Implementing IPv6 over MPLS

Last Updated: July 31, 2012

Multiprotocol Label Switching (MPLS) is deployed by many service providers in their IPv4 networks. Service providers want to introduce IPv6 services to their customers, but changes to their existing IPv4 infrastructure can be expensive and the cost benefit for a small amount of IPv6 traffic does not make economic sense. Several integration scenarios have been developed to leverage an existing IPv4 MPLS infrastructure and add IPv6 services without requiring any changes to the network backbone. This document describes how to implement IPv6 over MPLS.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Implementing IPv6 over MPLS

- This module assumes that you are familiar with IPv4. Refer to the publications referenced in the Prerequisites for Implementing IPv6 over MPLS, page 1 section for IPv4 configuration and command reference information.
- Before the IPv6 Provider Edge Router over MPLS (6PE) feature can be implemented, MPLS must be running over the core IPv4 network. If Cisco routers are used, Cisco Express Forwarding or distributed...
Cisco Express Forwarding must be enabled for both IPv4 and IPv6 protocols. This module assumes that you are familiar with MPLS.

Information About Implementing IPv6 over MPLS

- Benefits of Deploying IPv6 over MPLS Backbones, page 2
- IPv6 over a Circuit Transport over MPLS, page 2
- IPv6 Using Tunnels on the Customer Edge Routers, page 3
- IPv6 on the Provider Edge Routers, page 3

Benefits of Deploying IPv6 over MPLS Backbones

IPv6 over MPLS backbones enables isolated IPv6 domains to communicate with each other over an MPLS IPv4 core network. This implementation requires only a few backbone infrastructure upgrades and no reconfiguration of core routers because forwarding is based on labels rather than the IP header itself, providing a very cost-effective strategy for the deployment of IPv6.

Additionally, the inherent Virtual Private Network (VPN) and MPLS traffic engineering (MPLS-TE) services available within an MPLS environment allow IPv6 networks to be combined into IPv4 VPNs or extranets over an infrastructure supporting IPv4 VPNs and MPLS-TE.

IPv6 over a Circuit Transport over MPLS

Using any circuit transport for deploying IPv6 over MPLS networks has no impact on the operation or infrastructure of MPLS, and requires no configuration changes to the core or provider edge routers. Communication between the remote IPv6 domains runs native IPv6 protocols over a dedicated link, where the underlying mechanisms are fully transparent to IPv6. The IPv6 traffic is tunneled using the Any Transport over MPLS (MPLS/AToM) or Ethernet over MPLS (EoMPLS) feature with the routers connected through an ATM OC-3 or Ethernet interface, respectively.

The figure below shows the configuration for IPv6 over any circuit transport over MPLS.

Figure 1  IPv6 over a Circuit Transport over MPLS
IPv6 Using Tunnels on the Customer Edge Routers

Using tunnels on the customer edge (CE) routers is the simplest way of deploying IPv6 over MPLS networks with no impact on the operation or infrastructure of MPLS, and no configuration changes to the core or provider edge routers. Communication between the remote IPv6 domains uses standard tunneling mechanisms and requires the CE routers to be configured to run dual IPv4 and IPv6 protocol stacks. The figure below shows the configuration using tunnels on the CE routers.

Refer to Implementing Tunneling for IPv6 for configuration information on manually configured tunnels, automatic tunnels, and 6to4 tunnels.

Limitations on using tunnels involve the manual configuring of a mesh of tunnels on the CE routers, creating scaling issues for large networks.

IPv6 on the Provider Edge Routers

The Cisco implementation of IPv6 provider edge router over MPLS is called 6PE, and it enables IPv6 sites to communicate with each other over an MPLS IPv4 core network using MPLS label switched paths (LSPs). This feature relies on multiprotocol Border Gateway Protocol (BGP) extensions in the IPv4 network configuration on the provider edge (PE) router to exchange IPv6 reachability information in addition to an MPLS label for each IPv6 address prefix to be advertised. Edge routers are configured to be dual stack running both IPv4 and IPv6, and use the IPv4 mapped IPv6 address for IPv6 prefix reachability exchange.

A hierarchy of labels is imposed on the 6PE ingress router to keep the IPv6 traffic transparent to all the core routers. The top label provides connectivity inside the IPv4 MPLS core network and the label is distributed by Label Distribution Protocol (LDP), Tag Distribution Protocol (TDP), or Resource
Reservation Protocol (RSVP). TDP and LDP can both be used for label distribution, but RSVP is used only in the context of MPLS-TE label exchange. The bottom label, automatically assigned to the IPv6 prefix of the destination, is distributed by multiprotocol BGP and used at each 6PE egress router for IPv6 forwarding.

In the figure below the 6PE routers are configured as dual stack routers able to route both IPv4 and IPv6 traffic. Each 6PE router is configured to run LDP, TDP, or RSVP (if traffic engineering is configured) to bind the IPv4 labels. The 6PE routers use multiprotocol BGP to exchange reachability information with the other 6PE devices within the MPLS domain, and to distribute aggregate IPv6 labels between them. All 6PE and core routers—P routers in Figure 3—within the MPLS domain share a common IPv4 Interior Gateway Protocol (IGP) such as Open Shortest Path First (OSPF) or Integrated Intermediate System-to-Intermediate System (IS-IS).

![6PE Router Topology](image)

The interfaces on the 6PE routers connecting to the CE router can be configured to forward IPv6 traffic, IPv4 traffic, or both types of traffic depending on the customer requirements. 6PE routers advertise IPv6 reachability information learned from their 6PE peers over the MPLS cloud. Service providers can delegate an IPv6 prefix from their registered IPv6 prefixes over the 6PE infrastructure; otherwise, there is no impact on the CE router.

The P routers in the core of the network are not aware that they are switching IPv6 packets. Core routers are configured to support MPLS and the same IPv4 IGP as the PE routers to establish internal reachability inside the MPLS cloud. Core routers also use LDP, TDP, or RSVP for binding IPv4 labels. Implementing the Cisco 6PE feature does not have any impact on the MPLS core devices.

Within the MPLS network, IPv6 traffic is forwarded using label switching, making the IPv6 traffic transparent to the core of the MPLS network. No IPv6 over IPv4 tunnels or Layer 2 encapsulation methods are required.

- 6PE Multipath, page 5
6PE Multipath

Internal and external BGP multipath for IPv6 allows the IPv6 router to load balance between several paths (for example, the same neighboring autonomous system or subautonomous system, or the same metric) to reach its destination. The 6PE multipath feature uses multiprotocol internal BGP (MP-iBGP) to distribute IPv6 routes over the MPLS IPv4 core network and to attach an MPLS label to each route.

When MP-iBGP multipath is enabled on the 6PE router, all labeled paths are installed in the forwarding table with MPLS information (label stack) when MPLS information is available. This functionality enables 6PE to perform load balancing.

How to Implement IPv6 over MPLS

- Deploying IPv6 over a Circuit Transport over MPLS, page 5
- Deploying IPv6 on the Provider Edge Routers (6PE), page 5
- Verifying 6PE Configuration and Operation, page 10

Deploying IPv6 over a Circuit Transport over MPLS

To deploy IPv6 over a circuit transport over MPLS, the IPv6 routers must be configured for IPv6 connectivity. The MPLS router configuration requires AToM configuration or EoMPLS configuration.

Deploying IPv6 on the Provider Edge Routers (6PE)

- Specifying the Source Address Interface on a 6PE Router, page 5
- Binding and Advertising the 6PE Label to Advertise Prefixes, page 7
- Configuring iBGP Multipath Load Sharing, page 9

Specifying the Source Address Interface on a 6PE Router

Two configuration tasks using the network shown in the figure below are required at the 6PE1 router to enable the 6PE feature.

The customer edge router--CE1 in the figure below--is configured to forward its IPv6 traffic to the 6PE1 router. The P1 router in the core of the network is assumed to be running MPLS, a label distribution protocol, an IPv4 IGP, and Cisco Express Forwarding or distributed Cisco Express Forwarding, and does not require any new configuration to enable the 6PE feature.

Figure 4 6PE Configuration Example

IPv6 Prefix: 3ffe:0000::/48
• The 6PE routers—the 6PE1 and 6PE2 routers in the figure below—must be members of the core IPv4 network. The 6PE router interfaces attached to the core network must be running MPLS, the same label distribution protocol, and the same IPv4 IGP, as in the core network.
• The 6PE routers must also be configured to be dual stack to run both IPv4 and IPv6.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ipv6 unicast-routing
4. ipv6 cef
5. interface type number
6. ipv6 address ipv6-address / prefix-length | prefix-name sub-bits / prefix-length

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong> ipv6 unicast-routing</td>
<td>Enables the forwarding of IPv6 unicast datagrams.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# ipv6 unicast-routing</td>
</tr>
<tr>
<td><strong>Step 4</strong> ipv6 cef</td>
<td>Enables IPv6 Cisco Express Forwarding.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# ipv6 cef</td>
</tr>
<tr>
<td><strong>Step 5</strong> interface type number</td>
<td>Specifies an interface type and number and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• In the context of this feature, the interface to be configured is the interface communicating with the CE router.</td>
</tr>
<tr>
<td>Router(config)# interface Serial 0/0</td>
<td></td>
</tr>
</tbody>
</table>
Command or Action | Purpose
--- | ---
**Step 6** ipv6 address ipv6-address / prefix-length | Configures an IPv6 address based on an IPv6 general prefix and enable IPv6 processing on an interface.

Example:

```
Router(config-if)# ipv6 address 2001:DB8:FFFF::/64
```

### Binding and Advertising the 6PE Label to Advertise Prefixes

Perform this task to enable the binding and advertising of aggregate labels when advertising IPv6 prefixes to a specified BGP neighbor.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router bgp as-number
4. no bgp default ipv4-unicast
5. neighbor {ip-address | ipv6-address | peer-group-name} remote-as as-number
6. neighbor {ip-address | ipv6-address | peer-group-name} update-source interface-type interface-number
7. address-family ipv6 [unicast]
8. neighbor {ip-address | peer-group-name | ipv6-address} activate
9. neighbor {ip-address | ipv6-address} send-label

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
## Command or Action

<table>
<thead>
<tr>
<th>Step 3</th>
<th><code>router bgp as-number</code></th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Enters router configuration mode for the specified routing process.</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
Router(config)# router bgp 65000
```

<table>
<thead>
<tr>
<th>Step 4</th>
<th><code>no bgp default ipv4-unicast</code></th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Disables the IPv4 unicast address family for the BGP routing process specified in the previous step.</td>
<td></td>
</tr>
</tbody>
</table>

**Note** Routing information for the IPv4 unicast address family is advertised by default for each BGP routing session configured with the `neighbor remote-as` command unless you configure the `no bgp default ipv4-unicast` command before configuring the `neighbor remote-as` command.

**Example:**

```
Router(config-router)# no bgp default ipv4-unicast
```

| Step 5 | `neighbor [ip-address | ipv6-address | peer-group-name] remote-as as-number` | Purpose |
|--------|----------------------------------------|---------|
|        | Adds the IP address of the neighbor in the specified autonomous system to the BGP neighbor table of the local router. |

**Example:**

```
Router(config-router)# neighbor 192.168.99.70 remote-as 65000
```

| Step 6 | `neighbor [ip-address | ipv6-address | peer-group-name] update-source interface-type interface-number` | Purpose |
|--------|-------------------------------------------------|---------|
|        | Specifies the interface whose IPv4 address is to be used as the source address for the peering. |
|        | • In the context of this task, the interface must have an IPv4 address with a 32-bit mask configured. Use of a loopback interface is recommended. This address is used to determine the IPv6 next hop by the peer 6PE. |

**Example:**

```
Router(config-router)# neighbor 192.168.99.70 update-source Loopback 0
```

<table>
<thead>
<tr>
<th>Step 7</th>
<th><code>address-family ipv6 [unicast]</code></th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specifies the IPv6 address family and enters address family configuration mode.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The <code>unicast</code> keyword specifies the IPv6 unicast address family. By default, the router is placed in configuration mode for the IPv6 unicast address family if the <code>unicast</code> keyword is not specified with the <code>address-family ipv6</code> command.</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
Router(config-router)# address-family ipv6
```

| Step 8 | `neighbor [ip-address | peer-group-name] ipv6-address activate` | Purpose |
|--------|-------------------------------------------------|---------|
|        | Enables the neighbor to exchange prefixes for the IPv6 address family with the local router. |

**Example:**

```
Router(config-router-af)# neighbor 192.168.99.70 activate
```
### Configuring iBGP Multipath Load Sharing

Perform this task to configure iBGP multipath load sharing and control the maximum number of parallel iBGP routes that can be installed in a routing table.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router bgp as-number
4. maximum-paths ibgp number-of-paths

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> router bgp as-number</td>
<td>Enters router configuration mode for the specified routing process.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# router bgp 65000</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 4</th>
<th>maximum-paths ibgp number-of-paths</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>Controls the maximum number of parallel iBGP routes that can be installed in a routing table.</td>
</tr>
</tbody>
</table>

**Example:**

```
Router(config-router)# maximum-paths ibgp 3
```

### Verifying 6PE Configuration and Operation

When 6PE is running, the following components can be monitored:

- Multiprotocol BGP
- MPLS
- Cisco Express Forwarding for IPv6
- IPv6 routing table

**SUMMARY STEPS**

1. `show bgp ipv6 {unicast | multicast} [ipv6-prefix / prefix-length] [longer-prefixes] [labels]`
2. `show bgp ipv6 {unicast | multicast} neighbors [ipv6-address] [received-routes | routes | flap-statistics | advertised-routes | paths regular-expression | dampened-routes]`
3. `show mpls forwarding-table [network{mask | length}] [labels label[- label] | interface interface] nexthop address | lsp-tunnel[tunnel-id] | [vrf vrf-name] [detail]`
4. `show ipv6 cef [ipv6-prefix / prefix-length] [interface-type interface-number] [longer-prefixes | similar-prefixes | detail | internal | platform | epoch | source]`
5. `show ipv6 route [ipv6-address | ipv6-prefix / prefix-length | protocol | interface-type interface-number]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** `show bgp ipv6 {unicast | multicast} [ipv6-prefix / prefix-length] [longer-prefixes] [labels]` | (Optional) Displays entries in the IPv6 BGP routing table.  
  • In this example, information about the IPv6 route for the prefix 2001:DB8:DDDD::/48 is displayed. |
| Example: | Router> show bgp ipv6 unicast 2001:DB8:DDDD::/48 |
| **Step 2** `show bgp ipv6 {unicast | multicast} neighbors [ipv6-address] [received-routes | routes | flap-statistics | advertised-routes | paths regular-expression | dampened-routes]` | (Optional) Displays information about IPv6 BGP connections to neighbors.  
  • In this example, information including the IPv6 label capability is displayed for the BGP peer at 192.168.99.70. |
| Example: | Router> show bgp ipv6 neighbors unicast 192.168.99.70 |
Command or Action | Purpose
--- | ---
**Step 3** show mpls forwarding-table [network(mask|length)] [labels label[-label]] [interface interface|nexthop address|lsp-tunnel[tunnel-id]] [vrf vrf-name] [detail] | (Optional) Displays the contents of the MPLS Forwarding Information Base (FIB).

- In this example, information linking the MPLS label with IPv6 prefixes is displayed where the labels are shown as aggregate and the prefix is shown as IPv6.

Example:

Router> show mpls forwarding-table

**Step 4** show ipv6 cef [ipv6-prefix / prefix-length] | [interface-type interface-number] | [longer-prefixes | similar-prefixes | detail | internal | platform | epoch | source] | (Optional) Displays FIB entries based on IPv6 address information.

- In this example, label information from the Cisco Express Forwarding table for prefix 2001:DB8:DDDD::/64 is displayed.

Example:

Router> show ipv6 cef 2001:DB8:DDDD::/64

**Step 5** show ipv6 route [ipv6-address | ipv6-prefix / prefix-length] [protocol | interface-type interface-number] | (Optional) Displays the current contents of the IPv6 routing table.

Example:

Router> show ipv6 route

Output Examples

- Output Examples, page 11

**Sample Output from the show bgp ipv6 Command**

This example shows output information about an IPv6 route using the `show bgp ipv6` command with an IPv6 prefix:

```
Router# show bgp ipv6 2001:DB8:DDDD::/48
BGP routing table entry for 2001:DB8:DDDD::/48, version 15
Paths: (1 available, best #1, table Global-IPv6-Table)
  Not advertised to any peer
  Local ::FFFF:192.168.99.70 (metric 20) from 192.168.99.70 (192.168.99.70)
  Origin IGP, localpref 100, valid, internal, best
```

**Sample Output from the show bgp ipv6 neighbors Command**

This example shows output information about a BGP peer, including the "IPv6 label" capability, using the `show bgp ipv6 neighbors` command with an IP address:

```
Router# show bgp ipv6 neighbors 192.168.99.70
BGP neighbor is 192.168.99.70, remote AS 65000, internal link
  BGP version 4, remote router ID 192.168.99.70
  BGP state - Established, up for 00:05:17
  Last read 00:00:09, hold time is 0, keepalive interval is 60 seconds
```
Neighbor capabilities:
  Route refresh: advertised and received
  Address family IPv6 Unicast: advertised and received
  ipv6 MPLS Label capability: advertised and received
Received 54 messages, 0 notifications, 0 in queue
Sent 55 messages, 1 notifications, 0 in queue
Default minimum time between advertisement runs is 5 seconds
For address family: IPv6 Unicast
  BGP table version 21880, neighbor version 21880
  Index 1, Offset 0, Mask 0x2
  Route refresh request: received 0, sent 0
  77 accepted prefixes consume 4928 bytes
  Prefix advertised 4303, suppressed 0, withdrawn 1328
  Number of NLRIs in the update sent: max 1, min 0

Sample Output from the show mpls forwarding-table Command

This example shows output information linking the MPLS label with prefixes using the `show mpls forwarding-table` command. If the 6PE feature is configured, the labels are aggregated because there are several prefixes for one local label, and the prefix column contains "IPv6" instead of a target prefix.

```
Router# show mpls forwarding-table
Local Outgoing  Prefix          Bytes tag Outgoing       Next Hop
   tag  tag or VC  or Tunnel Id      switched  interface
  16    Aggregate  IPv6            0
  17    Aggregate  IPv6            0
  18    Aggregate  IPv6            0
  19    Pop tag    192.168.99.64/30 0       Se0/0         point2point
  20    Pop tag    192.168.99.70/32 0       Se0/0         point2point
  21    Pop tag    192.168.99.200/32 0      Se0/0         point2point
  22    Aggregate  IPv6            5424
  23    Aggregate  IPv6            3576
  24    Aggregate  IPv6            2600
```

Sample Output from the show bgp ipv6 Command

This example shows output information about the top of the stack label with label switching information using the `show bgp ipv6` command with the `labels` keyword:

```
Router# show bgp ipv6 labels
Network          Next Hop           In tag/Out tag
2001:DB8:DDDD::/64 ::FFFF:192.168.99.70  notag/20
```

Sample Output from the show ipv6 cef Command

This example shows output information about labels from the Cisco Express Forwarding table using the `show ipv6 cef` command with an IPv6 prefix:

```
Router# show ipv6 cef 2001:DB8:DDDD::/64
2001:DB8:DDDD::/64
  nexthop ::FFFF:192.168.99.70
  fast tag rewrite with Se0/0, point2point, tags imposed {19 20}
```

Sample Output from the show ipv6 route Command

This example shows output information from the IPv6 routing table using the `show ipv6 route` command. The output shows the IPv6 MPLS virtual interface as the output interface of IPv6 routes forwarded across the MPLS cloud. In this example using the routers in the figure above, the output is from the 6PE1 router.

The 6PE2 router has advertised the IPv6 prefix of 2001:DB8:ddddd::/48 configured for the CE2 router and the next-hop address is the IPv4-compatible IPv6 address ::ffff:192.168.99.70, where 192.168.99.70 is the IPv4 address of the 6PE2 router.

```
Router# show ipv6 route
```
Configuration Examples for IPv6 over MPLS

The following examples show 6PE configuration examples for three of the routers shown in the figure above and used in the Specifying the Source Address Interface on a 6PE Router, page 5 and Binding and Advertising the 6PE Label to Advertise Prefixes, page 7 sections.

- Example: Customer Edge Router, page 13
- Example: Provider Edge Router, page 13
- Example: Core Router, page 14

Example: Customer Edge Router

This example shows that the serial interface 0/0 of the customer edge router--CE1 in the figure above--is connected to the service provider and is assigned an IPv6 address. IPv6 is enabled and a default static route is installed using the IPv6 address of serial interface 0/0 of the 6PE1 router.

```
ip cef
!
ipv6 unicast-routing
!
interface Serial 0/0
  description to_6PE1_router
  no ip address
  ipv6 address 2001:DB8:FFFF::2/64
  !
ipv6 route ::/0 Serial 0/0 FE80::210:XXXX:FEE1:1001
```

Example: Provider Edge Router

The 6PE router--Router 6PE1 in the figure above--is configured for both IPv4 and IPv6 traffic. Ethernet interface 0/0 is configured with an IPv4 address and is connected to a router in the core of the network--router P1 in the figure above. Integrated IS-IS and TDP configurations on this router are similar to the P1 router.

Router 6PE1 exchanges IPv6 routing information with another 6PE router--Router 6PE2 in the figure above--using internal BGP (iBGP) established over an IPv4 connection so that all the `neighbor` commands use the IPv4 address of the 6PE2 router. All the BGP peers are within autonomous system 65000, so synchronization with IGP is turned off for IPv4. In IPv6 address family configuration mode, synchronization is disabled by default.

IPv6 and Cisco Express Forwarding for IPv6 are enabled, the 6PE2 neighbor is activated, and aggregate label binding and advertisement is enabled for IPv6 prefixes using the `neighbor send-label` command. Connected and static IPv6 routes are redistributed using BGP. If IPv6 packets are generated in the local router, the IPv6 address for MPLS processing will be the address of loopback interface 0.
This example shows that the serial interface 0/0 connects to the customer and the IPv6 prefix delegated to the customer is 2001:DB8:ffff::/48, which is determined from the service provider IPv6 prefix. A static route is configured to route IPv6 packets between the 6PE route and the CE router.

```

**Example: Core Router**

This example shows that the router in the core of the network--Router P in the figure above--is running MPLS, IS-IS, and IPv4 only. The Ethernet interfaces are configured with IPv4 address and are connected to the 6PE routers. IS-IS is the IGP for this network and the P1 and 6PE routers are in the same IS-IS area 49.0001. TDP and tag switching are enabled on both the Ethernet interfaces. Cisco Express Forwarding is enabled in global configuration mode.

```plaintext
ip cef

tag-switching tdp router-id Loopback0

interface Loopback0
  ip address 192.168.99.200 255.255.255.255

interface Ethernet0/0
description to_6PE1
  ip address 192.168.99.2 255.255.255.252
  ip router isis
tag-switching ip

interface Ethernet0/1
description to_6PE2
```
ip address 192.168.99.66 255.255.255.252
ip router isis
tag-switching ip
router isis
passive-interface Loopback0
net 49.0001.1921.6809.9200.00

Where to Go Next

If you want to further customize your MPLS network, refer to the Cisco IOS IP Switching Configuration Guide.

Feature Information for Implementing IPv6 over MPLS

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
