16.240.0</td>
<td></td>
</tr>
<tr>
<td>Step 17</td>
<td><code>show ip ospf flood-list interface-type interface-number</code></td>
<td>Displays lists of information related to the OSPF database.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; show ip ospf 1 1 flood-list GigabitEthernet 1/0</td>
<td></td>
</tr>
<tr>
<td>Step 18</td>
<td><code>show ip ospf flood-list interface-type interface-number</code></td>
<td>Displays a list of LSAs waiting to be flooded over an interface (to observe OSPF packet pacing).</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; show ip ospf flood-list GigabitEthernet 1/0</td>
<td></td>
</tr>
<tr>
<td>Step 19</td>
<td><code>show ip ospf interface interface-type interface-number</code></td>
<td>Displays OSPF-related interface information.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; show ip ospf interface GigabitEthernet 0/0</td>
<td></td>
</tr>
<tr>
<td>Step 20</td>
<td><code>show ip ospf neighbor [interface-type interface-number] [neighbor-id] [detail]</code></td>
<td>Displays OSPF neighbor information on a per-interface basis.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; show ip ospf neighbor</td>
<td></td>
</tr>
<tr>
<td>Step 21</td>
<td><code>show ip ospf request-list [neighbor] [interface] [interface-neighbor]</code></td>
<td>Displays a list of all LSAs requested by a router.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device&gt; show ip ospf request-list</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 22</strong></td>
<td>Displays a list of all LSAs waiting to be re-sent.</td>
<td></td>
</tr>
<tr>
<td>show ip ospf retransmission-list [neighbor] [interface] [interface-neighbor]</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device&gt; show ip ospf retransmission-list</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 23</strong></td>
<td>Displays a list of all summary-address redistribution information configured under an OSPF process.</td>
<td></td>
</tr>
<tr>
<td>show ip ospf process-id summary-address [neighbor] [interface] [interface-neighbor]</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device&gt; show ip ospf summary-address</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 24</strong></td>
<td>Displays OSPF-related virtual-link information.</td>
<td></td>
</tr>
<tr>
<td>show ip ospf virtual-links</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device&gt; show ip ospf virtual-links</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 25</strong></td>
<td>Clears redistribution based on the OSPF routing process ID. If the process-id value is not specified, all OSPF processes are cleared.</td>
<td></td>
</tr>
<tr>
<td>clear ip ospf [process-id {process</td>
<td>redistribution</td>
<td>counters [neighbor [neighbor-interface] [neighbor-id]}]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device&gt; clear ip ospf process</td>
<td></td>
<td></td>
</tr>

**Configuration Examples for OSPF**

**Example: OSPF Point-to-Multipoint**

In the figure below, Router 1 uses data-link connection identifier (DLCI) 201 to communicate with Router 2, DLCI 202 to communicate with Router 4, and DLCI 203 to communicate with Router 3. Router 2 uses DLCI 101 to communicate with Router 1 and DLCI 102 to communicate with Router 3. Router 3 communicates
with Router 2 (DLCI 401) and Router 1 (DLCI 402). Router 4 communicates with Router 1 (DLCI 301). Configuration examples follow the figure.

**Figure 4: OSPF Point-to-Multipoint Example**

**Router 1 Configuration**

```
hostname Router 1
!
interface serial 1
  ip address 10.0.0.2 255.0.0.0
  ip ospf network point-to-multipoint
  encapsulation frame-relay
  frame-relay map ip 10.0.0.1 101 broadcast
  frame-relay map ip 10.0.0.4 402 broadcast
!
router ospf 1
  network 10.0.0.0 0.0.0.255 area 0
```

**Router 2 Configuration**

```
hostname Router 2
!
interface serial 0
  ip address 10.0.0.1 255.0.0.0
  ip ospf network point-to-multipoint
  encapsulation frame-relay
  frame-relay map ip 10.0.0.2 101 broadcast
  frame-relay map ip 10.0.0.4 102 broadcast
!
router ospf 1
  network 10.0.0.0 0.0.0.255 area 0
```

**Router 3 Configuration**

```
hostname Router 3
!
interface serial 3
  ip address 10.0.0.4 255.0.0.0
  ip ospf network point-to-multipoint
  encapsulation frame-relay
  clock rate 1000000
  frame-relay map ip 10.0.0.1 401 broadcast
  frame-relay map ip 10.0.0.2 402 broadcast
!
router ospf 1
  network 10.0.0.0 0.0.0.255 area 0
```
**Example: OSPF Point-to-Multipoint with Broadcast**

The following example illustrates a point-to-multipoint network with broadcast:

```
interface Serial0
 ip address 10.0.1.1 255.255.255.0
 encapsulation frame-relay
 ip ospf cost 100
 ip ospf network point-to-multipoint
 frame-relay map ip 10.0.1.3 202 broadcast
 frame-relay map ip 10.0.1.4 203 broadcast
 frame-relay map ip 10.0.1.5 204 broadcast
 frame-relay local-dlci 301

! router ospf 1
 network 10.0.1.0 0.0.0.255 area 0
 neighbor 10.0.1.5 cost 5
 neighbor 10.0.1.4 cost 10
```

The following example shows the configuration of the neighbor at 10.0.1.3:

```
interface serial 0
 ip address 10.0.1.3 255.255.255.0
 encapsulation frame-relay
 frame-relay local-dlci 301
 frame-relay map ip 10.0.1.1 300 broadcast
 no shutdown

! router ospf 1
 network 10.0.1.0 0.0.0.255 area 0
```

The output shown for neighbors in the first configuration is as follows:

```
Device# show ip ospf neighbor
Neighbor ID Pri State Dead Time Address Interface
172.16.1.1 1 FULL/ - 00:01:50 10.0.1.5 Serial0
172.16.1.4 1 FULL/ - 00:01:47 10.0.1.4 Serial0
172.16.1.8 1 FULL/ - 00:01:45 10.0.1.3 Serial0
```

The route information in the first configuration is as follows:

```
Device# show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
 D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
    E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
 i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, * - candidate default
 U - per-user static route, o - ODR
 Gateway of last resort is not set
 C 1.0.0.0/8 is directly connected, Loopback0
 10.0.0.0/8 is variably subnetted, 4 subnets, 2 masks
 O 10.0.1.3/32 [110/100] via 10.0.1.3, 00:39:08, Serial0
 C 10.0.1.0/24 is directly connected, Serial0
```
Example: OSPF Point-to-Multipoint with Nonbroadcast

The following example illustrates a point-to-multipoint network with nonbroadcast:

interface Serial0
ip address 10.0.1.1 255.255.255.0
ip ospf network point-to-multipoint non-broadcast
encapsulation frame-relay
no keepalive
frame-relay local-dlci 200
frame-relay map ip 10.0.1.3 202
frame-relay map ip 10.0.1.4 203
frame-relay map ip 10.0.1.5 204
no shutdown
!
router ospf 1
  network 10.0.1.0 0.0.0.255 area 0
  neighbor 10.0.1.3 cost 5
  neighbor 10.0.1.4 cost 10
  neighbor 10.0.1.5 cost 15

The following example is the configuration for the router on the other side:

interface Serial9/2
ip address 10.0.1.3 255.255.255.0
encapsulation frame-relay
ip ospf network point-to-multipoint non-broadcast
no ip mroute-cache
no keepalive
no fair-queue
frame-relay local-dlci 301
frame-relay map ip 10.0.1.1 300
no shutdown
!
router ospf 1
  network 10.0.1.0 0.0.0.255 area 0

The output shown for neighbors in the first configuration is as follows:

Device# show ip ospf neighbor

Neighbor ID Pri State Dead Time Address Interface
172.16.1.1 1 FULL/ - 00:01:52 10.0.1.5 Serial0
172.16.1.4 1 FULL/ - 00:01:52 10.0.1.4 Serial0
172.16.1.8 1 FULL/ - 00:01:52 10.0.1.3 Serial0

Example: Variable-Length Subnet Masks

OSPF, static routes, and IS-IS support variable-length subnet masks (VLSMs). With VLSMs, you can use different masks for the same network number on different interfaces, which allows you to conserve IP addresses and more efficiently use available address space.

In the following example, a 30-bit subnet mask is used, leaving two bits of address space reserved for serial-line host addresses. There is sufficient host address space for two host endpoints on a point-to-point serial link.

interface ethernet 0
  ip address 172.16.10.1 255.255.255.0
  ! 8 bits of host address space reserved for ethernets
interface serial 0
  ip address 172.16.20.1 255.255.255.252
  ! 2 bits of address space reserved for serial lines
Example: Configuring OSPF NSSA

In the following example, an Open Shortest Path First (OSPF) stub network is configured to include OSPF Area 0 and OSPF Area 1, using five devices. Device 3 is configured as the NSSA Autonomous System Border Router (ASBR). Device 2 configured to be the NSSA Area Border Router (ABR). OSPF Area 1 is defined as a Not-So-Stubby Area (NSSA).

Example: OSPF NSSA Area with RFC 3101 Disabled and RFC 1587 Active

In the following example, the output for the show ip ospf and show ip ospf database nssa commands shows an Open Shortest Path First Not-So-Stubby Area (OSPF NSSA) area where RFC 3101 is disabled, RFC 1587 is active, and an NSSA Area Border Router (ABR) device is configured as a forced NSSA LSA translator. If RFC 3101 is disabled, the forced NSSA LSA translator remains inactive.

Device# show ip ospf
Routing Process "ospf 1" with ID 10.0.2.1
Start time: 00:00:25.512, Time elapsed: 00:01:02.200
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Supports NSSA (compatible with RFC 1587)
Event-log enabled, Maximum number of events: 1000, Mode: cyclic
Router is not originating router-LSAs with maximum metric
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 0 normal 0 stub 1 nssa
Number of areas transit capable is 0
External flood list length 0
IETF NSF helper support enabled
Cisco NSF helper support enabled
Reference bandwidth unit is 100 mbps
Area 1
Number of interfaces in this area is 1
It is a NSSA area
Configured to translate Type-7 LSAs, inactive (RFC3101 support disabled)
Area has no authentication
SPF algorithm last executed 00:00:07.160 ago
SPF algorithm executed 3 times

Example: OSPF Routing and Route Redistribution

OSPF typically requires coordination among many internal routers, ABRs, and ASBRs. At a minimum, OSPF-based routers can be configured with all default parameter values, with no authentication, and with interfaces assigned to areas.

Three types of examples follow:

- The first is a simple configuration illustrating basic OSPF commands.
- The second example illustrates a configuration for an internal router, ABR, and ASBRs within a single, arbitrarily assigned, OSPF autonomous system.
The third example illustrates a more complex configuration and the application of various tools available for controlling OSPF-based routing environments.

Example: Basic OSPF Configuration

The following example illustrates a simple OSPF configuration that enables OSPF routing process 9000, attaches Ethernet interface 0 to area 0.0.0.0, and redistributes RIP into OSPF and OSPF into RIP:

```plaintext
interface ethernet 0
  ip address 10.93.1.1 255.255.255.0
  ip ospf cost 1
interface ethernet 1
  ip address 10.94.1.1 255.255.255.0
router ospf 9000
  network 10.93.0.0 0.0.255.255 area 0.0.0.0
  redistribute rip metric 1 subnets
router rip
  network 10.94.0.0
  redistribute ospf 9000
default-metric 1
```

Example: Basic OSPF Configuration for Internal Router ABR and ASBRs

The following example illustrates the assignment of four area IDs to four IP address ranges. In the example, OSPF routing process 109 is initialized, and four OSPF areas are defined: 10.9.50.0, 2, 3, and 0. Areas 10.9.50.0, 2, and 3 mask specific address ranges, and area 0 enables OSPF for all other networks.

```plaintext
router ospf 109
  network 192.168.10.0 0.0.0.255 area 10.9.50.0
  network 192.168.20.0 0.0.255.255 area 2
  network 192.168.30.0 0.0.255.255 area 3
  network 192.168.40.0 255.255.255.255 area 0
  interface Ethernet0 is in area 10.9.50.0:
    interface ethernet 0
      ip address 192.168.10.5 255.255.255.0
  interface Ethernet1 is in area 2:
    interface ethernet 1
      ip address 192.168.20.5 255.255.255.0
  interface Ethernet2 is in area 2:
    interface ethernet 2
      ip address 192.168.20.7 255.255.255.0
  interface Ethernet3 is in area 3:
    interface ethernet 3
      ip address 192.169.30.5 255.255.255.0
  interface Ethernet4 is in area 0:
    interface ethernet 4
      ip address 192.168.40.1 255.255.255.0
  interface Ethernet5 is in area 0:
    interface ethernet 5
      ip address 192.168.40.12 255.255.0.0
```

Each network area router configuration command is evaluated sequentially, so the order of these commands in the configuration is important. The Cisco software sequentially evaluates the address/wildcard-mask pair
for each interface. See the **network area** command page in the *Cisco IOS IP Routing: OSPF Command Reference* for more information.

Consider the first **network area** command. Area ID 10.9.50.0 is configured for the interface on which subnet 192.168.10.0 is located. Assume that a match is determined for Ethernet interface 0. Ethernet interface 0 is attached to area 10.9.50.0 only.

The second **network area** command is evaluated next. For area 2, the same process is then applied to all interfaces (except Ethernet interface 0). Assume that a match is determined for Ethernet interface 1. OSPF is then enabled for that interface, and Ethernet interface 1 is attached to area 2.

This process of attaching interfaces to OSPF areas continues for all **network area** commands. Note that the last **network area** command in this example is a special case. With this command, all available interfaces (not explicitly attached to another area) are attached to area 0.

**Example: Complex Internal Router with ABR and ASBR**

The following example outlines a configuration for several routers within a single OSPF autonomous system. The figure below provides a general network map that illustrates this sample configuration.
In this configuration, five routers are configured with OSPF:

- Router A and Router B are both internal routers within area 1.
- Router C is an OSPF ABR. Note that for Router C, Area 1 is assigned to E3 and area 0 is assigned to S0.
- Router D is an internal router in area 0 (backbone area). In this case, both network router configuration commands specify the same area (area 0, or the backbone area).
- Router E is an OSPF ASBR. Note that BGP routes are redistributed into OSPF and that these routes are advertised by OSPF.

You do not need to include definitions of all areas in an OSPF autonomous system in the configuration of all routers in the autonomous system. Only the directly connected areas must be defined. In the example that follows, routes in area 0 are learned by the routers in area 1 (Router A and Router B) when the ABR (Router C) injects summary LSAs into area 1.

The OSPF domain in BGP autonomous system 109 is connected to the outside world via the BGP link to the external peer at IP address 10.0.0.6. Sample configurations follow.

Following is the sample configuration for the general network map shown in the figure above.

**Router A Configuration—Internal Router**

```bash
interface ethernet 1
  ip address 192.168.1.1 255.255.255.0
router ospf 1
  network 192.168.0.0 0.0.255.255 area 1
```

**Router B Configuration—Internal Router**

```bash
interface ethernet 2
  ip address 192.168.1.2 255.255.255.0
router ospf 202
  network 192.168.0.0 0.0.255.255 area 1
```

**Router C Configuration—ABR**

```bash
interface ethernet 3
  ip address 192.168.1.3 255.255.255.0
interface serial 0
  ip address 192.168.2.3 255.255.255.0
router ospf 999
  network 192.168.1.0 0.0.0.255 area 1
  network 192.168.2.0 0.0.0.255 area 0
```

**Router D Configuration—Internal Router**

```bash
interface ethernet 4
  ip address 10.0.0.4 255.0.0.0
interface serial 1
  ip address 192.168.2.4 255.255.255.0
router ospf 50
  network 192.168.2.0 0.0.0.255 area 0
  network 10.0.0.0 0.255.255.255 area 0
```
**Example: Complex OSPF Configuration for ABR**

The following sample configuration accomplishes several tasks in setting up an ABR. These tasks can be split into two general categories:

- Basic OSPF configuration
- Route redistribution

The specific tasks outlined in this configuration are detailed briefly in the following descriptions. The figure below illustrates the network address ranges and area assignments for the interfaces.

**Figure 6: Interface and Area Specifications for OSPF Sample Configuration**

The basic configuration tasks in this example are as follows:

- Configure address ranges for Ethernet interface 0 through Ethernet interface 3.
- Enable OSPF on each interface.
- Set up an OSPF authentication password for each area and network.
- Assign link-state metrics and other OSPF interface configuration options.
• Create a stub area with area ID 36.0.0.0. (Note that the authentication and stub options of the area router configuration command are specified with separate area command entries, but can be merged into a single area command.)

• Specify the backbone area (area 0).

Configuration tasks associated with redistribution are as follows:

• Redistribute IGRP and RIP into OSPF with various options set (including including metric-type, metric, tag, and subnet).

• Redistribute IGRP and OSPF into RIP.

The following is a sample OSPF configuration:

```
interface ethernet 0
  ip address 192.0.2.201 255.255.255.0
  ip ospf authentication-key abcdefgh
  ip ospf cost 10

interface ethernet 1
  ip address 172.19.251.202 255.255.255.0
  ip ospf authentication-key ijklmnop
  ip ospf cost 20
  ip ospf retransmit-interval 10
  ip ospf transmit-delay 2
  ip ospf priority 4

interface ethernet 2
  ip address 172.19.254.2 255.255.255.0
  ip ospf authentication-key abcdefgh
  ip ospf cost 10

interface ethernet 3
  ip address 10.56.0.0 255.255.0.0
  ip ospf authentication-key ijklmnop
  ip ospf cost 20
  ip ospf dead-interval 80
```

In the following configuration, OSPF is on network 172.16.0.0:

```
router ospf 201
  network 10.10.0.0 0.255.255.255 area 10.10.0.0
  network 192.42.110.0 0.0.0.255 area 192.42.110.0
  network 172.16.0.0 0.0.255.255 area 0
  area 0 authentication
  area 10.10.0.0 stub
  area 10.10.0.0 authentication
  area 10.10.0.0 default-cost 20
  area 192.42.110.0 authentication
  area 10.10.0.0 range 10.10.0.0 255.0.0.0
  area 192.42.110.0 range 192.42.110.0 255.255.255.0
  area 0 range 172.16.254.0 255.255.255.0
  redistribute igrp 200 metric-type 2 metric 1 tag 200 subnets
  redistribute rip metric-type 2 metric 1 tag 200
```

In the following configuration, IGRP autonomous system 200 is on 192.0.2.1:

```
router igrp 200
  network 172.31.0.0

! RIP for 192.168.110

! router rip
  network 192.168.110.0
  redistribute igrp 200 metric 1
  redistribute ospf 201 metric 1
```
Examples: Route Map

The examples in this section illustrate the use of redistribution, with and without route maps. Examples from the IP and Connectionless Network Service (CLNS) routing protocols are given.

The following example redistributes all OSPF routes into IGRP:

```
router igrp 109
   redistribute ospf 110
```

The following example redistributes RIP routes with a hop count equal to 1 into OSPF. These routes will be redistributed into OSPF as external LSAs with a metric of 5, a metric type of Type 1, and a tag equal to 1.

```
router ospf 109
   redistribute rip route-map rip-to-ospf
```

```
route-map rip-to-ospf permit
   match metric 1
   set metric 5
   set metric-type type1
   set tag 1
```

The following example redistributes OSPF learned routes with tag 7 as a RIP metric of 15:

```
router rip
   redistribute ospf 109 route-map 5
```

```
route-map 5 permit
   match tag 7
   set metric 15
```

The following example redistributes OSPF intra-area and interarea routes with next-hop routers on serial interface 0 into BGP with an INTER_AS metric of 5:

```
router bgp 109
   redistribute ospf 109 route-map 10
```

```
route-map 10 permit
   match route-type internal
   match interface serial 0
   set metric 5
```

The following example redistributes two types of routes into the integrated IS-IS routing table (supporting both IP and CLNS). The first type is OSPF external IP routes with tag 5; these routes are inserted into Level 2 IS-IS link state packets (LSPs) with a metric of 5. The second type is ISO-IGRP derived CLNS prefix routes that match CLNS access list 2000; these routes will be redistributed into IS-IS as Level 2 LSPs with a metric of 30.

```
router isis
   redistribute ospf 109 route-map 2
   redistribute iso-igrp nsfnet route-map 3
```

```
route-map 2 permit
   match route-type external
   match tag 5
   set metric 5
   set level level-2
```

```
route-map 3 permit
   match address 2000
   set metric 30
```

With the following configuration, OSPF external routes with tags 1, 2, 3, and 5 are redistributed into RIP with metrics of 1, 1, 5, and 5, respectively. The OSPF routes with a tag of 4 are not redistributed.

```
router rip
```
In the following configuration, a RIP-learned route for network 192.168.0.0 and an ISO-IGRP-learned route with prefix 49.0001.0002 are redistributed into an IS-IS Level 2 LSP with a metric of 5:

```
router isis
  redistribute rip route-map 1
  redistribute iso-igrp remote route-map 1
  route-map 1 permit
    match ip address 1
    match clns address 2
    set metric 5
    set level level-2
    !
    access-list 1 permit 192.168.0.0 0.0.255.255
    clns filter-set 2 permit 49.0001.0002...
```

The following configuration example illustrates how a route map is referenced by the **default-information** router configuration command. This type of reference is called **conditional default origination**. OSPF will originate the default route (network 0.0.0.0) with a Type 2 metric of 5 if 172.16.0.0 is in the routing table.

**Note**

Only routes external to the OSPF process can be used for tracking, such as non-OSPF routes or OSPF routes from a separate OSPF process.

```
route-map ospf-default permit
  match ip address 1
  set metric 5
  set metric-type type-2
  !
  access-list 1 permit 172.16.0.0 0.0.255.255
  !
  router ospf 109
  default-information originate route-map ospf-default
```
Example: Changing the OSPF Administrative Distances

The following configuration changes the external distance to 200, making it less trustworthy. The figure below illustrates the example.

**Figure 7: OSPF Administrative Distance**

Router A Configuration

```
router ospf 1
redistribute ospf 2 subnet
distance ospf external 200
!
router ospf 2
redistribute ospf 1 subnet
distance ospf external 200
```

Router B Configuration

```
router ospf 1
redistribute ospf 2 subnet
distance ospf external 200
!
router ospf 2
redistribute ospf 1 subnet
distance ospf external 200
```
Example: OSPF over On-Demand Routing

The following configuration allows OSPF over an on-demand circuit, as shown in the figure below. Note that the on-demand circuit is defined on one side only (BRI 0 on Router A); it is not required to be configured on both sides.

Figure 8: OSPF over On-Demand Circuit

Router A Configuration

username RouterB password 7 060C1A2F47
isdn switch-type basic-5ess
ip routing
  interface TokenRing0
    ip address 192.168.50.5 255.255.255.0
    no shutdown
  interface BRI0
    no cdp enable
description connected PBX 1485
    ip address 192.168.45.30 255.255.255.0
    encapsulation ppp
dialer map ip 192.0.2.6 name RouterB broadcast 61484
dialer-group 1
    ppp authentication chap
    no shutdown
dialer-list 1 protocol ip permit

Router B Configuration

dialer-group 1
    ppp authentication chap
    no shutdown
dialer-list 1 protocol ip permit
Example: LSA Group Pacing

The following example changes the OSPF pacing between LSA groups to 60 seconds:

```
router ospf
timers pacing lsa-group 60
```

Example: Blocking OSPF LSA Flooding

The following example prevents flooding of OSPF LSAs to broadcast, nonbroadcast, or point-to-point networks reachable through Ethernet interface 0:

```
interface ethernet 0
 ip ospf database-filter all out
```

The following example prevents flooding of OSPF LSAs to point-to-multipoint networks to the neighbor at IP address 10.10.10.45:

```
router ospf 109
neighbor 10.10.10.45 database-filter all out
```

Example: Ignoring MOSPF LSA Packets

The following example configures the router to suppress the sending of syslog messages when it receives MOSPF packets:

```
router ospf 109
 ignore lsa mospf
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for IPv6 Routing: OSPFv3

- Complete the OSPFv3 network strategy and planning for your IPv6 network. For example, you must decide whether multiple areas are required.
- Enable IPv6 unicast routing.
- Enable IPv6 on the interface.
Restrictions for IPv6 Routing: OSPFv3

When running a dual-stack IP network with OSPF version 2 for IPv4 and OSPFv3, be careful when changing the defaults for commands used to enable OSPFv3. Changing these defaults may affect your OSPFv3 network, possibly adversely.

Information About IPv6 Routing: OSPFv3

How OSPFv3 Works

OSPFv3 is a routing protocol for IPv4 and IPv6. It is a link-state protocol, as opposed to a distance-vector protocol. Think of a link as being an interface on a networking device. A link-state protocol makes its routing decisions based on the states of the links that connect source and destination machines. The state of a link is a description of that interface and its relationship to its neighboring networking devices. The interface information includes the IPv6 prefix of the interface, the network mask, the type of network it is connected to, the devices connected to that network, and so on. This information is propagated in various type of link-state advertisements (LSAs).

A device’s collection of LSA data is stored in a link-state database. The contents of the database, when subjected to the Dijkstra algorithm, result in the creation of the OSPF routing table. The difference between the database and the routing table is that the database contains a complete collection of raw data; the routing table contains a list of shortest paths to known destinations via specific device interface ports.

OSPFv3, which is described in RFC 5340, supports IPv6 and IPv4 unicast AFs.

Comparison of OSPFv3 and OSPF Version 2

Much of OSPF version 3 is the same as in OSPF version 2. OSPFv3, which is described in RFC 5340, expands on OSPF version 2 to provide support for IPv6 routing prefixes and the larger size of IPv6 addresses.

In OSPFv3, a routing process does not need to be explicitly created. Enabling OSPFv3 on an interface will cause a routing process, and its associated configuration, to be created.

In OSPFv3, each interface must be enabled using commands in interface configuration mode. This feature is different from OSPF version 2, in which interfaces are indirectly enabled using the device configuration mode.

When using a nonbroadcast multiaccess (NBMA) interface in OSPFv3, you must manually configure the device with the list of neighbors. Neighboring devices are identified by their device ID.

In IPv6, you can configure many address prefixes on an interface. In OSPFv3, all address prefixes on an interface are included by default. You cannot select some address prefixes to be imported into OSPFv3; either all address prefixes on an interface are imported, or no address prefixes on an interface are imported.

Unlike OSPF version 2, multiple instances of OSPFv3 can be run on a link.

OSPF automatically prefers a loopback interface over any other kind, and it chooses the highest IP address among all loopback interfaces. If no loopback interfaces are present, the highest IP address in the device is chosen. You cannot tell OSPF to use any particular interface.
LSA Types for OSPFv3

The following list describes LSA types, each of which has a different purpose:

• Device LSAs (Type 1)—Describes the link state and costs of a device's links to the area. These LSAs are flooded within an area only. The LSA indicates if the device is an Area Boundary Router (ABR) or Autonomous System Boundary Router (ASBR), and if it is one end of a virtual link. Type 1 LSAs are also used to advertise stub networks. In OSPFv3, these LSAs have no address information and are network-protocol-independent. In OSPFv3, device interface information may be spread across multiple device LSAs. Receivers must concatenate all device LSAs originated by a given device when running the SPF calculation.

• Network LSAs (Type 2)—Describes the link-state and cost information for all devices attached to the network. This LSA is an aggregation of all the link-state and cost information in the network. Only a designated device tracks this information and can generate a network LSA. In OSPFv3, network LSAs have no address information and are network-protocol-independent.

• Interarea-prefix LSAs for ABRs (Type 3)—Advertises internal networks to devices in other areas (interarea routes). Type 3 LSAs may represent a single network or a set of networks summarized into one advertisement. Only ABRs generate summary LSAs. In OSPFv3, addresses for these LSAs are expressed as \( \text{prefix, prefix length instead of address, mask} \). The default route is expressed as a prefix with length 0.

• Interarea-device LSAs for ASBRs (Type 4)—Advertises the location of an ASBR. Devices that are trying to reach an external network use these advertisements to determine the best path to the next hop. Type 4 LSAs are generated by ABRs on behalf of ASBRs.

• Autonomous system external LSAs (Type 5)—Redistributes routes from another autonomous system, usually from a different routing protocol into OSPFv3. In OSPFv3, addresses for these LSAs are expressed as \( \text{prefix, prefix length instead of address, mask} \). The default route is expressed as a prefix with length 0.

• Link LSAs (Type 8)—Have local-link flooding scope and are never flooded beyond the link with which they are associated. Link LSAs provide the link-local address of the device to all other devices attached to the link, inform other devices attached to the link of a list of prefixes to associate with the link, and allow the device to assert a collection of Options bits to associate with the network LSA that will be originated for the link.

• Intra-Area-Prefix LSAs (Type 9)—A device can originate multiple intra-area-prefix LSAs for each device or transit network, each with a unique link-state ID. The link-state ID for each intra-area-prefix LSA describes its association to either the device LSA or the network LSA and contains prefixes for stub and transit networks.

An address prefix occurs in almost all newly defined LSAs. The prefix is represented by three fields: PrefixLength, PrefixOptions, and Address Prefix. In OSPFv3, addresses for these LSAs are expressed as \( \text{prefix, prefix length instead of address, mask} \). The default route is expressed as a prefix with length 0. Type 3 and Type 9 LSAs carry all prefix (subnet) information that, in OSPFv2, is included in device LSAs and network LSAs. The Options field in certain LSAs (device LSAs, network LSAs, interarea-device LSAs, and link LSAs) has been expanded to 24 bits to provide support for OSPFv3.

In OSPFv3, the sole function of the link-state ID in interarea-prefix LSAs, interarea-device LSAs, and autonomous-system external LSAs is to identify individual pieces of the link-state database. All addresses or device IDs that are expressed by the link-state ID in OSPF version 2 are carried in the body of the LSA in OSPFv3.
The link-state ID in network LSAs and link LSAs is always the interface ID of the originating device on the link being described. For this reason, network LSAs and link LSAs are now the only LSAs whose size cannot be limited. A network LSA must list all devices connected to the link, and a link LSA must list all of the address prefixes of a device on the link.

**NBMA in OSPFv3**

On NBMA networks, the designated router (DR) or backup DR (BDR) performs the LSA flooding. On point-to-point networks, flooding simply goes out an interface directly to a neighbor.

Devices that share a common segment (Layer 2 link between two interfaces) become neighbors on that segment. OSPFv3 uses the Hello protocol, periodically sending hello packets out each interface. Devices become neighbors when they see themselves listed in the neighbor’s hello packet. After two devices become neighbors, they may proceed to exchange and synchronize their databases, which creates an adjacency. Not all neighboring devices have an adjacency.

On point-to-point and point-to-multipoint networks, the software floods routing updates to immediate neighbors. There is no DR or BDR; all routing information is flooded to each networking device.

On broadcast or NBMA segments only, OSPFv3 minimizes the amount of information being exchanged on a segment by choosing one device to be a DR and one device to be a BDR. Thus, the devices on the segment have a central point of contact for information exchange. Instead of each device exchanging routing updates with every other device on the segment, each device exchanges information with the DR and BDR. The DR and BDR relay the information to the other devices.

The software looks at the priority of the devices on the segment to determine which devices will be the DR and BDR. The device with the highest priority is elected the DR. If there is a tie, then the device with the higher device ID takes precedence. After the DR is elected, the BDR is elected the same way. A device with a device priority set to zero is ineligible to become the DR or BDR.

When using NBMA in OSPFv3, you cannot automatically detect neighbors. On an NBMA interface, you must configure your neighbors manually using interface configuration mode.

**Load Balancing in OSPFv3**

When a device learns multiple routes to a specific network via multiple routing processes (or routing protocols), it installs the route with the lowest administrative distance in the routing table. Sometimes the device must select a route from among many learned via the same routing process with the same administrative distance. In this case, the device chooses the path with the lowest cost (or metric) to the destination. Each routing process calculates its cost differently and the costs may need to be manipulated in order to achieve load balancing.

OSPFv3 performs load balancing automatically in the following way. If OSPFv3 finds that it can reach a destination through more than one interface and each path has the same cost, it installs each path in the routing table. The only restriction on the number of paths to the same destination is controlled by the `maximum-paths` command. The default maximum paths is 16, and the range is from 1 to 64.

**Addresses Imported into OSPFv3**

When importing the set of addresses specified on an interface on which OSPFv3 is running into OSPFv3, you cannot select specific addresses to be imported. Either all addresses are imported, or no addresses are imported.
**OSPFv3 Customization**

You can customize OSPFv3 for your network, but you likely will not need to do so. The defaults for OSPFv3 are set to meet the requirements of most customers and features. If you must change the defaults, refer to the IPv6 command reference to find the appropriate syntax.

⚠️ **Caution**

Be careful when changing the defaults. Changing defaults will affect your OSPFv3 network, possibly adversely.

**OSPFv3 Cost Calculation**

Because cost components can change rapidly, it might be necessary to reduce the volume of changes to reduce network-wide churn. The recommended values for S2, S3, and S4 in the second table below are based on network simulations that may reduce the rate of network changes. The recommended value for S1 is 0 to eliminate this variable from the route cost calculation.

The overall link cost is computed using the formula shown in the figure below.

*Figure 9: Overall Link Cost Formula*

\[
\text{LinkCost} = OC + \frac{BW \times \text{Throughput_weight}}{100} + \frac{\text{Resources} \times \text{Resources_weight}}{100} + \frac{\text{Latency} \times \text{Latency_weight}}{100} + \frac{\text{L2_factor} \times \text{L2_weight}}{100}
\]

\[
OC = \frac{\text{ospf_reference_bw}}{\text{MDR} \times 1000}
\]

\[
BW = \frac{\text{MDR} \times \text{CDR} \times 100}{100}
\]

\[
\text{Resources} = \frac{100 - \text{Resources}}{1000000}
\]

\[
\text{Latency} = \text{latency}
\]

\[
\text{L2_factor} = \frac{100 - \text{FLQ}}{100}
\]

The table below defines the symbols used in the OSPFv3 cost calculation.

*Table 4: OSPFv3 Cost Calculation Definitions*

<table>
<thead>
<tr>
<th>Cost Component</th>
<th>Component Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>OC</td>
<td>The default OSPFv3 cost. Calculated from reference bandwidth using reference_bw / (MDR*1000), where reference_bw=10^8.</td>
</tr>
</tbody>
</table>
### Cost Component Definition

<table>
<thead>
<tr>
<th>Cost Component</th>
<th>Component Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>A through D</td>
<td>Various radio-specific data-based formulas that produce results in the 0 through 64,000 range.</td>
</tr>
<tr>
<td>A</td>
<td>CDR- and MDR-related formula: ( \frac{2^{16} \times (100 - (\text{CDR} \times 100 / \text{MDR}))}{100} )</td>
</tr>
<tr>
<td>B</td>
<td>Resources related formula: ( \frac{(100 - \text{RESOURCES})^3 \times 2^{16}}{10^6} )</td>
</tr>
<tr>
<td>C</td>
<td>Latency as reported by the radio, already in the 0 through 64,000 range when reported (LATENCY).</td>
</tr>
<tr>
<td>D</td>
<td>RLF-related formula: ( \frac{(100 - \text{RLF}) \times 2^{16}}{100} )</td>
</tr>
<tr>
<td>S1 through S4</td>
<td>Scalar weighting factors input from the CLI. These scalars scale down the values as computed by A through D. The value of 0 disables and the value of 100 enables full 0 through 64,000 range for one component.</td>
</tr>
</tbody>
</table>

Because each network might have unique characteristics that require different settings to optimize actual network performance, these are recommended values intended as a starting point for optimizing an OSPFv3 network. The table below lists the recommended value settings for OSPFv3 cost metrics.

#### Table 5: Recommended Value Settings for OSPFv3 Cost Metrics

<table>
<thead>
<tr>
<th>Setting</th>
<th>Metric Description</th>
<th>Default Value</th>
<th>Recommended Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>S1</td>
<td>ipv6 ospf dynamic weight throughout</td>
<td>100</td>
<td>0</td>
</tr>
<tr>
<td>S2</td>
<td>ipv6 ospf dynamic weight resources</td>
<td>100</td>
<td>29</td>
</tr>
<tr>
<td>S3</td>
<td>ipv6 ospf dynamic weight latency</td>
<td>100</td>
<td>29</td>
</tr>
<tr>
<td>S4</td>
<td>ipv6 ospf dynamic weight L2 factor</td>
<td>100</td>
<td>29</td>
</tr>
</tbody>
</table>

The default path costs were calculated using this formula, as noted in the following list. If these values do not suit your network, you can use your own method of calculating path costs.

- 56-kbps serial link—Default cost is 1785.
• 64-kbps serial link—Default cost is 1562.
• T1 (1.544-Mbps serial link)—Default cost is 64.
• E1 (2.048-Mbps serial link)—Default cost is 48.
• 4-Mbps Token Ring—Default cost is 25.
• Ethernet—Default cost is 10.
• 16-Mbps Token Ring—Default cost is 6.
• FDDI—Default cost is 1.
• X25—Default cost is 5208.
• Asynchronous—Default cost is 10,000.
• ATM—Default cost is 1.

To illustrate these settings, the following example shows how OSPFv3 cost metrics might be defined for a Virtual Multipoint Interface (VMI) interface:

```
interface vmi1
  ipv6 ospf cost dynamic weight throughput 0
  ipv6 ospf cost dynamic weight resources 29
  ipv6 ospf cost dynamic weight latency 29
  ipv6 ospf cost dynamic weight L2-factor 29
```

### Force SPF in OSPFv3

When the `process` keyword is used with the `clear ipv6 ospf` command, the OSPFv3 database is cleared and repopulated, and then the SPF algorithm is performed. When the `force-spf` keyword is used with the `clear ipv6 ospf` command, the OSPFv3 database is not cleared before the SPF algorithm is performed.

### How to Configure Load Balancing in OSPFv3

### Configuring the OSPFv3 Device Process

Once you have completed step 3 and entered OSPFv3 router configuration mode, you can perform any of the subsequent steps in this task as needed to configure OSPFv3 Device configuration.
SUMMARY STEPS

1. enable
2. configure terminal
3. router ospfv3 [process-id]
4. area area-ID [default-cost | nssa | stub]
5. auto-cost reference-bandwidth Mbps
6. default {area area-ID [range ipv6-prefix | virtual-link router-id]} [default-information originate [always | metric | metric-type | route-map] | distance | distribute-list prefix-list prefix-list-name {in | out} [interface] | maximum-paths paths | redistribute protocol | summary-prefix ipv6-prefix]
7. ignore lsa mospf
8. interface-id snmp-if-index
9. log-adjacency-changes [detail]
10. passive-interface [default | interface-type interface-number]
11. queue-depth {hello | update} {queue-size | unlimited}
12. router-id router-id

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>router ospfv3 [process-id]</td>
<td>Enters router configuration mode for the IPv4 or IPv6 address family.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>Device(config)# router ospfv3 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>area area-ID [default-cost</td>
<td>nssa</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-router)# area 1</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 5</th>
<th>auto-cost reference-bandwidth</th>
<th><strong>M</strong>bps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-router)# auto-cost reference-bandwidth 1000</td>
<td>Controls the reference value OSPFv3 uses when calculating metrics for interfaces in an IPv4 OSPFv3 process.</td>
</tr>
</tbody>
</table>

| Step 6 | default | [area area-ID] [range ipv6-prefix] [virtual-link router-id] [default-information originate] [always | metric | metric-type | route-map] | distance | distribute-list prefix-list prefix-list-name [in | out] [interface] | maximum-paths paths | redistribute protocol | summary-prefix ipv6-prefix |
|--------|---------|-----------------|-------------|-------------|-----------------|-------------|-------------------|------------------|----------------|-------------------|
| Example: | Device(config-router)# default area 1 | Returns an OSPFv3 parameter to its default value. |

<table>
<thead>
<tr>
<th>Step 7</th>
<th>ignore lsa mospf</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-router)# ignore lsa mospf</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 8</th>
<th>interface-id snmp-if-index</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-router)# interface-id snmp-if-index</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 9</th>
<th>log-adjacency-changes [detail]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-router)# log-adjacency-changes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 10</th>
<th>passive-interface [default]</th>
<th>[interface-type interface-number]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-router)# passive-interface default</td>
<td>Suppresses sending routing updates on an interface when an IPv4 OSPFv3 process is used.</td>
</tr>
</tbody>
</table>

| Step 11 | queue-depth [hello | update] | {queue-size | unlimited} |
|---------|-----------------|--------------------|
| Example: | Device(config-router)# queue-depth update 1500 | Configures the number of incoming packets that the IPv4 OSPFv3 process can keep in its queue. |
### Configuring NBMA Interfaces in OSPFv3

You can customize OSPFv3 in your network to use NBMA interfaces. OSPFv3 cannot automatically detect neighbors over NBMA interfaces. On an NBMA interface, you must configure your neighbors manually using interface configuration mode.

**Before You Begin**

Before you configure NBMA interfaces, you must perform the following tasks:

- Configure your network to be an NBMA network
- Identify each neighbor

**Note**

- You cannot automatically detect neighbors when using NBMA interfaces. You must manually configure your device to detect neighbors when using an NBMA interface.
- When the `ipv6 ospf neighbor` command is configured, the IPv6 address used must be the link-local address of the neighbor.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `ipv6 enable`
5. `ipv6 ospf neighbor ipv6-address [priority number] [poll-interval seconds] [cost number] [database-filter all out]`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

**Step 2**

configure terminal

Example:

Device# configure terminal

**Step 3**

interface type number

Example:

**Step 4**

ipv6 enable

Example:

Device (config-if)#ipv6 enable

**Step 5**

ipv6 ospf neighbor ipv6-address [priority number] [poll-interval seconds] [cost number] [database-filter all out]

Example:

Device(config-if) ipv6 ospf neighbor FE80::A8BB:CCFF:FE00::C01

**Forcing an SPF Calculation**

**SUMMARY STEPS**

1. enable
2. clear ospfv3 [process-id] force-spf
3. clear ospfv3 [process-id] process
4. clear ospfv3 [process-id] redistribution
5. clear ipv6 ospf [process-id] {process | force-spf | redistribution}
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Runs SPF calculations for an OSPFv3 process. |
| clear ospfv3 [process-id] force-spf | |
| **Example:** Device# clear ospfv3 1 force-spf | If the clear ospfv3 force-spf command is configured, it overwrites the clear ipv6 ospf configuration. |
| | Once the clear ospfv3 force-spf command has been used, the clear ipv6 ospf command cannot be used. |

| **Step 3** | Resets an OSPFv3 process. |
| clear ospfv3 [process-id] process | |
| **Example:** Device# clear ospfv3 2 process | If the clear ospfv3 force-spf command is configured, it overwrites the clear ipv6 ospf configuration. |
| | Once the clear ospfv3 force-spf command has been used, the clear ipv6 ospf command cannot be used. |

| **Step 4** | Clears OSPFv3 route redistribution. |
| clear ospfv3 [process-id] redistribution | |
| **Example:** Device# clear ospfv3 redistribution | If the clear ospfv3 force-spf command is configured, it overwrites the clear ipv6 ospf configuration. |
| | Once the clear ospfv3 force-spf command has been used, the clear ipv6 ospf command cannot be used. |

| **Step 5** | Clears the OSPFv3 state based on the OSPFv3 routing process ID, and forces the start of the SPF algorithm. |
| clear ipv6 ospf [process-id] [process force-spf | |
| | If the clear ospfv3 force-spf command is configured, it overwrites the clear ipv6 ospf configuration. |
| | Once the clear ospfv3 force-spf command has been used, the clear ipv6 ospf command cannot be used. |
| | redistribution] | |
| **Example:** Device# clear ipv6 ospf force-spf | |

### Verifying OSPFv3 Configuration and Operation

This task is optional, and the commands can be entered in any order, as needed.
### SUMMARY STEPS

1. **enable**

2. **show ospfv3** `[process-id] [address-family] border-routers`

3. **show ospfv3** `[process-id [area-id]] [address-family] database` `[database-summary | internal | external [ipv6-prefix]] [link-state-id] [grace] [inter-area prefix [ipv6-prefix] [link-state-id]] [inter-area router [destination-router-id] [link-state-id]] [link [interface interface-name] [link-state-id]] [network [link-state-id]] [nsa-external [ipv6-prefix] [link-state-id]] [prefix [ref-lsa {router | network}] [link-state-id]] [promiscuous router [link-state-id]] [unknown [area | as | link] [link-state-id]] [adv-router router-id] [self-originate]

4. **show ospfv3** `[process-id] [address-family] events` `[generic | interface | lsa | neighbor | reverse | rib | spf]`

5. **show ospfv3** `[process-id] [area-id] [address-family] flood-list` `interface-type interface-number`

6. **show ospfv3** `[process-id] [address-family] graceful-restart`

7. **show ospfv3** `[process-id] [area-id] [address-family] interface` `[type number] [brief]`

8. **show ospfv3** `[process-id] [area-id] [address-family] neighbor` `[interface-type interface-number] [neighbor-id] [detail]`

9. **show ospfv3** `[process-id] [area-id] [address-family] request-list [neighbor] [interface] [interface-neighbor]`

10. **show ospfv3** `[process-id] [area-id] [address-family] retransmission-list [neighbor] [interface] [interface-neighbor]`

11. **show ospfv3** `[process-id] [address-family] statistic [detail]`

12. **show ospfv3** `[process-id] [address-family] summary-prefix`

13. **show ospfv3** `[process-id] [address-family] timers` `rate-limit`

14. **show ospfv3** `[process-id] [address-family] traffic` `interface-type interface-number`

15. **show ospfv3** `[process-id] [address-family] virtual-links`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| Example:  
Device> enable | |
| **Step 2** show ospfv3 `[process-id] [address-family] border-routers` | Displays the internal OSPFv3 routing table entries to an ABR and ASBR.  
Example:  
Device# show ospfv3 border-routers | |
| **Step 3** show ospfv3 `[process-id [area-id]] [address-family] database` `[database-summary | internal | external [ipv6-prefix]] [link-state-id] [grace] [inter-area prefix [ipv6-prefix] [link-state-id]] [inter-area router [destination-router-id] [link-state-id]] [link [interface] | Displays lists of information related to the OSPFv3 database for a specific device. |
### Purpose

<table>

</tbody>
</table>

## Configuration Examples for Load Balancing in OSPFv3

### Example: Configuring the OSPFv3 Device Process

```bash
Device# show ospfv3 database
OSPFv3 Device with ID (172.16.4.4) (Process ID 1)
Device Link States (Area 0)
ADV Device Age Seg# Fragment ID Link count Bits
172.16.4.4 239 0x80000003 0 1 B
```
Example: Configuring NBMA Interfaces

The following example shows how to configure an OSPFv3 neighboring device with the IPv6 address of FE80::A8BB:CCFF:FE00:C01.

```
interface serial 0
ipv6 enable
ipv6 ospf 1 area 0
capsulation frame-relay
frame-relay map ipv6 FE80::A8BB:CCFF:FE00:C01 120
ipv6 ospf neighbor FE80::A8BB:CCFF:FE00:C01
```

Example: Forcing SPF Configuration

The following example shows how to trigger SPF to redo the SPF and repopulate the routing tables:

```
clear ipv6 ospf force-spf
```

CHAPTER 3

IPv6 Routing: OSPFv3 Authentication Support with IPsec

In order to ensure that Open Shortest Path First version 3 (OSPFv3) packets are not altered and re-sent to the device, OSPFv3 packets must be authenticated. OSPFv3 uses the IPsec secure socket API to add authentication to OSPFv3 packets. This API supports IPv6.

• Finding Feature Information, page 83
• Prerequisites for IPv6 Routing: OSPFv3 Authentication Support with IPsec, page 83
• Information About IPv6 Routing: OSPFv3 Authentication Support with IPsec, page 84
• How to Configure IPv6 Routing: OSPFv3 Authentication Support with IPsec, page 85

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for IPv6 Routing: OSPFv3 Authentication Support with IPsec

Configure the IP Security (IPsec) secure socket application program interface (API) on OSPFv3 in order to enable authentication and encryption.
**Information About IPv6 Routing: OSPFv3 Authentication Support with IPsec**

**OSPFv3 Authentication Support with IPsec**

In order to ensure that OSPFv3 packets are not altered and re-sent to the device, causing the device to behave in a way not desired by its system administrators, OSPFv3 packets must be authenticated. OSPFv3 uses the IPsec secure socket API to add authentication to OSPFv3 packets. This API supports IPv6.

OSPFv3 requires the use of IPsec to enable authentication. Crypto images are required to use authentication, because only crypto images include the IPsec API needed for use with OSPFv3.

In OSPFv3, authentication fields have been removed from OSPFv3 packet headers. When OSPFv3 runs on IPv6, OSPFv3 requires the IPv6 authentication header (AH) or IPv6 ESP header to ensure integrity, authentication, and confidentiality of routing exchanges. IPv6 AH and ESP extension headers can be used to provide authentication and confidentiality to OSPFv3.

To use the IPsec AH, you must enable the `ipv6 ospf authentication` command. To use the IPsec ESP header, you must enable the `ipv6 ospf encryption` command. The ESP header may be applied alone or in combination with the AH, and when ESP is used, both encryption and authentication are provided. Security services can be provided between a pair of communicating hosts, between a pair of communicating security gateways, or between a security gateway and a host.

To configure IPsec, you configure a security policy, which is a combination of the security policy index (SPI) and the key (the key is used to create and validate the hash value). IPsec for OSPFv3 can be configured on an interface or on an OSPFv3 area. For higher security, you should configure a different policy on each interface configured with IPsec. If you configure IPsec for an OSPFv3 area, the policy is applied to all of the interfaces in that area, except for the interfaces that have IPsec configured directly. Once IPsec is configured for OSPFv3, IPsec is invisible to you.

The secure socket API is used by applications to secure traffic. The API needs to allow the application to open, listen, and close secure sockets. The binding between the application and the secure socket layer also allows the secure socket layer to inform the application of changes to the socket, such as connection open and close events. The secure socket API is able to identify the socket; that is, it can identify the local and remote addresses, masks, ports, and protocol that carry the traffic requiring security.

Each interface has a secure socket state, which can be one of the following:

- **NULL**: Do not create a secure socket for the interface if authentication is configured for the area.
- **DOWN**: IPsec has been configured for the interface (or the area that contains the interface), but OSPFv3 either has not requested IPsec to create a secure socket for this interface, or there is an error condition.
- **GOING UP**: OSPFv3 has requested a secure socket from IPsec and is waiting for a CRYPTO_SS_SOCKET_UP message from IPsec.
- **UP**: OSPFv3 has received a CRYPTO_SS_SOCKET_UP message from IPsec.
- **CLOSING**: The secure socket for the interface has been closed. A new socket may be opened for the interface, in which case the current secure socket makes the transition to the DOWN state. Otherwise, the interface will become UNCONFIGURED.
- **UNCONFIGURED**: Authentication is not configured on the interface.
OSPFv3 will not send or accept packets while in the DOWN state.

How to Configure IPv6 Routing: OSPFv3 Authentication Support with IPsec

Configuring IPsec on OSPFv3

Once you have configured OSPFv3 and decided on your authentication, you must define the security policy on each of the devices within the group. The security policy consists of the combination of the key and the SPI. To define a security policy, you must define an SPI and a key.

You can configure an authentication or encryption policy either on an interface or for an OSPFv3 area. When you configure for an area, the security policy is applied to all of the interfaces in the area. For higher security, use a different policy on each interface.

You can configure authentication and encryption on virtual links.

Defining Authentication on an Interface

Before You Begin

Before you configure IPsec on an interface, you must configure OSPFv3 on that interface.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface  type number
4. Do one of the following:
   - ospfv3 authentication {ipsec spi} {md5 | sha1} { key-encryption-type key } | null
   - ipv6 ospf authentication {null | ipsec spi authentication-algorithm [key-encryption-type] [key]}

DETAILED STEPS

### Configuration Examples for IPv6 Routing: OSPFv3 Authentication Support with IPsec

**Example: Defining Authentication on an Interface**

The following example shows how to define authentication on Ethernet interface 0/0:

```plaintext
interface Ethernet0/0
  ipv6 enable
  ipv6 ospf 1 area 0
  ipv6 ospf authentication ipsec spi 500 md5 1234567890ABCDEF1234567890ABCDEF
interface Ethernet0/0
  ipv6 enable
  ipv6 ospf authentication null
  ipv6 ospf 1 area 0
```

---

*IP Routing: OSPF Configuration Guide, Cisco IOS Release 15M&T*
The following example shows how to define authentication on a VLAN interface of the Cisco ASR 901 Series Router:

```plaintext
interface Vlan60
ipv6 ospf encryption ipsec spi 300 esp 3des 4D92199549E0F2EF009B4160F3580E5528A11A45017F3887
    md5 79054025245FB1A26E4BC422AEFS4501
```

**Example: Defining Authentication in an OSPFv3 Area**

The following example shows how to define authentication on OSPFv3 area 0:

```plaintext
ipv6 router ospf 1
    router-id 10.11.11.1
    area 0 authentication ipsec spi 1000 md5 1234567890ABCDEF1234567890ABCDEF
```

OSPFv2 Cryptographic Authentication

To prevent unauthorized or invalid routing updates in your network, Open Shortest Path First version 2 (OSPFv2) protocol packets must be authenticated.

There are two methods of authentication that are defined for OSPFv2: plain text authentication and cryptographic authentication. This module describes how to configure cryptographic authentication using the Hashed Message Authentication Code - Secure Hash Algorithm (HMAC-SHA). OSPFv2 specification (RFC 2328) allows only the Message-Digest 5 (MD5) algorithm for cryptographic authentication. However, RFC 5709 (OSPFv2 HMAC-SHA Cryptographic Authentication) allows OSPFv2 to use HMAC-SHA algorithms for cryptographic authentication.

- Finding Feature Information, page 91
- Prerequisites for OSPFv2 Cryptographic Authentication, page 91
- Information About OSPFv2 Cryptographic Authentication, page 92
- How to Configure OSPFv2 Cryptographic Authentication, page 93

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPFv2 Cryptographic Authentication

Ensure that Open Shortest Path First version 2 (OSPFv2) is configured on your network.
Information About OSPFv2 Cryptographic Authentication

Configuring OSPFv2 Cryptographic Authentication

The OSPFv2 Cryptographic Authentication feature allows you to configure a key chain on the OSPF interface to authenticate OSPFv2 packets by using HMAC-SHA algorithms. You can use an existing key chain that is being used by another protocol, or you can create a key chain specifically for OSPFv2.

A key chain is a list of keys. Each key consists of a key string, which is also called the password or passcode. A key-string is essential for a key to be operational. Each key is identified by a unique key ID. To authenticate the OSPFv2 packets, it is essential that the cryptographic authentication algorithm be configured with a key. OSPFv2 supports keys with key IDs ranging from 1 to 255. The combination of the cryptographic authentication algorithm and the key is known as a Security Association (SA).

The authentication key on a key chain is valid for a specific time period called lifetime. An SA has the following configurable lifetimes:

- Accept lifetime
- Send lifetime

While adding a new key, the Send lifetime is set to a time in the future so that the same key can be configured on all devices in the network before the new key becomes operational. Old keys are removed only after the new key is operational on all devices in the network. When packets are received, the key ID is used to fetch the data for that key. The packet is verified using the cryptographic authentication algorithm and the configured key ID. If the key ID is not found, the packet is dropped.

Use the `ip ospf authentication key-chain` command to configure key chains for OSPFv2 cryptographic authentication.

---

**Note**

If OSPFv2 is configured to use a key chain, all MD5 keys that were previously configured using the `ip ospf message-digest-key` command are ignored.
How to Configure OSPFv2 Cryptographic Authentication

Defining a Key Chain

SUMMARY STEPS

1. enable
2. configure terminal
3. key chain name
4. key key-id
5. key-string name
6. cryptographic-algorithm name
7. send-lifetime start-time {infinite | end-time | duration seconds}
8. end

| **Step 3** key chain name          | Specifies the key chain name and enters key-chain configuration mode.   |
| Example:                           |                                                                         |
| Device(config)# key chain sample1  |                                                                         |

| **Step 4** key key-id              | Specifies the key identifier and enters key-chain key configuration mode. The range is from 1 to 255. |
| Example:                           |                                                                         |
| Device(config-keychain)# key 1    |                                                                         |
### Purpose

**Command or Action**

**Step 5**

key-string *name*

**Example:**

Device(config-keychain-key)# key-string string1

**Purpose**

Specifies the key string.

**Step 6**

cryptographic-algorithm *name*

**Example:**

Device(config-keychain-key)# cryptographic-algorithm hmac-sha-256

**Purpose**

Configures the key with the specified cryptographic algorithm.

**Step 7**

send-lifetime *start-time* {infinite | end-time | duration *seconds*}

**Example:**

Device(config-keychain-key)# send-lifetime local 10:00:00 5 July 2013 infinite

**Purpose**

Sets the time period during which an authentication key on a key chain is valid to be sent during key exchange with another device.

**Step 8**

end

**Example:**

Device(config-keychain-key)# end

**Purpose**

Exits key-chain key configuration mode and returns to privileged EXEC mode.

### Configuration Examples for OSPFv2 Cryptographic Authentication

#### Example: Defining a Key Chain

The following example shows how to configure a key chain:

```
Device> enable
Device# configure terminal
Device(config)# key chain sample1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string ThisIsASampleKey12345
Device(config-keychain-key)# cryptographic-algorithm hmac-sha-256
Device(config-keychain-key)# end-lifetime local 10:00:00 5 July 2013 infinite
```
Example: Verifying a Key Chain

The following sample output from the `show key chain` command displays the key chain information:

```
Device# show key chain Key-chain sample1

key 1 -- text "ThisIsASampleKey12345"
send lifetime (10:00:00 PDT Jul 5 2013) - (infinite)
accept lifetime (always valid) - (always valid) [valid now]
```

The table below describes the significant fields in the output:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>Status of the configured key.</td>
</tr>
<tr>
<td>accept lifetime</td>
<td>The time interval within which the device accepts the key during key exchange with another device.</td>
</tr>
<tr>
<td>send lifetime</td>
<td>The time interval within which the device sends the key during a key exchange with another device.</td>
</tr>
</tbody>
</table>

Example: Defining Authentication on an Interface

The following example shows how to define authentication on Gigabit Ethernet interface 0/0/0:

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet0/0/0
Device (config-if)# ip ospf authentication key-chain sample1
Device (config-if)# end
```

Example: Verifying Authentication on an Interface

The following sample output of the `show ip ospf interface` command displays the cryptographic key information:

```
Device# show ip ospf interface GigabitEthernet0/0/0

GigabitEthernet0/0/0 is up, line protocol is up
Internet Address 192.168.8.2/24, Area 1, Attached via Interface Enable
Process ID 1, Router ID 10.1.1.8, Network Type BROADCAST, Cost: 10
Topology-MTID Cost Disabled Shutdown Topology Name
0 10 no no Base
Enabled by interface config, including secondary ip addresses
Transmit Delay is 1 sec, State DR, Priority 1
Designated Router (ID) 10.1.1.8, Interface address 192.168.8.2
Backup Designated router (ID) 10.1.1.9, Interface address 192.168.8.9
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  oob-resync timeout 40
  Hello due in 00:00:00
  Supports Link-local Signaling (LLS)
  Cisco NSF helper support enabled
  IETF NSF helper support enabled
```
Can be protected by per-prefix Loop-Free FastReroute
Can be used for per-prefix Loop-Free FastReroute repair paths
Index 1/1, flood queue length 0
Next 0x0(0)/0x0(0)
Last flood scan length is 0, maximum is 1
Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 1, Adjacent neighbor count is 1
  Adjacent with neighbor 10.1.1.9 (Backup Designated Router)
Suppress hello for 0 neighbor(s)
Cryptographic authentication enabled
  Sending SA: Key 25, Algorithm HMAC-SHA-256 – key chain sample1

The table below describes the significant fields in the output:

OSPFv3 IPSec ESP Encryption and Authentication

When Open Shortest Path First version 3 (OSPFv3) runs on IPv6, OSPFv3 requires the IPv6 encapsulating security payload (ESP) header or IPv6 authentication header to ensure integrity, authentication, and confidentiality of routing exchanges. IPv6 ESP extension headers can be used to provide authentication and confidentiality to OSPFv3.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPFv3 IPSec ESP Encryption and Authentication

Configure the IP Security (IPsec) secure socket application program interface (API) on OSPFv3 in order to enable authentication and encryption.
Information About OSPFv3 IPSec ESP Encryption and Authentication

OSPFv3 Authentication Support with IPsec

In order to ensure that OSPFv3 packets are not altered and re-sent to the device, causing the device to behave in a way not desired by its system administrators, OSPFv3 packets must be authenticated. OSPFv3 uses the IPsec secure socket API to add authentication to OSPFv3 packets. This API supports IPv6.

OSPFv3 requires the use of IPsec to enable authentication. Crypto images are required to use authentication, because only crypto images include the IPsec API needed for use with OSPFv3.

In OSPFv3, authentication fields have been removed from OSPFv3 packet headers. When OSPFv3 runs on IPv6, OSPFv3 requires the IPv6 authentication header (AH) or IPv6 ESP header to ensure integrity, authentication, and confidentiality of routing exchanges. IPv6 AH and ESP extension headers can be used to provide authentication and confidentiality to OSPFv3.

To use the IPsec AH, you must enable the \texttt{ipv6 ospf authentication} command. To use the IPsec ESP header, you must enable the \texttt{ipv6 ospf encryption} command. The ESP header may be applied alone or in combination with the AH, and when ESP is used, both encryption and authentication are provided. Security services can be provided between a pair of communicating hosts, between a pair of communicating security gateways, or between a security gateway and a host.

To configure IPsec, you configure a security policy, which is a combination of the security policy index (SPI) and the key (the key is used to create and validate the hash value). IPsec for OSPFv3 can be configured on an interface or on an OSPFv3 area. For higher security, you should configure a different policy on each interface configured with IPsec. If you configure IPsec for an OSPFv3 area, the policy is applied to all of the interfaces in that area, except for the interfaces that have IPsec configured directly. Once IPsec is configured for OSPFv3, IPsec is invisible to you.

The secure socket API is used by applications to secure traffic. The API needs to allow the application to open, listen, and close secure sockets. The binding between the application and the secure socket layer also allows the secure socket layer to inform the application of changes to the socket, such as connection open and close events. The secure socket API is able to identify the socket; that is, it can identify the local and remote addresses, masks, ports, and protocol that carry the traffic requiring security.

Each interface has a secure socket state, which can be one of the following:

- **NULL**: Do not create a secure socket for the interface if authentication is configured for the area.
- **DOWN**: IPsec has been configured for the interface (or the area that contains the interface), but OSPFv3 either has not requested IPsec to create a secure socket for this interface, or there is an error condition.
- **GOING UP**: OSPFv3 has requested a secure socket from IPsec and is waiting for a CRYPTO_SS_SOCKET_UP message from IPsec.
- **UP**: OSPFv3 has received a CRYPTO_SS_SOCKET_UP message from IPsec.
- **CLOSING**: The secure socket for the interface has been closed. A new socket may be opened for the interface, in which case the current secure socket makes the transition to the DOWN state. Otherwise, the interface will become UNCONFIGURED.
- **UNCONFIGURED**: Authentication is not configured on the interface.
OSPFv3 will not send or accept packets while in the DOWN state.

**OSPFv3 Virtual Links**

For each virtual link, a master security information datablock is created for the virtual link. Because a secure socket must be opened on each interface, there will be a corresponding security information datablock for each interface in the transit area. The secure socket state is kept in the interface’s security information datablock. The state field in the master security information datablock shows the status of all of the secure sockets opened for the virtual link. If all of the secure sockets are UP, then the security state for the virtual link will be set to UP.

Packets sent on a virtual link with IPsec must use predetermined source and destination addresses. The first local area address found in the device’s intra-area-prefix LSA for the area is used as the source address. This source address is saved in the area data structure and used when secure sockets are opened and packets sent over the virtual link. The virtual link will not transition to the point-to-point state until a source address is selected. Also, when the source or destination address changes, the previous secure sockets must be closed and new secure sockets opened.

---

**Note**

Virtual links are not supported for the IPv4 AF.

---

How to Configure OSPFv3 IPSec ESP Encryption and Authentication

**Defining Encryption on an Interface**

**Before You Begin**

Before you configure IPsec on an interface, you must configure OSPFv3 on that interface.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface type number`
4. Do one of the following:

   - `ospfv3 encryption {ipsec spi spi esp encryption-algorithm key-encryption-type key authentication-algorithm key-encryption-type key | null}`
   - `ipv6 ospf encryption {ipsec spi spi esp {encryption-algorithm [[key-encryption-type] key] | null} authentication-algorithm [key-encryption-type] key | null}`

OSPF ABR Type 3 LSA Filtering

The OSPF ABR Type 3 LSA Filtering feature extends the ability of an ABR that is running the OSPF protocol to filter type 3 link-state advertisements (LSAs) that are sent between different OSPF areas. This feature allows only packets with specified prefixes to be sent from one area to another area and restricts all packets with other prefixes. This type of area filtering can be applied out of a specific OSPF area, into a specific OSPF area, or into and out of the same OSPF areas at the same time.

- Finding Feature Information, page 111
- Benefits, page 111
- Restrictions, page 112
- Configuration Tasks, page 112
- Configuration Examples, page 114
- Additional References, page 114
- Feature Information for the OSPF ABR Type 3 LSA Filtering, page 116

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Benefits

The OSPF ABR Type 3 LSA Filtering feature gives the administrator improved control of route distribution between OSPF areas.
Restrictions

Only type 3 LSAs that originate from an ABR are filtered.

Related Features and Technologies

This feature is an extension of the OSPF routing protocol. For more information about configuring OSPF and configuring route summarization and filtering, refer to the "OSPF" module of the Cisco IOS IP Configuration Guide, Release 12.4 and the Cisco IOS IP Routing Protocols Command Reference, Release 12.4T.

Configuration Tasks

See the following sections for configuration tasks for the OSPF ABR Type 3 LSA Filtering feature. Each task in the list is identified as either required or optional:

Configuring OSPF ABR Type 3 LSA Filtering

SUMMARY STEPS

1. Router(config)# router ospf process-id
2. Router(config-router)# area area-id filter-list prefix prefix-list-name in
3. Router(config-router)# exit
4. Router(config)# ip prefix-list list-name [seq seq-value] deny | permit network/len [ge ge-value] [le le-value]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>router(config)# router ospf process-id</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>router(config-router)# area area-id filter-list prefix prefix-list-name in</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>router(config-router)# exit</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ip prefix-list list-name [seq seq-value] deny</td>
</tr>
</tbody>
</table>
Configuring OSPF ABR Type 3 LSA Filtering

To filter interarea routes out of a specified area, use the following commands beginning in router configuration mode:

**SUMMARY STEPS**

1. `Router(config)# router ospf process-id`
2. `Router(config-router)# area area-id filter-list prefix prefix-list-name out`
3. `Router(config-router)# exit`
4. `Router(config)# ip prefix-list list-name [seq seq-value] deny [permit network/len [ge ge-value] [le le-value]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Router(config)# router ospf process-id</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Router(config-router)# area area-id filter-list prefix prefix-list-name out</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Router(config-router)# exit</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Router(config)# ip prefix-list list-name [seq seq-value] deny [permit network/len [ge ge-value] [le le-value]</td>
</tr>
</tbody>
</table>

**Verifying OSPF ABR Type 3 LSA Filtering**

To verify that the OSPF ABR Type 3 LSA Filtering feature has been configured, use the `show ip ospf` command in the EXEC mode. The `show ip ospf` command will show that this feature has been enabled by listing the area filter as "in" or "out." The following is sample output from the `show ip ospf` command:

```
router# show ip ospf 1
Routing Process "ospf 1" with ID 172.16.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
It is an area border router
SPF schedule delay 5 secs, Hold time between two SPF 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 2. 2 normal 0 stub 0 nssa
External flood list length 0
  Area BACKBONE(0)
    Number of interfaces in this area is 2
    Area has no authentication
    SPF algorithm executed 6 times
```
Area ranges are
10.0.0.0/8 Passive Advertise
Area-filter AREA_0_IN in
Area-filter AREA_0_OUT out
Number of LSA 5. Checksum Sum 0x29450
Number of opaque link LSA 0. Checksum Sum 0x0
Number of DCbitless LSA 0
Number of indication LSA 0
Number of DoNotAge LSA 0
Flood list length 0

Area 1
Number of interfaces in this area is 1
Area has no authentication
SPF algorithm executed 4 times
Area ranges are
Area-filter AREA_1_IN in
Area-filter AREA_1_OUT out
Number of LSA 6. Checksum Sum 0x30100
Number of opaque link LSA 0. Checksum Sum 0x0
Number of DCbitless LSA 0
Number of indication LSA 0
Number of DoNotAge LSA 0
Flood list length 0

### Monitoring and Maintaining OSPF ABR Type 3 LSA Filtering

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router# show ip prefix-list</td>
<td>Displays information about a prefix list or prefix list entries.</td>
</tr>
</tbody>
</table>

### Configuration Examples

The following configuration example output shows interarea filtering that is applied to both incoming and outgoing routes:

```
Router(config)# router ospf 1
log-adjacency-changes
area 1 filter-list prefix AREA_1_OUT out
area 3 filter-list prefix AREA_3_IN in
network 10.0.0.0 0.255.255.255 area 3
network 172.16.1.0 0.0.0.255 area 0
network 192.168.0.0 0.255.255.255 area 1
!
ip prefix-list AREA_1_OUT seq 10 permit 10.25.0.0/8 ge 16
ip prefix-list AREA_1_OUT seq 20 permit 172.20.0.0/24
!
ip prefix-list AREA_3_IN seq 10 permit 172.31.0.0/16
```

CHAPTER 7

OSPF Stub Router Advertisement

The OSPF Stub Router Advertisement feature allows you to bring a new router into a network without immediately routing traffic through the new router and allows you to gracefully shut down or reload a router without dropping packets that are destined for other networks.

• Finding Feature Information, page 117
• Information About OSPF Stub Router Advertisement, page 117
• Supported Platforms, page 119
• How to Configure OSPF Stub Router Advertisement, page 120
• Configuration Examples of OSPF Stub Router Advertisement, page 124
• Additional References, page 125
• Feature Information for OSPF Stub Router Advertisement, page 126

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About OSPF Stub Router Advertisement

OSPF Stub Router Advertisement Functionality

The OSPF Stub Router Advertisement feature allows you to bring a new router into a network without immediately routing traffic through the new router and allows you to gracefully shut down or reload a router without dropping packets that are destined for other networks. This feature introduces three configuration
options that allow you to configure a router that is running the Open Shortest Path First (OSPF) protocol to advertise a maximum or infinite metric to all neighbors.

When any of these three configuration options are enabled on a router, the router will originate link-state advertisements (LSAs) with a maximum metric (LSInfinity: 0xFFFF) through all nonstub links. The advertisement of a maximum metric causes other routers to assign a cost to the new router that is higher than the cost of using an alternate path. Because of the high cost assigned to paths that pass through the new router, other routers will not use a path through the new router as a transit path to forward traffic that is destined for other networks, which allows switching and routing functions to be up and running and routing tables to converge before transit traffic is routed through this router.

Note: Directly connected links in a stub network are not affected by the configuration of a maximum or infinite metric because the cost of a stub link is always set to the output interface cost.

Allowing Routing Tables to Converge

Two configuration options introduced by the OSPF Stub Router Advertisement feature allow you to bring a new router into a network without immediately routing traffic through the new router. These configuration options are useful because Interior Gateway Protocols (IGPs) converge very quickly upon a router during startup or after a reload, often before Border Gateway Protocol (BGP) routing tables have completely converged. If neighbor routers forward traffic through a router while that router is building BGP routing tables, packets that have been received for other destinations may be dropped. Advertising a maximum metric during startup will allow routing tables to converge before traffic that is destined for other networks is sent through the router. The following two configuration options enable a router to advertise a maximum metric at startup:

- You can configure a timer to advertise a maximum metric when the router is started or reloaded. When this option is configured, the router will advertise a maximum metric, which forces neighbor routers to select alternate paths until the timer expires. When the timer expires, the router will advertise accurate (normal) metrics, and other routers will send traffic to this router depending on the cost. The configurable range of the timer is from 5 to 86,400 seconds.

- You can configure a router to advertise a maximum metric at startup until BGP routing tables converge or until the default timer expires (600 seconds). Once BGP routing tables converge or the default timer expires, the router will advertise accurate (normal) metrics and other routers will send traffic to this router, depending on the cost.

Configuring a Graceful Shutdown

The third configuration option introduced by the OSPF Stub Router Advertisement feature allows you to gracefully remove a router from the network by advertising a maximum metric through all links, which allows other routers to select alternate paths for transit traffic to follow before the router is shut down. There are many situations where you may need to remove a router from the network. If a router is removed from a network and neighbor routers cannot detect that the physical interface is down, neighbors will need to wait for dead timers to expire before the neighbors will remove the adjacency and routing tables will reconverge. This situation may occur when there is a switch between other routers and the router that is shut down. Packets may be dropped while the neighbor routing tables reconverge.
When this third option is configured, the router advertises a maximum metric, which allows neighbor routers to select alternate paths before the router is shut down. This configuration option could also be used to remove a router that is in a critical condition from the network without affecting traffic that is destined for other networks.

**Note**
You should not save the running configuration of a router when it is configured for a graceful shutdown because the router will continue to advertise a maximum metric after it is reloaded.

---

## Benefits of OSPF Stub Router Advertisement

**Improved Stability and Availability**
Advertising a maximum metric through all links at startup or during a reload will prevent neighbor routers from using a path through the router as a transit path, thereby reducing the number of packets that are dropped and improving the stability and availability of the network.

**Graceful Removal from the Network**
Advertising a maximum metric before shutdown allows other routers to select alternate paths before the transit path through a router becomes inaccessible.

---

## Related Features and Technologies

The OSPF Stub Router Advertisement feature is an extension of the OSPF routing protocol. For more information about configuring OSPF and BGP, refer to the *Cisco IOS IP Routing Configuration Guide* and the *Cisco IOS IP Routing Command Reference*.

---

## Supported Platforms

The OSPF Stub Router Advertisement feature is supported by the following platforms in Cisco IOS Release 12.2(14)S that support OSPF:

- Cisco 7200 series
- Cisco 7400 series
- Cisco 7500 series

**Determining Platform Support Through Cisco Feature Navigator**
Cisco IOS software is packaged in feature sets that support specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can
search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

http://www.cisco.com/go/fn

Availability of Cisco IOS Software Images

Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

How to Configure OSPF Stub Router Advertisement

See the following sections for configuration tasks to configure OSPF to advertise a maximum metric. This feature has three different configuration options. All tasks are optional and should be individually configured.

Configuring Advertisement on Startup

SUMMARY STEPS

1. Router(config)# router ospf process-id
2. Router(config-router)# max-metric router-lsa on-startup announce-time

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Router(config)# router ospf process-id</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Router(config-router)# max-metric router-lsa on-startup announce-time</td>
</tr>
</tbody>
</table>
Configuring Advertisement Until Routing Tables Converge

SUMMARY STEPS

1. Router(config)# router ospf process-id
2. Router(config-router)# max-metric router-lsa on-startup wait-for-bgp

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config)# router ospf process-id</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router(config-router)# max-metric router-lsa on-startup wait-for-bgp</td>
</tr>
</tbody>
</table>

Configuring Advertisement for a Graceful Shutdown

SUMMARY STEPS

1. Router(config)# router ospf process-id
2. Router(config-router)# max-metric router-lsa
3. Router(config-router)# exit
4. Router(config)# exit
5. Router# show ip ospf

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config)# router ospf process-id</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router(config-router)# max-metric router-lsa</td>
</tr>
<tr>
<td>Step 3</td>
<td>Router(config-router)# exit</td>
</tr>
</tbody>
</table>
Purpose| Command or Action | Purpose |
---|---|---
Step 4 | Router(config)# exit | Exits configuration mode and places the router in privileged EXEC mode. |
Step 5 | Router# show ip ospf | Displays general information about OSPF routing processes. The show ip ospf command is entered in order to verify that the max-metric router-lsa command has been enabled before the router is shut down or reloaded. |

**What to Do Next**

**Note**
You should not save the running configuration of a router when it is configured for a graceful shutdown because the router will continue to advertise a maximum metric after it is reloaded.

**Verifying the Advertisement of a Maximum Metric**

To verify that the advertisement of a maximum metric has been configured correctly, use the show ip ospf command.

The output of the show ip ospf command will display the condition, state, and remaining time delay of the advertisement of a maximum metric, depending on which options were configured with the max-metric router-lsa command.

The following sample output is similar to the output that will be displayed when the on-startup keyword and announce-time argument are configured with the max-metric router-lsa command:

```
Router# show ip ospf
Routing Process "ospf 1998" with ID 10.18.134.155
   Supports only single TOS(TOS0) routes
   Supports opaque LSA
   It is an area border and autonomous system boundary router
   Redistributing External Routes from,
      static, includes subnets in redistribution
   Originating router-LSAs with maximum metric, Time remaining: 00:01:18
      Condition: on startup for 300 seconds, State: active
   SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
   Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
   Number of external LSA 7. Checksum Sum 0x47261
   Number of opaque AS LSA 0. Checksum Sum 0x0
   Number of DCbitless external and opaque AS LSA 0
   Number of DoNotAge external and opaque AS LSA 0
   Number of areas in this router is 2. 1 normal 0 stub 1 nssa
   External flood list length 0
      Area BACKBONE (0)
         Number of interfaces in this area is 1
         Area has no authentication
         SPF algorithm executed 3 times
         Area ranges are
         Number of LSA 8. Checksum Sum 0x474AE
         Number of opaque link LSA 0. Checksum Sum 0x0
```
The following sample output is similar to the output that will be displayed when the on-startup and wait-for-bgp keywords are configured with the max-metric router-lsa command:

```
Router# show ip ospf
Routing Process "ospf 1998" with ID 10.18.134.155
    Supports only single TOS(TOS0) routes
    Supports opaque LSA
    It is an area border and autonomous system boundary router
    Redistributing External Routes from,
    static, includes subnets in redistribution
    Originating router-LSAs with maximum metric, Time remaining: 00:01:18
    Condition: on startup while BGP is converging, State: active
    SPF schedule delay 5 secs, Hold time between two SPF's 10 secs
    Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
    Number of external LSA 7. Checksum Sum 0x47261
    Number of opaque AS LSA 0. Checksum Sum 0x0
    Number of DCbitless external and opaque AS LSA 0
    Number of DoNotAge external and opaque AS LSA 0
    Number of areas in this router is 2. 1 normal 0 stub 1 nssa
    External flood list length 0
    Area BACKBONE(0)
        Number of interfaces in this area is 1
        Area has no authentication
        SPF algorithm executed 3 times
        Area ranges are
        Number of LSA 8. Checksum Sum 0x474AE
        Number of opaque link LSA 0. Checksum Sum 0x0
```

The following sample output is similar to the output that will be displayed when the max-metric router-lsa command is configured without any keywords or arguments:

```
Router# show ip ospf
Routing Process "ospf 1998" with ID 10.18.134.155
    Supports only single TOS(TOS0) routes
    Supports opaque LSA
    It is an area border and autonomous system boundary router
    Redistributing External Routes from,
    static, includes subnets in redistribution
    Originating router-LSAs with maximum metric
    Condition: always, State: active
    SPF schedule delay 5 secs, Hold time between two SPF's 10 secs
    Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
    Number of external LSA 7. Checksum Sum 0x47261
    Number of opaque AS LSA 0. Checksum Sum 0x0
    Number of DCbitless external and opaque AS LSA 0
    Number of DoNotAge external and opaque AS LSA 0
    Number of areas in this router is 2. 1 normal 0 stub 1 nssa
    External flood list length 0
    Area BACKBONE(0)
        Number of interfaces in this area is 1
        Area has no authentication
        SPF algorithm executed 3 times
        Area ranges are
        Number of LSA 8. Checksum Sum 0x474AE
        Number of opaque link LSA 0. Checksum Sum 0x0
```

The output of the show ip ospf database command will display information about OSPF LSAs and indicate if the router is announcing maximum cost links. The following sample output is similar to the output that will be displayed when any form of the max-metric router-lsa command is configured:

```
Router# show ip ospf database
    Exception Flag: Announcing maximum link costs
    LS age: 68
    Options: (No TOS-capability, DC)
    LS Type: Router Links
    Link State ID: 172.18.134.155
    Advertising Router: 172.18.134.155
    LS Seq Number: 80000002
    Checksum: 0x175D
    Length: 60
```
Area Border Router
AS Boundary Router
Number of Links: 3

- Link connected to: a Transit Network
  (Link ID) Designated Router address: 192.168.1.11
  (Link Data) Router Interface address: 192.168.1.14
  Number of TOS metrics: 0
  TOS 0 Metrics: 65535 (metric used for local calculation: 10)

- Link connected to: a Transit Network
  (Link ID) Designated Router address: 10.1.145.11
  (Link Data) Router Interface address: 10.1.145.14
  Number of TOS metrics: 0
  TOS 0 Metrics: 65535 (metric used for local calculation: 10)

- Link connected to: a Stub Network
  (Link ID) Network/subnet number: 10.11.12.0
  (Link Data) Network Mask: 255.255.255.0
  Number of TOS metrics: 0
  TOS 0 Metrics: 1

---

### Monitoring and Maintaining OSPF Stub Router Advertisement

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router# <code>show ip ospf</code></td>
<td>Displays general information about OSPF routing processes and provides information about the configuration settings and status of the OSPF Stub Router Advertisement feature.</td>
</tr>
<tr>
<td>Router# <code>show ip ospf database router</code></td>
<td>Displays information about router LSAs, and indicates if a router is announcing maximum link costs.</td>
</tr>
</tbody>
</table>

### Configuration Examples of OSPF Stub Router Advertisement

#### Example Advertisement on Startup

In the following example, a router that is running OSPF is configured to advertise a maximum metric at startup for 300 seconds:

```shell
Router(config)# router ospf 100
Router(config-router)# max-metric router-lsa on-startup 300
```

#### Example Advertisement Until Routing Tables Converge

In the following example, a router that is running OSPF is configured to advertise a maximum metric until BGP routing tables converge or until the default timer expires (600 seconds):

```shell
Router(config)# router ospf 100
Router(config-router)# max-metric router-lsa on-startup wait-for-bgp
```
Example Graceful Shutdown

In the following example, a router that is running OSPF is configured to advertise a maximum metric until the router is shut down:

Router(config)# router ospf 100
Router(config-router)# max-metric router-lsa
Router(config-router)# exit
Router(config)# exit
Router# show ip ospf

| OSPF Stub Router Advertisement    | 12.1(8)E 12.0(15)S 12.0(15)SC 12.0(16)ST 12.2(4)T 12.2(4)T3 12.2(14)S Cisco IOS XE 3.1.0 SG | The OSPF Stub Router Advertisement feature allows you to bring a new router into a network without immediately routing traffic through the new router and allows you to gracefully shut down or reload a router without dropping packets that are destined for other networks. The following commands are introduced or modified in the feature documented in this module:  
  • max-metric router-lsa  
  • show ip ospf                                                                                                                                 |

OSPF Stub Router Advertisement

Feature Information for OSPF Stub Router Advertisement
CHAPTER 8

OSPF Update Packet-Pacing Configurable Timers

This module describes the OSPF Update Packet-Pacing Configurable Timers feature, which allows you to configure the rate at which OSPF LSA flood pacing, retransmission pacing, and group pacing updates occur.

- Finding Feature Information, page 127
- Restrictions on OSPF Update Packet-Pacing Configurable Timers, page 127
- Information About OSPF Update Packet-Pacing Configurable Timers, page 128
- Supported Platforms, page 128
- How to Configure OSPF Packet-Pacing Timers, page 129
- Configuration Examples of OSPF Update Packet-Pacing, page 132
- Additional References, page 133
- Feature Information for OSPF Update Packet-Pacing Configurable Timers, page 134

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions on OSPF Update Packet-Pacing Configurable Timers

Do not change the packet pacing timers unless all other options to meet OSPF packet flooding requirements have been exhausted. Specifically, network operators should prefer summarization, stub area usage, queue tuning, and buffer tuning before changing the default timers. Furthermore, there are no guidelines for changing
timer values; each OSPF deployment is unique and should be considered on a case-by-case basis. The network operator assumes risks associated with changing the default timer values.

Information About OSPF Update Packet-Pacing Configurable Timers

Functionality of the OSPF Update Packet-Pacing Timers

In rare situations, you might need to change Open Shortest Path First (OSPF) packet-pacing default timers to mitigate CPU or buffer utilization issues associated with flooding very large numbers of link-state advertisements (LSAs). The OSPF Update Packet-Pacing Configurable Timers feature allows you to configure the rate at which OSPF LSA flood pacing, retransmission pacing, and group pacing updates occur.

Configuring OSPF flood pacing timers allows you to control interpacket spacing between consecutive link-state update packets in the OSPF transmission queue. Configuring OSPF retransmission pacing timers allows you to control interpacket spacing between consecutive link-state update packets in the OSPF retransmission queue. Cisco IOS software groups the periodic refresh of LSAs to improve the LSA packing density for the refreshes in large topologies. The group timer controls the interval used for group LSA refreshment; however, this timer does not change the frequency that individual LSAs are refreshed (the default refresh occurs every 30 minutes).

Note

The default settings for OSPF packet pacing timers are suitable for the majority of OSPF deployments. You should change the default timers only as a last resort.

Benefits of OSPF Update Packet-Pacing Configurable Timers

The OSPF Update Packet-Pacing Configurable Timers feature provides the administrator with a mechanism to control the rate at which LSA updates occur in order to reduce high CPU or buffer utilization that can occur when an area is flooded with a very large number of LSAs.

Related Features and Technologies

The OSPF Update Packet-Pacing Configurable Timers feature is an extension of the OSPF routing protocol. For more information about configuring OSPF, packet pacing, area border router (ABR) and autonomous system boundary router (ASBR) summarization, and stub router configuration, refer to the "Configuring OSPF" module of the Cisco IOS IP Routing Configuration Guide and the Cisco IOS IP Routing: OSPF Command Reference.

Supported Platforms

The OSPF Update Packet-Pacing Configurable Timers feature is supported by the following platforms in Cisco IOS Release 12.2(14)S that support OSPF:
Cisco 7200 series
Cisco 7400 series
Cisco 7500 series

Determining Platform Support Through Cisco Feature Navigator
Cisco IOS software is packaged in feature sets that support specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:
http://www.cisco.com/go/fn

Availability of Cisco IOS Software Images
Platform support for particular Cisco IOS software releases is dependent on the availability of the software images for those platforms. Software images for some platforms may be deferred, delayed, or changed without prior notice. For updated information about platform support and availability of software images for each Cisco IOS software release, refer to the online release notes or, if supported, Cisco Feature Navigator.

How to Configure OSPF Packet-Pacing Timers

See the following sections for configuration tasks for the OSPF Update Packet-Pacing Configurable Timers feature. Each task in the list is identified as either required or optional:

Configuring OSPF Packet-Pacing Timers

SUMMARY STEPS

1. Router(config)# router ospf process-id
2. Router(config-router)# timers pacing flood milliseconds

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router(config)# router ospf process-id</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router(config-router)# timers pacing flood milliseconds</td>
</tr>
</tbody>
</table>
Configuring a Group Packet Pacing Timer

To configure a retransmission packet pacing timer, use the following commands beginning in router configuration mode:

**SUMMARY STEPS**

1. Router(config)# `router ospf process-id`
2. Router(config-router)# `timers pacing lsa-group seconds`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# <code>router ospf process-id</code></td>
<td>Places the router in router configuration mode and enables an OSPF routing process.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-router)# <code>timers pacing lsa-group seconds</code></td>
<td>Configures an LSA group packet pacing timer delay (in seconds).</td>
</tr>
</tbody>
</table>

Configuring a Group Packet Pacing Timer

To configure a retransmission packet pacing timer, use the following commands beginning in router configuration mode:

**SUMMARY STEPS**

1. Router(config)# `router ospf process-id`
2. Router(config-router)# `timers pacing lsa-group seconds`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# <code>router ospf process-id</code></td>
<td>Places the router in router configuration mode and enables an OSPF routing process.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-router)# <code>timers pacing lsa-group seconds</code></td>
<td>Configures an LSA group packet pacing timer delay (in seconds).</td>
</tr>
</tbody>
</table>
Verifying OSPF Packet-Pacing Timers

To verify that OSPF packet pacing has been configured, use the `show ip ospf` privileged EXEC command. The output of the `show ip ospf` command will display the type and delay time of the configurable pacing timers (flood, retransmission, group). The following example output is from the `show ip ospf` command:

```
Router# show ip ospf
Routing Process "ospf 1" with ID 10.0.0.1 and Domain ID 10.20.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFss 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
LSA group pacing timer 100 secs
Interface flood pacing timer 55 msecs
Retransmission pacing timer 100 msecs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 2. 2 normal 0 stub 0 nssa
External flood list length 0

```

Troubleshooting Tips

If the number of OSPF packet retransmissions rapidly increases, increase the value of the packet pacing timers. The number of OSPF packet retransmissions is displayed in the output of the `show ip ospf neighbor` command.
Monitoring and Maintaining OSPF Packet-Pacing Timers

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router# show ip ospf</td>
<td>Displays general information about OSPF routing processes.</td>
</tr>
<tr>
<td>router# show ip ospf neighbor</td>
<td>Displays OSPF neighbor information on a per-interface basis.</td>
</tr>
<tr>
<td>Router# clear ip ospf redistribution</td>
<td>Clears route redistribution based on the OSPF routing process ID.</td>
</tr>
</tbody>
</table>

Configuration Examples of OSPF Update Packet-Pacing

Example Flood Pacing

The following example configures LSA flood pacing updates to occur in 50-millisecond intervals for OSPF routing process 1:

```
Router(config)# router ospf 1
Router(config-router)# timers pacing flood 50
```

Example Retransmission Pacing

The following example configures retransmission pacing updates to occur in 100-millisecond intervals for OSPF routing process 1:

```
Router(config)# router ospf 1
Router(config-router)# timers pacing retransmission 100
```

Example Group Pacing

The following example configures OSPF group pacing updates between LSA groups to occur in 75-second intervals for OSPF routing process 1:

```
Router(config)# router ospf 1
Router(config-router)# timers pacing lsa-group 75
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Feature Overview

Using OSPF in PE-CE Router Connections

In an MPLS VPN configuration, the OSPF protocol is one way you can connect customer edge (CE) routers to service provider edge (PE) routers in the VPN backbone. OSPF is often used by customers that run OSPF as their intrasite routing protocol, subscribe to a VPN service, and want to exchange routing information between their sites using OSPF (during migration or on a permanent basis) over an MPLS VPN backbone.

The figure below shows an example of how VPN client sites that run OSPF can connect over an MPLS VPN backbone.

When OSPF is used to connect PE and CE routers, all routing information learned from a VPN site is placed in the VPN routing and forwarding (VRF) instance associated with the incoming interface. The PE routers that attach to the VPN use the Border Gateway Protocol (BGP) to distribute VPN routes to each other. A CE router can then learn the routes to other sites in the VPN by peering with its attached PE router. The MPLS VPN superbackbone provides an additional level of routing hierarchy to interconnect the VPN sites running OSPF.

When OSPF routes are propagated over the MPLS VPN backbone, additional information about the prefix in the form of BGP extended communities (route type, domain ID extended communities) is appended to the BGP update. This community information is used by the receiving PE router to decide the type of link-state advertisement (LSA) to be generated when the BGP route is redistributed to the OSPF PE-CE process. In this way, internal OSPF routes that belong to the same VPN and are advertised over the VPN backbone are seen as interarea routes on the remote sites.

For basic information about how to configure an MPLS VPN, refer to the "MPLS Virtual Private Networks Configuration" module.
Using a Sham-Link to Correct OSPF Backdoor Routing

Although OSPF PE-CE connections assume that the only path between two client sites is across the MPLS VPN backbone, backdoor paths between VPN sites (shown in grey in the figure below) may exist. If these sites belong to the same OSPF area, the path over a backdoor link will always be selected because OSPF prefers intraarea paths to interarea paths. (PE routers advertise OSPF routes learned over the VPN backbone as interarea paths.) For this reason, OSPF backdoor links between VPN sites must be taken into account so that routing is performed based on policy.

For example, the figure above shows three client sites, each with backdoor links. Because each site runs OSPF within the same Area 1 configuration, all routing between the three sites follows the intraarea path across the backdoor links, rather than over the MPLS VPN backbone.

The following example shows BGP routing table entries for the prefix 10.3.1.7/32 in the PE-1 router in the figure above. This prefix is the loopback interface of the Winchester CE router. As shown in bold in this example, the loopback interface is learned via BGP from PE-2 and PE-3. It is also generated through redistribution into BGP on PE-1.

PE-1# show ip bgp vpnv4 all 10.3.1.7
BGP routing table entry for 100:251:10.3.1.7/32, version 58
Paths: (3 available, best #2)
   Advertised to non peer-group peers:
       10.3.1.2 10.3.1.5
Local
   10.3.1.5 (metric 30) from 10.3.1.5 (10.3.1.5)
       Origin incomplete, metric 22, localpref 100, valid, internal
       Extended Community: RT:1:793 OSPF DOMAIN ID:0.0.0.100 OSPF
       RT:1:2:0 OSPF 2
Local
       10.2.1.38 from 0.0.0.0 (10.3.1.6)
           Origin incomplete, metric 86, localpref 100, weight 32768,
           valid, sourced, best
Within BGP, the locally generated route (10.2.1.38) is considered to be the best route. However, as shown in bold in the next example, the VRF routing table shows that the selected path is learned via OSPF with a next hop of 10.2.1.38, which is the Vienna CE router.

```
PE-1# show ip route vrf ospf 10.3.1.7
Routing entry for 10.3.1.7/32
   Known via "ospf 100", distance 110, metric 86, type intra area
   Redistributing via bgp 215
   Advertised by bgp 215
   Last update from 10.2.1.38 on Serial0/0/0, 00:00:17 ago
   Routing Descriptor Blocks:
      * 10.2.1.38
        from 10.3.1.7, 00:00:17 ago, via Serial0/0/0
        Route metric is 86, traffic share count is 1
```

This path is selected because:

- The OSPF intra-area path is preferred over the interarea path (over the MPLS VPN backbone) generated by the PE-1 router.
- OSPF has a lower administrative distance (AD) than internal BGP (BGP running between routers in the same autonomous system).

If the backdoor links between sites are used only for backup purposes and do not participate in the VPN service, then the default route selection shown in the preceding example is not acceptable. To reestablish the desired path selection over the MPLS VPN backbone, you must create an additional OSPF intra-area (logical) link between ingress and egress VRFs on the relevant PE routers. This link is called a sham-link.

A sham-link is required between any two VPN sites that belong to the same OSPF area and share an OSPF backdoor link. If no backdoor link exists between the sites, no sham-link is required.

The figure below shows a sample sham-link between PE-1 and PE-2. A cost is configured with each sham-link and is used to decide whether traffic will be sent over the backdoor path or the sham-link path. When a sham-link is configured between PE routers, the PEs can populate the VRF routing table with the OSPF routes learned over the sham-link.
Because the sham-link is seen as an intra-area link between PE routers, an OSPF adjacency is created and database exchange (for the particular OSPF process) occurs across the link. The PE router can then flood LSAs between sites from across the MPLS VPN backbone. As a result, the desired intra-area connectivity is created.

The section, "Creating a Sham-Link, on page 144", describes how to configure a sham-link between two PE routers. For more information about how to configure OSPF, refer to the "Configuring OSPF" module.

**Sham-Link Configuration Example**

The example in this section is designed to show how a sham-link is used only to affect the OSPF intra-area path selection of the PE and CE routers. The PE router also uses the information received from MP-BGP to set the outgoing label stack of incoming packets, and to decide to which egress PE router to label switch the packets.

The figure below shows a sample MPLS VPN topology in which a sham-link configuration is necessary. A VPN client has three sites, each with a backdoor link. Two sham-links have been configured, one between PE-1 and PE-2, and another between PE-2 and PE-3. A sham-link between PE-1 and PE-3 is not necessary in this configuration because the Vienna and Winchester sites do not share a backdoor link.
The following examples show the forwarding that occurs between sites from the standpoint of how PE-1 views the 10.3.1.7/32 prefix, the loopback1 interface of the Winchester CE router in the figure above.

```
PE-1# show ip bgp vpnv4 all 10.3.1.7
BGP routing table entry for 100:251:10.3.1.7/32, version 124
Paths: (1 available, best #1)
  Local 10.3.1.2 (metric 30) from 10.3.1.2 (10.3.1.2)
    Origin incomplete, metric 11, localpref 100, valid, internal, best
    Extended Community: RT:1:793 OSPF DOMAIN ID:0.0.0.100 OSPF RT:1:2:0 OSPF 2

PE-1# show ip route vrf ospf 10.3.1.7
Routing entry for 10.3.1.7/32
  Known via "ospf 100", distance 110, metric 13, type intra area
  Redistributing via bgp 215
  Last update from 10.3.1.2 00:12:59 ago
Routing Descriptor Blocks:
  10.3.1.2 (Default-IP-Routing-Table), from 10.3.1.7, 00:12:59 ago

The next example shows forwarding information in which the next hop for the route, 10.3.1.2, is the PE-3 router rather than the PE-2 router (which is the best path according to OSPF). The reason the OSPF route is not redistributed to BGP on the PE is because the other end of the sham-link already redistributed the route to BGP and there is no need for duplication. The OSPF sham-link is used only to influence intra-area path selection. When sending traffic to a particular destination, the PE router uses the MP-BGP forwarding information.

```

```
PE-1# show ip bgp vpnv4 all tag | begin 10.3.1.7
10.3.1.7/32
  10.3.1.2
notag/38

PE-1# show tag-switching forwarding 10.3.1.2
Local Outgoing Prefix Bytes tag Outgoing Next Hop
tag or VC or Tunnel Id switched interface
31 42 10.3.1.2/32

```
0 PO3/0/0 point2point

PE-1# show ip cef vrf ospf 10.3.1.7
10.3.1.7/32, version 73, epoch 0, cached adjacency to PO3/0/0
0 packets, 0 bytes
tag information set
local tag: VPN-route-head
fast tag rewrite with PO3/0/0, point2point, tags imposed: {42 38 }
via 10.3.1.2
0 dependencies, recursive
next hop 10.1.1.17, PO3/0/0 via 10.3.1.2/32
valid cached adjacency
tag rewrite with PO3/0/0, point2point, tags imposed: {42 38 }
If a prefix is learned across the sham-link and the path via the sham-link is selected as the best, the PE router does not generate an MP-BGP update for the prefix. It is not possible to route traffic from one sham-link over another sham-link.

In the following example, PE-2 shows how an MP-BGP update for the prefix is not generated. Although 10.3.1.7/32 has been learned via OSPF across the sham-link as shown in bold, no local generation of a route into BGP is performed. The only entry within the BGP table is the MP-BGP update received from PE-3 (the egress PE router for the 10.3.1.7/32 prefix).

PE-2# show ip route vrf ospf 10.3.1.7
Routing entry for 10.3.1.7/32
Known via "ospf 100",
distance 110, metric 12, type intra area
Redistributing via bgp 215
Last update from 10.3.1.2 00:00:10 ago
Routing Descriptor Blocks:
* 10.3.1.2 (Default-IP-Routing-Table), from 10.3.1.7, 00:00:10 ago
Route metric is 12, traffic share count is 1
PE-2# show ip bgp vpnv4 all 10.3.1.7
BGP routing table entry for 100:251:10.3.1.7/32, version 166
Paths: (1 available, best #1)
Not advertised to any peer
Local
10.3.1.2 (metric 30) from 10.3.1.2 (10.3.1.2)
Origin incomplete, metric 11, localpref 100, valid, internal, best
Extended Community: RT:1:793 OSPF DOMAIN ID:0.0.0.100 OSPF
RT:1:2:0 OSPF 2

The PE router uses the information received from MP-BGP to set the ongoing label stack of incoming packets, and to decide to which egress PE router to label switch the packets.

Benefits

Client Site Connection Across the MPLS VPN Backbone
A sham-link overcomes the OSPF default behavior for selecting an intra-area backdoor route between VPN sites instead of an interarea (PE-to-PE) route. A sham-link ensures that OSPF client sites that share a backdoor link can communicate over the MPLS VPN backbone and participate in VPN services.

Flexible Routing in an MPLS VPN Configuration
In an MPLS VPN configuration, the OSPF cost configured with a sham-link allows you to decide if OSPF client site traffic will be routed over a backdoor link or through the VPN backbone.
Restrictions

When OSPF is used as a protocol between PE and CE routers, the OSPF metric is preserved when routes are advertised over the VPN backbone. The metric is used on the remote PE routers to select the correct route. For this reason, you should not modify the metric value when OSPF is redistributed to BGP, and when BGP is redistributed to OSPF. If you modify the metric value, routing loops may occur.

Determining Platform Support Through Cisco Feature Navigator

Cisco IOS software is packaged in feature sets that support specific platforms. To get updated information regarding platform support for this feature, access Cisco Feature Navigator. Cisco Feature Navigator dynamically updates the list of supported platforms as new platform support is added for the feature.

Cisco Feature Navigator is a web-based tool that enables you to quickly determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

http://www.cisco.com/go/fn

Supported Standards MIBs and RFCs

Standards
No new or modified standards are supported by this feature.

MIBs
No new or modified MIBs are supported by this feature.
To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at the following URL:

RFCs
No new or modified RFCs are supported by this feature.

Prerequisites
Before you can configure a sham-link in an MPLS VPN, you must first enable OSPF as follows:
• Create an OSPF routing process.
• Specify the range of IP addresses to be associated with the routing process.
• Assign area IDs to be associated with the range of IP addresses.

For more information on these OSPF configuration procedures, go to:

Configuration Tasks
See the following sections for configuration tasks for the sham-link feature. Each task in the list is identified as either required or optional.
• Creating a Sham-Link, on page 144 (required)
• Verifying Sham-Link Creation, on page 146 (optional)

Creating a Sham-Link

Before You Begin
Before you create a sham-link between PE routers in an MPLS VPN, you must:
• Configure a new interface with a /32 address on the remote PE so that OSPF packets can be sent over the VPN backbone to the remote end of the sham-link. The /32 address must meet the following criteria:
  • Belong to a VRF.
  • Not be advertised by OSPF.
  • Be advertised by BGP.

You can use the /32 address for other sham-links.
• Associate the sham-link with an existing OSPF area.
### SUMMARY STEPS

1. Router1# configure terminal
2. Router1(config)# interface loopback interface-number
3. Router1(config-if)# ip vrf forwarding vrf-name
4. Router1(config-if)# ip address ip-address mask
5. Router1(config)# end
6. Router2# configure terminal
7. Router2(config)# interface loopback interface-number
8. Router2(config-if)# ip vrf forwarding vrf-name
9. Router2(config-if)# ip address ip-address mask
10. Router1(config)# end
11. Router1(config)# router ospf process-id vrf vrf-name
12. Router1(config-if)# area area-id sham-link source-address destination-address cost number
13. Router2(config)# router ospf process-id vrf vrf-name
14. Router2(config-if)# area area-id sham-link source-address destination-address cost number

### DETAILED STEPS

</tbody>
</table>
Purpose

Command or Action

Step 11
Router1(config)# router ospf process-id vrf vrf-name

Configure the specified OSPF process with the VRF associated with the sham-link interface on PE-1 and enters interface configuration mode.

Step 12
Router1(config-if)# area area-id sham-link source-address destination-address cost number

Configure the sham-link on the PE-1 interface within a specified OSPF area and with the loopback interfaces specified by the IP addresses as endpoints. cost number configures the OSPF cost for sending an IP packet on the PE-1 sham-link interface.

Step 13
Router2(config)# router ospf process-id vrf vrf-name

Configure the specified OSPF process with the VRF associated with the sham-link interface on PE-2 and enters interface configuration mode.

Step 14
Router2(config-if)# area area-id sham-link source-address destination-address cost number

Configure the sham-link on the PE-2 interface within a specified OSPF area and with the loopback interfaces specified by the IP addresses as endpoints. cost number configures the OSPF cost for sending an IP packet on the PE-2 sham-link interface.

Verifying Sham-Link Creation

To verify that the sham-link was successfully created and is operational, use the `show ip ospf sham-links` command in EXEC mode:

```
Router1# show ip ospf sham-links
Sham Link OSPF_SL0 to address 10.2.1.2 is up
Area 1 source address 10.2.1.1
  DoNotAge LSA allowed. Cost of using 40 State POINT_TO POINT,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
  Hello due in 00:00:04
  Adjacency State FULL (Hello suppressed)
  Index 2/2, retransmission queue length 4, number of retransmission 0
  First 0x63311F3C(205)/0x63311FE4(59) Next
  0x63311F3C(205)/0x63311FE4(59)
  Last retransmission scan length is 0, maximum is 0
  Last retransmission scan time is 0 msec, maximum is 0 msec
  Link State retransmission due in 360 msec
```
Monitoring and Maintaining a Sham-Link

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router# <code>show ip ospf sham-links</code></td>
<td>Displays the operational status of all sham-links configured for a router.</td>
</tr>
<tr>
<td>Router# <code>show ip ospf data router ip-address</code></td>
<td>Displays information about how the sham-link is advertised as an unnumbered point-to-point connection between two PE routers.</td>
</tr>
</tbody>
</table>

Configuration Examples

The following example shows how to configure a sham-link between two PE routers:

```plaintext
Router1(config)
    # interface loopback 1
Router1(config-if)# ip vrf forwarding ospf
Router1(config-if)# ip address 10.2.1.1 255.255.255.255

Router2(config)
    # interface loopback 1
Router2(config-if)# ip vrf forwarding ospf
Router2(config-if)# ip address 10.2.1.2 255.255.255.255

Router1(config)
    router ospf 100 vrf ospf
    area 1 sham-link 10.2.1.1 10.2.1.2 cost 40

Router2(config)
    router ospf 100 vrf ospf

Glossary

- **BGP** -- Border Gateway Protocol. Interdomain routing protocol that exchanges reachability information with other BGP systems. It is defined in RFC 1163.
- **CE router** -- customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router. CE routers are not aware of associated VPNs.
- **CEF** -- Cisco Express Forwarding. An advanced Layer 3 IP switching technology. CEF optimizes network performance and scalability for networks with large and dynamic traffic patterns.
- **OSPF** -- Open Shortest Path First protocol.
- **IGP** -- Interior Gateway Protocol. An Internet protocol used to exchange routing information within an autonomous system. Examples of common IGPs include IGRP, OSPF, and RIP.
- **LSA** -- link-state advertisement. A broadcast packet used by link-state protocols. The LSA contains information about neighbors and path costs and is used by the receiving router to maintain a routing table.
- **MPLS** -- Multiprotocol Label Switching. Emerging industry standard upon which tag switching is based.
- **PE router** -- provider edge router. A router that is part of a service provider network connected to a customer edge (CE) router. All VPN processing occurs in the PE router.
SPF --shortest path first calculation.

VPN --Virtual Private Network. A secure IP-based network that shares resources on one or more physical networks. A VPN contains geographically dispersed sites that can communicate securely over a shared backbone.

VRF --VPN routing and forwarding instance. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a PE router.
CHAPTER 10

OSPF Retransmissions Limit

The OSPF Retransmissions Limit feature adds a limit to the number of retransmissions of database exchange and update packets for both demand and non-demand circuits. The retransmission of these packets stops once this retry limit is reached, thus preventing unnecessary use of the link in continual retransmission of the packets if, for some reason, a neighbor is not responding during adjacency forming. This feature module describes the change in how the Open Shortest Path First (OSPF) protocol handles retransmissions.

- Finding Feature Information, page 149
- Restrictions For OSPF Retransmissions Limit, page 149
- Information About OSPF Retransmissions Limit, page 150
- Overview About OSPF Retransmissions Limit, page 150
- How to Configure OSPF Retransmissions Limit, page 150
- Configuration Examples for OSPF Retransmissions Limit, page 151
- Additional References for OSPF Retransmissions Limit, page 151
- Feature Information for OSPF Retransmissions Limit, page 152

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions For OSPF Retransmissions Limit

The limit to the number of retransmissions does not apply for update packets on nonbroadcast multiaccess (NBMA) point-to-multipoint direct circuits. In this situation, the dead timer is used to end communication with non-responding neighbors and thus stop the retransmissions.
Information About OSPF Retransmissions Limit

Overview About OSPF Retransmissions Limit

Cisco IOS Release 12.2(4)T added a limit to the number of retransmissions of database exchange and update packets for both demand and non-demand circuits. The retransmission of these packets stops once this retry limit is reached, thus preventing unnecessary use of the link in continual retransmission of the packets if, for some reason, a neighbor is not responding during adjacency forming.

The limit for both demand circuit and non-demand circuit retransmissions is 24.

The limit-retransmissions command allows you to either remove (disable) the limit or change the maximum number of retransmissions to be a number from 1 to 255.

Benefits

The limit-retransmissions command provides for backward compatibility for previous or other releases of Cisco IOS or other routers that do not have this feature.

How to Configure OSPF Retransmissions Limit

Setting OSPF Retransmission Limits

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf process-ID
4. limit retransmissions [{dc {max-number | disable}} [non-dc {max-number | disable}]]
5. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>- Enter your password if prompted.</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 2</th>
<th>configure terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
</tr>
</tbody>
</table>

Enters global configuration mode.

<table>
<thead>
<tr>
<th>Step 3</th>
<th>router ospf process-ID</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# router ospf 18</td>
</tr>
</tbody>
</table>

Configures OSPF routing process and enters OSPF router configuration mode.

| Step 4 | limit retransmissions {dc {max-number | disable} | non-dc {max-number | disable} |
|--------|-------------------------|
| **Example:** | Device(config-router)# limit retransmissions dc 5 |

Sets the limit in the number of retransmissions of database exchange and update packets for both demand and non-demand circuits.

<table>
<thead>
<tr>
<th>Step 5</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-router)# end</td>
</tr>
</tbody>
</table>

Exits address router configuration mode and returns to privileged EXEC mode.

CHAPTER 11

OSPF Support for Multi-VRF on CE Routers

The OSPF Support for Multi-VRF on CE Routers feature provides the capability of suppressing provider edge (PE) checks that are needed to prevent loops when the PE is performing a mutual redistribution of packets between the OSPF and BGP protocols. When VPN routing and forward (VRF) is used on a router that is not a PE (that is, one that is not running BGP), the checks can be turned off to allow for correct population of the VRF routing table with routes to IP prefixes.

OSPF multi-VRF allows you to split the router into multiple virtual routers, where each router contains its own set of interfaces, routing table, and forwarding table.

- Finding Feature Information, page 155

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About OSPF Support for Multi-VRF on CE Routers

The OSPF Support for Multi-VRF on CE Routers feature provides the capability of suppressing provider edge (PE) checks that are needed to prevent loops when the PE is performing a mutual redistribution of packets
between the OSPF and BGP protocols. When VPN routing and forward (VRF) is used on a router that is not a PE (that is, one that is not running BGP), the checks can be turned off to allow for correct population of the VRF routing table with routes to IP prefixes.

OSPF multi-VRF allows you to split the router into multiple virtual routers, where each router contains its own set of interfaces, routing table, and forwarding table. OSPF multi-VRF gives you the ability to segment parts of your network and configure those segments to perform specific functions, yet still maintain correct routing information.

### How to Configure OSPF Support for Multi-VRF on CE Routers

#### Configuring the Multi-VRF Capability for OSPF Routing

**Before You Begin**

CEF must be running on the network.

**SUMMARY STEPS**

1. `enable`
2. `show ip ospf [process-id]`
3. `configure terminal`
4. `router ospf process-id [vrf vpn-name]`
5. `capability vrf-lite`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong><code>enable</code></td>
<td>Enables higher privilege levels, such as privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router&gt; enable</code></td>
<td>· Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong><code>show ip ospf [process-id]</code></td>
<td>Displays the status of the router. If the display indicates that the router is connected to the VPN backbone, you can use the <code>capability vrf-lite</code> command to decouple the PE router from the VPN backbone.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router&gt; show ip ospf 1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong><code>router ospf process-id [vrf vpn-name]</code></td>
<td>Enables OSPF routing and enters router configuration mode.</td>
</tr>
</tbody>
</table>
### Purpose

#### Command or Action

<table>
<thead>
<tr>
<th>Example:</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Router(config)# router ospf 1 vrf grc | • The *process-id* argument identifies the OSPF process.  
• Use the *vrf* keyword and *vpn-name* argument to identify a VPN. |

**Step 5**

<table>
<thead>
<tr>
<th>capability vrf-lite</th>
<th>Applies the multi-VRF capability to the OSPF process.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# capability vrf-lite</td>
<td></td>
</tr>
</tbody>
</table>

### Verifying the OSPF Multi-VRF Configuration

No specific `debug` or `show` commands are associated with this feature. You can verify the success of the OSPF multi-VRF configuration by using the `show ip ospf [process-id]` command to verify that the router is not connected to the VPN backbone.

This output from the `show ip ospf process` command indicates that the PE router is currently connected to the backbone.

```
Router# show ip ospf 12
Routing Process "ospf 12" with ID 151.1.1.1 and Domain ID 0.0.0.12
Supports only single TOS(TOS0) routes
Supports opaque LSA
Connected to MPLS VPN Superbackbone
SPF schedule delay 5 secs, Hold time between two SPF 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 0. 0 normal 0 stub 0 nssa
External flood list length 0
```

When the OSPF VRF process is configured with the `capability vrf-lite` command under the `router ospf` command, the "Connected to MPLS VPN Superbackbone" line will not be present in the display.

### Configuration Examples for OSPF Support for Multi-VRF on CE Routers

#### Example Configuring the Multi-VRF Capability

This example shows a basic OSPF network with a VRF named grc configured. The `capability vrf-lite` command is entered to suppress the PE checks.

```
!  
ip cef
```
Example Verifying the OSPF Multi-VRF Configuration

This example illustrates the output display from the `show ip ospf` command after OSPF multi-VRF has been configured on the router.

Device# show ip ospf 9000

Routing Process "ospf 9000" with ID 10.0.0.1
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Supports NSSA (compatible with RFC 3101)
Event-log disabled
It is an autonomous system boundary router
Redistributing External Routes from, rip with metric mapped to 1, includes subnets in redistribution
Router is not originating router-LSAs with maximum metric
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
Number of areas transit capable is 0
External flood list length 0
IETF NSF helper support enabled
Cisco NSF helper support enabled
Reference bandwidth unit is 100 mbps
Area BACKBONE(0) (Inactive)
  Number of interfaces in this area is 1
  Area has no authentication
  SPF algorithm last executed 00:00:10.264 ago
  SPF algorithm executed 1 times
  Area ranges are
  Number of LSA 1. Checksum Sum 0x00B674
  Number of opaque link LSA 0. Checksum Sum 0x000000
  Number of DCbitless LSA 0
  Number of indication LSA 0
  Number of DoNotAge LSA 0
  Flood list length 0

Glossary

CE Router -- Customer Edge router, an edge router in the C network, defined as a C router which attaches directly to a P router.

C Network -- Customer (enterprise or service provider) network.

C Router -- Customer router, a router in the C network.

LSA -- link-state advertisement. Broadcast packet used by link-state protocols that contains information about neighbors and path costs. LSAs are used by the receiving routers to maintain their routing tables.

PE Router -- Provider Edge router, an edge router in the P network, defined as a P router which attaches directly to a C router.

P Network -- MPLS-capable service provider core network. P routers perform MPLS.

P Router -- Provider router, a router in the P network.

SPF -- shortest path first. A routing algorithm that iterates on length of path to determine a shortest-path spanning tree.

VPN -- Virtual Private Network. Enables IP traffic to travel securely over a public TCP/IP network by encrypting all traffic from one network to another.

VRF -- VPN Routing and Forwarding.
OSPFv2 Multiarea Adjacency

This module describes how to configure multiarea adjacency for Open Shortest Path First version 2 (OSPFv2). You can add more than one area to an existing OSPFv2 primary interface. The additional logical interfaces support multiarea adjacency.

- Finding Feature Information, page 163
- Prerequisites for OSPFv2 Multiarea Adjacency, page 163
- Restrictions for OSPFv2 Multiarea Adjacency, page 164
- Information About OSPFv2 Multiarea Adjacency, page 164
- How to Configure OSPFv2 Multiarea Adjacency, page 165
- Configuration Examples for OSPFv2 Multiarea Adjacency, page 166
- Additional References for OSPFv2 Multiarea Adjacency, page 167
- Feature Information for OSPFv2 Multiarea Adjacency, page 168

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPFv2 Multiarea Adjacency

- Ensure that Open Shortest Path First (OSPF) is configured on the primary interface.
- Ensure that the primary interface type is point-to-point.
Restrictions for OSPFv2 Multiarea Adjacency

A multiarea interface has the following restrictions.

- Operates only if OSPF is configured on the primary interface.
- Exists as a logical construct over a primary interface for OSPF; however, the neighbor state on the primary interface is independent of the multiarea interface.
- Establishes a neighbor relationship with the corresponding multiarea interface on the neighboring device. A mixture of multiarea and primary interfaces is not supported.
- Advertises an unnumbered point-to-point link in the device link-state advertisement (LSA) for the corresponding area when the neighbor state is full.
- Inherits all the OSPF parameters (such as, authentication) from the primary interface. You cannot configure the parameters on a multiarea interface; however, you can configure the parameters on the primary interface.

Information About OSPFv2 Multiarea Adjacency

OSPFv2 Multiarea Adjacency Overview

The Open Shortest Path First (OSPF) protocol allows you to divide a network topology into separate areas. The interface on which OSPF is configured belongs to only one area at any given point of time. This causes suboptimal routing for certain topologies, due to intra-area route preference over the interarea routes.

Open shortest path first version 2 (OSPFv2) allows a single physical link to be shared by multiple areas. This creates an intra-area path in each of the corresponding areas sharing the same link. All areas have an interface on which OSPF is configured. One of these interfaces is designated as the primary interface and others as secondary interfaces.

The OSPFv2 Multiarea Adjacency feature allows you to configure a link on the primary interface to enable optimized routing in multiple areas. Each multiarea interface is announced as a point-to-point unnumbered link. The multiarea interface exists as a logical construct over an existing primary interface. The neighbor state on the primary interface is independent of the neighbor state of the multiarea interface. The multiarea interface establishes a neighbor relationship with the corresponding multiarea interface on the neighboring device. You can only configure multiarea adjacency on an interface that has two OSPF speakers. In case of native broadcast networks, the interface must be configured as an OSPF point-to-point type to enable the interface for multiarea adjacency.

Use the `ip ospf multi-area` command to configure multiarea adjacency on the primary OSPFv2 interface.
# How to Configure OSPFv2 Multiarea Adjacency

## Configuring OSPFv2 Multiarea Adjacency

### SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. ip address ip-address mask
5. ip ospf proces-id area area-id
6. ip ospf network point-to-point
7. ip ospf multi-area multi-area-id
8. ip ospf multi-area multi-area-id cost interface-cost
9. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong> &lt;br&gt; Example: Device&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong> &lt;br&gt; Example: Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>interface type number</strong> &lt;br&gt; Example: Device(config)# interface Ethernet 0/0</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>ip address ip-address mask</strong> &lt;br&gt; Example: Device(config)# ip address 10.0.12.1 255.255.255.0</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>ip ospf proces-id area area-id</strong> &lt;br&gt; Example: Device (config-if)# ip ospf 10 area 8</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• The area-id argument identifies the OSPF area. The range is from 0 to 4294967295, or you can use an IP address.</td>
</tr>
</tbody>
</table>

#### Step 6
`ip ospf network point-to-point`  
**Example:**  
Device (config-if)# ip ospf network point-to-point

#### Step 7
`ip ospf multi-area multi-area-id`  
**Example:**  
Device (config-if)# ip ospf multi-area 11

#### Step 8
`ip ospf multi-area multi-area-id cost interface-cost`  
(Optional) Specifies the cost of sending a packet on an Open Shortest Path First (OSPF) multiarea interface,  
**Example:**  
Device (config-if)# ip ospf multi-area 11 cost 10

#### Step 9
`end`  
**Example:**  
Device (config-if)# end

---

### Configuration Examples for OSPFv2 Multiarea Adjacency

#### Example: Configuring OSPFv2 Multiarea Adjacency

```
Device# enable  
Device# configure terminal  
Device(config)# interface Ethernet 0/0  
Device (config-if)# ip address 10.0.12.1 255.255.255.0  
Device (config-if)# ip ospf 1 area 0  
Device (config-if)# ip ospf network point-to-point  
Device (config-if)# ip ospf multi-area 2  
Device (config-if)# ip ospf multi-area 2 cost 10  
Device (config-if)# end  

The following is a sample output from the show ip ospf 2 multi-area command.  
Device# show ip ospf 2 multi-area  
OSPF MA1 is up, line protocol is up  
Primary Interface Ethernet0/0, Area 2  
Interface ID 2  
MTU is 1500 bytes  
Neighbor Count is 1  
```
The following is a sample output from the `show ip ospf interface` command.

Device# **show ip ospf interface**

```
Ethernet0/0 is up, line protocol is up
Internet Address 10.0.12.1/24, Area 0, Attached via Interface Enable

CHAPTER 13

OSPFv2 Autoroute Exclude

The OSPFv2 Autoroute Exclude feature allows specific destinations and prefixes to avoid Traffic Engineering (TE) tunnels for the packet transport. The rest of the prefixes can still be set to use TE tunnels. Prefixes that are excluded do not use a TE tunnel path. Only native non-TE paths are downloaded to RIB for such routes. This module describes how to configure the OSPFv2 Autoroute Exclude feature.

- Finding Feature Information, page 169
- Prerequisites for OSPFv2 Autoroute Exclude, page 169
- Information About OSPFv2 Autoroute Exclude, page 170
- How to Configure OSPFv2 Autoroute Exclude, page 170
- Configuration Examples for OSPFv2 Autoroute Exclude, page 171

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPFv2 Autoroute Exclude

- Open Shortest Path First (OSPF) must be configured in your network.
- Cisco Express Forwarding (CEF) must be enabled.
- Multiprotocol Label Switching (MPLS) TE tunnels must be configured.
Information About OSPFv2 Autoroute Exclude

Overview of OSPFv2 Autoroute Exclude

The Autoroute feature is an IP routing method that forces OSPF to use MPLS TE tunnels to build paths for IP traffic routes.

The Autoroute feature enables all routes to use TE Tunnels, even if there is an alternate non-TE path available for that route.

The OSPFv2 Autoroute Exclude feature allows specific destinations or prefixes to avoid TE tunnels, while other prefixes can still be configured to use TE tunnels. Prefixes that are excluded do not use a TE tunnel path. Only native non-TE paths are downloaded to RIB for such routes.

The autoroute exclude option is configured under the router OSPF configuration mode by using a prefix list. IP addresses and prefixes that are members of this prefix list are excluded from TE tunnels, even when the auto route is enabled on them. If the IP addresses or prefixes are added to the prefix list, they are dynamically routed without passing through the TE tunnel. If the IP addresses or prefixes are removed from the prefix list, they are dynamically rerouted back on the TE tunnel path.

How to Configure OSPFv2 Autoroute Exclude

Configuring OSPFv2 Autoroute Exclude

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf process-ID
4. router-id ip-address
5. mpls traffic-eng router-id interface-name
6. mpls traffic-eng areaarea-number
7. mpls traffic-eng autoroute-exclude prefix-list prefix-list-name
8. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>

<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
|      | **Example:**  
|      | Device# configure terminal | |
| Step 3 | router ospf process-ID | Configures OSPF routing process and enters OSPF router configuration mode. |
|      | **Example:**  
|      | Device(config)# router ospf 18 | |
| Step 4 | router-id ip-address | Enables to use a fixed router ID in router configuration mode. |
|      | **Example:**  
|      | Device(config-router)# router-id 10.1.1.1 | |
| Step 5 | mpls traffic-eng router-id interface-name | Specifies the traffic engineering router identifier for the node and the IP address associated with a given interface. |
|      | **Example:**  
|      | Device(config-router)# mpls traffic-eng router-id Loopback0 | |
| Step 6 | mpls traffic-eng area number | Configures a router running OSPF MPLS so that it floods traffic engineering for the indicated OSPF area. |
|      | **Example:**  
|      | Device(config-router)# mpls traffic-eng area 0 | |
| Step 7 | mpls traffic-eng autoroute-exclude prefix-list prefix-list-name | Allows specific destinations and prefixes to avoid routing through TE tunnels.  
  • Prefixes that are excluded do not use a TE tunnel path. |
|      | **Example:**  
|      | Device(config-router)# mpls traffic-eng autoroute-exclude prefix-list kmd | |
| Step 8 | exit | Exits router configuration mode and returns to privileged EXEC mode. |
|      | **Example:**  
|      | Device(config-router)# exit | |

### Configuration Examples for OSPFv2 Autoroute Exclude

#### Example: Configuring OSPFv2 Autoroute Exclude

```plaintext

!  
router ospf 1
```
OSPFv2 Autoroute Exclude

router-id 3.3.3.3
mpls traffic-eng router-id Loopback0
mpls traffic-eng area 0
mpls traffic-eng autoroute-exclude prefix-list XX
!

OSPFv3 Multiarea Adjacency

The OSPFv3 Multiarea Adjacency feature allows you to configure a link that multiple Open Shortest Path First version 3 (OSPFv3) areas can share to enable optimized routing. You can add more than one area to an existing OSPFv3 primary interface.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPFv3 Multiarea Adjacency

- Ensure that Open Shortest Path First version 3 (OSPFv3) is configured on the primary interface.
- Ensure that the primary interface type is point-to-point.
Restrictions for OSPFv3 Multiarea Adjacency

- A multiarea interface operates only if OSPFv3 is configured on the primary interface and the OSPFv3 network type of the primary interface is point-to-point.

- A multiarea interface exists as a logical construct over a primary interface for OSPFv3; however, the neighbor state on the primary interface is independent of the multiarea interface.

- A multiarea interface establishes a neighbor relationship with the corresponding multiarea interface on the neighboring device. A mixture of multiarea and primary interfaces is not supported.

- A multiarea interface advertises a point-to-point connection to another device in the device link-state advertisement (LSA) for the corresponding area when the neighbor state is full.

- A multiarea interface inherits all the OSPFv3 parameters (such as, authentication) from the primary interface. You cannot configure the parameters on a multiarea interface; however, you can configure the parameters on the primary interface.

Information About OSPFv3 Multiarea Adjacency

OSPFv3 Multiarea Adjacency Overview

Open Shortest Path First version 3 (OSPFv3) allows a single physical link to be shared by multiple areas. This creates an intra-area path in each of the corresponding areas sharing the same link. All areas have an interface on which you can configure OSPFv3. One of these interfaces is designated as the primary interface and others as secondary interfaces.

The OSPFv3 Multiarea Adjacency feature allows you to configure a link on the primary interface to enable optimized routing in multiple areas. Each multiarea interface is announced as a point-to-point unnumbered link. The multiarea interface exists as a logical construct over an existing primary interface. The neighbor state on the primary interface is independent of the neighbor state of the multiarea interface. The multiarea interface establishes a neighbor relationship with the corresponding multiarea interface on the neighboring device. You can only configure multiarea adjacency on an interface that has two OSPFv3 speakers.

Use the `ospfv3 multi-area` command to configure multiarea adjacency on the primary OSPFv3 interface.
How to Configure OSPFv3 Multiarea Adjacency

Configuring OSPFv3 Multiarea Adjacency

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. ipv6 enable
5. ospfv3 multi-area multi-area-id
6. ospfv3 multi-area multi-area-id cost interface-cost
7. ospfv3 process-id ipv6 area area-id
8. serial restart-delay count
9. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>

<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 interface type number</td>
<td>Specifies the interface type and number.</td>
</tr>
<tr>
<td>Example: Device(config)# interface serial 2/0</td>
<td></td>
</tr>
<tr>
<td>Step 4 ipv6 enable</td>
<td>Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.</td>
</tr>
<tr>
<td>Example: Device(config-if)# ipv6 enable</td>
<td></td>
</tr>
<tr>
<td>Step 5 ospfv3 multi-area multi-area-id</td>
<td>Configures multiarea adjacency on the interface.</td>
</tr>
<tr>
<td>Example: Device(config-if)# ospfv3 multi-area 100</td>
<td>• The multi-area-id argument identifies the OSPFv3 multiarea. The range is from 0 to 4294967295, or you can use an IP address.</td>
</tr>
</tbody>
</table>
### Purpose

Command or Action | Purpose
--- | ---
**Step 6** | ospfv3 multi-area multi-area-id cost interface-cost

(Optional) Specifies the cost of sending a packet on an OSPFv3 multiarea interface. Use this command to specify the cost only if you want the cost of the multiarea interface to be different than the cost of the primary interface.

**Example:**
Device(config-if)# ospfv3 multi-area 100 cost 512

**Step 7** | ospfv3 process-id ipv6 area area-id

Configures the OSPFv3 interface.

- The process-id argument identifies the OSPF process. The range is from 1 to 65535.
- The area-id argument identifies the OSPF area. The range is from 0 to 4294967295, or you can use an IP address.

**Example:**
Device(config-if)# ospfv3 1 ipv6 area 0

**Step 8** | serial restart-delay count

Sets the amount of time that the router waits before trying to bring up a serial interface when it goes down. The count argument specifies the frequency (in seconds) at which that hardware is reset. The range is from 0 to 900.

**Example:**
Device(config-if)# serial restart-delay 0

**Step 9** | end

Returns to privileged EXEC mode.

**Example:**
Device(config-if)# end

### Verifying OSPFv3 Multiarea Adjacency

#### SUMMARY STEPS

1. enable
2. show ospfv3 interface brief
3. show ospfv3 multi-area
4. show ospfv3 interface

### Configuration Examples for OSPFv3 Multiarea Adjacency

#### Example: OSPFv3 Multiarea Adjacency Configuration

```plaintext
Device> enable
Device# configure terminal
Device(config)# interface serial 2/0
Device(config-if)# ipv6 enable
Device(config-if)# ospfv3 multi-area 100
Device(config-if)# ospfv3 multi-area 100 cost 512
Device(config-if)# ospfv3 1 ipv6 area 0
Device(config-if)# serial restart-delay 0
Device(config-if)# end
```

#### Example: Verifying OSPFv3 Multiarea Adjacency

**Sample Output for the show ospfv3 interface brief Command**

To display brief information about Open Shortest Path First version 3 (OSPFv3) interfaces, use the `show ospfv3 interface brief` command in privileged EXEC mode.

```plaintext
Device# show ospfv3 interface brief

<table>
<thead>
<tr>
<th>Interface</th>
<th>PID</th>
<th>Area</th>
<th>AF</th>
<th>Cost</th>
<th>State</th>
<th>Nbrs</th>
<th>F/C</th>
</tr>
</thead>
<tbody>
<tr>
<td>Se2/0</td>
<td>1</td>
<td>0</td>
<td>ipv6</td>
<td>64</td>
<td>P2P</td>

Information About OSPFv3 Authentication Trailer

Overview of OSPFv3 Authentication Trailer

Prior to the OSPFv3 Authentication Trailer, OSPFv3 IPsec as defined in RFC 4552 was the only mechanism for authenticating protocol packets. The OSPFv3 Authentication Trailer feature defines an alternative mechanism to authenticate OSPFv3 protocol packets that additionally provides a packet replay protection via sequence number and does not have any platform dependencies.
To perform non-IPsec cryptographic authentication, OSPFv3 devices append a special data block, that is, Authentication Trailer, to the end of the OSPFv3 packets. The length of the Authentication Trailer is not included in the length of the OSPFv3 packet but is included in the IPv6 payload length. The Link-Local Signaling (LLS) block is established by the L-bit setting in the "OSPFv3 Options" field in OSPFv3 hello and database description packets. If present, the LLS data block is included along with the OSPFv3 packet in the cryptographic authentication computation.

A new Authentication Trailer (AT)-bit is introduced into the OSPFv3 Options field. OSPFv3 devices must set the AT-bit in OSPFv3 Hello and Database Description packets to indicate that all the packets on this link will include an Authentication Trailer. For OSPFv3 Hello and Database Description packets, the AT-bit indicates the AT is present. For other OSPFv3 packet types, the OSPFv3 AT-bit setting from the OSPFv3 Hello/Database Description setting is preserved in the OSPFv3 neighbor data structure. OSPFv3 packet types that do not include an OSPFv3 Options field will use the setting from the neighbor data structure to determine whether or not the AT is expected. The AT-bit must be set in all OSPFv3 Hello and Database Description packets that contain an Authentication Trailer.

To configure the Authentication Trailer, OSPFv3 utilizes existing Cisco IOS key chain command. For outgoing OSPFv3 packets, the following rules are used to select the key from the key chain:

- Select the key that is the last to expire.
- If two keys have the same stop time, select the one with the highest key ID.

The security association (SA) ID maps to the authentication algorithm and the secret key, which is used to generate and verify the message digest. If the authentication is configured but the last valid key is expired, then the packets are sent using the key. A syslog message is also generated. If no valid key is available then the packet is sent without the authentication trailer. When packets are received, the key ID is used to look up the data for that key. If the key ID is not found in the key chain or if the SA is not valid, the packet is dropped. Otherwise, the packet is verified using the algorithm and the key that is configured for the key ID. Key chains support rollover using key lifetimes. A new key can be added to a key chain with the send start time set in the future. This setting allows the new key to be configured on all devices before the keys are actually used.

The hello packets have higher priority than any other OSPFv3 packets and therefore can get re-ordered on the outgoing interface. This reordering can create problems with sequence number verification on neighboring devices. To prevent sequence mismatch, OSPFv3 verifies the sequence number separately for each packet type.

See RFC 6506 for more details on the authentication procedure.
How to Configure OSPFv3 Authentication Trailer

Configuring OSPFv3 Authentication Trailer

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface type number`

### Configuration Examples for OSPFv3 Authentication Trailer

#### Example: Configuring OSPFv3 Authentication Trailer

```plaintext
interface GigabitEthernet 0/0
  ospfv3 1 ipv4 authentication key-chain ospf-1
  router ospfv3 1
  address-family ipv6 unicast vrf vrf1
  area 1 authentication key-chain ospf-1
  area 1 virtual-link 1.1.1.1 authentication key-chain ospf-1
  area 1 sham-link 1.1.1.1 authentication key-chain ospf-1
  authentication mode deployment

! key chain ospf-1
key 1
  key-string ospf
  cryptographic-algorithm hmac-sha-512
```

#### Example: Verifying OSPFv3 Authentication Trailer

The following examples show the output of the `show ospfv3` commands.

```plaintext
Device# show ospfv3
OSPFV3 1 address-family ipv6
Router ID 1.1.1.1

... RFC1583 compatibility enabled
Authentication configured with deployment key lifetime
Active Key-chains:
  Key chain mama: Send key 1, Algorithm HMAC-SHA-256, Number of interfaces 1
  Area BACKBONE(0)

Device# show ospfv3 neighbor detail
OSPFV3 1 address-family ipv6 (router-id 2.2.2.2)

Neighbor 1.1.1.1
  In the area 0 via interface GigabitEthernet0/0
  Neighbor: interface-id 2, link-local address FE80::A8BB:CCFF:FE01:2D00
  Neighbor priority is 1, State is FULL, 6 state changes
  DR is 2.2.2.2 BDR is 1.1.1.1
  Options is 0x000413 in Hello (V6-Bit, E-Bit, R-Bit, AT-Bit)
  Options is 0x000413 in DBD (V6-Bit, E-Bit, R-Bit, AT-Bit)
  Dead timer due in 00:00:33
```

### Table

CHAPTER 16

OSPFv3 Autoroute Exclude

OSPFv3 Autoroute Exclude feature allows you to use specific destinations and prefix-list to specify a list of prefixes that are routed using native paths instead of TE tunnels for packet transport. The rest of the prefixes can still be set to use TE tunnels. Prefixes that are excluded do not use a TE tunnel path. IPv6 routes over TE tunnels are supported by OSPFv3 using Autoroute Announce (AA) or Forwarding Adjacencies (FA).

This module describes how to configure the OSPFv3 Autoroute Exclude feature.

- Finding Feature Information, page 191
- Prerequisites for OSPFv3 Autoroute Exclude, page 191
- Information About OSPFv3 Autoroute Exclude, page 192
- How to Configure OSPFv3 Autoroute Exclude, page 192
- Configuration Examples for OSPFv3 Autoroute Exclude, page 193
- Additional References for OSPFv3 Autoroute Exclude, page 194
- Feature Information for OSPFv3 Autoroute Exclude, page 195

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPFv3 Autoroute Exclude

- Open Shortest Path First (OSPF) must be configured in your network.
- Cisco Express Forwarding (CEF) must be enabled.
Multiprotocol Label Switching (MPLS) TE tunnels must be configured.

Auto route announce and forwarding adjacencies must be configured. You can configure either auto route announce or forwarding adjacencies on an interface. You cannot configure them both on the same interface.

Information About OSPFv3 Autoroute Exclude

Overview of OSPFv3 Autoroute Exclude

The autoroute feature is an IP routing method that forces OSPF to use MPLS TE tunnels to build paths for IP traffic routes. The autoroute feature enables all routes to use TE Tunnels, even if there is an alternate non-TE path available for that route.

The OSPFv3 Autoroute Exclude feature allows specific IPv6 destinations or prefixes to avoid TE tunnels, while other prefixes can still be configured to use TE tunnels. Prefixes that are excluded do not use a TE tunnel path. Only native non-TE paths are downloaded to RIB for such routes. IPv6 routes over TE tunnels are supported by OSPFv3 using auto route announce (AA) or forwarding adjacencies (FA).

The autoroute exclude option is configured under the router OSPF configuration mode by using a prefix list. IP addresses and prefixes that are members of this prefix list are excluded from TE tunnels, even when the auto route is enabled on them. If the IP addresses or prefixes are added to the prefix list, they are dynamically routed without passing through the TE tunnel. If the IP addresses or prefixes are removed from the prefix list, they are dynamically rerouted back on the TE tunnel path.

See the Autoroute Announce and Forwarding Adjacencies For OSPFv3 module in IP Routing: OSPF Configuration Guide for details on configuring auto route announce and forwarding adjacencies For OSPFv3.

How to Configure OSPFv3 Autoroute Exclude

Configuring OSPFv3 Autoroute Exclude

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospfv3 process-ID
4. address-family ipv6 unicast
5. mpls traffic-engineering autoroute-exclude prefix-list prefix-list-name
6. end

OSPFv2-OSPF Live-Live

The OSPFv2-OSPF Live-Live feature delivers multicast streams over non-overlapping paths to various applications. The multicast traffic is split into multiple streams at the beginning of a protected network. All streams flow over non-overlapping paths so that when a link failure occurs on one path, multicast traffic is still delivered through other paths. All streams are merged back at the end of the protected network. This module describes how to configure the OSPFv2-OSPF Live-Live feature.

Information About OSPFv2-OSPF Live-Live

Overview of OSPFv2-OSPF Live-Live

Many new applications driving the growth of networking market are multicast based. Applications such as Internet Protocol television (IPTV) are typically associated with simultaneously delivering massive amount
of sensitive data streams to large audiences. Packet drop is a critical issue in multimedia traffic. There is a demand to reduce multicast traffic loss to the range of milliseconds or to zero packet loss. The zero packet loss solution for multicast in case of single link failure is also known as live-live.

In a live-live network, multicast streams (typically two flows) form their own reverse path forwarding (RPF)/shortest path trees (SPT) over diversified physical links, so that failure on one link does not affect multicast traffic on other link. The existing multi topology technology in Cisco IOS software supports the multiple multicast topologies.

The OSPFv2-OSPF Live-Live feature enables the protocol independent multicast (PIM) to handle multiple multicast topologies. When a multicast topology is created and enabled on OSPF, IP prefixes on each topology are injected into topology-based Routing Information Base (RIB). PIM then decides which RIB to use for RPF lookup.

PIM RPF topology is a collection of routes used by PIM to perform the RPF operation when building shared or source trees. In a multi topology environment, multiple RPF topologies can be created in the same network. A particular source may be reachable in only one of the topologies or in several of them through different paths.

To select the RPF topology for a particular multicast distribution tree, consider the following:

1. Configure a policy that maps a group range to a topology. When RPF information needs to be resolved for the RP or the sources for a group within the range, the RPF lookup takes place in the specified topology. This can be used for PIM Sparse Mode (PIM-SM)/source-specific multicast (SSM)/Bidirectional (Bidir) PIM.

2. Configure a policy that maps a source prefix range to a topology. This can be used for PIM-SM and PIM-SSM.

3. Use the topology identified by the Join Attribute encoding in the received PIM packets.

The PIM Join Attribute extends PIM signaling to identify a topology that should be used when constructing a particular multicast distribution tree. For more details on the PIM Join Attribute, see PIM Multi-Topology ID (MT-ID) Join-Attribute IEEE draft.
How to Configure OSPFv2-OSPF Live-Live

Configuring OSPFv2-OSPF Live-Live

SUMMARY STEPS

1. enable
2. configure terminal
3. ip multicast-routing
4. ip multicast rpf multitopology
5. global-address-family ipv4 multicast
6. topology {topology-A | topology-B}
7. exit
8. interface type number
9. ip address address mask
10. ip pim sparse-dense-mode
11. ip ospf process-id area area-id
12. topology ipv4 multicast topology-name
13. exit
14. router ospf process-id
15. network ip-address mask area area-id
16. address-family ipv4 multicast
17. topology topology-name tid topology-id
18. end
19. configure terminal
20. ip multicast topology multicast topology-name tid topology-id
21. ip multicast rpf select topology multicast topology-name access-list number
22. ip access-list extended access-list-number
23. permit ip any ip-address
24. end
25. show ip multicast topology multicast topology-name
26. debug ip multicast topology

### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat this step to configure another topology (ip multicast topology multicast live-B tid 200).</td>
</tr>
</tbody>
</table>

**Example:**

```
Device(config)# ip multicast topology multicast live-A tid 100
```

**Step 21**

- `ip multicast rpf select topology multicast topology-name access-list number`

**Example:**

```
Device(config)# ip multicast rpf select topology multicast topology live-A 111
```

- Repeat this step to associate the topology with another multicast group (ip multicast rpf select topology multicast live-B 122).

**Step 22**

- `ip access-list extended access-list-number`

**Example:**

```
Device(config)# ip access-list extended 111
```

- Defines an IP access list to enable filtering for packets with IP helper-address destinations and enters extended named access list configuration mode.

**Step 23**

- `permit ip any ip-address`

**Example:**

```
Device(config-ext-nacl)# permit ip any 203.0.113.1
```

- Sets condition to allow a packet to pass a named IP access list.

**Step 24**

- `end`

**Example:**

```
Device(config-ext-nacl)# end
```

- Exits extended named access list configuration mode and enters privileged EXEC mode.

**Step 25**

- `show ip multicast topology multicast topology-name`

**Example:**

```
Device# show ip multicast topology multicast live-A
```

- Displays topology information for multicast streams.

**Step 26**

- `debug ip multicast topology`

**Example:**

```
Device# debug ip multicast topology
```

- Enables debugging output for multicast stream topology.

---

### Configuration Examples for OSPFv2-OSPF Live-Live

**Example: Configuring OSPFv2-OSPF Live-Live**

```
ip multicast-routing

## Feature Information for OSPFv2-OSPF Live-Live

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to . An account on Cisco.com is not required.

### Table 21: Feature Information for OSPFv2-OSPF Live-Live

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSPFv2-OSPF Live-Live</td>
<td>15.4(2)T</td>
<td>The OSPFv2-OSPF Live-Live feature delivers multicast streams over non overlapping paths to various applications. The multicast traffic is split into multiple streams at the beginning of a protected network. All streams flow over non overlapping paths so that when a link failure occurs on one path, multicast traffic is still delivered through other paths. All streams are merged back at the end of the protected network. No commands were introduced or modified.</td>
</tr>
</tbody>

Chapter 18

OSPFv3 Address Families

The Open Shortest Path First version 3 (OSPFv3) address families feature enables both IPv4 and IPv6 unicast traffic to be supported. With this feature, users may have two processes per interface, but only one process per address family (AF).

- Finding Feature Information, page 205
- Prerequisites for OSPFv3 Address Families, page 205
- Information About OSPFv3 Address Families, page 206

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPFv3 Address Families

- To use the IPv4 unicast address families (AF) in OSPFv3, you must enable IPv6 on a link, although the link may not be participating in IPv6 unicast AF.
- With the OSPFv3 Address Families feature, users may have two processes per interface, but only one process per AF. If the AF is IPv4, an IPv4 address must first be configured on the interface, but IPv6 must be enabled on the interface.
Information About OSPFv3 Address Families

OSPFv3 Address Families

The OSPFv3 address families feature enables both IPv4 and IPv6 unicast traffic to be supported. With this feature, you may have two device processes per interface, but only one process per AF. If the IPv4 AF is used, an IPv4 address must first be configured on the interface, but IPv6 must be enabled on the interface. A single IPv4 or IPv6 OSPFv3 process running multiple instances on the same interface is not supported.

If you have an IPv6 network that uses OSPFv3 as its Interior Gateway Protocol (IGP) you may want to use the same IGP to help carry and install IPv4 routes. All devices on this network have an IPv6 forwarding stack. Some (or all) of the links on this network may be allowed to do IPv4 forwarding and be configured with IPv4 addresses. Pockets of IPv4-only devices exist around the edges running an IPv4 static or dynamic routing protocol. In this scenario, you need the ability to forward IPv4 traffic between these pockets without tunneling overhead, which means that any IPv4 transit device has both IPv4 and IPv6 forwarding stacks (that is, dual stack).

This feature allows a separate (possibly incongruent) topology to be constructed for the IPv4 AF. It installs IPv4 routes in the IPv4 Routing Information Base (RIB), and then the forwarding occurs natively. The OSPFv3 process fully supports an IPv4 AF topology and can redistribute routes from and into any other IPv4 routing protocol.

An OSPFv3 process can be configured to be either IPv4 or IPv6. The address-family command is used to determine which AF will run in the OSPFv3 process, and only one address family can be configured per instance. Once the AF is selected, you can enable multiple instances on a link and enable address-family-specific commands.

Different instance ID ranges are used for each AF. Each AF establishes different adjacencies, has a different link state database, and computes a different shortest path tree. The AF then installs the routes in the AF-specific RIB. LSAs that carry IPv6 unicast prefixes are used without any modification in different instances to carry each AF’s prefixes.

The IPv4 subnets configured on OSPFv3-enabled interfaces are advertised through intra-area prefix LSAs, just as any IPv6 prefixes. External LSAs are used to advertise IPv4 routes redistributed from any IPv4 routing protocol, including connected and static. The IPv4 OSPFv3 process runs the Shortest Path First (SPF) calculations and finds the shortest path to those IPv4 destinations. These computed routes are then inserted in the IPv4 RIB (computed routes are inserted into an IPv6 RIB for an IPv6 AF).

Because the IPv4 OSPFv3 process allocates a unique pdbindex in the IPv4 RIB, all other IPv4 routing protocols can redistribute routes from it. The parse chain for all protocols is the same, so the ospfv3 keyword added to the list of IPv4 routing protocols causes OSPFv3 to appear in the redistribute command from any IPv4 routing protocol. With the ospfv3 keyword, IPv4 OSPFv3 routes can be redistributed into any other IPv4 routing protocol as defined in the redistribute ospfv3 command.

The OSPFv3 address families feature is supported as of Cisco IOS Release 15.1(3)S and Cisco IOS Release 15.2(1)T. Cisco devices that run software older than these releases and third-party devices will not neighbor with devices running the AF feature for the IPv4 AF because they do not set the AF bit. Therefore, those devices will not participate in the IPv4 AF SPF calculations and will not install the IPv4 OSPFv3 routes in the IPv6 RIB.
How to Configure OSPFv3 Address Families

Configuring the OSPFv3 Device Process

Once you have completed step 3 and entered OSPFv3 router configuration mode, you can perform any of the subsequent steps in this task as needed to configure OSPFv3 Device configuration.

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospfv3 [process-id]
4. area area-ID [default-cost | nssa | stub]
5. auto-cost reference-bandwidth Mbps
6. default {area area-ID [range ipv6-prefix | virtual-link router-id]} [default-information originate [always | metric | metric-type | route-map] | distance | distribute-list prefix-list prefix-list-name {in | out} [interface] | maximum-paths paths | redistribute protocol | summary-prefix ipv6-prefix]
7. ignore lsa mospf
8. interface-id snmp-if-index
9. log-adjacency-changes [detail]
10. passive-interface [default | interface-type interface-number]
11. queue-depth {hello | update} {queue-size | unlimited}
12. router-id router-id

## Configuring the IPv6 Address Family in OSPFv3

Perform this task to configure the IPv6 address family in OSPFv3. Once you have completed step 4 and entered IPv6 address-family configuration mode, you can perform any of the subsequent steps in this task as needed to configure the IPv6 AF.

This task can be performed in Cisco IOS Release 15.1(3)S and 15.2(1)T and later releases.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router ospfv3 [process-id]`
4. `address-family ipv6 unicast`
5. `area area-ID range ipv6-prefix / prefix-length`
6. `default [area area-ID [range ipv6-prefix | virtual-link router-id]] [default-information originate [always | metric | metric-type | route-map] | distance | distribute-list prefix-list prefix-list-name {in | out} | interface] | maximum-paths paths | redistribute protocol | summary-prefix ipv6-prefix]
7. `default-information originate [always ] metric metric-value | metric-type type-value | route-map map-name`
8. `default-metric metric-value`
9. `distance distance`
10. `distribute-list prefix-list list-name {in [interface-type interface-number] | out routing-process [as-number]}
11. `maximum-paths number-paths`
12. `summary-prefix prefix [not-advertise | tag tag-value]`
## DETAILED STEPS

<table>

</tbody>
</table>

### Configuring the IPv4 Address Family in OSPFv3

Perform this task to configure the IPv4 address family in OSPFv3. Once you have completed step 4 and entered IPv4 address family configuration mode, you can perform any of the subsequent steps in this task as needed to configure the IPv4 AF.
**Note**

OSPFv3 IPv4 support is specified in RFC5838 and it does not support virtual links.

This task can be performed in Cisco IOS Release 15.1(3)S and 15.2(1)T and later releases.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router ospfv3 [process-id]
4. address-family ipv4 unicast
5. area area-id range ip-address ip-address-mask [advertise | not-advertise] [cost cost]
6. default area area-ID[default-information originate [always | metric | metric-type | route-map] | distance | distribute-list prefix-list prefix-list-name {in | out} [interface] | maximum-paths paths | redistribute protocol | summary-prefix ipv4-prefix]
7. default-information originate [always] metric metric-value | metric-type type-value | route-map map-name
8. default-metric metric-value
9. distance distance
10. distribute-list prefix-list list-name {in [interface-type interface-number] | out routing-process [as-number]}
11. maximum-paths number-paths
12. summary-prefix prefix [not-advertise | tag tag-value]

</tbody>
</table>
### OSPFv3 Address Families

#### Enabling OSPFv3 on an Interface

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface type number
4. Do one of the following:
   - `ospfv3 process-id area area-ID {ipv4 | ipv6} [instance instance-id]`
   - `ipv6 ospf process-id area area-id [instance instance-id]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| Example: | Device> enable | |
| **Step 2** | configure terminal | Enters global configuration mode. |
| Example: | Device# configure terminal | |
### Defining an OSPFv3 Area Range for the IPv6 or IPv4 Address Family

The cost of the summarized routes will be the highest cost of the routes being summarized. For example, if the following routes are summarized:

```
OI 2001:DB8:0:7::/64 [110/20]
   via FE80::A8BB:CCFF:FE00:6F00, Ethernet0/0
OI 2001:DB8:0:8::/64 [110/100]
   via FE80::A8BB:CCFF:FE00:6F00, Ethernet0/0
OI 2001:DB8:0:9::/64 [110/20]
   via FE80::A8BB:CCFF:FE00:6F00, Ethernet0/0
```

They become one summarized route, as follows:

```
OI 2001:DB8::/48 [110/100]
   via FE80::A8BB:CCFF:FE00:6F00, Ethernet0/0
```

The task can be performed in Cisco IOS Release 15.1(3)S and 15.2(1)T and later releases.

### Before You Begin

OSPFv3 routing must be enabled.
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router ospfv3 [process-id]`
4. `address-family ipv6 unicast`
5. `area area-ID range ipv6-prefix`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**

  - `enable`

  **Example:**

  Device> enable

  - Enables privileged EXEC mode.

  - Enter your password if prompted.

| **Step 2**

  - `configure terminal`

  **Example:**

  Device# configure terminal

  - Enters global configuration mode.

| **Step 3**

  - `router ospfv3 [process-id]`

  **Example:**

  Device(config)# router ospfv3 1

  - Enables OSPFv3 router configuration mode for the IPv4 or IPv6 address family.

| **Step 4**

  - `address-family ipv6 unicast`

  **Example:**

  Device(config-router)# address-family ipv6 unicast

  **Example:**

  Device(config-router)# address-family ipv4 unicast

  - Enters IPv6 address family configuration mode for OSPFv3.

  or

  - Enters IPv4 address family configuration mode for OSPFv3.

| **Step 5**

  - `area area-ID range ipv6-prefix`

  **Example:**

  Device(config-router-af)# area 1 range 2001:DB8:0:0::0/128

  - Configures OSPFv3 area parameters.
Defining an OSPFv3 Area Range

The task can be performed in releases prior to Cisco IOS Release 15.1(3)S and 15.2(1)T.

SUMMARY STEPS

1. enable
2. configure terminal
3. ipv6 router ospf  process-id
4. area  area-id  range  ipv6-prefix / prefix-length  [advertise | not-advertise] [cost cost]

Configuration Examples for OSPFv3 Address Families

Example: Configuring OSPFv3 Address Families

Device# show ospfv3
Routing Process "ospfv3 1" with ID 10.0.0.1
Supports IPv6 Address Family
Event-log enabled, Maximum number of events: 1000, Mode: cyclic
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPF s 10000 msecs
Maximum wait time between two consecutive SPF s 10000 msecs
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x000000
Graceful restart helper support enabled
Reference bandwidth unit is 100 mbps
Relay willingness value is 128
Pushback timer value is 2000 msecs
Relay acknowledgement timer value is 1000 msecs
LSA cache Disabled : current count 0, maximum 1000
ACK cache Disabled : current count 0, maximum 1000
Selective Peering is not enabled
Hello requests and responses will be sent multicast

OSPF Forwarding Address Suppression in Translated Type-5 LSAs

The OSPF Forwarding Address Suppression in Translated Type-5 LSAs feature causes a not-so-stubby area (NSSA) area border router (ABR) to translate Type-7 link state advertisements (LSAs) to Type-5 LSAs, but use the address 0.0.0.0 for the forwarding address instead of that specified in the Type-7 LSA. This feature causes routers that are configured not to advertise forwarding addresses into the backbone to direct forwarded traffic to the translating NSSA ABRs.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for OSPF Forwarding Address Suppression in Translated Type-5 LSAs

This document presumes you have OSPF configured on the networking device; it does not document other steps to configure OSPF.

Information About OSPF Forwarding Address Suppression in Translated Type-5 LSAs

Benefits of OSPF Forwarding Address Suppression in Translated Type-5 LSAs

The OSPF Forwarding Address Suppression in Translated Type-5 LSAs feature causes an NSSA ABR to translate Type-7 LSAs to Type-5 LSAs, but use the 0.0.0.0 as the forwarding address instead of that specified in the Type-7 LSA. This feature causes routers that are configured not to advertise forwarding addresses into the backbone to direct forwarded traffic to the translating NSSA ASBRs.

When to Suppress OSPF Forwarding Address in Translated Type-5 LSAs

In the figure below, it would be advantageous to filter Area 2 addresses from Area 0 to minimize the number of routes introduced into the backbone (Area 0). However, using the area range command to consolidate and summarize routes at the area boundary--filtering the Area 2 addresses--will not work because the Area 2 addresses include forwarding addresses for Type-7 LSAs that are generated by the ASBR. If these Type-7
LSA forwarding addresses have been filtered out of Area 0, the backbone routers cannot reach the prefixes advertised in the translated Type-5 LSAs (autonomous system external LSAs).

Figure 10: OSPF Forwarding Address Suppression in Translated Type-5 LSAs

This problem is solved by suppressing the forwarding address on the ABR so that the forwarding address is set to 0.0.0.0 in the Type-5 LSAs that were translated from Type-7 LSAs. A forwarding address set to 0.0.0.0 indicates that packets for the external destination should be forwarded to the advertising OSPF router, in this case, the translating NSSA ABR.

Before configuring this feature, consider the following caution.

---

**Caution**

Configuring this feature causes the router to be noncompliant with RFC 1587. Also, suboptimal routing might result because there might be better paths to reach the destination’s forwarding address. This feature should not be configured without careful consideration and not until the network topology is understood.
How to Suppress OSPF Forwarding Address in Translated Type-5 LSAs

Suppressing OSPF Forwarding Address in Translated Type-5 LSAs

CHAPTER 20

OSPF Inbound Filtering Using Route Maps with a Distribute List

The OSPF Inbound Filtering Using Route Maps with a Distribute List feature allows users to define a route map to prevent Open Shortest Path First (OSPF) routes from being added to the routing table. In the route map, the user can match on any attribute of the OSPF route.

- Finding Feature Information, page 233

Prerequisites for OSPF Inbound Filtering Using Route Maps with a Distribute List

It is presumed that you have OSPF configured in your network.
Information About OSPF Inbound Filtering Using Route Maps with a Distribute List

Users can define a route map to prevent OSPF routes from being added to the routing table. This filtering happens at the moment when OSPF is installing the route in the routing table. This feature has no effect on link-state advertisement (LSA) flooding. In the route map, the user can match on any attribute of the OSPF route. That is, the route map could be based on the following `match` options:

- `match interface`
- `match ip address`
- `match ip next-hop`
- `match ip route-source`
- `match metric`
- `match route-type`
- `match tag`

This feature can be useful during redistribution if the user tags prefixes when they get redistributed on Autonomous System Boundary Routers (ASBRs) and later uses the tag to filter the prefixes from being installed in the routing table on other routers.

**Filtering Based on Route Tag**

Users can assign tags to external routes when they are redistributed to OSPF. Then the user can deny or permit those routes in the OSPF domain by identifying that tag in the `route-map` and `distribute-list in` commands.

**Filtering Based on Route Type**

In OSPF, the external routes could be Type 1 or Type 2. Users can create route maps to match either Type 1 or Type 2 and then use the `distribute-list in` command to filter certain prefixes. Also, route maps can identify internal routes (interarea and intra-area) and then those routes can be filtered.

**Filtering Based on Route Source**

When a match is done on the route source, the route source represents the OSPF Router ID of the LSA originator of the LSA in which the prefix is advertised.

**Filtering Based on Interface**

When a match is done on the interface, the interface represents the outgoing interface for the route that OSPF is trying to install in the routing table.

**Filtering Based on Next Hop**

When a match is done on the next hop, the next hop represents the next hop for the route that OSPF is trying to install in the routing table.
The **distribute-list in** command can be configured to prevent routes from being installed in the global Routing Information Base (RIB). Prior to the implementation of OSPF local RIB (for feature information on OSPF local RIB, see OSPFv2 Local RIB), OSPF would attempt to install a less preferred route (e.g. an inter-area route when the intra-area path is filtered). With OSPF local RIB, only the best route is considered (because this is the only route the local RIB maintains). There is no concept of a "second-best" OSPF route. For more information on the routing algorithm used by Cisco OSPF routers, please refer to RFC 2328.

# How to Configure OSPF Inbound Filtering Using Route Maps

## Configuring OSPF Route Map-Based Filtering

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `route-map map-tag [permit | deny] [sequence-number]`
4. `match tag tag-name`
5. Repeat Steps 3 and 4 with other `route-map` and `match` commands.
6. `exit`
7. `router ospf process-id`
8. `distribute-list route-map map-tag in`
9. `end`

</table>
Configuration Examples for OSPF Inbound Filtering Using Route Maps with a Distribute List

Example OSPF Route Map-Based Filtering

In this example, OSPF external LSAs have a tag. The value of the tag is examined before the prefix is installed in the routing table. All OSPF external prefixes that have the tag value of 777 are filtered (prevented from being installed in the routing table). The permit statement with sequence number 20 has no match conditions, and there are no other route-map statements after sequence number 20, so all other conditions are permitted.

```plaintext
route-map tag-filter deny 10
  match tag 777
route-map tag-filter permit 20
!
router ospf 1
  router-id 10.0.0.2
  log-adjacency-changes
  network 172.16.2.1 0.0.0.255 area 0
  distribute-list route-map tag-filter in
```

Information About OSPFv3 Fast Convergence: LSA and SPF Throttling

Fast Convergence: LSA and SPF Throttling

The OSPFv3 LSA and SPF throttling feature provides a dynamic mechanism to slow down link-state advertisement updates in OSPFv3 during times of network instability. It also allows faster OSPFv3 convergence by providing LSA rate limiting in milliseconds.

OSPFv3 can use static timers for rate-limiting SPF calculation and LSA generation. Although these timers are configurable, the values used are specified in seconds, which poses a limitation on OSPFv3 convergence. LSA and SPF throttling achieves subsecond convergence by providing a more sophisticated SPF and LSA rate-limiting mechanism that is able to react quickly to changes and also provide stability and protection during prolonged periods of instability.

How to Configure OSPFv3 Fast Convergence: LSA and SPF Throttling

Tuning LSA and SPF Timers for OSPFv3 Fast Convergence

This task can be performed in Cisco IOS Release 15.1(3)S and 15.2(1)T and later releases.

### Configuration Examples for OSPFv3 Fast Convergence: LSA and SPF Throttling

#### Example: Configuring LSA and SPF Throttling for OSPFv3 Fast Convergence

The following example show how to display the configuration values for SPF and LSA throttling timers:

```
Device# show ipv6 ospf
Routing Process "ospfv3 1" with ID 10.9.4.1
Event-log enabled, Maximum number of events: 1000, Mode: cyclic
It is an autonomous system boundary router
  Redistributing External Routes from,
  ospf 2
  Initial SPF schedule delay 5000 msecs
  Minimum hold time between two consecutive SPFss 10000 msecs
  Maximum wait time between two consecutive SPFss 10000 msecs
  Minimum LSA interval 5 secs
  Minimum LSA arrival 1000 msecs
```

</tr>
</tbody>
</table>
OSPF Shortest Path First Throttling

The OSPF Shortest Path First Throttling feature makes it possible to configure SPF scheduling in millisecond intervals and to potentially delay shortest path first (SPF) calculations during network instability. SPF is scheduled to calculate the Shortest Path Tree (SPT) when there is a change in topology. One SPF run may include multiple topology change events.

The interval at which the SPF calculations occur is chosen dynamically and is based on the frequency of topology changes in the network. The chosen interval is within the boundary of the user-specified value ranges. If network topology is unstable, SPF throttling calculates SPF scheduling intervals to be longer until topology becomes stable.

- Information About OSPF SPF Throttling, page 250
- How to Configure OSPF SPF Throttling, page 251
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About OSPF SPF Throttling

Shortest Path First Calculations

SPF calculations occur at the interval set by the `timers throttle spf` command. The wait interval indicates the amount of time to wait until the next SPF calculation occurs. Each wait interval after that calculation is twice as long as the previous one until the wait interval reaches the maximum wait time specified.

The SPF timing can be better explained using an example. In this example the start interval is set at 5 milliseconds (ms), the wait interval at 1000 milliseconds, and the maximum wait time is set at 90,000 milliseconds.

.timers throttle spf 5 1000 90000

The figure below shows the intervals at which the SPF calculations occur so long as at least one topology change event is received in a given wait interval.

Figure 11: SPF Calculation Intervals Set by the timers throttle spf Command

Notice that the wait interval between SPF calculations doubles when at least one topology change event is received during the previous wait interval. Once the maximum wait time is reached, the wait interval remains the same until the topology stabilizes and no event is received in that interval.

If the first topology change event is received after the current wait interval, the SPF calculation is delayed by the amount of time specified as the start interval. The subsequent wait intervals continue to follow the dynamic pattern.

If the first topology change event occurs after the maximum wait interval begins, the SPF calculation is again scheduled at the start interval and subsequent wait intervals are reset according the parameters specified in
the `timers throttle spf` command. Notice in the figure below that a topology change event was received after the start of the maximum wait time interval and that the SPF intervals have been reset.

Verifying SPF Throttle Values

To verify SPF throttle timer values, use the `show ip ospf` command. The values are displayed in the lines that begin, "Initial SPF schedule delay..." "Minimum hold time between two consecutive SPF...", and "Maximum wait time between..."

```
Router# show ip ospf
Routing Process "ospf 1" with ID 10.10.10.2 and Domain ID 0.0.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
It is an autonomous system boundary router
Redistributing External Routes from,
    static, includes subnets in redistribution
Initial SPF schedule delay 5 msecs
Minimum hold time between two consecutive SPF 1000 msecs
Maximum wait time between two consecutive SPF 90000 msecs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 4. Checksum Sum 0x17445
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
Area BACKBONE(0)
    Number of interfaces in this area is 2
    Area has no authentication
    SPF algorithm last executed 19:11:15.140 ago
    SPF algorithm executed 28 times
    Area ranges are
    Number of LSA 4. Checksum Sum 0x2C1D4
    Number of opaque link LSA 0. Checksum Sum 0x0
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0
```

### Configuration Examples for OSPF SPF Throttling

#### Throttle Timers Example

This example shows a router configured with the start, hold, and maximum interval values for the `timers throttle spf` command set at 5, 1,000, and 90,000 milliseconds, respectively.

```
router ospf 1
router-id 10.10.10.2
log-adjacency-changes
timers throttle spf 5 1000 90000
redistribute static subnets
   network 21.21.21.0 0.0.0.255 area 0
   network 22.22.22.0 0.0.0.255 area 0
```

CHAPTER 23

OSPF Support for Fast Hello Packets

The OSPF Support for Fast Hello Packets feature provides a way to configure the sending of hello packets in intervals less than 1 second. Such a configuration would result in faster convergence in an Open Shortest Path First (OSPF) network.

- Finding Feature Information, page 257
- Prerequisites for OSPF Support for Fast Hello Packets, page 257
- Information About OSPF Support for Fast Hello Packets, page 258
- How to Configure OSPF Fast Hello Packets, page 259
- Configuration Examples for OSPF Support for Fast Hello Packets, page 260
- Additional References, page 261
- Feature Information for OSPF Support for Fast Hello Packets, page 262

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF Support for Fast Hello Packets

OSPF must be configured in the network already or configured at the same time as the OSPF Support for Fast Hello Packets feature.
Information About OSPF Support for Fast Hello Packets

OSPF Hello Interval and Dead Interval

OSPF hello packets are packets that an OSPF process sends to its OSPF neighbors to maintain connectivity with those neighbors. The hello packets are sent at a configurable interval (in seconds). The defaults are 10 seconds for an Ethernet link and 30 seconds for a non-broadcast link. Hello packets include a list of all neighbors for which a hello packet has been received within the dead interval. The dead interval is also a configurable interval (in seconds), and defaults to four times the value of the hello interval. The value of all hello intervals must be the same within a network. Likewise, the value of all dead intervals must be the same within a network.

These two intervals work together to maintain connectivity by indicating that the link is operational. If a router does not receive a hello packet from a neighbor within the dead interval, it will declare that neighbor to be down.

OSPF Fast Hello Packets

OSPF fast hello packets refer to hello packets being sent at intervals of less than 1 second. To understand fast hello packets, you should already understand the relationship between OSPF hello packets and the dead interval. See the section OSPF Hello Interval and Dead Interval, on page 258.

OSPF fast hello packets are achieved by using the `ip ospf dead-interval` command. The dead interval is set to 1 second, and the hello-multiplier value is set to the number of hello packets you want sent during that 1 second, thus providing subsecond or "fast" hello packets.

When fast hello packets are configured on the interface, the hello interval advertised in the hello packets that are sent out this interface is set to 0. The hello interval in the hello packets received over this interface is ignored.

The dead interval must be consistent on a segment, whether it is set to 1 second (for fast hello packets) or set to any other value. The hello multiplier need not be the same for the entire segment as long as at least one hello packet is sent within the dead interval.

Benefits of OSPF Fast Hello Packets

The benefit of the OSPF Fast Hello Packets feature is that your OSPF network will experience faster convergence time than it would without fast hello packets. This feature allows you to detect lost neighbors within 1 second. It is especially useful in LAN segments, where neighbor loss might not be detected by the Open System Interconnection (OSI) physical layer and data-link layer.
How to Configure OSPF Fast Hello Packets

Configuring OSPF Fast Hello Packets

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. ip ospf dead-interval minimal hello-multiplier multiplier
5. end
6. show ip ospf interface [interface-type interface-number]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface type number</td>
<td>Configures an interface type and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example: Router(config)# interface ethernet 0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip ospf dead-interval minimal hello-multiplier multiplier</td>
<td>Sets the interval during which at least one hello packet must be received, or else the neighbor is considered down.</td>
</tr>
<tr>
<td>Example: Router(config-if)# ip ospf dead-interval minimal hello-multiplier 5</td>
<td>• In the example, OSPF Support for Fast Hello Packets is enabled by specifying the minimal keyword and the hello-multiplier keyword and value. Because the multiplier is set to 5, five hello packets will be sent every second.</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Purpose**

**Step 5**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>(Optional) Saves configuration commands to the running configuration file, exits configuration mode, and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

- Use this command when you are ready to exit configuration mode and save the configuration to the running configuration file.

**Example:**

```
Router(config-if)# end
```

**Step 6**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip ospf interface [interface-type interface-number]</td>
<td>(Optional) Displays OSPF-related interface information.</td>
</tr>
</tbody>
</table>

- The relevant fields that verify OSPF fast hello packets are indicated in the sample output following this table.

**Example:**

```
Router# show ip ospf interface ethernet 1/3
```

### Examples

The following example output verifies that OSPF Support for Fast Hello Packets is configured. In the line that begins with "Timer intervals configured," the hello interval is 200 milliseconds, the dead interval is 1 second, and the next hello packet is due in 76 milliseconds.

```
Router# show ip ospf interface ethernet 1/3
Ethernet1/3 is up, line protocol is up
Internet Address 172.16.1.2/24, Area 0
Process ID 1, Router ID 172.17.0.2, Network Type BROADCAST, Cost:1
Transmit Delay is 1 sec, State DR, Priority 1
Designated Router (ID) 172.17.0.2, Interface address 172.16.1.2
Backup Designated router (ID) 172.16.0.1, Interface address 172.16.1.1
Timer intervals configured, Hello 200 msec, Dead 1, Wait 1, Retransmit 5
Hello due in 76 msec
Index 2/2, flood queue length 0
Next 0x0(0)/0x0(0)
Last flood scan length is 2, maximum is 3
Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 1, Adjacent neighbor count is 1
Adjacent with neighbor 172.16.0.1 (Backup Designated Router)
Suppress hello for 0 neighbor(s)
```

### Configuration Examples for OSPF Support for Fast Hello Packets

#### Example OSPF Fast Hello Packets

The following example configures OSPF fast hello packets; the dead interval is 1 second and five hello packets are sent every second:

```
interface ethernet 1
  ip ospf dead-interval minimal hello-multiplier 5
```

</tr>
</tbody>
</table>
OSPF Incremental SPF

The Open Shortest Path First (OSPF) protocol can be configured to use an incremental SPF algorithm for calculating the shortest path first routes. Incremental SPF is more efficient than the full SPF algorithm, thereby allowing OSPF to converge faster on a new routing topology in reaction to a network event.

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information for OSPF Incremental SPF, on page 266.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Finding Feature Information

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for OSPF Incremental SPF

It is presumed that you have OSPF configured in your network.

Information About OSPF Incremental SPF

OSPF uses Dijkstra’s SPF algorithm to compute the shortest path tree (SPT). During the computation of the SPT, the shortest path to each node is discovered. The topology tree is used to populate the routing table with routes to IP networks. When changes to a Type-1 or Type-2 link-state advertisement (LSA) occur in an area, the entire SPT is recomputed. In many cases, the entire SPT need not be recomputed because most of the tree remains unchanged. Incremental SPF allows the system to recompute only the affected part of the tree. Recomputing only a portion of the tree rather than the entire tree results in faster OSPF convergence and saves CPU resources. Note that if the change to a Type-1 or Type-2 LSA occurs in the calculating router itself, then the full SPT is performed.

Incremental SPF is scheduled in the same way as the full SPF. Routers enabled with incremental SPF and routers not enabled with incremental SPF can function in the same internetwork.

How to Enable OSPF Incremental SPF

Enabling Incremental SPF

This section describes how to enable incremental SPF.

Feature Information for OSPF Incremental SPF

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to . An account on Cisco.com is not required.

**Table 28: Feature Information for OSPF Incremental SPF**

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| OSPF Incremental SPF  | 12.0(24)S 12.3(2)T 12.2(18)S 12.2(27)SBC 12.2(33)SRA 12.2(33)XNE Cisco IOS XE 3.1.0 SG | OSPF can be configured to use an incremental SPF algorithm for calculating the shortest path first routes. Incremental SPF is slightly more efficient than the full SPF algorithm, thereby allowing OSPF to converge faster on a new routing topology in reaction to a network event. The following commands are introduced or modified in the feature documented in this module: *
|                       |                                               | • ispf                                                                             |
OSPF Limit on Number of Redistributed Routes

Open Shortest Path First (OSPF) supports a user-defined maximum number of prefixes (routes) that are allowed to be redistributed into OSPF from other protocols or other OSPF processes. Such a limit could help prevent the router from being flooded by too many redistributed routes.

- Finding Feature Information, page 269
- Prerequisites for OSPF Limit on Number of Redistributed Routes, page 269
- Information About OSPF Limit on Number of Redistributed Routes, page 270

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF Limit on Number of Redistributed Routes

It is presumed that you have OSPF configured in your network, along with another protocol or another OSPF process you are redistributing.
Information About OSPF Limit on Number of Redistributed Routes

If large number of IP routes are sent into OSPF by redistributing Border Gateway Protocol (BGP) into OSPF, the network can be severely flooded. Limiting the number of redistributed routes prevents this potential problem.

OSPF can receive and accept packets from non-routable addresses (for example, 0.0.0.0/7) also.

How to Configure OSPF Limit the Number of OSPF Redistributed Routes

This section contains the following procedures, which are mutually exclusive. That is, you cannot both limit redistributed prefixes and also choose to be warned.

Limiting the Number of OSPF Redistributed Routes

This task describes how to limit the number of OSPF redistributed routes. If the number of redistributed routes reaches the maximum value configured, no more routes will be redistributed.

The redistribution limit applies to all IP redistributed prefixes, including summarized ones. The redistribution limit does not apply to default routes or prefixes that are generated as a result of Type-7 to Type-5 translation.

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf process-id
4. redistribute protocol [process-id][as-number] [metric metric-value] [metric-type type-value] [match {internal|external 1|external 2}][tag tag-value] [route-map map-tag] [subnets]
5. redistribute maximum-prefix maximum [threshold]
6. end
7. show ip ospf [process-id]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>
## OSPF Limit on Number of Redistributed Routes

Limiting the Number of OSPF Redistributed Routes

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| `configure terminal` | Example:  
  Router# configure terminal |
| **Step 3**        | Configures an OSPF routing process. |
| `router ospf process-id` | Example:  
  Router(config)# router ospf 1 |
| **Step 4**        | Redistributes routes from one routing domain into another routing domain. |
| `redistribute protocol [process-id][as-number] [metric metric-value] [metric-type type-value] [match {internal | external 1 | external 2}] [tag tag-value] [route-map map-tag] [subnets]` | Example:  
  Router(config-router)# redistribute eigrp 10 |
| **Step 5**        | Sets a maximum number of IP prefixes that are allowed to be redistributed into OSPF. |
| `redistribute maximum-prefix maximum [threshold]` | Example:  
  Router(config-router)# redistribute maximum-prefix 100 80 |
| **Step 6**        | Exits router configuration mode. |
| `end` | Example:  
  Router(config-router)# end |
| **Step 7**        | (Optional) Displays general information about OSPF routing processes. |
| `show ip ospf [process-id]` | Example:  
  Router# show ip ospf 1 |

**Note**  
If the `warning-only` keyword had been configured in this command, no limit would be enforced; a warning message is simply logged.

- There is no default value for the `maximum` argument.
- The `threshold` value defaults to 75 percent.
Requesting a Warning About the Number of Routes Redistributed into OSPF

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router ospf process-id
4. redistribute protocol [process-id][as-number] [metric metric-value] [metric-type type-value] [match {internal | external 1 | external 2}] [tag tag-value] [route-map map-tag] [subnets]
5. redistribute maximum-prefix maximum [threshold] warning-only
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>* Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong> router ospf process-id</td>
<td>Configures an OSPF routing process.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# router ospf 1</td>
</tr>
<tr>
<td><strong>Step 4</strong> redistribute protocol [process-id][as-number] [metric metric-value] [metric-type type-value] [match {internal</td>
<td>external 1</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-router)# redistribute eigrp 10</td>
</tr>
<tr>
<td><strong>Step 5</strong> redistribute maximum-prefix maximum [threshold] warning-only</td>
<td>Causes a warning message to be logged when the maximum number of IP prefixes has been redistributed into OSPF.</td>
</tr>
</tbody>
</table>

Note: The redistribution count applies to external IP prefixes, including summarized routes. Default routes and prefixes that are generated as a result of Type-7 to Type-5 translation are not considered.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-router)# redistribute</code></td>
<td>• Because the <strong>warning-only</strong> keyword is included, no limit is imposed on the number of redistributed prefixes into OSPF.</td>
</tr>
<tr>
<td><code>maximum-prefix 1000 80 warning-only</code></td>
<td>• There is no default value for the <code>maximum</code> argument.</td>
</tr>
<tr>
<td></td>
<td>• The <code>threshold</code> value defaults to 75 percent.</td>
</tr>
<tr>
<td></td>
<td>• This example causes two warnings: one at 80 percent of 1000 (800 routes redistributed) and another at 1000 routes redistributed.</td>
</tr>
</tbody>
</table>

**Step 6**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>end</code></td>
<td>Exits router configuration mode.</td>
</tr>
</tbody>
</table>

**Example: Requesting a Warning About the Number of Redistributed Routes**

This example allows two warning messages to be logged, the first if the number of prefixes redistributed reaches 85 percent of 600 (510 prefixes), and the second if the number of redistributed routes reaches 600. However, the number of redistributed routes is not limited.

```
router ospf 1
network 10.0.0.0 0.0.0.255 area 0
```

---

**Configuration Examples for OSPF Limit on Number of Redistributed Routes**

**Example OSPF Limit on Number of Redistributed Routes**

This example sets a maximum of 1200 prefixes that can be redistributed into OSPF process 1. Prior to reaching the limit, when the number of prefixes redistributed reaches 80 percent of 1200 (960 prefixes), a warning message is logged. Another warning is logged when the limit is reached and no more routes are redistributed.

```
router ospf 1
router-id 10.0.0.1
domain-id 5.6.7.8
log-adjacency-changes
timers lsa-interval 2
network 10.0.0.1 0.0.0.0 area 0
network 10.1.5.1 0.0.0.0 area 0
network 10.2.2.1 0.0.0.0 area 0
redistribute static subnets
redistribute maximum-prefix 1200 80
```
redistribute eigrp 10 subnets
redistribute maximum-prefix 600 85 warning-only

OSPFv3 Max-Metric Router LSA

The Open Shortest Path First version 3 (OSPFv3) max-metric router link-state advertisement (LSA) feature enables OSPFv3 to advertise its locally generated router LSAs with a maximum metric. The feature allows OSPFv3 processes to converge but not attract transit traffic through the device if there are better alternate paths.

- Finding Feature Information, page 277
- Information About OSPFv3 Max-Metric Router LSA, page 277
- How to Configure OSPFv3 Max-Metric Router LSA, page 278
- Configuration Examples for OSPFv3 Max-Metric Router LSA, page 279
- Additional References, page 280
- Feature Information for OSPFv3 Max-Metric Router LSA, page 281

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About OSPFv3 Max-Metric Router LSA

OSPFv3 Max-Metric Router LSA

The OSPFv3 max-metric router LSA feature enables OSPFv3 to advertise its locally generated router LSAs with a maximum metric. The feature allows OSPFv3 processes to converge but not attract transit traffic through
the device if there are better alternate paths. After a specified timeout or a notification from Border Gateway Protocol (BGP), OSPFv3 advertises the LSAs with normal metrics.

The max-metric LSA control places the OSPFv3 router into the stub router role using its LSA advertisement. A stub router only forwards packets destined to go to its directly connected links. In OSPFv3 networks, a device could become a stub router by advertising large metrics for its connected links, so that the cost of a path through this device becomes larger than that of an alternative path. OSPFv3 stub router advertisement allows a device to advertise the infinity metric (0xFFFF) for its connected links in router LSAs and advertise the normal interface cost if the link is a stub network.

How to Configure OSPFv3 Max-Metric Router LSA

Configuring the OSPFv3 Max-Metric Router LSA

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospfv3 process-id
4. address-family ipv6 unicast
5. max-metric router-lsa [external-lsa [max-metric-value]] [include-stub] [inter-area-lsas [max-metric-value]] [on-startup {seconds | wait-for-bgp}] [prefix-lsa] [stub-prefix-lsa [max-metric-value]] [summary-lsa [max-metric-value]]
6. end
7. show ospfv3 [process-id] max-metric

DETAILED STEPS

CHAPTER 27

OSPF Link-State Advertisement Throttling

The OSPF Link-State Advertisement (LSA) Throttling feature provides a dynamic mechanism to slow down link-state advertisement (LSA) updates in OSPF during times of network instability. It also allows faster Open Shortest Path First (OSPF) convergence by providing LSA rate limiting in milliseconds.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF LSA Throttling

It is presumed that you have OSPF configured in your network.

Information About OSPF LSA Throttling

Benefits of OSPF LSA Throttling

Prior to the OSPF LSA Throttling feature, LSA generation was rate-limited for 5 seconds. That meant that changes in an LSA could not be propagated in milliseconds, so the OSPF network could not achieve millisecond convergence.

The OSPF LSA Throttling feature is enabled by default and allows faster OSPF convergence (in milliseconds). This feature can be customized. One command controls the generation (sending) of LSAs and another command controls the receiving interval. This feature also provides a dynamic mechanism to slow down the frequency of LSA updates in OSPF during times of network instability.

How OSPF LSA Throttling Works

The timers throttle lsa all command controls the generation (sending) of LSAs. The first LSA is always generated immediately upon an OSPF topology change, and the next LSA generated is controlled by the minimum start interval. The subsequent LSAs generated for the same LSA are rate-limited until the maximum interval is reached. The "same LSA" is defined as an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID.

The timers lsa arrival command controls the minimum interval for accepting the same LSA. If an instance of the same LSA arrives sooner than the interval that is set, the LSA is dropped. It is recommended that the arrival interval be less than or equal to the hold-time interval of the timers throttle lsa all command.
How to Customize OSPF LSA Throttling

Customizing OSPF LSA Throttling

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf process-id
4. timers throttle lsa all start-interval hold-interval max-interval
5. timers lsa arrival milliseconds
6. end
7. show ip ospf timers rate-limit
8. show ip ospf

DETAILED STEPS

Configuration Examples for OSPF LSA Throttling

Example OSPF LSA Throttling

This example customizes OSPF LSA throttling so that the start interval is 200 milliseconds, the hold interval is 10,000 milliseconds, and the maximum interval is 45,000 milliseconds. The minimum interval between instances of receiving the same LSA is 2000 milliseconds.

```
router ospf 1
  log-adjacency-changes
  timers throttle lsa all 200 10000 45000
  timers lsa arrival 2000
  network 10.10.4.0 0.0.0.255 area 24
  network 10.10.24.0 0.0.0.255 area 24
```

OSPF Support for Unlimited Software VRFs per PE Router

In a Multiprotocol Label Switching—Virtual Private Network (MPLS-VPN) deployment, each VPN routing and forwarding instance (VRF) needs a separate Open Shortest Path First (OSPF) process when configured to run OSPF. The OSPF Support for Unlimited Software VRFs per Provider Edge (PE) Router feature addresses the scalability issue for OSPF VPNs by eliminating the OSPF VPN limit of 32 processes.

- Prerequisites for OSPF Support for Unlimited Software VRFs per PE Router, page 294
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF Support for Unlimited Software VRFs per PE Router

You must have OSPF configured in your network.

Restrictions for OSPF Support for Unlimited Software VRFs per PE Router

Only 32 processes per VRF can be supported. For different VRF processes, there is no limit.

Information About OSPF Support for Unlimited Software VRFs per PE Router

Before Cisco IOS Releases 12.3(4)T and 12.0(27)S, a separate OSPF process was necessary for each VRF that receives VPN routes via OSPF. When VPNs are deployed, an MPLS Provider Edge (PE) router will be running both multiprotocol Border Gateway Protocol (BGP) for VPN distribution, and Interior Gateway Protocol (IGP) for PE-P connectivity. It is a common scenario when OSPF is used as the IGP between a customer edge (CE) router and a PE router. OSPF was not scalable in VPN deployment because of the limit of 32 processes. By default one process is used for connected routes and another process is used for static routes, therefore only 28 processes can be created for VRFs.

The OSPF Support for Unlimited Software VRFs per Provider Edge Router feature allows for an approximate range of 300 to 10,000 VRFs, depending on the particular platform and on the applications, processes, and protocols that are currently running on the platform.
How to Configure OSPF Support for Unlimited Software VRFs per PE Router

Configuring and Verifying Unlimited Software VRFs per Provider Edge Router

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf  process-id [vrf vpn-name]
4. end
5. show ip ospf [process-id]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

**Example:**

Router# show ip ospf 1

---

### Configuration Examples for OSPF Support for Unlimited Software VRFs per PE Router

#### Example Configuring OSPF Support for Unlimited Software VRFs per PE Router

This example shows a basic OSPF configuration using the `router ospf` command to configure OSPF VRF processes for the VRFs first, second, and third:

```plaintext
Router> enable
Router# configure terminal
Router(config)# router ospf 12 vrf first
Router(config)# router ospf 13 vrf second
Router(config)# router ospf 14 vrf third
Router(config)# exit
```

#### Example Verifying OSPF Support for Unlimited Software VRFs per PE Router

This example illustrates the output display from the `show ip ospf` command to verify that the OSPF VRF process 12 has been created for the VRF named first. The output that relates to the VRF first appears in bold.

```plaintext
Router# show ip ospf 12
main ID type 0x0005, value 0.0.0.100
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Connected to MPLS VPN Superbackbone, VRF first
It is an area border router
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPF sets 10000 msecs
Maximum wait time between two consecutive SPF sets 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
```
Number of areas transit capable is 0
External flood list length 0
  Area BACKBONE(0)
    Number of interfaces in this area is 1
    Area has no authentication
    SPF algorithm last executed 00:00:15.204 ago
    SPF algorithm executed 2 times
    Area ranges are
    Number of LSA 1. Checksum Sum 0xD9F3
    Number of opaque link LSA 0. Checksum Sum 0x0
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0

Glossary

**multiprotocol BGP** -- Border Gateway Protocol (BGP) can be used as an interdomain routing protocol in networks that use Connectionless Network Service (CLNS) as the network-layer protocol.
CHAPTER 29

OSPF Area Transit Capability

The OSPF Area Transit Capability feature provides an OSPF Area Border Router (ABR) with the ability to discover shorter paths through the transit area for forwarding traffic that would normally need to travel through the virtual-link path. This functionality allows Cisco IOS software to be compliant with RFC 2328.

- Finding Feature Information, page 299
- Information About OSPF Area Transit Capability, page 299
- How to Disable OSPF Area Transit Capability, page 300
- Additional References, page 301
- Feature Information for OSPF Area Transit Capability, page 302

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About OSPF Area Transit Capability

The OSPF Area Transit Capability feature is enabled by default. RFC 2328 defines OSPF area transit capability as the ability of the area to carry data traffic that neither originates nor terminates in the area itself. This capability enables the OSPF ABR to discover shorter paths through the transit area and forward traffic along those paths rather than using the virtual link or path, which are not as optimal.

For a detailed description of OSPF area transit capability, see RFC 2328, OSPF Version 2, at the following URL:

http://www.faqs.org/rfcs/rfc2328.html
How to Disable OSPF Area Transit Capability

Disabling OSPF Area Transit Capability on an Area Border Router

This task describes how to disable the OSPF Area Transit Capability feature on an OSPF ABR.

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf process-id [vrf vpn-name]
4. no capability transit

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About OSPF Per-Interface Link-Local Signaling

Benefits of the OSPF Per-Interface Link-Local Signaling Feature

LLS allows for the extension of existing OSPF packets in order to provide additional bit space. The additional bit space enables greater information per packet exchange between OSPF neighbors. This functionality is used, for example, by the OSPF Nonstop Forwarding (NSF) Awareness feature that allows customer premises
How to Configure OSPF Per-Interface Link-Local Signaling

Turning Off LLS on a Per-Interface Basis

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type slot/port
4. ip address ip-address mask [secondary]
5. no ip directed-broadcast [access-list-number | extended access-list-number]
6. ip ospf message-digest-key key-id encryption-type md5 key
7. [no | default] ip ospf lls [disable]

**What to Do Next**

To verify that LLS has been enabled or disabled for a specific interface, use the `show ip ospf interface` command. See the "Example: Configuring and Verifying the OSPF Per-Interface Link-Local Signaling Feature" section for an example of the information displayed.

**Configuration Examples for OSPF Per-Interface Link-Local Signaling**

**Example OSPF Per-Interface Link-Local Signaling**

In the following example, LLS has been enabled on Ethernet interface 1/0 and disabled on Ethernet interface 2/0:

```
interface Ethernet1/0
  ip address 10.2.145.2 255.255.255.0
```
no ip directed-broadcast
ip ospf message-digest-key 1 md5 testing
ip ospf lls
!
interface Ethernet2/0
ip address 10.1.145.2 255.255.0.0
no ip directed-broadcast
ip ospf message-digest-key 1 md5 testing
!
ip ospf lls disable
interface Ethernet3/0
ip address 10.3.145.2 255.255.255.0
no ip directed-broadcast
!
routing ospf 1
log-adjacency-changes detail
area 0 authentication message-digest
redistribute connected subnets
network 10.0.0.0 0.255.255.255 area 1
network 10.2.3.0 0.0.0.255 area 1

In the following example, the `show ip ospf interface` command has been entered to verify that LLS has been enabled for Ethernet interface 1/0 and disabled for interface Ethernet 2/0:

```
Router# show ip ospf interface
Ethernet1/0 is up, line protocol is up
Internet Address 10.2.145.2/24, Area 1
Process ID 1, Router ID 10.22.222.2, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State BDR, Priority 1
Designated Router (ID) 10.2.2.3, Interface address 10.2.145.1
Backup Designated router (ID) 10.22.222.2, Interface address 10.2.145.2

</table>
The OSPF Link-State Database Overload Protection feature allows you to limit the number of non-self-generated link-state advertisements (LSAs) for a given Open Shortest Path First (OSPF) process. Excessive LSAs generated by other routers in the OSPF domain can substantially drain the CPU and memory resources of the router.

- Prerequisites for OSPF Link-State Database Overload Protection, page 310
- Information About OSPF Link-State Database Overload Protection, page 310
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF Link-State Database Overload Protection

It is presumed you have OSPF running on your network.

Information About OSPF Link-State Database Overload Protection

Benefits of Using OSPF Link-State Database Overload Protection

The OSPF Link-State Database Overload Protection feature provides a mechanism at the OSPF level to limit the number of nonself-generated LSAs for a given OSPF process. When other routers in the network have been misconfigured, they may generate a high volume of LSAs, for instance, to redistribute large numbers of prefixes. This protection mechanism prevents routers from receiving a large number of LSAs and therefore experiencing CPU and memory shortages.

How OSPF Link-State Database Overload Protection Works

When the OSPF Link-State Database Overload Protection feature is enabled, the router keeps a count of the number of received (nonself-generated) LSAs it has received. When the configured threshold number of LSAs is reached, an error message is logged. When the configured maximum number of LSAs is exceeded, the router will send a notification. If the count of received LSAs is still higher than the configured maximum after one minute, the OSPF process takes down all adjacencies and clears the OSPF database. In this ignore state, all OSPF packets received on any interface that belongs to this OSPF process are ignored and no OSPF packets are generated on any of these interfaces. The OSPF process remains in the ignore state for the time configured by the ignore-time keyword of the max-lsa command. Each time the OSPF process gets into an ignore state a counter is incremented. If this counter exceeds the number counts configured by the ignore-count keyword, the OSPF process stays permanently in the same ignore state and manual intervention is required to get the
OSPF process out of the ignore state. The ignore state counter is reset to 0 when the OSPF process remains in the normal state of operation for the amount of time that was specified by the `reset-time` keyword.

If the `warning-only` keyword of the `max-lsa` command has been configured, the OSPF process will send only a warning that the LSA maximum has been exceeded.

## How to Configure OSPF Link-State Database Overload Protection

### Limiting the Number of NonSelf-Generating LSAs for an OSPF Process

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router ospf process-id`
4. `router-id ip-address`
5. `log-adjacency-changes [detail]`
6. `max-lsa maximum-number [threshold-percentage] [warning-only] [ignore-time minutes] [ignore-count count-number] [reset-time minutes]`
7. `network ip-address wildcard-mask area area-id`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> router ospf process-id</td>
<td>Enables OSPF routing.</td>
</tr>
<tr>
<td>Example: Router(config)# router ospf 1</td>
<td>• The <code>process-id</code> argument identifies the OSPF process.</td>
</tr>
<tr>
<td><strong>Step 4</strong> router-id ip-address</td>
<td>Specifies a fixed router ID for an OSPF process.</td>
</tr>
<tr>
<td>Example: Router(config-router)# router-id 10.0.0.1</td>
<td></td>
</tr>
</tbody>
</table>
## Step 5
**Command or Action**
log-adjacency-changes [detail]

**Example:**
Router(config-router)# log-adjacency-changes

**Purpose:**
Configures the router to send a syslog message when an OSPF neighbor goes up or down.

## Step 6
**Command or Action**
max-lsa maximum-number [threshold-percentage] [warning-only] [ignore-time minutes] [ignore-count number] [reset-time minutes]

**Example:**
Router(config-router)# max-lsa 12000

**Purpose:**
Limits the number of nonself-generated LSAs an OSPF routing process can keep in the OSPF link-state database (LSDB).

## Step 7
**Command or Action**
network ip-address wildcard-mask area area-id

**Example:**
Router(config-router)# network 209.165.201.1 255.255.255.255 area 0

**Purpose:**
Defines the interfaces on which OSPF runs and defines the area ID for those interfaces.

---

### Verifying the Number of Nonself-Generated LSAs on a Router

The `show ip ospf` command is entered with the `database-summary` keyword to verify the actual number of nonself-generated LSAs on a router. This command can be used at any given point in time to display lists of information related to the OSPF database for a specific router.

**Example:**

```
Router# show ip ospf 2000 database database-summary
```

```
OSPF Router with ID (192.168.1.3) (Process ID 2000)
Area 0 database summary
    LSA Type  Count  Delete  Maxage
    Router      5       0       0
    Network      2       0       0
    Summary Net  8       2       2
    Summary ASBR  0       0       0
    Type-7 Ext    0       0       0
    Prefixes redistributed in Type-7  0
    Opaque Link   0       0       0
    Opaque Area   0       0       0
    Subtotal     15       2       2

Process 2000 database summary
    LSA Type  Count  Delete  Maxage
    Router      5       0       0
    Network      2       0       0
    Summary Net  8       2       2
    Summary ASBR  0       0       0
    Type-7 Ext    0       0       0
    Opaque Link   0       0       0
    Opaque Area   0       0       0
    Type-5 Ext    4       0       0
    Prefixes redistributed in Type-5  0
    Opaque AS     0       0       0
    Non-self     16       0       0
    Total        19       2       2
```
Configuration Examples for OSPF Link-State Database Overload Protection

Example Setting a Limit for LSA Generation

In the following example, the router is configured to not accept any more nonself-generated LSAs once a maximum of 14,000 has been exceeded:

Router(config)# router ospf 1
Router(config-router)# router-id 192.168.0.1
Router(config-router)# log-adjacency-changes
Router(config-router)# max-lsa 14000
Router(config-router)# area 33 nssa
Router(config-router)# network 192.168.0.1 0.0.0.0 area 1
Router(config-router)# network 192.168.5.1 0.0.0.0 area 1
Router(config-router)# network 192.168.2.1 0.0.0.0 area 0

In the following example, the show ip ospf command has been entered to confirm the configuration:

Router# show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Maximum number of non self-generated LSA allowed 14000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 10 minutes
  Ignore-count allowed 5, current ignore-count 0
It is an area border and autonomous system boundary router

In the following example, the following output appears when the show ip ospf command has been entered during the time when the router is in the ignore state:

Router# show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Maximum number of non self-generated LSA allowed 14000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 10 minutes
  Ignore-count allowed 5, current ignore-count 1
  Ignoring all neighbors due to max-lsa limit, time remaining: 00:04:52
It is an area border and autonomous system boundary router

The following output appears when the show ip ospf command has been entered after the router left the ignore state:

Router# show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Maximum number of non self-generated LSA allowed 14000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 10 minutes
  Ignore-count allowed 5, current ignore-count 1 - time remaining: 00:09:51
It is an area border and autonomous system boundary router
The following output appears when the `show ip ospf` command has been entered for a router that is permanently in the ignore state:

```
Router# show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Maximum number of non self-generated LSA allowed 14000
  Threshold for warning message 75%
  Ignore-time 5 minutes, reset-time 10 minutes
  Ignore-count allowed 5, current ignore-count 6
  Permanently ignoring all neighbors due to max-lsa limit
It is an area border and autonomous system boundary router
```

Glossary

**LSDB** -- link-state database.
OSPF Enhanced Traffic Statistics for OSPFv2 and OSPFv3

This document describes new and modified commands that provide enhanced OSPF traffic statistics for OSPFv2 and OSPFv3. The ability to collect and display more detailed traffic statistics increases high availability for the OSPF network by making the troubleshooting process more efficient.

New OSPF traffic statistics are collected and displayed to include the following information:

- OSPF Hello input queue and OSPF process queue status and statistics.
- Global OSPF traffic statistics.
- Per OSPF interface traffic statistics.
- Per OSPF process traffic statistics.

Finding Feature Information, page 317
Prerequisites for OSPF Enhanced Traffic Statistics, page 318
Information About OSPF Enhanced Traffic Statistics, page 318
How to Display and Clear OSPF Enhanced Traffic Statistics, page 318
Configuration Examples for OSPF Enhanced Traffic Commands, page 320
Additional References, page 323
Feature Information for OSPF Enhanced Traffic Statistics, page 325

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for OSPF Enhanced Traffic Statistics

OSPFv2 or OSPFv3 must be configured on the router.

Information About OSPF Enhanced Traffic Statistics

The OSPF enhanced traffic statistics are enabled by default and cannot be disabled. The detailed OSPF traffic statistics are especially beneficial for troubleshooting the following types of OSPF instabilities:

- OSPF process queue status and statistical information can help the network administrator determine if an OSPF process can handle the amount of traffic sent to OSPF.
- OSPF packet header errors and LSA errors statistics keep a record of different errors found in received OSPF packets.

OSPF enhanced traffic control statistics also monitor the amount of traffic control exchanged between OSPF processes—a significant consideration in network environments with slow links and frequent topology changes.

How to Display and Clear OSPF Enhanced Traffic Statistics

Displaying and Clearing OSPF Traffic Statistics for OSPFv2

Before You Begin

Your network must run IPv4 to collect, display and clear detailed traffic statistics for Hello output, process queue status, global OSPF traffic statistics, per OSPF interface traffic statistics and per OSPF process traffic statistics.

SUMMARY STEPS

1. enable
2. show ip ospf [process-id] traffic[interface-type interface-number]
3. clear ip ospf traffic

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

- Enter your password if prompted.
### Displaying and Clearing OSPF Traffic Statistics for OSPFv3

#### Before You Begin

Your network must run IPv6 to collect, display and clear detailed traffic statistics for Hello output, process queue status, global OSPF traffic statistics, per OSPF interface traffic statistics and per OSPF process traffic statistics.

#### SUMMARY STEPS

1. `enable`
2. `show ipv6 ospf [process-id] traffic[interface-type interface-number]`
3. `clear ipv6 ospf traffic`

#### DETAILED STEPS

<table>

### Configuration Examples for OSPF Enhanced Traffic Commands

#### Displaying and Clearing Enhanced Traffic Statistics for OSPFv2 Example

The following example shows display output for the `show ip ospf traffic` command for OSPFv2:

```
Device# show ip ospf traffic
OSPF statistics:
  Rcvd: 55 total, 0 checksum errors
    22 hello, 7 database desc, 2 link state req
    6 link state updates, 6 link state acks
  Sent: 68 total
    45 hello, 7 database desc, 2 link state req
    10 link state updates, 4 link state acks
    OSPF Router with ID (10.1.1.1) (Process ID 8)
OSPF queues statistic for process ID 8:
  OSPF Hello queue size 0, no limit, drops 0, max size 0
  OSPF Router queue size 0, limit 200, drops 0, max size 0
Interface statistics:
  Interface Ethernet0/0.1
OSPF packets received/sent
  Type  Packets  Bytes
  RX Invalid  0  0
  RX Hello  0  0
  RX DB des  0  0
  RX LS req  0  0
  RX LS upd  0  0
  RX LS ack  0  0
  RX Total  0  0
  TX Failed  0  0

Feature Information for OSPF Enhanced Traffic Statistics

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to . An account on Cisco.com is not required.

</tr>
</tbody>
</table>
OSPF MIB Support of RFC 1850 and Latest Extensions

The OSPF MIB Support of RFC 1850 and Latest Extensions feature introduces the capability for Simple Network Management Protocol (SNMP) monitoring on the Open Shortest Path First (OSPF) routing protocol. Users have an improved ability to constantly monitor the changing state of an OSPF network by use of MIB objects to gather information relating to protocol parameters and trap notification objects that can signal the occurrence of significant network events such as transition state changes. The protocol information collected by the OSPF MIB objects and trap objects can be used to derive statistics that will help monitor and improve overall network performance.

- Finding Feature Information, page 327
- Prerequisites for OSPF MIB Support of RFC 1850 and Latest Extensions, page 328
- Restrictions for OSPF MIB Support of RFC 1850 and Latest Extensions, page 328
- Information About OSPF MIB Support of RFC 1850 and Latest Extensions, page 328
- How to Enable OSPF MIB Support of RFC 1850 and Latest Extensions, page 335
- Where to Go Next, page 340
- Additional References, page 340
- Feature Information for OSPF MIB Support of RFC 1850 and Latest Extensions, page 341

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for OSPF MIB Support of RFC 1850 and Latest Extensions

- OSPF must be configured on the router.
- Simple Network Management Protocol (SNMP) must be enabled on the router before notifications (traps) can be configured or before SNMP GET operations can be performed.

Restrictions for OSPF MIB Support of RFC 1850 and Latest Extensions

For routers that are running Cisco IOS Release 12.0(26)S, 12.2(25)S, 12.2(27)SBC, 12.2(31)SB2 and later releases, the OSPF MIB and CISCO OSPF MIB will be supported only for the first OSPF process (except for MIB objects that are related to virtual links and sham links, and in cases where support for multiple topologies is provided). SNMP traps will be generated for OSPF events that are related to any of the OSPF processes. There is no workaround for this situation.

Information About OSPF MIB Support of RFC 1850 and Latest Extensions

The following sections contain information about MIB objects standardized as part of RFC 1850 and defined in OSPF-MIB and OSPF-TRAP-MIB. In addition, extensions to RFC 1850 objects are described as defined in the two Cisco private MIBs, CISCO-OSPF-MIB and CISCO-OSPF-TRAP-MIB.

OSPF MIB Changes to Support RFC 1850

OSPF MIB

This section describes the new MIB objects that are provided by RFC 1850 definitions. These OSPF MIB definitions provide additional capacity that is not provided by the standard OSPF MIB that supported the previous RFC 1253. To see a complete set of OSPF MIB objects, see the OSPF-MIB file.

The table below shows the new OSPF-MIB objects that are provided by RFC 1850 definitions. The objects are listed in the order in which they appear within the OSPF-MIB file, per the tables that describe them.

<table>

**OSPF TRAP MIB**

This section describes scalar objects and MIB objects that are provided to support FRC 1850.

The following scalar objects are added to OSPF-TRAP-MIB and are listed in the order in which they appear in the OSPF-TRAP-MIB file:

- OspfExtLsdbLimit
- OspfMulticastExtensions
- OspfExitOverflowInterval
- OspfDemandExtensions

The ospfSetTrap control MIB object contains the OSPF trap MIB objects that enable and disable OSPF traps in the IOS CLI. These OSPF trap MIB objects are provided by the RFC 1850 standard OSPF MIB. To learn how to enable and disable the OSPF traps, see the How to Enable OSPF MIB Support of RFC 1850 and Latest Extensions, on page 335.

The table below shows the OSPF trap MIB objects, listed in the order in which they appear within the OSPF-TRAP-MIB file.

CISCO OSPF MIB

This section describes scalar and Cisco-specific OSPF MIB objects that are provided as extensions to support the RFC 1850 OSPF MIB definitions, to provide capability that the standard MIB cannot provide.

The following scalar objects are added to CISCO-OSPF-MIB:

- `cospfRFC1583Compatibility`
- `cospfOpaqueLsaSupport`
- `cospfOpaqueASLsaCount`
- `cospfOpaqueASLsaCksumSum`

For each of the following table entries, the new Cisco-specific MIB objects that are provided as extensions to support the RFC 1850 OSPF MIB definitions are listed. To see the complete set of objects for the Cisco-specific OSPF MIB, refer to the CISCO-OSPF-MIB file.

The table below shows the new CISCO-OSPF-MIB objects that are provided by RFC 1850 definitions. The objects are listed in the order in which they appear within the CISCO-OSPF-MIB file, per the tables that describe them.

The `cospfSetTrapMIB` object represents trap events in CISCO-OSPF-TRAP-MIB. This is a bit map, where the first bit represents the first trap. The following MIB objects are TRAP events that have been added to support RFC 1850. To see a complete set of Cisco OSPF Trap MIB objects, see the CISCO-OSPF-TRAP-MIB file.

The table below shows the trap events described within the `cospfSetTrap MIB` object in the CISCO-OSPf-TRAP-MIB:

### Table 37: CISCO-OSPf Trap Events

<table>

<tr>
<td>This trap is generated in the case of opaque LSAs when packets are sent by a nonvirtual interface. An opaque link-state advertisement (LSA) is used in MPLS traffic engineering to distribute attributes such as capacity and topology of links in a network. The scope of this LSA can be confined to the local network (Type 9, Link-Local), OSPF area (Type 20, Area-Local), or autonomous system (Type 11, AS scope). The information in an opaque LSA can be used by an external application across the OSPF network.</td>
</tr>
</tbody>
</table>

| **cospfVirtIfTxRetransmit** |
| This trap is generated in the case of opaque LSAs when packets are sent by a virtual interface. |

| **cospfOriginateLsa** |
| This trap is generated when a new opaque LSA is originated by the router when a topology change has occurred. |

| **cospfMaxAgeLsa** |
| The trap is generated in the case of opaque LSAs. |

| **cospfNssaTranslatorStatusChange** |
| The trap is generated if there is a change in the ability of a router to translate OSPF type-7 LSAs into OSPF type-5 LSAs. |

For information about how to enable OSPF MIB traps, see the How to Enable OSPF MIB Support of RFC 1850 and Latest Extensions, on page 335.

**Benefits of the OSPF MIB**

The OSPF MIBs (OSPF-MIB and OSPF-TRAP-MIB) and Cisco private OSPF MIBs (CISCO-OSPF-MIB and CISCO-OSPF-TRAP-MIB) allow network managers to more effectively monitor the OSPF routing protocol through the addition of new table objects and trap notification objects that previously were not supported by the RFC 1253 OSPF MIB.

New CLI commands have been added to enable SNMP notifications for OSPF MIB support objects, Cisco-specific errors, retransmission and state-change traps. The SNMP notifications are provided for errors and other significant event information for the OSPF network.
How to Enable OSPF MIB Support of RFC 1850 and Latest Extensions

Enabling OSPF MIB Support

**Before You Begin**

Before the OSPF MIB Support of RFC 1850 and Latest Extensions feature can be used, the SNMP server for the router must be configured.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `snmp-server community string1  ro`
4. `snmp-server community string2  rw`
5. `snmp-server host {hostname | ip-address} [vrf vrf-name] [traps | informs] [version {1 | 2c | 3 [auth | noauth | priv]}] community-string [udp-port port] [notification-type]`
6. `snmp-server enable traps ospf`
7. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** `enable` | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Example:**  
Router> enable | |
| **Step 2** `configure terminal` | Enters global configuration mode. |
| **Example:**  
Router# configure terminal | |
| **Step 3** `snmp-server community string1  ro` | Enables read access to all objects in the MIB, but does not allow access to the community strings. |
| **Example:**  
Router(config)# snmp-server community public ro | |
## Command or Action

### Step 4

**Purpose:** Enables read and write access to all objects in the MIB, but does not allow access to the community strings.

`snmp-server community string2 rw`

**Example:**

Router(config)# snmp-server community private rw

### Step 5

**Purpose:** Specifies a recipient (target host) for SNMP notification operations.

`snmp-server host [hostname | ip-address] [vrf vrf-name] [traps | informs] [version {1 | 2c | 3 [auth | noauth | priv]}] community-string [udp-port port] [notification-type]`

**Example:**

Router(config)# snmp-server host 172.20.2.162 version 2c public ospf

### Step 6

**Purpose:** Enables all SNMP notifications defined in the OSPF MIBs.

`snmp-server enable traps ospf`

**Example:**

Router(config)# snmp-server enable traps ospf

**Note:** This step is required only if you wish to enable all OSPF traps. When you enter the `no snmp-server enable traps ospf` command, all OSPF traps will be disabled.

### Step 7

**Purpose:** Ends your configuration session and exits global configuration mode.

`end`

**Example:**

Router(config)# end

---

### What to Do Next

If you did not want to enable all OSPF traps, follow the steps in the following section to selectively enable one or more type of OSPF trap:
Enabling Specific OSPF Traps

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `snmp-server enable traps ospf cisco-specific errors [config-error] [virt-config-error]`
4. `snmp-server enable traps ospf cisco-specific retransmit [packets] [virt-packets]`
5. `snmp-server enable traps ospf cisco-specific state-change [nssa-trans-change] [shamlink-state-change]`
6. `snmp-server enable traps ospf cisco-specific ls a [lsa-maxage] [lsa-originate]`
7. `snmp-server enable traps ospf errors [authentication-failure] [bad-packet] [config-error] [virt-authentication-failure] [virt-config-error]`
8. `snmp-server enable traps ospf ls a [lsa-maxage] [lsa-originate]`
9. `snmp-server enable traps ospf rate-limit seconds trap-number`
10. `snmp-server enable traps ospf retransmit [packets] [virt-packets]`
11. `snmp-server enable traps ospf state-change [if-state-change] [neighbor-state-change] [virt-if-state-change] [virtneighbor-state-change]`

</table>
Configuration Examples for OSPF MIB Support of RFC 1850 and Latest Extensions

Example Enabling and Verifying OSPF MIB Support Traps

The following example enables all OSPF traps.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# snmp-server enable traps ospf
Router(config)# end
```

The `show running-config` command is entered to verify that the traps are enabled:

```
Router# show running-config | include traps
snmp-server enable traps ospf
```

Where to Go Next

For more information about SNMP and SNMP operations, see the "Configuring SNMP Support" chapter of the *Cisco IOS Configuration Fundamentals and Network Management Configuration Guide*, Release 12.2.

CHAPTER 34

SNMP ifIndex Value for Interface ID in OSPFv2 and OSPFv3 Data Fields

This document describes the configuration command that allows you to use either the current interface number or the SNMP MIB-II interface index (ifIndex) value for the interface ID in OSPFv2 and OSPFv3 data fields. The advantage to using the SNMP MIB-II ifIndex value is that this number corresponds to the number that the user will see reported by SNMP.

- Finding Feature Information, page 343
- Prerequisites for Interface ID in Data Fields, page 343
- Information About Interface ID in Data Fields, page 344
- How to Configure the Interface ID in Data Fields, page 345
- Configuration Examples for the Interface ID in Data Fields, page 346
- Additional References, page 350

- Glossary, page 352

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Interface ID in Data Fields

OSPF must be configured on the router.
Information About Interface ID in Data Fields

Before choosing to switch from the current interface numbers to the SNMP MIB-II interface ID numbers, you should understand the following concepts:

Benefits of Choosing to Identify Interfaces by the SNMP MIB-II ifIndex Value

If you use Simple Network Management Protocol (SNMP) for your OSPF network, configuring the OSPF: SNMP ifIndex Value for Interface ID in OSPFv2 and OSPFv3 Data Fields feature can be beneficial for the following reasons:

- Using the SNMP MIB-II ifIndex (interface index) identification numbers to identify OSPF interfaces makes it easier for network administrators to identify interfaces because the numbers will correspond to the numbers that they will see reported by SNMP.
- When examining link-state advertisements (LSAs), the value used in fields that have the interface ID will be the same as the value that is reported by SNMP.
- When looking at the output of the `show ipv6 ospf interface` command, the interface ID number will have the same value that is reported by SNMP.
- Using the SNMP MIB-II IfIndex is also suggested, but not required, by the OSPF RFC 2328 for OSPFv2 and the RFC 2740 for OSPFv3.

How OSPFv2 and OSPFv3 Use the SNMP MIB-II ifIndex Value

The user chooses for OSPF interfaces to use the SNMP MIB-II ifIndex number by entering the `interface-id snmp-if-index` command for a specific OSPF process. If an interface under the specific OSPF process does not have an SNMP ifIndex number, OSPF will not be enabled on that interface.

For OSPFv2, the ifIndex number is used for the Link Data field in the Router LSA for unnumbered point-to-point interfaces and sham links. When the `interface-id snmp-if-index` command is entered, the affected LSAs will immediately be reoriginated.

For OSPFv3, the ifIndex number is used for the interface ID in router LSAs, as the LSID in Network and Link LSAs, and also as the interface ID in Hello packets. Intra-Area-Prefix LSAs that reference Network LSAs have the network LSAs LSID in the Referenced LSID field, so they will also be updated when the `interface-id snmp-if-index` command is entered. The old Network, Link and Intra-Area-Prefix LSAs that are associated with a Network LSA will be flushed.

For both OSPFv2 and OSPFv3, adjacencies are not flapped, except for affected OSPFv3 demand circuits (including virtual links) with full adjacencies.

For both OSPFv2 and OSPFv3, if an interface does not have an SNMP ifIndex number and an interface ID is needed (for OSPFv2 this applies only to unnumbered interfaces and sham links), an error message will be generated and the interface will be disabled. The interface will be reenabled if the `no interface-id snmp-if-index` command is entered.
How to Configure the Interface ID in Data Fields

Using SNMP MIB-II ifIndex Numbers

Follow the steps in this task to configure OSPF interfaces to use the SNMP MIB-II ifIndex numbers. These steps work for both OSPFv2 and OSPFv3. All OSPF interfaces must use the SNMP MIB-II ifIndex numbers or the interfaces will not be enabled for OSPF. Therefore, repeat the steps within this task for each OSPF process for which you want the interfaces to use the SNMP MIB-II ifIndex numbers.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. Do one of the following:
   - `router ospf  process-id [vrf vpn-name]`
   - `ipv6 router ospf  process-id`
4. **interface-id snmp-if-index**
5. **end**
6. **show snmp mib ifmib ifindex** `[interface-type] [slot] [port_adapter] [port]`

**DETAILED STEPS**

### Command or Action | Purpose
--- | ---
Example: Device(config)# ipv6 router ospf 4 | Configures OSPF interfaces with the SNMP interface index identification numbers (ifIndex values).

**Step 4** interface-id snmp-if-index

Example: Device(config-router)# interface-id snmp-if-index

**Step 5** end

Example: Device(config-router)# end

**Step 6** show snmp mib ifmib ifindex [interface-type] [slot /] [port-adapter /] [port]

Example: Device# show snmp mib ifmib ifindex Ethernet 0/1

---

### Configuration Examples for the Interface ID in Data Fields

#### Configuring the SNMP ifIndex Value for Interface ID for OSPFv2 Example

The following example configures the OSPF interfaces to use the SNMP ifIndex values for the interfaces IDs. The `show snmp mib ifmib ifindex` command confirms that the SNMP MIB-II ifIndex values are used for the Interface ID values in the OSPFv2 data fields.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# router ospf 1
Device(config-router)# interface-id snmp-if-index
Device(config-router)# ^Z
Device# show ip ospf 1 1 data router self
OSPF Router with ID (172.16.0.1) (Process ID 1)
   Router Link States (Area 1)
   LS age: 6
   Options: (No TOS-capability, DC)
   LS Type: Router Links
   Link State ID: 172.16.0.1
   Advertising Router: 172.16.0.1
   LS Seq Number: 80000007
   Checksum: 0x63AF
   Length: 48
   Area Border Router
   Number of Links: 2
```
Link connected to: another Router (point-to-point)
(Link ID) Neighboring Router ID: 172.17.0.1
(Link Data) Router Interface address: 0.0.0.53
Number of TOS metrics: 0
TOS 0 Metrics: 64
Link connected to: a Stub Network
(Link ID) Network/subnet number: 192.168.0.11
(Link Data) Network Mask: 255.255.255.255
Number of TOS metrics: 0
TOS 0 Metrics: 1

Device# show snmp mib ifmib ifindex s13/0
Serial13/0: Ifindex = 53

Configuring the SNMP ifIndex Value for Interface ID for OSPFv3 Example

The following example configures the OSPFv3 interfaces to use the SNMP ifIndex values for the interface IDs.

Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ipv6 router ospf 1
Device(config-router)# interface-id snmp-if-index
The output from the show snmp mib ifmib ifindex command confirms that the SNMP MIB-II ifIndex values are being used for the Interface ID values in the OSPFv3 data fields.

Device# show snmp mib ifmib ifindex Ethernet1/0
Ethernet1/0: Ifindex = 5
Device#
Device# show ipv6 ospf int

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About OSPFv3 Graceful Restart

OSPFv3 Graceful Restart

The graceful restart feature in OSPFv3 allows nonstop data forwarding along routes that are already known while the OSPFv3 routing protocol information is being restored. A device can participate in graceful restart either in restart mode (such as in a graceful-restart-capable device) or in helper mode (such as in a graceful-restart-aware device).
To perform the graceful restart function, a device must be in high availability (HA) stateful switchover (SSO) mode (that is, dual Route Processor (RP)). A device capable of graceful restart will perform the graceful restart function when the following failures occur:

- A RP failure that results in switchover to standby RP
- A planned RP switchover to standby RP

The graceful restart feature requires that neighboring devices be graceful-restart aware. For further information about SSO and nonstop forwarding (NSF), see the Stateful Switchover and Cisco Nonstop Forwarding documents.

### How to Enable OSPFv3 Graceful Restart

#### Enabling OSPFv3 Graceful Restart on a Graceful-Restart-Capable Device

This task can be performed for the OSPFv3 Graceful Restart feature in both IPv6 and IPv4.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router ospfv3 [process-id]
4. graceful-restart [restart-interval interval]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>

Configuration Examples for OSPFv3 Graceful Restart

Example: Enabling OSPFv3 Graceful Restart

Router# show ipv6 ospf graceful-restart
Routing Process: "ospf 1"
Graceful Restart enabled
restart-interval limit: 120 sec, last restart 00:00:15 ago (took 36 secs)
Graceful Restart helper support enabled
Router status: Active
Router is running in SSO mode
OSPF restart state: NO_RESTART
Router ID 10.1.1.1, checkpoint Router ID 10.0.0.0

The following example shows OSPFv3 information with graceful-restart helper support enabled on a graceful-restart-aware router.

Router# show ospfv3
Routing Process "ospfv3 1" with ID 10.0.0.1
Supports IPv6 Address Family
Event-log enabled, Maximum number of events: 1000, Mode: cyclic
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0, Checksum Sum 0x000000
Number of areas in this router is 0. 0 normal 0 stub 0 nssa
Graceful restart helper support enabled
Reference bandwidth unit is 100 mbps
Relay willingness value is 128
Pushback timer value is 2000 msecs
Relay acknowledgement timer value is 1000 msecs
LSA cache Disabled : current count 0, maximum 1000
ACK cache Disabled : current count 0, maximum 1000
Selective Peering is not enabled
Hello requests and responses will be sent multicast

OSPF RFC 3623 Graceful Restart Helper Mode

This document focuses on Nonstop Forwarding (NSF) helper mode for OSPFv2 in Cisco IOS software, using IETF standardized graceful restart helper mode functionality as described in RFC 3623, *Graceful OSPF Restart*. Graceful restart helper mode functionality, which is enabled by default, is useful for multiplatform network environments where helper mode routers on some platforms can assist restarting routers on mixed platforms that support OSPF graceful restart mode as well as helper mode.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF RFC 3623 Graceful Restart Helper Mode

- OSPF must be configured on the router.
Restrictions for OSPF RFC 3623 Graceful Restart Helper Mode

- IETF Graceful Restart is not supported over sham-links.

Information About OSPF RFC 3623 Graceful Restart Helper Mode

Cisco NSF Routing and Forwarding Operation

Prior to RFC 3623 Cisco implemented the Cisco proprietary NSF referred to as Cisco NSF. Users can configure either Cisco or RFC 3623 IETF NSF, depending on which versions are supported by the Cisco IOS software version running on the network. If the software version supports both types of NSF, you need to configure all routers with the same type of NSF.

Cisco NSF is supported by the BGP, EIGRP, OSPF, and IS-IS protocols for routing and by Cisco Express Forwarding (CEF) for forwarding. The BGP, EIGRP, OSPF, and IS-IS routing protocols have been enhanced with NSF capability and awareness, which means that routers that run these protocols can detect a switchover and take the necessary actions to continue forwarding network traffic and to recover route information from the neighbor routers.

In this document, a networking device is said to be NSF-aware if it is running NSF-compatible software. A device is said to be NSF-capable if it has been configured to support NSF; therefore, it would rebuild routing information from NSF-aware or NSF-capable neighbors. The NSF router mode of operation common to the Cisco and IETF NSF implementations is as follows:

- Restarting Mode--Also known as IETF NSF-restarting mode or graceful-restarting mode. In this mode, the OSPF router process is performing non-stop forwarding recovery because of an RP switchover; this may result from an RP crash or a software upgrade on the active RP.
- Helper Mode--Also known as IETF NSF-awareness. In this mode, the neighboring router is restarting and helping in the NSF recovery.

For more information about OSPF RFC 3623 Graceful Restart, see http://www.ietf.org/rfc/rfc3623.txt.

Cisco Express Forwarding for NSF

A key element of NSF is packet forwarding. The OSPF protocol depends on CEF to continue forwarding packets during switchover while the routing protocols rebuild the Routing Information Base (RIB) tables. Once OSPF has converged, CEF updates the Forwarding Information Base (FIB) table and removes stale route entries. CEF then updates the line cards with the new FIB information. CEF maintains the FIB and uses the FIB information that was current at the time of a switchover to continue forwarding packets during the switchover. This feature reduces traffic interruption during the switchover.

During normal NSF operation, CEF on the active RP synchronizes its current FIB and adjacency databases with the FIB and adjacency databases on the standby RP. Upon switchover of the active RP, the standby RP initially has FIB and adjacency databases that are mirror images of those that were current on the active RP. For platforms with intelligent line cards, the line cards maintain the current forwarding information over a switchover; for platforms with forwarding engines, CEF keeps the forwarding engine on the standby RP...
current with changes that are sent to it by CEF on the active RP. In this way, the line cards or forwarding engines can continue forwarding after a switchover as soon as the interfaces and a data path are available.

As the OSPF routing protocol starts to repopulate the RIB on a prefix-by-prefix basis, the updates in turn cause prefix-by-prefix updates that CEF uses to update the FIB and adjacency databases. Existing and new entries receive the new version number, indicating that they have been refreshed. The forwarding information is updated on the line cards or forwarding engines during convergence. The RP signals when the RIB has converged. The software removes all FIB and adjacency entries that have an epoch older than the current switchover epoch. The FIB now represents the newest routing protocol forwarding information.

The OSPF routing protocol runs on only the active RP, and OSPF receives routing updates from OSPF neighbor routers. The OSPF routing protocol does not run on the standby RP. Following a switchover, OSPF requests that the NSF-aware neighbor devices send state information to help rebuild the routing tables.

For NSF operation, OSPF depends on CEF to continue forwarding packets while OSPF rebuilds the routing information.

### OSPF Graceful Restart Helper Mode Functionality per RFC 3623

**Helper Mode Initiation**

When a neighbor router that is on the same network segment as the restarting router receives a grace-LSA from the restarting router, the neighbor enters helper mode as long as the following criteria are met:

- The neighbor must have a full adjacency with the restarting router over the associated network segment.
- There have been no changes to the link-state database since the restarting router began restarting.
- The grace period has not yet expired.
- Local policy allows the neighbor router to act as a helper router.
- The neighbor router must not be in its own graceful restart process.
- Helper mode for this router has not been disabled by the network administrator.

**Helper Mode Exit**

The helper router stops performing helper mode for its neighbor when one of the following events occur:

- The grace-LSA that was originated by the restarting router is flushed, to signify that the restarting router has exited the graceful restart process successfully.
- The grace period of the grace-LSA expires.
- A change in link-state database contents indicates a network topology change, forcing the termination of the graceful restart process.

The OSPF RFC 3623 Graceful Restart Helper Mode feature is enabled by default. Disabling this feature is not recommended because the disabled neighbor will detect the lost adjacency and the graceful restart process will be terminated on the restarting neighbor router.

The strict LSA checking feature allows a helper router to terminate the graceful restart process if it detects a changed LSA that would cause flooding during the graceful restart process. Strict LSA checking is disabled by default. You can enable strict LSA checking when there is a change to an LSA that would be flooded to the restarting router. You can configure strict LSA checking on both NSF-aware and NSF-capable routers; however, it becomes effective only when the router is in helper mode.

### How to Use OSPF RFC 3623 Graceful Restart Helper Mode

#### Configuring Strict LSA Checking on the Helper Router

### SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf  process-id  [vrf vpn-name]
4. nsf  ietf  helper disable
5. nsf ietf helper strict-lsa-checking
6. end
7. show ip ospf [process-id]

Feature Information for OSPF RFC 3623 Graceful Restart Helper Mode

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to . An account on Cisco.com is not required.

OSPF Mechanism to Exclude Connected IP Prefixes from LSA Advertisements

This document describes the Open Shortest Path First (OSPF) mechanism to exclude IP prefixes of connected networks from link-state advertisements (LSAs). When OSPF is deployed in large networks, limiting the number of IP prefixes that are carried in the OSPF LSAs can speed up OSPF convergence.

This feature can also be utilized to enhance the security of an OSPF network by allowing the network administrator to prevent IP routing toward internal nodes.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for Excluding Connected IP Prefixes from LSAs

Before you can use the mechanism to exclude IP prefixes from LSAs, the OSPF routing protocol must be configured.

Information About Excluding Connected IP Prefixes from LSAs

One way to improve OSPF network convergence is to limit the number of IP prefixes carried in LSAs.

Previous Methods to Limit the Number of IP Prefixes Carried in LSAs

Configuring interfaces as unnumbered limits IP prefixes. However, for network management and the ease of identifying and troubleshooting numbered interfaces, you might want to have numbered interfaces and also want to limit the number of IP advertisements.

Feature Overview

The OSPF mechanism to exclude connected IP prefixes from LSAs allows network administrators to control what IP prefixes are installed into LSAs. This functionality is implemented for router and network LSAs in the following manner:

- For the router LSA, to exclude prefixes, the feature excludes link type 3 (stub link).
- For the network LSA, the OSPF Designated Router (DR) generates LSAs with a special /32 network mask (0xFFFFFFFF).

Note

Previous versions of Cisco IOS software that do not have this feature will install the /32 prefix into the routing table.

Globally Suppressing IP Prefix Advertisements per OSPF Process

You can reduce OSPF convergence time by configuring the OSPF process on a router to prevent the advertisement of all IP prefixes by using the `prefix-suppression` command in router configuration mode.

Note

Prefixes that are associated with loopbacks, secondary IP addresses, and passive interfaces are excluded because typical network designs require those to remain reachable.

Supressing IP Prefix Advertisements on a Per-Interface Basis

You can explicitly configure an OSPF interface not to advertise its IP network to its neighbors by using the `ip ospf prefix-suppression` command in interface configuration mode.
If you have globally suppressed IP prefixes from connected IP networks by configuring the `prefix-suppression` router configuration command, the interface configuration command takes precedence over the router configuration mode command.

---

### How to Exclude Connected IP Prefixes from OSPF LSAs

This section describes how to configure two alternative methods to suppress IP prefix advertisements. You can suppress IP prefix advertisements per OSPF process or per interface. This section also explains how you can troubleshoot IP prefix suppression.

### Excluding IP Prefixes per OSPF Process

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router ospf process-id [vrf vpn-name]
4. prefix-suppression
5. end
6. show ip ospf

</tbody>
</table>

**Examples**

In the following example, output from the `show ip ospf` command shows that IP prefix advertisement has been suppressed for OSPF process 1.

```
Device# show ip ospf
Routing Process "ospf 1" with ID 10.0.0.6
Start time: 00:00:04.912, Time elapsed: 00:02:35.184
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
It is an area border router
Router is not originating router-LSAs with maximum metric
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 2. Checksum Sum 0x0132C8
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Number of areas transit capable is 1
External flood list length 0
IETF NSF helper support enabled
Cisco NSF helper support enabled
Prefix-suppression is enabled
```
## Excluding IP Prefixes on a Per-Interface Basis

### SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. ip ospf prefix-suppression [disable]
5. end
6. show ip ospf interface

<tr>
<td>Note</td>
<td>Use this command to verify that IP prefix suppression has been enabled for a specific interface.</td>
</tr>
</tbody>
</table>
Examples

In the following example, the output from the `show ip ospf interface` command verifies that prefix suppression has been enabled for Ethernet interface 0/0.

```
Device# show ip ospf interface
GigabitEthernet0/0 is up, line protocol is up
Internet Address 192.168.130.2/24, Area 2
Process ID 1, Router ID 10.0.0.6, Network Type BROADCAST, Cost: 10
Prefix-suppression is enabled
```

Troubleshooting IP Prefix Suppression

**SUMMARY STEPS**

1. enable
2. debug ip ospf lsa-generation
3. debug condition interface  interface-type interface-number [dlci dlci] [vc {vci | vpi | vci}]
4. show debugging
5. show logging [slot slot-number | summary]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> debug ip ospf lsa-generation</td>
<td>Displays informations about each OSPF LSA generated.</td>
</tr>
<tr>
<td>Example: Device# debug ip ospf lsa-generation</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> debug condition interface  interface-type interface-number [dlci dlci] [vc {vci</td>
<td>vpi</td>
</tr>
<tr>
<td>Example: Device# debug interface serial 0/0</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays information about the types of debugging that are enabled for your router.</td>
</tr>
<tr>
<td>Displays the state of syslog and the contents of the standard system logging buffer.</td>
</tr>
</tbody>
</table>

#### Step 4

- **Command or Action**: `show debugging`

  **Example**:
  
  ```
  Device# show debugging
  ```

#### Step 5

- **Command or Action**: `show logging [slot slot-number | summary]`

  **Example**:
  
  ```
  Device# show logging
  ```

### Examples

The following sample output from the **debug ip ospf lsa-generation** command verifies that for the Ethernet interface 0/0, IP prefixes from the connected network 192.168.131.0 are excluded.

```
Device# debug ip ospf lsa-generation
OSPF summary lsa generation debugging is on
Device# debug condition interface e0/0
Condition 1 set
Device# show debugging

IP routing:
  OSPF summary lsa generation debugging is on
Condition 1: interface Et0/0 (1 flags triggered)
  Flags: Et0/0
Device# show logging
*Jun 5 21:54:47.295: OSPF: Suppressing 192.168.131.0/24 on Ethernet1/0 from router LSA
*Jun 5 21:54:52.355: OSPF: Suppressing 192.168.131.0/24 on Ethernet1/0 from router LSA

```

### Configuration Examples for Excluding Connected IP Prefixes from LSAs

#### Excluding IP Prefixes from LSAs for an OSPF Process Example

The following example configures IP prefix suppression for OSPF routing process 23.

```
router ospf 23
  prefix-suppression
end
```
When the `show ip ospf` command is entered, the displayed output verifies that IP prefix suppression has been enabled for OSPF process 23.

Device# `show ip ospf`

```
outgoing Process "ospf 23" with ID 10.0.0.6
Start time: 00:00:04.912, Time elapsed: 00:02:35.184
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
It is an area border router
Router is not originating router-LSAs with maximum metric
Minimum hold time between two consecutive SPF schedules 10000 msecs
Maximum hold time between two consecutive SPF schedules 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 2. Checksum Sum 0x0132C8
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 3. 3 normal 0 stub 0 nssa
Number of areas transit capable is 1
External flood list length 0
IETF NSF helper support enabled
Cisco NSF helper support enabled
Prefix-suppression is enabled
```

### Excluding IP Prefixes from LSAs for a Specified Interface Example

The following example configures the suppression of all IP prefixes that are associated with Ethernet interface 0/0:

```
interface Ethernet 0/0
  ip ospf prefix-suppression
end
```

When the `show ip ospf interface` command is entered, the displayed output verifies that IP prefix suppression is enabled for Ethernet interface 0/0.

Device# `show ip ospf interface`

```
Ethernet0/0 is up, line protocol is up
  Internet Address 192.168.130.2/24, Area 2
  Process ID 1, Router ID 10.0.0.6, Network Type BROADCAST, Cost: 10
  Prefix-suppression is enabled
```

Glossary

network LSA --The link-state advertisement created by the designated router (DR) or pseudonode that represents a group of routers on the same interface. The network LSA advertises summary information to represent the group of routers on the network.

router LSA --The link-state advertisement that is generated by a router. The router LSA advertises routing information (connected routes) for the router.
OSPFv2 Local RIB

With the OSPFv2 Local RIB feature, each OSPF protocol instance has its own local Routing Information Base (RIB). The OSPF local RIB serves as the primary state for OSPF SPF route computation. The global RIB is not updated with intermediate results during the SPF. Instead, the global RIB is updated only when routes are added, deleted, or changed, thereby reducing global RIB computation. This reduced update activity may result in fewer dropped packets.

This feature is enabled by default and does not need to be configured. This document describes some optional configuration tasks to modify how the global and local RIBs function, although it is recommended to keep the default settings.

- Finding Feature Information, page 379
- Prerequisites for OSPFv2 Local RIB, page 380
- Restrictions for OSPFv2 Local RIB, page 380
- Information About OSPFv2 Local RIB, page 380

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for OSPFv2 Local RIB

Before this feature is configured, the OSPF routing protocol must be configured.

Restrictions for OSPFv2 Local RIB

This feature is available only for IP Version 4 networks.

Information About OSPFv2 Local RIB

Function of the OSPF Local RIB

A device that is running OSPFv2 maintains a local RIB in which it stores all routes to destinations that it has learned from its neighbors. At the end of each SPF, OSPF attempts to install the best (that is, the least-cost) routes to a destination present in the local RIB into the global IPv4 routing table. The global RIB will be updated only when routes are added, deleted, or changed. Routes in the local RIB and Forwarding Information Base (FIB) will not compute when intermediate results are computed during SPF, resulting in fewer dropped packets in some circumstances.

By default, OSPF installs discard routes to null0 for any area range (internal) or summary-address (external) prefixes that it advertises to other devices. Installation of a discard route can prevent routing loops in cases where portions of a summary do not have a more specific route in the RIB. Normally, internal discard routes are installed with an administrative distance of 110, while external discard routes have an administrative distance of 254.

There may be rare circumstances, however, when some other values are needed. For example, if one OSPF process installs a route that exactly matches an area range configured on another OSPF process, the internal discard routes for the second OSPF process could be given a higher (less desirable) administrative distance.

By default, the contents of the global RIB are used to compute inter-area summaries, NSSA translation, and forwarding addresses for type-5 and type-7 LSAs. Each of these functions can be configured to use the contents of the OSPF local RIB instead of the global RIB for their computation. Using the local RIB for the computation may be slightly faster in some circumstances, but because the local RIB has information for only a particular instance of OSPF, using it for the computation may yield incorrect results. Potential problems that may occur include routing loops and black-hole routes.

How to Configure the OSPFv2 Local RIB Feature

Although it is recommended to keep the default settings for the commands described in the following sections, it is optional to change the defaults settings. This section describes the following optional tasks:
Changing the Default Local RIB Criteria

**Note**
It is recommended that you not change the default values because they are conservative and preserve the current global RIB behavior.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router ospf  process-id  [vrf vpn-name]
4. local-rib-criteria [forwarding-address] [inter-area-summary] [nssa-translation]
5. end
6. show ip ospf  process-id  rib [redistribution] [network-prefix] [network-mask] [detail]

**DETAILED STEPS**

### Changing the Administrative Distance for Discard Routes

**Note**
It is recommended to keep the default settings, but you can follow the steps in this section to change the administrative distance for discard routes.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router ospf process-id [vrf vpn-name]`
4. `discard-route [external [distance]] [internal [distance]]`
5. `end`
6. `show ip route [ip-address [mask] [longer-prefixes] | protocol [process-id] | list [access-list-number | access-list-name] | static download]`

</tbody>
</table>

**Examples**

The sample output displayed for the show ip route command confirms that the administrative distance for the IP route 192.168.0.0 255.255.255.0 is 110.

Device# show ip route 192.168.0.0 255.255.255.0

Routing entry for 192.168.0.0/24
Known via "ospf 1", distance 110, metric 0, type intra area
Routing Descriptor Blocks:
* directly connected, via Null0
  Route metric is 0, traffic share count is 1
Troubleshooting Tips

You can research the output from the `debug ip ospf rib` command to learn about the function of the local RIB and the interaction between the route redistribution process and the global RIB. For example, you can learn why the routes that OSPF placed in the global RIB are not the same ones that you anticipated.

Configuration Examples for the OSPFv2 Local RIB Feature

Example: Changing the Default Local RIB Criteria

In the following example, the `local-rib-criteria` command is entered without any keywords to specify that the local RIB will be used as criteria for all of the following options: forwarding address, inter-area summary, and NSSA translation.

```
router ospf 1
router-id 10.0.0.6
local-rib-criteria
```

Example: Changing the Administrative Distance for Discard Routes

In the following example, the administrative distance for external and internal discard routes is set to 25 and 30, respectively.

```
router ospf 1
router-id 10.0.0.6
log-adjacency-changes
discard-route external 25 internal 30
area 4 range 10.2.0.0 255.255.0.0
summary-address 192.168.130.2 255.255.255.0
redistribute static subnets
   network 192.168.129.2 0.255.255.255 area 0
   network 192.168.130.12 0.255.255.255 area 0
```

The output from the `show ip route` command verifies that the administrative distance for the internal route 10.2.0.0/16 is set to 30.

```
Device# show ip route 10.2.0.0 255.255.0.0
Routing entry for 10.2.0.0/16
   Known via "ospf 1", distance 30, metric 1, type intra area
      Routing Descriptor Blocks:
      * directly connected, via Null0
         Route metric is 1, traffic share count is 1
```

The output from the `show ip route` command verifies that the administrative distance for the external route 192.168.130.2/24 is set to 25.

```
Device# show ip route 192.168.130.2 255.255.255.0
Routing entry for 192.168.130.2/24
   Known via "ospf 1", distance 25, metric 20, type intra area
      Routing Descriptor Blocks:
      * directly connected, via Null0
         Route metric is 20, traffic share count is 1
```

<tbody>
<tr>
<td>OSPFv2 Local RIB</td>
<td>12.4(15)T</td>
<td>With the OSPFv2 Local RIB feature, each OSPF protocol instance has its own local Routing Information Base (RIB). The OSPF local RIB serves as the primary state for OSPF SPF route computation. The global RIB is not updated with intermediate results during the SPF. Instead, the global RIB is updated only when routes are added, deleted, or changed, thereby reducing global RIB computation. This reduced update activity may result in fewer dropped packets. This feature is enabled by default and does not need to be configured. This document describes some optional configuration tasks to modify how the global and local RIBs function, although it is recommended to keep the default settings. The following commands were introduced or modified: <code>debug ip ospf rib</code>, <code>discard-route</code>, <code>local-rib-criteria</code>, <code>show ip ospf rib</code>.</td>

CHAPTER 39

OSPFv3 MIB

The OSPFv3 MIB feature enables remote monitoring and troubleshooting of Open Shortest Path First version 3 (OSPFv3) processes using standard Simple Network Management Protocol (SNMP) management workstations. The protocol information collected by the OSPFv3 MIB objects and trap objects can be used to derive statistics that helps monitor and improve overall network performance.

- Finding Feature Information, page 389
- Prerequisites for OSPFv3 MIB, page 389
- Restrictions for OSPFv3 MIB Support, page 390
- Information About OSPFv3 MIB, page 390
- How to Configure OSPFv3 MIB, page 390
- Configuration Examples for OSPFv3 MIB, page 393
- Additional References for OSPFv3 MIB, page 393
- Feature Information for OSPFv3 MIB, page 394

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPFv3 MIB

- Ensure that Open Shortest Path First version 3 (OSPFv3) is configured on the device.
- Ensure that Simple Network Management Protocol (SNMP) is enabled on the device before notifications (traps) can be configured or before SNMP GET operations can be performed.
Restrictions for OSPFv3 MIB Support

- To monitor multiple Open Shortest Path First version 3 (OSPFv3) processes, each process must be associated with a Simple Network Management Protocol (SNMP) context.
- To monitor multiple VRFs, each VRF must be associated with an SNMP context.

Information About OSPFv3 MIB

OSPFv3 MIB

Open Shortest Path First version 3 (OSPFv3) is the IPv6 implementation of OSPF. The OSPFv3 MIB is documented in RFC 5643 and defines a MIB for managing OSPFv3 processes through Simple Network Management Protocol (SNMP).

Users can constantly monitor the changing state of an OSPF network by using MIB objects. The MIB objects gather information relating to protocol parameters and trap notification objects that can signal the occurrence of significant network events such as transition state changes.

OSPFv3 TRAP MIB

The ospfv3Notifications MIB object contains the OSPFv3 trap MIB objects that enable and disable OSPF traps in the Cisco IOS CLI. These OSPFv3 trap MIB objects are provided by the RFC 5643 standard OSPFv3 MIB.

How to Configure OSPFv3 MIB

Enabling Specific OSPFv3 Traps

SUMMARY STEPS

1. enable
2. configure terminal
3. snmp-serverhost {hostname | ip-address} [vrf vrf-name] [traps | informs] [version {1 | 2c | 3 [auth | noauth | priv]}] community-string [udp-port port] [notification-type]
4. snmp-server enable traps ospfv3 errors [bad-packet] [config-error] [virt-bad-packet] [virt-config-error]
5. snmp-server enable traps ospfv3 rate-limit seconds trap-number
6. snmp-server enable traps ospfv3 state-change [if-state-change] [neighbor-restart-helper-status-change] [neighbor-state-change] [nssa-translator-status-change] [restart-status-change] [virtif-state-change] [virtneighbor-restart-helper-status-change] [virtneighbor-state-change]
7. end
## DETAILED STEPS

<table>
<thead>
<tr>

### Verifying OSPFv3 MIB Traps on the Device

**SUMMARY STEPS**

1. **enable**
2. **show running-config [options]**

**DETAILED STEPS**

**Step 1**  
**enable**

**Example:**

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

**Step 2**  
**show running-config [options]**

**Example:**

```
Device# show running-config | include traps
```

Displays the contents of the currently running configuration file and includes information about enabled traps.

- Verifies which traps are enabled.

---

**Purpos**

<table>
<thead>
<tr>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# snmp-server enable traps ospfv3 state-change</code></td>
<td>Exits global configuration mode and enters privileged EXEC mode.</td>
</tr>
</tbody>
</table>

---
**Configuration Examples for OSPFv3 MIB**

**Example: Enabling and Verifying OSPFv3 MIB Traps**

The following example shows how to enable all OSPFv3 error traps:

```console
Device> enable
Device# configure terminal
Device(config)# snmp-server enable traps ospfv3 errors
Device(config)# end
```

The following example shows how to verify that the traps are enabled:

```console
Device> enable
Device# show running-config | include traps
snmp-server enable traps ospfv3 errors
```

- Additional References, page 400
- Feature Information for TTL Security Support for OSPFv3 on IPv6, page 401

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for TTL Security Support for OSPFv3 on IPv6

- OSPFv3 TTL security can be configured for virtual and sham links only.
- OSPFv3 TTL security must be configured in IPv6 address family configuration mode (config-router-af). To enter IPv6 address family configuration mode you use the `address-family ipv6` command.
- Sham links must not be configured on the default Virtual Routing and Forwarding (VRF).
Prerequisites for TTL Security Support for OSPFv3 on IPv6

The TTL Security Support for OSPFv3 on IPv6 feature is available only on platforms with OSPFv3 routing capabilities.

Information About TTL Security Support for OSPFv3 on IPv6

OSPFv3 TTL Security Support for Virtual and Sham Links

In OSPFv3, all areas must be connected to a backbone area. If there is a break in backbone continuity, or the backbone is purposefully partitioned, you can establish a virtual link. The virtual link must be configured in the two devices you want to use to connect the partitioned backbone. The configuration information in each device consists of the other virtual endpoint (the other Area Border Router [ABR]) and the nonbackbone area that the two devices have in common (called the transit area.) Note that virtual links cannot be configured through stub areas. Sham links are similar to virtual links in many ways, but sham links are used in Layer 3 Multiprotocol Label Switching (MPLS) VPN networks to connect provider edge (PE) routers across the MPLS backbone.

Note

Multihop adjacencies such as virtual links and sham links use global IPv6 addresses that require you to configure TTL security to control the number of hops that a packet can travel.

If TTL security is enabled, OSPFv3 sends outgoing packets with an IP header TTL value of 255 and discards incoming packets that have TTL values less than the configurable threshold. Because each device that forwards an IP packet decreases the TTL value, packets received via a direct (one-hop) connection will have a value of 255. Packets that cross two hops will have a value of 254, and so on. The receive threshold is configured in terms of the maximum number of hops that a packet may have traveled. The value for this hop-count argument is a number from 1 to 254, with a default of 1.

To establish a virtual link or a sham link, use the area virtual-link or area sham-link cost commands respectively. To configure TTL security on a virtual link or a sham link, configure the ttl-security keyword and the hop-count argument in either command. Note that the hop-count argument value is mandatory in this case.

Note

OSPFv3 TTL Security can be configured for virtual and sham links only, and must be configured in address family configuration (config-router-af) mode for IPv6 address families.
How to Configure TTL Security Support for OSPFv3 on IPv6

Configuring TTL Security Support on Virtual Links for OSPFv3 on IPv6

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospfv3 [process-id]
4. address-family ipv6 unicast vrf vrf-name
5. area area-ID virtual-link router-id ttl-security hops hop-count
6. end

</table>
Command or Action | Purpose
---|---
**Step 3** | **router ospfv3** [process-id]
**Example:**
Device(config)# router ospfv3 1
| Enables OSPFv3 router configuration mode for the IPv4 or IPv6 address family.

**Step 4** | **address-family ipv6 unicast vrf vrf-name**
**Example:**
Device(config-router)# address-family ipv6 unicast vrf vrf1
| Enters address family configuration mode for OSPFv3, specifies IPv6 unicast address prefixes, and specifies the name of the VRF instance to associate with subsequent address family configuration mode commands.

**Step 5** | **area area-id sham-link source-address destination-address ttl-security hops hop-count**
**Example:**
Device(config-router-af)# area 1 sham-link 2001:DB8:1::1 2001:DB8:0:A222::2 ttl-security hops 10
| Defines an OSPFv3 sham link and configures TTL security on the sham link.

**Step 6** | **end**
**Example:**
Device(config-router-af)# end
| (Optional) Returns to privileged EXEC mode.

### Configuration Examples for TTL Security Support for OSPFv3 on IPv6

#### Example: TTL Security Support on Virtual Links for OSPFv3 on IPv6

The following example shows how to configure TTL virtual link security:

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 1
Device(config-router)# address-family ipv6 unicast vrf vrf1
Device(config-router-af)# area 1 virtual-link 10.1.1.1 ttl-security hops 10
Device(config-router-af)# end
Device# show ospfv3 virtual-links
OSPFV3 1 address-family ipv6 (router-id 10.1.1.7)
Virtual Link OSPFV3 VL0 to router 10.1.1.2 is down
Interface ID 23, IPv6 address ::
Run as demand circuit
DoNotAge LSA allowed.
Transit area 1, Cost of using 65535
Transmit Delay is 1 sec, State DOWN,
```
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Strict TTL checking enabled, up to 10 hops allowed

Example: TTL Security Support on Sham Links for OSPFv3 on IPv6

The following example shows how to configure TTL sham link security:

Device> enable
Device# configure terminal
Device(config)# router ospfv3 1
Device(config-router)# address-family ipv6 unicast vrf vrf1
Device(config-router-af)# area 1 sham-link 2001:DB8:1::1 2001:DB8:0:A222::2 ttl-security hops 10
Device(config-router-af)# end
Device#

<td>The TTL Security Support for OSPFv3 on IPv6 feature increases protection against OSPFv3 denial of service attacks. The following commands were introduced or modified by this feature: area sham-link, area virtual-link.</td>
</tr>
</tbody>
</table>
The OSPFv3 VRF-Lite/PE-CE feature adds Open Shortest Path First version 3 (OSPFv3) support for nondefault VPN routing and forwarding (VRF) instances. OSPFv3 can be used as a provider-edge-customer-edge (PE-CE) routing protocol as specified in RFC 6565, "OSPFv3 as a Provider Edge to Customer Edge (PE-CE) Routing Protocol." OSPFv3 in a nondefault VRF instance supports routing of IPv4 and IPv6 address families.

- Feature Information for OSPFv3 VRF-Lite/PE-CE, page 416

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for OSPFv3 VRF-Lite/PE-CE

In Cisco IOS Release 15.2(2)S and later releases, OSPFv3 interface commands in the ipv6 ospf format are no longer supported in VRF interface configuration mode. You must configure them in the new format, ospfv3. The ospfv3 commands can have one of following formats:

- ospfv3 — Applies to all OSPFv3 processes and address families on a given interface.
• **ospfv3 process-id** — Applies to an OSPFv3 process with the configured process ID and to both IPv4 and IPv6 address families.

• **ospfv3 process-id address-family-ID** — Applies to an OSPFv3 process with the configured process ID and the configured address family.

More specific commands take precedence over less specific commands, as shown in the following descending order:

1. Commands that specify a process ID and an address family.
2. Commands that specify only a process ID.
3. Commands that specify neither a process ID nor an address family.

In Cisco IOS Release 15.2(2)S and later releases, you cannot use the `ipv6 ospf router process-id` command to configure OSPFv3 VRF instances. You must configure the `router ospfv3 process-id` command in global configuration mode and specify the address family for the configured VRF in router configuration mode.

### Information About OSPFv3 VRF-Lite/PE-CE

#### Support for OSPFv3 VRF-Lite and PE-CE

Open Shortest Path First version 3 (OSPFv3) operates in nondefault VPN routing and forwarding (VRF) instances for both IPv6 and IPv4 address families and, transports the routes across a Border Gateway Protocol (BGP) or a Multiprotocol Label Switching (MPLS) backbone. On the provider edge (PE) device, customer routes are installed together by OSPFv3 and BGP in a common VRF or address family and each protocol is configured to redistribute the routes of the other. BGP combines the prefixes redistributed into it with a route-distinguisher value defined for the VRF and advertises them to other MPLS-BGP speakers in the same autonomous system using the VPNv4 or VPNv6 address family as appropriate.

The OSPFv3 route selection algorithm prefers intra-area routes across the back-door link over inter-area routes through the MPLS backbone. Sham-links are a type of virtual link across the MPLS backbone that connect OSPFv3 instances on different PEs. OSPFv3 instances tunnel protocol packets through the backbone and form adjacencies. Because OSPFv3 considers the sham-link as an intra-area connection, sham-link serves as a valid alternative to an intra-area back-door link.

Domain IDs are used to determine whether the routes are internal or external. They describe the administrative domain of the OSPFv3 instance from which the route originates. Every PE has a 48-bit primary domain ID (which may be NULL) and zero or more secondary domain IDs.
# How to Configure VRF-Lite/PE-CE

## Configuring a VRF in an IPv6 Address Family for OSPFv3

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf definition vrf-name**
4. **rd route-distinguisher**
5. **exit**
6. **router ospfv3 [process-id]**
7. **address-family ipv6 [unicast] [vrf vrf-name]**
8. **end**

### Configuring a Sham-Link for OSPFv3 PE-CE

**Before You Begin**

The OSPFv3 PE-CE feature supports direct forwarding on Border Gateway Protocol (BGP) routes. Before you configure a sham-link, you must create a Multiprotocol Label Switching (MPLS) backbone, configure a device as an MPLS VPN PE device, and configure OSPFv3 as the provider-edge-customer-edge (PE-CE) protocol in a virtual routing and forwarding (VRF) instance.
SUMMARY STEPS

1. enable
2. configure terminal
3. interface loopback  interface-number
4. description string
5. vrf forwarding vrf-name
6. ipv6 address ipv6-address/prefix-length
7. ipv6 enable
8. end
9. router ospfv3 process-id
10. address-family {ipv4 | ipv6} [unicast | multicast] [vrf vrf-name]
11. redistribute process-id [options]
12. area area-id sham-link source-address destination-address [cost number] [ttl-security hops hop-count]
13. end

</tbody>
</table>
Configuring a Domain ID for an OSPFv3 PE-CE

SUMMARY STEPS

1. enable
2. configure terminal
3. vrf definition vrf-name
4. rd route-distinguisher
5. exit
6. router ospfv3 [process-id]
7. address-family ipv6 [unicast] [vrf vrf-name]
8. domain-id type type value hex-value
9. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| Example: | Device> enable |
| Step 2 | configure terminal | Enters global configuration mode. |
| Example: | Device# configure terminal |
| Step 3 | vrf definition vrf-name | Configures a VRF routing table and enters VRF configuration mode. |
| Example: | Device(config)# vrf definition vrfsample |
| Step 4 | rd route-distinguisher | Creates routing and forwarding tables for a VRF. |
| Example: | Device(config-vrf)# rd 10:1 |
### Purpose

**Command or Action**  
**Purpose**

### Step 5

text

**Example:**

Device(config-vrf)# exit

- **Purpose:** Exists VRF configuration mode and returns to global configuration mode.

### Step 6

router ospfv3 [process-id]

**Example:**

Device(config)# router ospfv3 2

- **Purpose:** Enters router configuration mode.

### Step 7

address-family ipv6 [unicast] [vrf vrf-name]

**Example:**

Device(config-router)# address-family ipv6 unicast vrf vrfsample

- **Purpose:** Configures an instance of the OSPFv3 process in the VRF routing table for the IPv6 address family and enters address family configuration mode.

### Step 8

domain-id type value hex-value

**Example:**

Device(config-router-af)# domain-id type 0205 value 800EFFFF12AB

- **Purpose:** Configures the BGP domain ID.
  - The value for type can be 0005, 0105, 0205, or 8005.
  - The value for value is an arbitrary 48-bit number encoded as 12 hexadecimal digits.

### Step 9

end

**Example:**

Device(config-router-af)# end

- **Purpose:** Exists router address family mode and returns to privileged EXEC mode.

Graceful Shutdown Support for OSPFv3

This feature provides the ability to temporarily shut down an Open Shortest Path First version 3 (OSPFv3) process or interface in the least disruptive manner, and to notify its neighbors that it is going away. A graceful shutdown of a protocol can be initiated on all OSPFv3 interfaces or on a specific interface.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Graceful Shutdown Support for OSPFv3

OSPFv3 Graceful Shutdown

The Graceful Shutdown for OSPFv3 feature provides the ability to temporarily shut down the OSPFv3 protocol in the least disruptive manner and to notify its neighbors that it is going away. All traffic that has another path through the network will be directed to that alternate path. A graceful shutdown of the OSPFv3 protocol can be initiated using the shutdown command in router configuration mode or in address family configuration mode.
How to Configure Graceful Shutdown Support for OSPFv3

Configuring Graceful Shutdown of the OSPFv3 Process

**SUMMARY STEPS**

1. enable
2. configure terminal
3. Do one of the following:
   - `ipv6 router ospf` `process-id`
   - `router ospfv3` `process-id`
4. shutdown
5. end
6. Do one of the following:
   - `show ipv6 ospf` `[process-id]`
   - `show ospfv3` `[process-id]`

**DETAILED STEPS**

<table>

Graceful Shutdown Support for OSPFv3

Configuring Graceful Shutdown of the OSPFv3 Process in Address-Family Configuration Mode

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router ospfv3 [process-id]`
4. `address-family ipv6 unicast [vrf vrf-name]`
5. `shutdown`
6. `end`
7. `show ospfv3 [process-id]`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td>Purpose:</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| **Step 2** | configure terminal |
| Example: | Device# configure terminal |
| Purpose: | Enters global configuration mode. |

| **Step 3** | router ospfv3 [process-id] |
| Example: | Device(config)# router ospfv3 1 |
| Purpose: | Enables router configuration mode for the IPv6 address family. |

| **Step 4** | address-family ipv6 unicast [vrf vrf-name] |
| Example: | Device(config-router)#address-family ipv6 |
| Purpose: | Enters IPv6 address family configuration mode for OSPFv3. |

| **Step 5** | shutdown |
| Example: | Device(config-router-af)# shutdown |
| Purpose: | Shuts down the selected interface. |

| **Step 6** | end |
| Example: | Device(config-router-af)# end |
| Purpose: | Returns to privileged EXEC mode. |

| **Step 7** | show ospfv3 [process-id] |
| Example: | Device# show ospfv3 |
| Purpose: | (Optional) Displays general information about OSPFv3 routing processes. |
Configuring OSPFv3 Graceful Shutdown of the OSPFv3 Interface

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. Do one of the following:
   - ipv6 ospf shutdown
   - ospfv3 shutdown
5. end
6. show ospfv3 process-id [area-id] [address-family] [vrf {vrf-name | *}] interface [type number] [brief]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>interface type number</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# interface GigabitEthernet</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Do one of the following:</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)# ipv6 ospf shutdown</td>
</tr>
<tr>
<td></td>
<td>• ipv6 ospf shutdown</td>
</tr>
<tr>
<td></td>
<td>• ospfv3 shutdown</td>
</tr>
<tr>
<td></td>
<td>• When the ipv6 ospf shutdown interface command is entered, the interface on which it is configured sends a link-state update advising its neighbors that is going down, which allows those neighbors to begin routing OSPFv3 traffic around this device.</td>
</tr>
</tbody>
</table>
### Step 5

**Example:**

```device(config-if)# end```

Returns to privileged EXEC mode.

### Step 6

**Example:**

```device# show ospfv3 1 interface```

(Optional) Displays OSPFv3-related interface information.

---

## Configuration Examples for Graceful Shutdown Support for OSPFv3

### Example: Configuring Graceful Shutdown of the OSPFv3 Process

The following example shows how to configure graceful shutdown of the OSPFv3 process in IPv6 router OSPF configuration mode configuration mode:

```config
ipv6 router ospf 6
  router-id 10.10.10.10
  shutdown
```

The following example shows how to configure graceful shutdown of the OSPFv3 process in router OSPFv3 configuration mode:

```config
! router ospfv3 1
  shutdown
! address-family ipv6 unicast
  exit-address-family
```

The following example shows how to configure graceful shutdown of the OSPFv3 process in address-family configuration mode:

```config
! router ospfv3 1
  ! address-family ipv6 unicast
  shutdown
  exit-address-family
```
Example: Configuring Graceful Shutdown of the OSPFv3 Interface

The following example shows how to configure graceful shutdown of the OSPFv3 interface using the `ipv6 ospf shutdown` command:

```
! interface Serial2/1
  no ip address
  ipv6 enable
  ipv6 ospf 6 area 0
  ipv6 ospf shutdown
  serial restart-delay 0
end
```

The following example shows how to configure graceful shutdown of the OSPFv3 interface using the `ospfv3 shutdown` command:

```
! interface Serial2/0
  ip address 10.10.10.10 255.255.255.0
  ip ospf 1 area 0
  ipv6 enable
  ospfv3 shutdown
  ospfv3 1 ipv6 area 0
  serial restart-delay 0
end
```

**Feature Information for Graceful Shutdown Support for OSPFv3**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to . An account on Cisco.com is not required.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Graceful Shutdown Support for OSPFv3 | 15.3(2)T | This feature provides the ability to temporarily shut down an Open Shortest Path First version 3 (OSPFv3) process or interface in the least disruptive manner, and to notify its neighbors that it is going away. A graceful shutdown of a protocol can be initiated on all OSPFv3 interfaces or on a specific interface. The following commands were introduced:  
  - `ipv6 ospf shutdown`  
  - `ospfv3 shutdown`  
  - `shutdown (router ospfv3)` |
Prefix Suppression Support for OSPFv3

This feature enables Open Shortest Path First version 3 (OSPFv3) to hide the IPv4 and IPv6 prefixes of connected networks from link-state advertisements (LSAs). When OSPFv3 is deployed in large networks, limiting the number of IPv4 and IPv6 prefixes that are carried in the OSPFv3 LSAs can speed up OSPFv3 convergence.

This feature can also be utilized to enhance the security of an OSPFv3 network by allowing the network administrator to prevent IP routing toward internal nodes.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Prefix Suppression Support for OSPFv3

Before you can use the mechanism to exclude IPv4 and IPv6 prefixes from LSAs, the OSPFv3 routing protocol must be configured.
Information About Prefix Suppression Support for OSPFv3

OSPFv3 Prefix Suppression Support

The OSPFv3 Prefix Suppression Support feature allows you to hide IPv4 and IPv6 prefixes that are configured on interfaces running OSPFv3.

In OSPFv3, addressing semantics have been removed from the OSPF protocol packets and the main LSA types, leaving a network-protocol-independent core. This means that Router-LSAs and network-LSAs no longer contain network addresses, but simply express topology information. The process of hiding prefixes is simpler in OSPFv3 and suppressed prefixes are simply removed from the intra-area-prefix-LSA. Prefixes are also propagated in OSPFv3 via link LSAs.

The OSPFv3 Prefix Suppression feature provides a number of benefits. The exclusion of certain prefixes from advertisements means that there is more memory available for LSA storage, bandwidth and buffers for LSA flooding, and CPU cycles for origination and flooding of LSAs and for SPF computation. Prefixes are also filtered from link LSAs. A device only filters locally configured prefixes, not prefixes learnt via link LSAs. In addition, security has been improved by reducing the possibility of remote attack with the hiding of transit-only networks.

Globally Suppress IPv4 and IPv6 Prefix Advertisements by Configuring the OSPFv3 Process

You can reduce OSPFv3 convergence time by configuring the OSPFv3 process on a device to prevent the advertisement of all IPv4 and IPv6 prefixes by using the `prefix-suppression` command in router configuration mode or address-family configuration mode.

Note

Prefixes that are associated with loopbacks, secondary IP addresses, and passive interfaces are not suppressed by the `router mode` or the `address-family` configuration commands because typical network designs require prefixes to remain reachable.

Suppress IPv4 and IPv6 Prefix Advertisements on a Per-Interface Basis

You can explicitly configure an OSPFv3 interface not to advertise its IP network to its neighbors by using the `ipv6 ospf prefix-suppression` command or the `ospfv3 prefix-suppression` command in interface configuration mode.

Note

If you have globally suppressed IPv4 and IPv6 prefixes from connected IP networks by configuring the `prefix-suppression` router configuration command, the interface configuration command takes precedence over the router configuration command.

Configuration Examples for Prefix Suppression Support for OSPFv3

Example: Configuring Prefix Suppression Support for OSPFv3

The following example shows how to configure prefix suppression support for OSPFv3 in router configuration mode:

```
router ospfv3 1
  prefix-suppression
!
  address-family ipv6 unicast
  router-id 0.0.0.6
  exit-address-family
```

The following example shows how to configure prefix suppression support for OSPFv3 in address-family configuration mode:

```
router ospfv3 1
!
  address-family ipv6 unicast
  router-id 10.0.0.6
  prefix-suppression
  exit-address-family
```

The following example shows how to configure prefix suppression support for OSPFv3 in interface configuration mode:

```
interface Ethernet0/0
  ip address 10.0.0.1 255.255.255.0
  ipv6 address 2001:201::201/64
  ipv6 enable
  ospfv3 prefix-suppression
  ospfv3 1 ipv4 area 0
  ospfv3 1 ipv6 area 0
end
```

CHAPTER 44

OSPFv3 ABR Type 3 LSA Filtering

This feature extends the ability of an Area Border Router (ABR) that is running the Open Shortest Path First version 3 (OSPFv3) protocol to filter type 3 link-state advertisements (LSAs) that are sent between different OSPFv3 areas. This feature allows only packets with specified prefixes to be sent from one area to another area and restricts all packets with other prefixes. This type of area filtering can be applied out of a specific OSPFv3 area, into a specific OSPFv3 area, or into and out of the same OSPFv3 areas at the same time.

- Finding Feature Information, page 435
- OSPFv3 ABR Type 3 LSA Filtering, page 435
- Information About OSPFv3 ABR Type 3 LSA Filtering, page 436
- How to Configure OSPFv3 ABR Type 3 LSA Filtering, page 436

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

OSPFv3 ABR Type 3 LSA Filtering

Only type 3 LSAs that originate from an ABR are filtered.
Information About OSPFv3 ABR Type 3 LSA Filtering

Area Filter Support

OSPFv3 area filters allow the filtering of inter-area prefix LSAs on the ABRs. The filter, based on IPv6 prefix lists, can be applied in both directions. In the “in” direction, it filters out the LSAs coming from all other areas when sending the inter-area prefix LSAs into the specified area. In the “out” direction, it filters out the inter-area prefix LSAs generated for the specified area.

The Area Filter Support feature gives the administrator improved control of route distribution between OSPFv3 areas.

How to Configure OSPFv3 ABR Type 3 LSA Filtering

Configuring Area Filter Support for OSPFv3

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospfv3 process-id
4. area area-id filter-list prefix prefix-list-name {in | out}
5. end
6. ipv6 prefix-list list-name [seq seq-number] {deny ipv6-prefix/prefix-length | permit ipv6-prefix/prefix-length | description text} [ge ge-value] [le le-value]

Feature Information for OSPFv3 ABR Type 3 LSA Filtering

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to . An account on Cisco.com is not required.

Table 49: Feature Information for OSPFv3 ABR Type 3 LSA Filtering

<tr>
<td>OSPFv3 ABR Type 3 LSA Filtering</td>
<td>15.3(1)S</td>
<td>The OSPFv3 ABR Type 3 LSA Filtering feature extends the ability of an ABR that is running the OSPFv3 protocol to filter type 3 LSAs that are sent between different OSPFv3 areas. This feature allows only packets with specified prefixes to be sent from one area to another area and restricts all packets with other prefixes. This type of area filtering can be applied out of a specific OSPFv3 area, into a specific OSPFv3 area, or into and out of the same OSPFv3 areas at the same time.</td>
