

QoS Policy Propagation via BGP

The QoS Policy Propagation via BGP feature allows you to classify packets by IP precedence based on the Border Gateway Protocol (BGP) community lists, BGP autonomous system paths, and access lists. After packets have been classified, you can use other quality of service (QoS) features such as committed access rate (CAR) and Weighted Random Early Detection (WRED) to specify and enforce policies to fit your business model.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for QoS Policy Propagation via BGP

- Enable the Border Gateway Protocol (BGP) and Cisco Express Forwarding (CEF) or distributed CEF (dCEF) on the device. Subinterfaces on an ATM interface that have the **bgp-policy** command enabled must use CEF mode because dCEF is not supported. dCEF uses the Versatile Interface Processor (VIP) rather than the Route Switch Processor (RSP) to perform forwarding functions.
- Define the policy.
- Apply the policy through BGP.

- Configure the BGP community list, BGP autonomous system path, or access list and enable the policy on an interface.
- Enable committed access rate (CAR) or Weighted Random Early Detection (WRED) to use the policy.

Information About QoS Policy Propagation via BGP

Benefits of QoS Policy Propagation via BGP

The QoS Policy Propagation via BGP feature allows you to classify packets by IP precedence based on Border Gateway Protocol (BGP) community lists, BGP autonomous system paths, and access lists. After a packet has been classified, you can use other quality of service (QoS) features such as committed access rate (CAR) and Weighted Random Early Detection (WRED) to specify and enforce policies to fit your business model.

How to Configure QoS Policy Propagation via BGP

Configuring QoS Policy Propagation via BGP Based on Community Lists

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **named-ordering-route-map enable**]
4. **route-map** *map-tag* [**permit** | **deny**] [*sequence-number*] [**ordering-seq** *sequence-name*]
5. **match community** {*standard-list-number* | *expanded-list-number* | *community-list-name* [**exact**]}
6. **set ip precedence** [*number* | *name*]
7. **exit**
8. **router bgp** *autonomous-system*
9. **table-map** *route-map-name*
10. **exit**
11. **ip community-list** *standard-list-number* {**permit** | **deny**} [*community-number*]
12. **interface** *type number*
13. **bgp-policy** {**source** | **destination**} **ip-prec-map**
14. **exit**
15. **ip bgp-community new-format**
16. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	named-ordering-route-map enable] Example: Device(config)# named-ordering-route-map enable	Enables ordering of route-maps based on a string provided by the user.
Step 4	route-map map-tag [permit deny] [sequence-number] [ordering-seq sequence-name Example: Device(config)# route-map alpha permit ordering-seq sequence1	Configures a route map and specifies how the packets are to be distributed. ordering-seq indicates the sequence that is to be used for ordering of route-maps.
Step 5	match community {standard-list-number expanded-list-number community-list-name [exact]} Example: Device(config-route-map)# match community 1	Matches a Border Gateway Protocol (BGP) community list.
Step 6	set ip precedence [number name] Example: Device(config-route-map)# set ip precedence 5	Sets the IP Precedence field when the community list matches. Note You can specify either a precedence number or a precedence name.
Step 7	exit Example: Device(config-route-map)# exit	Exits route-map configuration mode and returns to global configuration mode.
Step 8	router bgp autonomous-system Example: Device(config)# router bgp 45000	Enables a BGP process and enters router configuration mode.
Step 9	table-map route-map-name Example: Device(config-router)# table-map rml	Modifies the metric and tag values when the IP routing table is updated with BGP learned routes.
Step 10	exit Example:	Exits router configuration mode and returns to global configuration mode.

	Command or Action	Purpose
	<code>Device(config-router)# exit</code>	
Step 11	ip community-list <i>standard-list-number</i> { permit deny } [<i>community-number</i>] Example: <code>Device(config)# ip community-list 1 permit 2</code>	Creates a community list for BGP and controls access to it.
Step 12	interface <i>type number</i> Example: <code>Device(config)# interface gigabitethernet 0/0/0</code>	Specifies the interface (or subinterface) and enters interface configuration mode.
Step 13	bgp-policy { source destination } ip-prec-map Example: <code>Device(config-if)# bgp-policy source ip-prec-map</code>	Classifies packets using IP precedence.
Step 14	exit Example: <code>Device(config-if)# exit</code>	Exits interface configuration mode and returns to global configuration mode.
Step 15	ip bgp-community new-format Example: <code>Device(config)# ip bgp-community new-format</code>	(Optional) Displays the BGP community number in AA:NN (autonomous system:community number/4-byte number) format.
Step 16	end Example: <code>Device(config)# end</code>	Exits global configuration mode and returns to privileged EXEC mode.

Configuring QoS Policy Propagation via BGP Based on the Autonomous System Path Attribute

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **named-ordering-route-map enable**]
4. **route-map** *map-tag* [**permit** | **deny**] [*sequence-number*] [**ordering-seq** *sequence-name*
5. **match as-path** *path-list-number*
6. **set ip precedence** [*number* | *name*]
7. **exit**

8. **router bgp** *autonomous-system*
9. **table-map** *route-map-name*
10. **exit**
11. **ip as-path access-list** *access-list-number* {**permit** | **deny**} *as-regular-expression*
12. **interface** *type number*
13. **bgp-policy** {**source** | **destination**} **ip-prec-map**
14. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	named-ordering-route-map enable] Example: Device(config)# named-ordering-route-map enable	Enables ordering of route-maps based on a string provided by the user.
Step 4	route-map <i>map-tag</i> [permit deny] [<i>sequence-number</i>] [ordering-seq <i>sequence-name</i>] Example: Device(config)# route-map alpha permit ordering-seq sequence1	Configures a route map and specifies how the packets are to be distributed. ordering-seq indicates the sequence that is to be used for ordering of route-maps.
Step 5	match as-path <i>path-list-number</i> Example: Device(config-route-map)# match as-path 2	Matches a Border Gateway Protocol (BGP) autonomous system path access list.
Step 6	set ip precedence [<i>number</i> <i>name</i>] Example: Device(config-route-map)# set ip precedence 5	Sets the IP Precedence field when the autonomous-system path matches. Note You can specify either a precedence number or a precedence name.
Step 7	exit Example: Device(config-route-map)# exit	Exits route-map configuration mode and returns to global configuration mode.

	Command or Action	Purpose
Step 8	router bgp <i>autonomous-system</i> Example: Device(config)# router bgp 45000	Enables a BGP process and enters router configuration mode.
Step 9	table-map <i>route-map-name</i> Example: Device(config-router)# table-map rml	Modifies the metric and tag values when the IP routing table is updated with BGP learned routes.
Step 10	exit Example: Device(config-router)# exit	Exits router configuration mode and returns to global configuration mode.
Step 11	ip as-path access-list <i>access-list-number</i> { permit deny } <i>as-regular-expression</i> Example: Device(config)# ip as-path access-list 500 permit 45000	Defines an autonomous system path access list.
Step 12	interface <i>type number</i> Example: Device(config)# interface gigabitethernet 0/0/0	Specifies the interface (or subinterface) and enters interface configuration mode.
Step 13	bgp-policy { source destination } ip-prec-map Example: Device(config-if)# bgp-policy source ip-prec-map	Classifies packets using IP precedence.
Step 14	end Example: Device(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Configuring QoS Policy Propagation via BGP Based on an Access List

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **named-ordering-route-map enable**]
4. **route-map** *map-tag* [**permit** | **deny**] [*sequence-number*] [**ordering-seq** *sequence-name*]
5. **match ip address** *access-list-number*
6. **set ip precedence** [*number* | *name*]
7. **exit**
8. **router bgp** *autonomous-system*
9. **table-map** *route-map-name*
10. **exit**

11. `access-list access-list-number {permit | deny} source`
12. `interface type number`
13. `bgp-policy {source | destination} ip-prec-map`
14. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	named-ordering-route-map enable] Example: Device(config)# named-ordering-route-map enable	Enables ordering of route-maps based on a string provided by the user.
Step 4	route-map map-tag [permit deny] [sequence-number] [ordering-seq sequence-name] Example: Device(config)# route-map alpha permit ordering-seq sequence1	Configures a route map and specifies how the packets are to be distributed. ordering-seq indicates the sequence that is to be used for ordering of route-maps.
Step 5	match ip address access-list-number Example: Device(config-route-map)# match ip address 69	Matches an access list.
Step 6	set ip precedence [number name] Example: Device(config-route-map)# set ip precedence routine	Sets the IP precedence field when the autonomous system path matches.
Step 7	exit Example: Device(config-route-map)# exit	Exits route-map configuration mode and returns to global configuration mode.
Step 8	router bgp autonomous-system Example: Device(config)# router bgp 45000	Enables a Border Gateway Protocol (BGP) process and enters router configuration mode.

	Command or Action	Purpose
Step 9	table-map <i>route-map-name</i> Example: Device(config-router)# table-map rml	Modifies the metric and tag values when the IP routing table is updated with BGP learned routes.
Step 10	exit Example: Device(config-router)# exit	Exits router configuration mode and returns to global configuration mode.
Step 11	access-list <i>access-list-number</i> { permit deny } <i>source</i> Example: Device(config)# access-list 69 permit 10.69.0.0	Defines an access list.
Step 12	interface <i>type number</i> Example: Device(config)# interface gigabitethernet 0/0/0	Specifies the interfaces (or subinterface) and enters interface configuration mode.
Step 13	bgp-policy { source destination } ip-prec-map Example: Device(config-if)# bgp-policy source ip-prec-map	Classifies packets using IP Precedence.
Step 14	end Example: Device(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Monitoring QoS Policy Propagation via BGP

To monitor the QoS Policy Propagation via the BGP feature configuration, use the following optional commands.

Command or Action	Purpose
show ip bgp	Displays entries in the Border Gateway Protocol (BGP) routing table to verify whether the correct community is set on the prefixes.
show ip bgp community-list <i>community-list-number</i>	Displays routes permitted by the BGP community to verify whether correct prefixes are selected.

Command or Action	Purpose
<code>show ip cef network</code>	Displays entries in the forwarding information base (FIB) table based on the specified IP address to verify whether Cisco Express Forwarding has the correct precedence value for the prefix.
<code>show ip interface</code>	Displays information about the interface.
<code>show ip route prefix</code>	Displays the current status of the routing table to verify whether correct precedence values are set on the prefixes.

Configuration Examples for QoS Policy Propagation via BGP

Example: Configuring QoS Policy Propagation via BGP

The following example shows how to create route maps to match access lists, Border Gateway Protocol (BGP) community lists, and BGP autonomous system paths, and apply IP precedence to routes learned from neighbors.

In the figure below, Device A learns routes from autonomous system 10 and autonomous system 60. The quality of service (QoS) policy is applied to all packets that match defined route maps. Any packets from Device A to autonomous system 10 or autonomous system 60 are sent the appropriate QoS policy, as the numbered steps in the figure indicate.

Figure 1: Device Learning Routes and Applying QoS Policy

Device A Configuration

```
interface serial 5/0/0/1:0
ip address 10.28.38.2 255.255.255.0
bgp-policy destination ip-prec-map
no ip mroute-cache
no cdp enable
frame-relay interface-dlci 20 IETF
```

Technical Assistance

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for QoS Policy Propagation via BGP

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for QoS Policy Propagation via BGP

Feature Name	Releases	Feature Information
QoS Policy Propagation via BGP		The QoS Policy Propagation via BGP feature allows you to classify packets by IP precedence based on Border Gateway Protocol (BGP) community lists, BGP autonomous system paths, and access lists. After a packet has been classified, you can use other quality of service (QoS) features such as committed access rate (CAR) and Weighted Random Early Detection (WRED) to specify and enforce policies to fit your business model.
Policy Routing Infrastructure		The Policy Routing Infrastructure feature provides full support of IP policy-based routing with Cisco Express Forwarding (CEF). As CEF gradually obsoletes fast switching, policy routing is integrated with CEF to increase customer performance requirements. When policy routing is enabled, redundant processing is avoided.
