auto-summary (RIP)

To restore the default behavior of automatic summarization of subnet routes into network-level routes, use the `auto-summary` command in router configuration mode. To disable this function and send subprefix routing information across classful network boundaries, use the `no` form of this command.

```
auto-summary
no auto-summary
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Enabled (the software summarizes subprefixes to the classful network boundary when crossing classful network boundaries).

**Command Modes**
Router configuration

**Command History**

<table>

<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Route summarization reduces the amount of routing information in the routing tables.

RIP Version 1 always uses automatic summarization. If you are using RIP Version 2, you can turn off automatic summarization by specifying the `no auto-summary` command. Disable automatic summarization if you must perform routing between disconnected subnets. When automatic summarization is off, subnets are advertised.

**Examples**
In the following example, network numbers are not summarized automatically:

```
router rip
version 2
no auto-summary
```
**bfd all-interfaces**

To enable Bidirectional Forwarding Detection (BFD) for all interfaces participating in the routing process, use the `bfd all-interfaces` command in router configuration or address family interface configuration mode. To disable BFD for all neighbors on a single interface, use the `no` form of this command.

`bfd all-interfaces`

`no bfd all-interfaces`

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

BFD is disabled on the interfaces participating in the routing process.

**Command Modes**

Router configuration (config-router)

Address family interface configuration (config-router-af)

**Command History**

</tr>
</tbody>
</table>
Usage Guidelines

There are two methods to configure routing protocols to use BFD for failure detection. To enable BFD for all interfaces, enter the `bfd all-interfaces` command in router configuration mode. In Cisco IOS Release 12.4(24)T, Cisco IOS 12.2(33)SRA, and earlier releases, the `bfd all-interfaces` command works in router configuration mode and address family interface mode.

In Cisco IOS Release 15.0(1)M and later releases, the `bfd all-interfaces` command in named router configuration mode is replaced by the `bfd` command in address family interface configuration mode. Use the `bfd` command in address family interface configuration mode to achieve the same functionality as that of the `bfd all-interfaces` command in router configuration mode.

Examples

The following example shows how to enable BFD for all Enhanced Interior Gateway Routing Protocol (EIGRP) neighbors:

```
Router> enable
Router# configure terminal
Router(config)# router eigrp 123
Router(config-router)# bfd all-interfaces
Router(config-router)# end
```

The following example shows how to enable BFD for all Intermediate System-to-Intermediate System (IS-IS) neighbors:

```
Router> enable
Router# configure terminal
Router(config)# router isis tag1
Router(config-router)# bfd all-interfaces
Router(config-router)# end
```

The following example shows how to enable BFD for all Open Shortest Path First (OSPF) neighbors:

```
Router> enable
Router# configure terminal
Router(config)# router ospf 123
Router(config-router)# bfd all-interfaces
Router(config-router)# end
```

The following example shows how to enable BFD for all EIGRP neighbors, using the `bfd` command in address family interface configuration mode:

```
Router> enable
Router# configure terminal
Router(config)# router eigrp my_eigrp
Router(config-router)# address family ipv4 autonomous-system 100
Router(config-router-af)# af-interface FastEthernet 0/0
Router(config-router-af)# bfd
```

The following example shows how to enable BFD for all Routing Information Protocol (RIP) neighbors:

```
Router> enable
Router# configure terminal
Router(config)# router rip
Router(config-router)# bfd all-interfaces
Router(config-router)# end
```

The following example shows how to enable IPv6 BFD for all IS-IS neighbors, in address family interface configuration mode:

```
Router> enable
Router# configure terminal
Router(config)# router isis
Router(config-router)# address family ipv6
```
**Related Commands**

clear ipv6 rip

To delete routes from the IPv6 Routing Information Protocol (RIP) routing table, use the clear ipv6 rip command in privileged EXEC mode.

**Cisco IOS Release XE 3.9S, Cisco IOS Release 15.3(2)S, and Later Releases**

```plaintext
clear ipv6 rip [name] [vrf vrf-name]
```

**Releases Prior to Cisco IOS XE Release 3.9S and Cisco IOS Release 15.3(2)S**

```plaintext
clear ipv6 rip [name]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>(Optional) Name of an IPv6 RIP process.</td>
</tr>
<tr>
<td>vrf vrf-name</td>
<td>(Optional) Clears information about the specified Virtual Routing and Forwarding (VRF) instance.</td>
</tr>
</tbody>
</table>

### Command Modes

Privileged EXEC

### Command History

<td>This command was integrated into Cisco IOS XE Release 3.9S. The vrf vrf-name keyword/argument pair was added.</td>
</tr>
<tr>
<td>15.3(3)M</td>
<td>This command was integrated into Cisco IOS Release 15.3(3)M.</td>
</tr>
</tbody>
</table>
Usage Guidelines

When the name argument is specified, only routes for the specified IPv6 RIP process are deleted from the IPv6 RIP routing table. If no name argument is specified, all IPv6 RIP routes are deleted.

Use the show ipv6 rip command to display IPv6 RIP routes.

Use the clear ipv6 rip name vrf vrf-name command to delete the specified VRF instances for the specified IPv6 RIP process.

Examples

The following example deletes all the IPv6 routes for the RIP process called one:

Device# clear ipv6 rip one

The following example deletes the IPv6 VRF instance, called vrf1 for the RIP process, called one:

Device# clear ipv6 rip one vrf vrf1

</tbody>
</table>

**Usage Guidelines**

The `debug ipv6 rip` command is similar to the `debug ip rip` command, except that it is IPv6-specific.

**Note**

By default, the network server sends the output from debug commands and system error messages to the console. To redirect debug output, use the `logging` command in global configuration mode. Destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. For complete information on debug commands and redirecting debug output, refer to the *Cisco IOS Debug Command Reference*.

Use the `debug ipv6 rip` command to enable IPv6 RIP debugging for RIP packets that are sent and received on all device interfaces. Use the `debug ipv6 rip interface-type interface-number` command to enable IPv6 RIP debugging for RIP packets that are sent and received only on the specified interface.

Use the `debug ipv6 rip vrf vrf-name` command to troubleshoot issues in the IPv6 RIP functionality when the VRF has already been enabled using a `vrf definition vrf-name` command. Ensure that the specified VRF name has already been defined. If a VRF name has not been defined, the following message is displayed:

```
% VRF <undefined VRF name> does not exist or does not have a RD.
```

**Examples**

The following is sample output from the `debug ipv6 rip` command:

```
Device# debug ipv6 rip
13:09:10:RIPng:Sending multicast update on Ethernet1/1 for as1_rip
13:09:10: src=2001:DB8::1
13:09:10: dst=2001:DB8:0:ABCD::1 (Ethernet1/1)
13:09:10: sport=521, dport=521, length=32
13:09:10: command=2, version=1, mbz=0, #rte=1
13:09:10: tag=0, metric=1, prefix=::/0
13:09:28:RIPng:response received from 2001:DB8:0:0:E000::F on Ethernet1/1 for as1_rip
13:09:28: src=FE80::202:FDFF:FE77:1E42 (Ethernet1/1)
13:09:28: dst=FF02::9
13:09:28: sport=521, dport=521, length=32
13:09:28: command=2, version=1, mbz=0, #rte=1
13:09:28: tag=0, metric=1, prefix=2000:0:1:1::/80
```

The above example shows two RIP packets; both are known as "responses" in RIP terminology and indicated by a "command" value of 2. The first is an update sent by the device, and the second is an update received by the device. Multicast update packets are sent to all neighboring IPv6 RIP devices (all devices that are on the same links as the device sending the update and have IPv6 RIP enabled). An IPv6 RIP device advertises the contents of its routing table to its neighbors by periodically sending update packets over those interfaces on which IPv6 RIP is configured. An IPv6 device may also send “triggered” updates immediately following a routing table change. In this case, the updates include only the changes to the routing table. An IPv6 RIP device may solicit the contents of the routing table of a neighboring device by sending a Request (command =1) message to the device. The device responds by sending an update (Response, command=2) containing
its routing table. In the example, the received response packet could be a periodic update from the address 2001:DB8:0:0:E000::F or a response to a RIP request message that was previously sent by the local device.

The following is sample output from the `debug ipv6 rip vrf` command:

```
Device# debug ipv6 rip vrf blue
RIP Routing Protocol debugging is on for vrf blue

Sending:
*Mar 15 11:23:08.508: RIPng: Sending multicast update on Ethernet0/0 for vrf for vrf blue
*Mar 15 11:23:08.508: dst=2001:DB8:0:1:11 (Ethernet0/0)
*Mar 15 11:23:08.508: sport=521, dport=521, length=52
*Mar 15 11:23:08.508: command=2, version=1, mbz=0, #rte=2
*Mar 15 11:23:08.508: tag=0, metric=1, prefix=6000::/64
*Mar 15 11:23:08.508: tag=0, metric=1, prefix=2000::/64
*Mar 15 11:23:08.508: RIPng: Process vrf received own response on Loopback1

Receiving
*Mar 15 11:23:20.316: RIPng: response received from FE80::A8BB:CCFF:FE00:7C00 on Ethernet0/0 for vrf
*Mar 15 11:23:20.316: command=2, version=1, mbz=0, #rte=1
*Mar 15 11:23:20.316: tag=0, metric=1, prefix=AAAA::/64
```

The table below describes the significant fields shown in the display.

**Table 1: debug ipv6 rip vrf Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>The address from which the update was originated.</td>
</tr>
<tr>
<td>dst</td>
<td>The destination address for the update.</td>
</tr>
<tr>
<td>sport, dport, length</td>
<td>The source, destination ports and the length for the update. (IPv6 RIP uses port 521, as shown in the display.)</td>
</tr>
<tr>
<td>command</td>
<td>The command field within the RIP packet. A value of 2 indicates that the RIP packet is a response (update); a value of 1 indicates that the RIP packet is a request.</td>
</tr>
<tr>
<td>version</td>
<td>The version of IPv6 RIP being used. The current version is 1.</td>
</tr>
<tr>
<td>mbz</td>
<td>There must be a 0 (mbz) field within the RIP packet.</td>
</tr>
<tr>
<td>#rte</td>
<td>Indicates the number of routing table entries (RTEs) that the RIP packet contains.</td>
</tr>
</tbody>
</table>
The tag, metric, and prefix fields are specific to each RTE contained in the update.

The tag field is intended to allow for the flagging of IPv6 RIP “internal” and “external” routes.

The metric field is the distance metric from the device (sending this update) to the prefix.

The prefix field is the IPv6 prefix of the destination being advertised.

<td>15.1(2)S</td>
<td>This command was modified. The <code>on-passive</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The route map referenced in the `default-information originate` command cannot use an extended access list; it can use a standard access list.

When you configure the `default-information originate on-passive` command, RIP sends the default route on a passive interface. A default route is the network route with which a router communicates when no other known route exists for a given IP packet’s destination address. Before a RIP provider edge (PE) router can send the default route to the customer edge (CE) router, you must configure the interfaces facing the CE as passive interfaces by using the `default-information originate on-passive` command.

Once you configure the `default-information originate on-passive` command, the output of the `show ip protocols` command displays that RIP default routes are sent on passive interfaces.

Applying a condition to determine when the default route is originated is called conditional default origination.
Examples

The following example shows how to originate a default route (0.0.0.0/0) over a certain interface when 172.17.0.0/16 is present. In this example a route map condition is applied.

```
router rip
  version 2
  network 172.17.16.0
  default-information originate route-map condition

  route-map condition permit 10
    match ip address 10
    set interface s1/0

  access-list 10 permit 172.17.16.0 0.0.255.255
```

<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `default-metric` command is used in conjunction with the `redistribute` router configuration command to cause the current routing protocol to use the same metric value for all redistributed routes. A default metric helps solve the problem of redistributing routes with incompatible metrics. Whenever metrics do not convert, using a default metric provides a reasonable substitute and enables the redistribution to proceed.

**Examples**

The following example shows a router in autonomous system 109 using both the RIP and the Open Shortest Path First (OSPF) routing protocols. The example advertises OSPF-derived routes using RIP and assigns the OSPF-derived routes a RIP metric of 10.

```
router rip
  default-metric 10
  redistribute ospf 109
```

.flash-update-threshold

To suppress regularly scheduled flash updates, use the flash-update-threshold command in router configuration mode. To return to the default state, use the no form of this command.

.flash-update-threshold seconds
.no flash-update-threshold

Syntax Description

| seconds | The time interval in seconds for which the suppression of flash updates can be configured. The range is from 1 to 30 seconds. |

Command Default

This command is disabled by default.

Command Modes

Router configuration

Command History

<table>
<thead>
<tr>

<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command suppresses flash updates when the arrival of a regularly scheduled update matches the number of seconds that is configured with the seconds argument. The range of seconds that can be configure is from 0 to 30 seconds. If the number of seconds matches the number of seconds or is less than the number seconds that is configured with the seconds argument, the flash update is suppressed. If the numbers seconds until the flash update arrives exceeds the number of seconds that is configured with the seconds argument, the flash update is not suppressed. The regular scheduled interval for flash updates and the configuration of the suppression of flash updates can be verified with the show ip protocol command.

Examples

The following example configures a router to suppress a regularly scheduled flash update if the update is due in 10 seconds or less:

router rip
flash-update-threshold 10

input-queue

The `input-queue` command defines the number of received, but not yet processed RIP update packets contained in the Routing Information Protocol (RIP) input queue. Use the `input-queue` command in router configuration mode. To remove the configured depth and restore the default depth, use the `no` form of this command.

```
input-queue depth
no input-queue
```

**Syntax Description**

| depth | Numerical value associated with the maximum number of packets in the RIP input queue. The larger the numerical value, the larger the depth of the queue. The range is from 0 to 1024. The default is 50. |

**Command Default**

A depth of 50.

**Command Modes**

Router configuration

<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Consider using the `input-queue` command if you have a high-end router that is sending at high speed to a low-speed router that might not be able to receive at the high speed. Configuring this command will help prevent the routing table from losing information.

Another way to prevent the routing table from losing information is to use the `output-delay` command to change the interpacket delay for RIP updates.

**Examples**

The following example sets the depth of the RIP input queue to 100:

```
router rip
   input-queue 100
```

</tr>
<tr>
<td>Cisco IOS XE Release 2.1</td>
<td>This command was integrated into Cisco IOS XE Release 2.1.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

RIP uses broadcast UDP data packets to exchange routing information. RIP sends routing information updates every 30 seconds, which is the default global periodic advertisement interval for a Cisco device.

Use the `ip rip advertise` command to override the default global periodic advertisement interval on a specific RIP-enabled interface and configure the required periodic advertisement interval on that interface.

If you have to configure a specific periodic advertisement interval on all RIP-enabled interfaces in a Cisco device, use the `timers basic` command. If you have to configure a specific periodic advertisement interval on a specific interface, use the `ip rip advertise` command.
**Examples**

The following example shows how to configure the periodic advertisement interval on an interface:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 0/1
Device(config-if)# ip rip advertise 5
Device(config-if)# end
```

**Related Commands**

<table>

</tr>
<tr>
<td>15.0(1)SY</td>
<td>This command was integrated into Cisco IOS Release 15.0(1)SY</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Some non-Cisco routers will not allow an MD5-authenticated RIPv2 neighbor session to start when the sequence number of the first MD5 packet received from the Cisco router is greater than 0. The IP-RIP Delay Start feature is used on Cisco routers to delay the initiation of RIPv2 neighbor sessions using MD5 authentication until the network connectivity between the neighbor routers is fully operational. This ensures the sequence number of the first MD5 packet that the router sends to the non-Cisco neighbor router is 0.

**Examples**

The following example configures the router to wait 45 seconds before sending the first MD5 authentication packet to a non-Cisco device:

```
Router(config)# interface POS 0/1/0
Router(config-subif)# ip rip initial-delay 45
```

<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When triggered extensions to RIP are enabled, routing updates are sent on the WAN only if one of the following events occurs:

- The router receives a specific request for a routing update. (Full database is sent.)
- Information from another interface modifies the routing database. (Only latest changes are sent.)
- The interface comes up or goes down. (Partial database is sent.)
- The router is first powered on, to ensure that at least one update is sent. (Full database is sent.)

You might want to enable this feature if you are using an on-demand circuit and you are charged for usage time. Fewer routing updates will incur lower usage costs.

Entries in the routing database can be either temporary or semipermanent. Entries learned from broadcasts on LANs are temporary; they will expire if not periodically refreshed by more broadcasts.

Entries learned from a triggered response on the WAN are semipermanent; they do not time out like other entries. Certain events can cause these routes to time out, such as the interface going down, or if the outgoing interface is the same as the incoming interface. Neighbor updates of the routes with a metric of 16 (infinity) mean the route is unreachable, and those routes are eventually removed from the routing table.
Examples

The following example enables triggered extensions to RIP:

```
interface serial 0
ip rip triggered
```

Related Commands

<tr>
<td>12.2SX</td>
<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `ip rip v2-broadcast` command to broadcast RIP Version 2 broadcast updates to hosts that do not listen to multicast broadcasts. Version 2 updates (requests and responses) will be sent to the IP broadcast address 255.255.255.255 instead of the IP multicast address 224.0.0.9.

In order to reduce unnecessary load on those hosts that are not listening to RIP Version 2 broadcasts, the system uses an IP multicast address for periodic broadcasts. The IP multicast address is 224.0.0.9.

**Note**

It is not necessary to configure Internet Group Management Protocol (IGMP) because the periodic broadcasts are interrouter messages that are not forwarded.

**Examples**

The following example configures Version 2 IP broadcast updates on RIP Ethernet interface 3/1:

```
Router(config) interface ethernet3/1
Router(config-if) ip address 172.16.1.1 255.255.255.0
```
Router(config-if) ip rip v2-broadcast
.
.
Router(config-if) router rip
Router(config-if) version 2
Router(config-if) network 172.0.0.0

Enter `debug ip rip` command to verify that RIP Version 2 IP broadcast updates are being sent to the IP broadcast address 255.255.255 instead of IP multicast address 224.0.0.9:

Router# debug ip rip
14:41:59: RIP: sending v2 update to 255.255.255.255 via Ethernet3/1 (172.16.1.1)

If the `ip rip v2-broadcast` command has not been entered, the output from the `debug ip rip` command verifies that the RIP Version 2 IP broadcast updates are being sent to the IP multicast address 224.0.0.9:

Router# debug ip rip
15:45:16: RIP: sending v2 update to 224.0.0.9 via Ethernet3.1 (172.16.1.1)

<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

Usage Guidelines

For all interfaces except those for which either Frame Relay or Switched Multimegabit Data Service (SMDS) encapsulation is enabled, the default condition for this command is `ip split-horizon`; in other words, the split horizon feature is active. If the interface configuration includes either the `encapsulation frame-relay` or `encapsulation smds` command, then the default is for split horizon to be disabled. Split horizon is not disabled by default for interfaces using any of the X.25 encapsulations.

Note

For networks that include links over X.25 packet switched networks (PSNs), the `neighbor` router configuration command can be used to defeat the split horizon feature. You can as an alternative explicitly specify the `no ip split-horizon` command in your configuration. However, if you do so you **must** similarly disable split horizon for all routers in any relevant multicast groups on that network.

Note

If split horizon has been disabled on an interface and you want to enable it, use the `ip split-horizon` command to restore the split horizon mechanism.
In general, changing the state of the default for the `ip split-horizon` command is not recommended, unless you are certain that your application requires a change in order to properly advertise routes. If split horizon is disabled on a serial interface (and that interface is attached to a PSN), you must disable split horizon for all routers and access servers in any relevant multicast groups on that network.

**Examples**

The following simple example disables split horizon on a serial link. The serial link is connected to an X.25 network.

```
interface serial 0
 encapsulation x25
 no ip split-horizon
```

<tr>
<td>12.2SX</td>
<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `ip summary-address rip` command is used to summarize an address or subnet under a specific interface. RIP automatically summarizes to classful network boundaries. Only one summary address can be configured for each classful subnet.

**Examples**

In the following example the major network is 10.0.0.0. The summary address 10.2.0.0 overrides the autosummary address of 10.0.0.0, so that 10.2.0.0 is advertised out Ethernet interface 1 and 10.0.0.0 is not advertised.
If split horizon is enabled, neither autosummary nor interface summary addresses (those configured with the `ip summary-address rip` command) are advertised.

```
interface Ethernet1
  ip address 10.1.1.1 255.255.255.0
  ip summary-address rip 10.2.0.0 255.255.0
  exit
router rip
  network 10.0.0.0
end
```

ipv6 rip vrf-mode enable

To enable VRF-aware support for IPv6 Routing Information Protocol (RIP), use the `ipv6 rip vrf-mode enable` command in global configuration mode. To disable VRF-aware support for IPv6 RIP, use the `no` form of this command.

```
ipv6 rip vrf-mode enable
no ipv6 rip vrf-mode enable
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
VRF-aware support is not enabled in IPv6 RIP.

**Command Modes**
Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</tr>
<tr>
<td>15.3(3)M</td>
<td>This command was integrated into Cisco IOS Release 15.3(3)M.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
When VRF-aware support is enabled in IPv6 RIP, you can configure only one RIP instance at a given time. More than one RIP instance is not allowed.

**Examples**
The following example shows how to enable VRF-aware support for IPv6 RIP routing.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 rip vrf-mode enable
Device(config)# end
```

</tr>
<tr>
<td>15.1(2)S</td>
<td>This command was integrated into Cisco IOS Release 15.1(2)S.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command permits point-to-point (nonbroadcast) exchange of routing information. When it is used in combination with the `passive-interface` command, routing information can be exchanged between a subset of routers and access servers on a LAN.

Use multiple `neighbor` commands to specify additional neighbors or peers.
Examples

In the following example, RIP updates are sent to all interfaces on network 10.108.0.0 except Ethernet interface 1. However, in this case, a `neighbor` router configuration command is included. This command permits the sending of routing updates to specific neighbors. One copy of the routing update is generated per neighbor.

```
Router> enable
Router# configure terminal
Router(config)# router rip
Router(config-router)# network 10.108.0.0
Router(config-router)# passive-interface Ethernet 1
Router(config-router)# neighbor 10.108.20.4
Router(config-router)# end
```

The following example shows how to enable BFD for RIP neighbors:

```
Router> enable
Router# configure terminal
Router(config)# neighbor 10.0.0.1 bfd
Router(config-router)# end
```

Related Commands

network (RIP)

To specify a list of networks for the Routing Information Protocol (RIP) routing process, use the `network` command in router configuration mode. To remove an entry, use the `no` form of this command.

```
network ip-address
no network ip-address
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip-address</code></td>
<td>IP address of the network of directly connected networks.</td>
</tr>
</tbody>
</table>

### Command Default

No networks are specified.

### Command Modes

Router configuration

### Command History

<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The network number specified must not contain any subnet information. There is no limit to the number of `network` commands you can use on the router. RIP routing updates will be sent and received only through interfaces on this network.

RIP sends updates to the interfaces in the specified networks. Also, if the network of an interface is not specified, the interface will not be advertised in any RIP update.

### Examples

The following example defines RIP as the routing protocol to be used on all interfaces connected to networks 10.99.0.0 and 192.168.7.0:

```
router rip
network 10.99.0.0
network 192.168.7.0
```

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2SX</td>
<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The offset value is added to the routing metric. An offset list with an interface type and interface number is considered extended and takes precedence over an offset list that is not extended. Therefore, if an entry passes the extended offset list and the normal offset list, the offset of the extended offset list is added to the metric.

**Examples**

In the following example, the router applies an offset of 10 to the delay component of a router only to access list 21:

```
offset-list 21 out 10
```

In the following example, the router applies an offset of 10 to routes learned from Ethernet interface 0:

```
offset-list 21 in 10 ethernet 0
```
**output-delay**

To change the interpacket delay for Routing Information Protocol (RIP) updates sent, use the `output-delay` command in router configuration mode. To remove the delay, use the `no` form of this command.

```
output-delay delay
no output-delay
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>delay</code></td>
<td>Delay between packets in a multiple-packet RIP update (in milliseconds). The range is from 8 to 50. The default is 0.</td>
</tr>
</tbody>
</table>

**Command Default**

The default interpacket delay is 0 milliseconds.

**Command Modes**

Router configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>

<td>12.2SX</td>
<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Consider using this command if you have a high-end router that is sending at high speed to a low-speed router that might not be able to receive at the high speed. Configuring this command will help prevent the routing table from losing information.

**Examples**

The following example sets the interpacket delay to 10 milliseconds:

```
router rip
output-delay 10
```
**router rip**

To configure the Routing Information Protocol (RIP) routing process, use the `router rip` command in global configuration mode. To turn off the RIP routing process, use the `no` form of this command.

```
router rip
no router rip
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No RIP routing process is defined.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

service-module ip rip relay

To enable the delivery of RIP update messages from a Cisco IOS router containing an integrated cable modem or a cable modem HWIC to a Hybrid Fiber-Coaxial (HFC) CMTS when they are on different subnets, use the `service-module ip rip relay` command in interface configuration mode. To disable RIP relay, use the `no` form of this command.

```
service-module ip rip relay
no service-module ip rip relay
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

RIP relay is disabled.

**Command Modes**

Interface configuration (config-if)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.4(15)XY</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.4(20)T</td>
<td>This command was integrated into Cisco IOS Release 12.4(20)T.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `service-module ip rip relay` command is used to enable the HFC RIP Relay feature that allows the delivery of RIP messages from a Cisco IOS router containing an integrated cable modem or a cable modem High-Speed WAN Interface Card (HWIC) to the Cable Modem Termination system (CMTS) when they are on different subnets. In Cisco IOS releases prior to 12.4(15)XY and 12.4(20)T, RIP messages were rejected by the CMTS because the interface on the Cisco IOS router was in a different subnet from the CMTS.

**Examples**

The following example enables RIP relay on an Integrated Services Router (ISR) cable modem. A static IP address is configured for the cable modem interface, and RIP relay is enabled on the interface. To allow RIP updates from unknown sources, the normal validation of the source IP address of incoming RIP routing updates is disabled. RIP is defined as the routing protocol to be used on all interfaces that are connected to networks 10.0.0.0 and 172.18.0.0.

```
interface Cable-Modem0/3/0
  ip address 10.5.5.5 255.255.255.0
  service-module ip rip relay
exit
router rip
  version 2
  no validate-update-source
  network 10.0.0.0
  network 172.18.0.0
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show controllers</code></td>
<td>Displays information that is specific to the hardware.</td>
</tr>
</tbody>
</table>
show ip rip database

To display summary address entries in the Routing Information Protocol (RIP) routing database entries if relevant are routes being summarized based upon a summary address, use the `show ip rip database` command in privileged EXEC mode.

```
show ip rip database [ip-address mask]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-address</td>
<td>(Optional) Address about which routing information should be displayed.</td>
</tr>
<tr>
<td>mask</td>
<td>(Optional) Argument for the subnet mask. The subnet mask must also be specified if the IP address argument is entered.</td>
</tr>
</tbody>
</table>

### Command Default

No default behavior or values.

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(6)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
<tr>
<td>12.2SX</td>
<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Summary address entries will appear in the database only if relevant child routes are being summarized. When the last child route for a summary address becomes invalid, the summary address is also removed from the routing table.

The RIP private database is populated only if triggered extensions to RIP are enabled with the `ip rip triggered` command.

### Examples

The following output shows a summary address entry for route 10.11.0.0/16, with three child routes active:

```
Router# show ip rip database
10.0.0.0/8    auto-summary
10.11.0.0/24   directly connected, Ethernet2
10.1.0.0/8    auto-summary
```
The following is sample output from the `show ip rip database` command with a prefix and mask:

```
Router# show ip rip database
172.19.86.0 255.255.255.0 172.19.65.0/24
[1] via 172.19.67.38, 00:00:25, Serial0
[2] via 172.19.70.36, 00:00:14, Serial1
```

The table below describes the fields in the display.

skeptical interval

To configure cautious Cisco nonstop forwarding (NSF) helper functionality with a neighbor with an interval, use the skeptical interval command in router configuration mode. To configure a cautious NSF helper with the default interval, use the no form of this command.

skeptical interval minutes

no skeptical interval

Syntax Description

| minutes | Number of minutes for the interval. Range: 0 to 1440. Default: 5. |

Command Default

The default interval for configuring an NSF helper is 5 minutes.

Command Modes

Router configuration (config-router)

Command History

Release | Modification
--- | ---
12.2(33)SX | This command was introduced.

Usage Guidelines

When the skeptical interval command is configured with an interval, NSF will not be supported with the neighbor during this period. If you configure the skeptical interval 0 command, it means that you always support NSF with the neighbor. Whenever you configure the skeptical interval command, you should also configure the nsf interval command.

Examples

The following example configures the skeptical interval to 30 minutes:

```
Router(config)# router isis
Router(config-router)# skeptical interval 30
Router(config-router)#
```

Related Commands

</tbody>
</table>
throttle (router configuration)

To enable throttle for Routing Information Protocol (RIP) requests, use the throttle command in router configuration mode. To disable the configuration, use the no form of this command.

```
throttle
no throttle
```

Syntax Description
This command has no arguments or keywords.

Command Default
Throttle is not enabled by default.

Command Modes
Router configuration (config-router)

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SB14</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
You can use the throttle command if you are using RIP as a routing protocol to serve a large number of routers. This command prevents RIP from generating update packets in response to RIP requests from a faulty neighbor. Because only one RIP request per minute will be serviced from a neighbor, incoming regular updates are less likely to be dropped.

You can configure the throttle command only when the interpacket delay is configured using the output-delay command.

Examples
The following example shows how to enable throttle for RIP requests:

```
Router# configure terminal
Router(config-router)# network 192.0.2.1
Router(config-router)# output-delay 20
Router(config-router)# throttle
```

Related Commands

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>output-delay</td>
<td>Changes the interpacket delay for RIP updates sent.</td>
</tr>
</tbody>
</table>
timers basic (RIP)

To adjust Routing Information Protocol (RIP) network timers, use the `timers basic` command in router configuration mode. To restore the default timers, use the `no` form of this command.

```
timers basic update invalid holddown flush
no timers basic
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>update</code></td>
<td>Rate (in seconds) at which updates are sent. This is the fundamental timing parameter of the routing protocol. The default is 30 seconds.</td>
</tr>
<tr>
<td><code>invalid</code></td>
<td>Interval of time (in seconds) after which a route is declared invalid; it should be at least three times the value of the <code>update</code> argument. A route becomes invalid when there is an absence of updates that refresh the route. The route then enters into a <code>holddown</code> state. The route is marked inaccessible and advertised as unreachable. However, the route is still used for forwarding packets. The default is 180 seconds.</td>
</tr>
<tr>
<td><code>holddown</code></td>
<td>Interval (in seconds) during which routing information regarding better paths is suppressed. It should be at least three times the value of the <code>update</code> argument. A route enters into a <code>holddown</code> state when an update packet is received that indicates the route is unreachable. The route is marked inaccessible and advertised as unreachable. However, the route is still used for forwarding packets. When holddown expires, routes advertised by other sources are accepted and the route is no longer inaccessible. The default is 180 seconds.</td>
</tr>
<tr>
<td><code>flush</code></td>
<td>Amount of time (in seconds) that must pass before the route is removed from the routing table; the interval specified should be greater than the value of the <code>invalid</code> argument. If it is less than this sum, the proper <code>holddown</code> interval cannot elapse, which results in a new route being accepted before the <code>holddown</code> interval expires. The default is 240 seconds.</td>
</tr>
</tbody>
</table>

### Command Default

No RIP network timers are adjusted.

### Command Modes

Router configuration
Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2S, 12.4T</td>
<td>This command was enhanced to allow for the explicit specification of timers for an address family (VRF).</td>
</tr>
<tr>
<td>12.2SX</td>
<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The basic timing parameters for RIP are adjustable. Because RIP is executing a distributed, asynchronous routing algorithm, these timers must be the same for all routers and access servers in the network.

Note

The current and default timer values can be seen by inspecting the output of the `show ip protocols` EXEC command. The relationships of the various timers should be preserved as described previously.

In addition, an address family can have explicitly specified timers that apply to that address-family (or VRF) only. The `timers basic` command must be specified for an address family or the system defaults for the timers basic command are used regardless of what is configured for RIP routing. The VRF does not inherit the timer values from the base RIP configuration. The VRF will always use the system default timers unless explicitly changed using the timers basic command.

Examples

The following example sets updates to be broadcast every 5 seconds. If a router is not heard from in 15 seconds, the route is declared unusable. Further information is suppressed for an additional 15 seconds. At the end of the suppression period, the route is flushed from the routing table.

```
router rip
  timers basic 5 15 15 30
```

Note

By setting a short update period, you run the risk of congesting slow-speed serial lines. A short update period can be a concern on faster-speed Ethernets and T1-rate serial lines. Also, if you have many routes in your updates, you can cause the routers to spend an excessive amount of time processing updates.

The following example show adjusting address family timers.

```
router rip
  version 2
  timers basic 5 10 15 20
  redistribute connected
  network 5.0.0.0
  default-metric 10
  no auto-summary
  !
  address-family ipv4 vrf foo
  timers basic 10 20 20 20
  redistribute connected
  network 10.0.0.0
```
default-metric 5
no auto-summary
version 2
exit-address-family
!
address-family ipv4 vrf bar
timers basic 20 40 60 80
redistribute connected
network 20.0.0.0
default-metric 2
no auto-summary
version 2
exit-address-family
!
validate-update-source

To have the Cisco IOS software validate the source IP address of incoming routing updates for Routing Information Protocol (RIP) and Interior Gateway Routing Protocol (IGRP) routing protocols, use the `validate-update-source` command in router configuration mode. To disable this function, use the `no` form of this command.

```
validate-update-source
no validate-update-source
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
The behavior of this command is enabled by default.

**Command Modes**
Router configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
<tr>
<td>12.2SX</td>
<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command is applicable only to RIP and IGRP. The software ensures that the source IP address of incoming routing updates is on the same IP network as one of the addresses defined for the receiving interface.

Disabling split horizon on the incoming interface will also cause the system to perform this validation check.

For unnumbered IP interfaces (interfaces configured as IP unnumbered), no checking is performed.

**Examples**
The following example configures a router not to perform validation checks on the source IP address of incoming RIP updates:

```
routerrip
network 10.105.0.0
no validate-update-source
```
version

To specify a Routing Information Protocol (RIP) version used globally by the router, use the `version` command in router configuration mode. To restore the default value, use the `no version` command.

```
version {1|2}
no version
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Specifies RIP Version 1.</td>
</tr>
<tr>
<td>2</td>
<td>Specifies RIP Version 2.</td>
</tr>
</tbody>
</table>

**Command Default**

The software receives RIP Version 1 and Version 2 packets, but sends only Version 1 packets.

**Command Modes**

Router configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
<tr>
<td>12.2SX</td>
<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To specify RIP versions used on an interface basis, use the `ip rip receive version` and `ip rip send version` commands.

**Examples**

The following example enables the software to send and receive RIP Version 2 packets:

```
version 2
```
