OSPF Link-State Advertisement Throttling

The OSPF Link-State Advertisement Throttling feature provides a dynamic mechanism to slow down link-state advertisement (LSA) updates in Open Shortest Path First (OSPF) during times of network instability. It also allows faster OSPF convergence by providing LSA rate limiting in milliseconds.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF LSA Throttling

It is presumed that you have OSPF configured in your network.
Information About OSPF LSA Throttling

Benefits of OSPF LSA Throttling

Prior to the OSPF LSA Throttling feature, LSA generation was rate-limited for 5 seconds. That meant that changes in an LSA could not be propagated in milliseconds, so the OSPF network could not achieve millisecond convergence.

The OSPF LSA Throttling feature is enabled by default and allows faster OSPF convergence (in milliseconds). This feature can be customized. One command controls the generation (sending) of LSAs, and another command controls the receiving interval. This feature also provides a dynamic mechanism to slow down the frequency of LSA updates in OSPF during times of network instability.

How OSPF LSA Throttling Works

The timers throttle lsa all command controls the generation (sending) of LSAs. The first LSA is always generated immediately upon an OSPF topology change, and the next LSA generated is controlled by the minimum start interval. The subsequent LSAs generated for the same LSA are rate-limited until the maximum interval is reached. The "same LSA" is defined as an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID.

The timers lsa arrival command controls the minimum interval for accepting the same LSA. If an instance of the same LSA arrives sooner than the interval that is set, the LSA is dropped. It is recommended that the arrival interval be less than or equal to the hold-time interval of the timers throttle lsa all command.

How to Customize OSPF LSA Throttling

Customizing OSPF LSA Throttling

SUMMARY STEPS

1. enable
2. configure terminal
3. router ospf  process-id
4. timers throttle lsa all  start-interval hold-interval max-interval
5. timers lsa arrival  milliseconds
6. end
7. show ip ospf timers rate-limit
8. show ip ospf

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

**Step 2**

configure terminal

**Example:**

Router# configure terminal

Enters global configuration mode.

**Step 3**

router ospf  process-id

**Example:**

Router(config)# router ospf 1

Configures an OSPF routing process.

**Step 4**

timers throttle lsa all  start-interval hold-interval max-interval

**Example:**

Router(config-router)# timers throttle lsa all 100 10000 45000

(Optional) Sets the rate-limiting values (in milliseconds) for LSA generation.

• The default values are as follows:
  • start-interval is 0 milliseconds.
  • hold-interval is 5000 milliseconds.
  • max-interval is 5000 milliseconds.

**Step 5**

timers lsa arrival  milliseconds

**Example:**

Router(config-router)# timers lsa arrival 2000

(Optional) Sets the minimum interval (in milliseconds) between instances of receiving the same LSA.

• The default value is 1000 milliseconds.

• We suggest you keep the milliseconds value of the LSA arrival timer less than or equal to the neighbors’ hold-interval value of the timers throttle lsa all command.

**Step 6**

end

**Example:**

Router(config-router)# end

Exits router configuration mode.

**Step 7**

show ip ospf timers rate-limit

**Example:**

Router# show ip ospf timers rate-limit

(Optional) Displays a list of the LSAs in the rate limit queue (about to be generated).

• The example shows two LSAs in the queue. Each LSA is identified by LSA ID number, Type (of LSA), Advertising router ID, and the time in hours:minutes:seconds (to the milliseconds) when the LSA is due to be generated.

Example:

LSAID: 10.1.1.1  Type: 1  Adv Rtr: 172.16.2.2  Due in: 00:00:00.028
**Customizing OSPF LSA Throttling**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>(Optional) Displays information about OSPF.</td>
</tr>
<tr>
<td>LSAID: 192.168.4.1 Type: 3 Adv Rtr: 172.17.2.2 Due in: 00:00:00.028</td>
<td>• The output lines that specify initial throttle delay, minimum hold time for LSA throttle, and maximum wait time for LSA throttle indicate the LSA throttling values.</td>
</tr>
</tbody>
</table>

**Step 8**

**show ip ospf**

**Example:**

Router# **show ip ospf**

**Example:**

Routing Process "ospf 4" with ID 10.10.24.4

**Example:**

Supports only single TOS(TOS0) routes

**Example:**

Supports opaque LSA

**Example:**

Supports Link-local Signaling (LLS)

**Example:**

Initial SPF schedule delay 5000 msecs

**Example:**

Minimum hold time between two consecutive SPFs 10000 msecs

**Example:**

Maximum wait time between two consecutive SPFs 10000 msecs

**Example:**

Incremental-SPF disabled

**Example:**

Initial LSA throttle delay 100 msecs

**Example:**

Minimum hold time for LSA throttle 10000 msecs
<table>

### Configuration Examples for OSPF LSA Throttling

#### Example OSPF LSA Throttling

This example customizes OSPF LSA throttling so that the start interval is 200 milliseconds, the hold interval is 10,000 milliseconds, and the maximum interval is 45,000 milliseconds. The minimum interval between instances of receiving the same LSA is 2000 milliseconds.

```plaintext
router ospf 1
log-adjacency-changes
timers throttle lsa all 200 10000 45000
timers lsa arrival 2000
network 10.10.4.0 0.0.0.255 area 24
network 10.10.24.0 0.0.0.255 area 24
```

## Feature Information for OSPF Link-State Advertisement Throttling

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 1: Feature Information for OSPF Link-State Advertisement Throttling**

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| OSPF Link-State Advertisement Throttling         | Cisco IOS XE Release 2.1 Cisco IOS XE Release 2.6 | The OSPF Link-State Advertisement Throttling feature provides a dynamic mechanism to slow down link-state advertisement (LSA) updates in OSPF during times of network instability. It also allows faster OSPF convergence by providing LSA rate limiting in milliseconds.  
The following commands are introduced or modified in the feature documented in this module:  
  • debug ip ospf database-timer rate-limit  
  • show ip ospf  
  • show ip ospf timers rate-limit  
  • timers lsa arrival  
  • timers throttle lsa all |
