

# Enabling ISG to Interact with External Policy Servers

---

**Last Updated: December 19, 2012**

Intelligent Services Gateway (ISG) is a software feature set that provides a structured framework in which edge devices can deliver flexible and scalable services to subscribers. This document describes how to enable the ISG to retrieve session policies or accept dynamic updates to session policies from external policy servers.

- [Finding Feature Information, page 1](#)
- [Restrictions for ISG Interaction with External Policy Servers, page 1](#)
- [Information About ISG Interaction with External Policy Servers, page 2](#)
- [How to Enable ISG to Interact with External Policy Servers, page 3](#)
- [Configuration Examples for ISG Interaction with External Policy Servers, page 8](#)
- [Additional References, page 9](#)
- [Feature Information for ISG Interaction with External Policy Servers, page 10](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Restrictions for ISG Interaction with External Policy Servers

The ISG and external policy servers should be available in the same virtual routing and forwarding (VRF) instance.

# Information About ISG Interaction with External Policy Servers

- [Initial and Dynamic Authorization, page 2](#)
- [Triple Key Authentication for ISG, page 2](#)

## Initial and Dynamic Authorization

ISG works with external devices, referred to as *policy servers* that store per-subscriber and per-service information. ISG supports two models of interaction between the ISG and external policy servers: initial authorization and dynamic authorization.

In the initial authorization model, ISG must retrieve policies from the external policy server at specific points in a session. In this model, the external policy server is typically an authentication, authorization, and accounting (AAA) server that uses RADIUS. ISG is the RADIUS client. Instead of a AAA server, some systems use a RADIUS proxy component that converts to other database protocols, such as Lightweight Directory Access Protocol (LDAP).

The dynamic authorization model allows the external policy server to dynamically send policies to ISG. These operations can be initiated in-band by subscribers (through service selection) or through the actions of an administrator, or applications can change policies on the basis of some algorithm (for example, change session quality of service (QoS) at a certain time of day). This model is facilitated by the Change of Authorization (CoA) RADIUS extension. CoA introduces peer-to-peer capability to RADIUS that enables ISG and the external policy server to act as the RADIUS client and server respectively.

## Triple Key Authentication for ISG

Triple key authentication is a method of authenticating users based on their username, password, and location after ISG redirects them to the Cisco Service Management Engine (SME) portal. The SME server provides the location based on the source IP address of the subscriber being authenticated. Before the Triple Key Authentication Support feature was introduced, users were authenticated only on the basis of the username and password (two-key authentication). The Triple Key Authentication Support feature also eases migration from Service Selection Gateway (SSG) to an ISG platform because SSG uses triple key authentication.

For SSG, the Cisco Subscriber Edge Services Manager (SESM) server populates RADIUS attribute 31 (calling-station ID) in the user-login request that it sends to the SSG with a string containing the subscriber's location. The SSG then includes this location string in the access-request message that it sends to the RADIUS server where the login is authenticated based on the username, password, and location string.

With ISG triple key authentication, the ISG sends the location string within a Cisco vendor-specific attribute (VSA) that is included in the access-request message to the RADIUS server.

The location information is received from SME as Cisco VSA 250. This location information is included in session authentication requests, session accounting requests from the ISG, and prepaid authorization requests.

The table below shows the Cisco vendor-specific non-AVPair attribute used for triple key authentication.

**Table 1** Cisco Vendor-Specific Non-AVPair Attribute

Sub-AttrID	Attribute Type	Value	Function	Example	Used in
250	account-info	L<location-string>	Third key in triple key authentication	LWiFiHotSpot001	Acc-Req CoA Req Accounting

## How to Enable ISG to Interact with External Policy Servers

- [Configuring ISG as a AAA Client, page 3](#)
- [Configuring ISG as a AAA Server, page 5](#)
- [Enabling the Location VSA for Triple Key Authentication, page 7](#)

### Configuring ISG as a AAA Client

Perform this task to configure AAA method lists and enable ISG to retrieve policies from a AAA server. This task must be performed for both initial and dynamic authorization models.

The servers and server groups referenced by the AAA methods must be configured.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa authentication login** { default | list-name } method1 [method2...]
4. **aaa authentication ppp** { default | list-name } method1 [method2...]
5. **aaa authorization** { network | exec | commands level | reverse-access | configuration } { default | list-name } [method1 [method2...]]
6. **aaa authorization subscriber-service** { default { cache | group | local } | list-name } method1 [method2...]
7. **aaa service-profile key username-with-nasport**
8. **aaa accounting** { auth-proxy | system | network | exec | connection | commands level } { default | list-name } [vrf vrf-name] { start-stop | stop-only | none } [broadcast] group group-name
9. **end**

#### DETAILED STEPS

Command or Action	Purpose
<b>Step 1</b> enable  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

Command or Action	Purpose
<p><b>Step 2</b> <code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>	Enters global configuration mode.
<p><b>Step 3</b> <code>aaa authentication login {default   list-name} method1 [method2...]</code></p> <p><b>Example:</b></p> <pre>Router(config)# aaa authentication login PPP1 group radius</pre>	Specifies one or more AAA authentication methods to be used at login.
<p><b>Step 4</b> <code>aaa authentication ppp {default   list-name} method1 [method2...]</code></p> <p><b>Example:</b></p> <pre>Router(config)# aaa authentication ppp default group radius</pre>	Specifies one or more AAA authentication methods for use on serial interfaces that are running PPP.
<p><b>Step 5</b> <code>aaa authorization {network   exec   commands level   reverse-access   configuration} {default   list-name} [method1 [method2...]]</code></p> <p><b>Example:</b></p> <pre>Router(config)# aaa authorization network NET1 radius</pre>	Specifies one or more AAA authorization methods to be used for restricting subscriber access to a network.
<p><b>Step 6</b> <code>aaa authorization subscriber-service {default {cache   group   local}   list-name} method1 [method2...]</code></p> <p><b>Example:</b></p> <pre>Router(config)# aaa authorization subscriber-service default local group radius</pre>	<p>Specifies one or more AAA authorization methods for ISG to use in providing a service.</p> <ul style="list-style-type: none"> <li>The <b>default</b> keyword used with either the <b>cache</b>, <b>group</b> or <b>local</b> keywords selects the default cached-group, server group or local database respectively, for the authorization method.</li> </ul>
<p><b>Step 7</b> <code>aaa service-profile key username-with-nasport</code></p> <p><b>Example:</b></p> <pre>Router(config)# aaa service-profile key username-with-nasport</pre>	Configures the service profile parameters for a AAA session.

Command or Action	Purpose
<p><b>Step 8</b> <code>aaa accounting {auth-proxy   system   network   exec   connection   commands level} {default   list-name} [vrf vrf-name] {start-stop   stop-only   none} [broadcast] group group-name</code></p> <p><b>Example:</b></p> <pre>Router(config)# aaa accounting network default start-stop group radius</pre>	<p>Enables AAA accounting of requested services for billing or security purposes.</p>
<p><b>Step 9</b> <code>end</code></p> <p><b>Example:</b></p> <pre>Router(config)# end</pre>	<p>Exits global configuration mode.</p>

## Configuring ISG as a AAA Server

Dynamic authorization allows a policy server to dynamically send policies to ISG. Perform this task to configure ISG as a AAA server and enable dynamic authorization.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa server radius dynamic-author`
4. `client {name | ip-address} [key [0 | 7] word] [vrf vrf-id]`
5. `port port-number`
6. `server-key [0 | 7] word`
7. `auth-type {all | any | session-key}`
8. `ignore {server-key | session-key}`
9. `end`

### DETAILED STEPS

Command or Action	Purpose
<p><b>Step 1</b> <code>enable</code></p> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

Command or Action	Purpose
<p><b>Step 2</b> <code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Router# configure terminal</pre>	<p>Enters global configuration mode.</p>
<p><b>Step 3</b> <code>aaa server radius dynamic-author</code></p> <p><b>Example:</b></p> <pre>Router(config)# aaa server radius dynamic-author</pre>	<p>Configures ISG as a AAA server and enters dynamic authorization local server configuration mode.</p>
<p><b>Step 4</b> <code>client {name   ip-address} [key [0   7] word] [vrf vrf-id]</code></p> <p><b>Example:</b></p> <pre>Router(config-locsvr-da-radius)# client 10.76.86.90 key cisco</pre>	<p>Specifies a client with which ISG will be communicating.</p>
<p><b>Step 5</b> <code>port port-number</code></p> <p><b>Example:</b></p> <pre>Router(config-locsvr-da-radius)# port 1600</pre>	<p>Specifies the RADIUS server port.</p> <ul style="list-style-type: none"> <li>• Default is 1700.</li> </ul>
<p><b>Step 6</b> <code>server-key [0   7] word</code></p> <p><b>Example:</b></p> <pre>Router(config-locsvr-da-radius)# server-key cisco</pre>	<p>Specifies the encryption key shared with the RADIUS client.</p>
<p><b>Step 7</b> <code>auth-type {all   any   session-key}</code></p> <p><b>Example:</b></p> <pre>Router(config-locsvr-da-radius)# auth-type all</pre>	<p>Specifies the attributes to be used for session authorization.</p>
<p><b>Step 8</b> <code>ignore {server-key   session-key}</code></p> <p><b>Example:</b></p> <pre>Router(config-locsvr-da-radius)# ignore session-key</pre>	<p>Configures ISG to ignore the shared encryption key or attribute 151.</p>

Command or Action	Purpose
<b>Step 9</b> end  <b>Example:</b> Router(config-locsvr-da-radius)# end	Exits dynamic authorization local server configuration mode.

## Enabling the Location VSA for Triple Key Authentication

Perform this task to enable ISG to include the location VSA in authentication and accounting requests.

### SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. radius-server vsa send accounting
5. radius-server vsa send authentication
6. end

### DETAILED STEPS

Command or Action	Purpose
<b>Step 1</b> enable  <b>Example:</b> Router> enable	Enters privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b> configure terminal  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b> aaa new-model  <b>Example:</b> Router(config)# aaa new-model	Enables AAA.

Command or Action	Purpose
<b>Step 4</b> <b>radius-server vsa send accounting</b>  <b>Example:</b> Router(config)# radius-server vsa send accounting	Enables ISG to recognize and use accounting VSAs as defined by RADIUS attribute 26.
<b>Step 5</b> <b>radius-server vsa send authentication</b>  <b>Example:</b> Router(config)# radius-server vsa send authentication	Enables ISG to recognize and use authentication VSAs as defined by RADIUS attribute 26.
<b>Step 6</b> <b>end</b>  <b>Example:</b> Router(config)# end	Exits to privileged EXEC mode.

## Configuration Examples for ISG Interaction with External Policy Servers

- [Example: Enabling ISG to Interact with External Policy Servers, page 8](#)
- [Example: Enabling the Location VSA for Triple Key Authentication, page 9](#)

### Example: Enabling ISG to Interact with External Policy Servers

The following example shows how to configure ISG as a AAA client.

```
aaa group server radius CAR_SERVER
  server 10.100.2.36 auth-port 1812 acct-port 1813

aaa authentication login default none
aaa authentication login IP_AUTHEN_LIST group CAR_SERVER
aaa authentication ppp default group CAR_SERVER
aaa authorization network default group CAR_SERVER
aaa authorization subscriber-service default local group radius
aaa accounting network default start-stop group CAR_SERVER
```

The following example shows how to configure ISG as a AAA server.

```
aaa server radius dynamic-author
  client 10.76.86.90 server-key cisco
  port 1600
  server-key cisco
  auth-type all
  ignore session-key
```

## Example: Enabling the Location VSA for Triple Key Authentication

The following example shows how to enable ISG to use VSAs for accounting and authentication.

```
aaa new-model
radius-server vsa send accounting
radius-server vsa send authentication
```

The following example shows an authentication record with the session information, including the location attribute. You can display this output by using the **debug radius accounting** command or the **gw-accounting syslog** command.

```
Device# debug radius accounting

## Feature Information for ISG Interaction with External Policy Servers

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 2** Feature Information for ISG Interaction with External Policy Servers

Feature Name	Releases	Feature Information
ISG-Policy Control Policy Server CoA	15.1(1)SG	This feature provides ISG support for the RADIUS Change of Authorization (CoA) extension, which facilitates dynamic authorization.  This feature was integrated into Cisco IOS Release 15.1(1)SG.

Feature Name	Releases	Feature Information
ISG-Session Lifecycle Packet of Disconnect (POD)	15.1(1)SG	<p>This feature enables an external policy server to terminate an ISG session when it receives a RADIUS Packet of Disconnect (POD).</p> <p>This feature was integrated into Cisco IOS Release 15.1(1)SG.</p>
