OSPF Inbound Filtering Using Route Maps with a Distribute List

The OSPF Inbound Filtering Using Route Maps with a Distribute List feature allows users to define a route map to prevent Open Shortest Path First (OSPF) routes from being added to the routing table. In the route map, the user can match on any attribute of the OSPF route.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites OSPF Inbound Filtering Using Route Maps with a Distribute List

It is presumed that you have OSPF configured in your network.
Information About OSPF Inbound Filtering Using Route Maps with a Distribute List

Benefits of OSPF Route-Map-Based-Filtering

Users can define a route map to prevent OSPF routes from being added to the routing table. This filtering happens at the moment when OSPF is installing the route in the routing table. This feature has no effect on LSA flooding. In the route map, the user can match on any attribute of the OSPF route. That is, the route map could be based on the following match options:

- match interface
- match ip address
- match ip next-hop
- match ip route-source
- match metric
- match route-type
- match tag

This feature can be useful during redistribution if the user tags prefixes when they get redistributed on ASBRs and later uses the tag to filter the prefixes from being installed in the routing table on other routers.

Filtering Based on Route Tag

Users can assign tags to external routes when they are redistributed to OSPF. Then the user can deny or permit those routes in the OSPF domain by identifying that tag in the route-map and distribute-list in commands.

Filtering Based on Route Type

In OSPF, the external routes could be Type 1 or Type 2. Users can create route maps to match either Type 1 or Type 2 and then use the distribute-list in command to filter certain prefixes. Also, route maps can identify internal routes (interarea and intra-area) and then those routes can be filtered.

Filtering Based on Route Source

When a match is done on the route source, the route source represents the OSPF Router ID of the LSA originator of the LSA in which the prefix is advertised.

Filtering Based on Interface

When a match is done on the interface, the interface represents the outgoing interface for the route that OSPF is trying to install in the routing table.

Filtering Based on Next-Hop

When a match is done on the next hop, the next hop represents the next hop for the route that OSPF is trying to install in the routing table.
# How to Configure OSPF Inbound Filtering Using Route Maps

## Configuring OSPF Inbound Filtering Using a Route Map

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `route-map map-tag [permit | deny] [sequence-number]`
4. `match tag tag-name`
5. Repeat Steps 3 and 4 with other `route-map` and `match` commands if you choose.
6. `exit`
7. `router ospf process-id`
8. `distribute-list route-map map-tag in`
9. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Router&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> route-map `map-tag [permit</td>
<td>deny] [sequence-number]`</td>
</tr>
<tr>
<td>Example: <code>Router(config)# route-map tag-filter deny 10</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> match tag <code>tag-name</code></td>
<td>Matches routes with a specified name, to be used as the route map is referenced.</td>
</tr>
<tr>
<td>Example:</td>
<td>• At least one <code>match</code> command is required, but it need not be this <code>match</code> command. This is just an example.</td>
</tr>
<tr>
<td>Example: <code>or other match commands</code></td>
<td>• The list of <code>match</code> commands available to be used in this type of route map appears on the <code>distribute-list in</code> command reference page.</td>
</tr>
</tbody>
</table>
### Command or Action

**Example:**
Router(config-router)# match tag 777

- This type of route map will have no **set** commands.

---

**Step 5**
Repeat Steps 3 and 4 with other **route-map** and **match** commands if you choose.

**Step 6**
exit

**Example:**
Router(config-router)# exit

Exits router configuration mode.

**Step 7**
**router ospf** *process-id*

**Example:**
Router(config)# router ospf 1

Configures an OSPF routing process.

**Step 8**
**distribute-list route-map** *map-tag* **in**

**Example:**
Router(config-router)# distribute-list route-map tag-filter in

Enables filtering based on an OSPF route map.

**Step 9**
end

**Example:**
Router(config-router)# end

Exits router configuration mode.

---

**Configuration Examples for OSPF Inbound Filtering Using Route Maps with a Distribute List**

**Example OSPF Route-Map-Based Filtering**

In this example, OSPF external LSAs have a tag. The value of the tag is examined before the prefix is installed in the routing table. All OSPF external prefixes that have the tag value of 777 are filtered (prevented from being installed in the routing table). The permit statement with sequence number 20 has no match conditions, and there are no other route-map statements after sequence number 20, so all other conditions are permitted.

```
route-map tag-filter deny 10
match tag 777
route-map tag-filter permit 20
```
!  
router ospf 1  
router-id 10.0.0.2  
log-adjacency-changes  
network 172.16.2.1 0.0.0.255 area 0  
distribute-list route-map tag-filter in

Feature Information for OSPF Inbound Filtering Using Route Maps with a Distribute List

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
