Service Provider WiFi: Support for Integrated Ethernet Over GRE

Generic Routing Encapsulation (GRE) is a tunneling protocol that encapsulates a wide variety of network layer protocols inside virtual point-to-point links over a Layer 3 IPv4 or Layer 3 IPv6 access network.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Ethernet Over GRE

Ethernet over GRE (EoGRE) is a new aggregation solution for aggregating WiFi traffic from hotspots. This solution enables customer premises equipment (CPE) devices to bridge the Ethernet traffic coming from an end host, and encapsulate the traffic in Ethernet packets over an IP GRE tunnel. When the IP GRE tunnels are terminated on a service provider broadband network gateway, the end host’s traffic is terminated and subscriber sessions are initiated for the end host.

The following figure shows the structure of the Ethernet over GRE.
Restrictions for Configuring Ethernet Over GRE

The following features are not supported on the Cisco ASR 1000 Series Aggregation Services Routers:

- IPsec tunnel between the Cisco ASR 1000 Series Aggregation Services Routers and the CPE devices
- Native multicast coexistence for subscribers
- Per-CPE QoS
- IPv6 subscriber
- The Cisco Intelligent Services Gateway (ISG) RADIUS proxy initiator
- QinQ tag for the inner L2 frame
- High Availability is not supported if ISG is not configured.
- If the VLAN priority tag inside the EoGRE packet is set to a nonzero value, iWAG ignores the packet

Prerequisites for Configuring Ethernet Over GRE

Before you configure the Ethernet over GRE feature on the Cisco ASR 1000 Series Aggregation Services Routers, ensure that the following prerequisites are met:

- A physical interface or dot1Q interface should be configured.
- The ISG policy should not be applied to the physical interface.

Information About Configuring Ethernet Over GRE

The Cisco ASR 1000 Series Aggregation Services Routers serve as a service provider broadband network gateway that:
- Terminates IPv4 or IPv6 GRE tunnels.
- Manages the subscriber session for end-host clients.

The EoGRE feature works with legacy residential gateways and CPE devices to terminate the Ethernet L2 traffic in the Cisco ASR 1000 Series Aggregation Services Routers. When configured as an intelligent Wireless Access Gateway (iWAG) with EoGRE access tunneling support, the Cisco ASR 1000 Series Aggregation Services Routers can extend mobility and the ISG services in support of these legacy devices.

The following figure shows the structure of the EoGRE feature with PMIP/GTP integrated for mobility service.

Figure 2: Structure of the EoGRE Feature with PMIP/GTP Integrated for Mobility Service

The following figure shows the structure of the EoGRE feature for simple IP service.
The EoGRE feature supports the following deployments:

- EoGRE Deployment with PMIPv6 Integrated for Mobility Service
- EoGRE Deployment with GTP Integrated for Mobility Service
- EoGRE Deployment with ISG Integrated for Simple IP Service

**EoGRE Deployment with PMIPv6 Integrated for Mobility Service**

Proxy Mobile IPv6 (PMIPv6) provides mobility service to the mobile nodes that are connected to the Mobile Access Gateway (MAG) via an EoGRE tunnel. The following figure shows the structure of the EoGRE deployment with PMIPv6 integrated for mobility service.
Mobile nodes access the mobile internet service over Wi-Fi access points. The access points are either autonomous access points or are connected to the Cisco Wireless LAN Controller (WLC). These access points and WLCs are used as residential gateways or CPE devices. CPEs are preconfigured with a point-to-multipoint GRE IP tunnel to the Cisco ASR 1000 Series Aggregation Services Routers as the MAG. The tunnel from the CPE device can be configured with a static GRE key. The CPEs are provisioned to forward the Ethernet traffic from both public and private customers to the GRE tunnel, and to add a VLAN tag on the Ethernet frame before forwarding the traffic.

As with regular PMIPv6 deployments, the Cisco ASR 1000 Series Aggregation Services Routers can create IP sessions on EoGRE access tunnels similar to the regular IP sessions on the physical Ethernet interfaces, and allocate IP addresses for mobile nodes, either locally or in the proxy mode. Mobility service is provided to the mobile nodes and the tunneled Ethernet traffic is forwarded via IP tunnels to the Local Mobility Anchor (LMA).

When you ping a mobile node from the MAG with a packet size that is larger than that of the path maximum transmission unit (PMTU) that is configured with the DF bit set, the packet will be dropped. However, you will not get the return type as M.M.M (could not fragment). This is reflected in the log messages or error messages.

For more information about PMIPv6 and the ISG configurations for the iWAG, see the Intelligent Wireless Gateway Configuration Guide.

**EoGRE Deployment with GTP Integrated for Mobility Service**

GPRS Tunneling Protocol (GTP) provides mobility service to the mobile nodes that are connected to the iWAG via an EoGRE tunnel, as shown in the following figure.
Figure 5: Structure of the EoGRE Deployment with GTP Integrated for Mobility Service

For more information about the GTP and ISG configurations for the iWAG, see the Intelligent Wireless Gateway Configuration Guide.

**EoGRE Deployment with ISG Integrated for Simple IP Service**

The ISG provides simple IP service to mobile nodes that are connected to ISG via the EoGRE tunnel, as shown in the following figure. The Cisco ASR 1000 Series Aggregation Services Routers use the ISG framework to allocate IP sessions for authenticated subscribers. Simple IP subscribers are provided ISG services, including Internet access, but are not provided access to mobility services via GTP or PMIPv6.

Figure 6: Structure of the EoGRE Deployment with ISG Integrated for Simple IP Service
Supported Features

The following features are supported as part of the EoGRE feature on the Cisco ASR 1000 Series Aggregation Services Routers:

- Ethernet over GRE traffic termination on the routers
- Frames can have up to one dot1Q VLAN tag
- L2-connected IPv4 mobile nodes
- GRE tunnel for IPv4 or IPv6
- ISG and PMIPv6 or GTP integrated with the EoGRE tunnel
- ISG initiator-unclassified MAC, DHCP, DNAv4
- Subscriber roaming

How to Configure the EoGRE Feature

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-name
4. ip unnumbered loopback interface-name or ip address ip-address
5. tunnel source interface-type interface-number
6. (For simple IP mode) mac-address H.H.H
7. tunnel mode ethernet gre ipv4 or tunnel mode ethernet gre ipv6
8. (Optional) tunnel vlan vlan-id
9. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables the privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Enter your password, if prompted.</td>
</tr>
<tr>
<td></td>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>interface interface-name</td>
<td>Specifies the logical interface for the EoGRE tunnel.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# interface Tunnel 0</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 4</th>
<th>ip unnumbered loopback interface-name or ip address ip-address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Router(config-if)# ip unnumbered loopback 0 or Router(config-if)# ip address 20.1.1.2 255.255.255.0</td>
</tr>
</tbody>
</table>

**Purpose:**

For PMIPv6 and GTP scenarios, an unnumbered address or a specified IP address can be configured on the tunnel interface. For a simple IP scenario, only a specified IP address can be configured on the tunnel interface. This IP address can be used as a default gateway IP address.

<table>
<thead>
<tr>
<th>Step 5</th>
<th>tunnel source interface-type interface-number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Router(config-if)# tunnel source Loopback 0</td>
</tr>
</tbody>
</table>

**Purpose:**

Sets the source interface for the EoGRE tunnel interface.

<table>
<thead>
<tr>
<th>Step 6</th>
<th>(For simple IP mode) mac-address H.H.H</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Router(config-if)# mac-address 0000.5e00.5213</td>
</tr>
</tbody>
</table>

**Purpose:**

Sets the source MAC address for the EoGRE tunnel interface. The MAC address is mandatory for simple IP deployment. For PMIPv6/GTP, the default MAC address associated with EoGRE Tunnel is 0000.5e00.5213.

<table>
<thead>
<tr>
<th>Step 7</th>
<th>tunnel mode ethernet gre ipv4 or tunnel mode ethernet gre ipv6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Router(config-if)# tunnel mode ethernet gre ipv4 or Router(config-if)# tunnel mode ethernet gre ipv6</td>
</tr>
</tbody>
</table>

**Purpose:**

Sets the EoGRE encapsulation mode for the tunnel interface for IPv4. or Sets the EoGRE encapsulation mode for the tunnel interface for IPv6.

<table>
<thead>
<tr>
<th>Step 8</th>
<th>(Optional) tunnel vlan vlan-id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Router(config-if)# tunnel vlan 1000</td>
</tr>
</tbody>
</table>

**Purpose:**

(Optional) Sets the VLAN ID of the EoGRE tunnel.

<table>
<thead>
<tr>
<th>Step 9</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Router(config-if)# end</td>
</tr>
</tbody>
</table>

**Purpose:**

Ends the current configuration session.

### Example: Configuring the EoGRE Feature

```bash
aaa new-model
!
aaa group server radius AAA_SERVER_CAR

    ipv4-address 192.168.199.1
!
ipv6 mobile pmipv6-mag M1 domain D1
sessionmgr
    role 3GPP
    address ipv4 9.9.9.9
interface Tunnel100
interface Tunnel200
lma LMA_5K D1
    ipv4-address 192.168.199.1
    encap gre-ipv4
!
ntp master
!
gtp
    information-element rat-type wlan
interface local GigabitEthernet1/0/0.778
apn 1
    apn-name gtp.com
    ip address ggsn 172.16.199.1
    fixed link-layer address 00ab.00cd.00ef
default-gw 20.100.254.254 prefix-len 16
dns-server 20.100.254.254
    dhcp-server 20.100.254.254
! end

You can use the following commands to check and show subscriber session information:

show ip dhcp sip statistics
show subscriber statistics
show subscriber session
show ipv6 mobile pmipv6 mag binding
show gtp pdp-context all
show interface tunnel-name
```

Feature Information for Configuring Ethernet Over GRE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
### Table 1: Feature Information for Configuring the Ethernet Over GRE Feature

| Service Provider WiFi: Integrated Ethernet Over GRE | 3.9.1S | This feature enables the Ethernet over Generic Routing Encapsulation (EoGRE) tunnel to be used as a service provider WiFi access interface from CPE devices. A Cisco ASR 1000 Series Aggregation Services Router is used as an L2 aggregator to terminate L2 traffic at the GRE tunnel interface and provide L3 services. In Cisco IOS XE Release 3.9.1S, this feature is implemented on the Cisco ASR 1000 Series Aggregation Services Routers. The following sections provide information about this feature:  
  - Information About Configuring Ethernet Over GRE, on page 2  
  - How to Configure the EoGRE Feature, on page 7 |
