Flex LSP Overview

Flex LSP also known as Associated Bidirectional LSPs is the combination of static bidirectional MPLS-TP and dynamic MPLS-TE. Flex LSP provides bidirectional label switched paths (LSPs) set up dynamically through Resource Reservation Protocol–Traffic Engineering (RSVP-TE). It does not support non-co routed LSPs.

Flex Label Switched Paths are LSP instances where the forward and the reverse direction paths are setup, monitored and protected independently and associated together during signaling. You use a RSVP Association object to bind the two forward and reverse LSPs together to form either a co-routed or non co-routed associated bidirectional TE tunnel.

You can associate a protecting MPLS-TE tunnel with either a working MPLS-TE LSP, protecting MPLS-TE LSP, or both. The working LSP is the primary LSP backed up by the protecting LSP. When a working LSP goes down, the protecting LSP is automatically activated. You can configure a MPLS-TE tunnel to operate without protection as well.

Effective Cisco IOS XE Release 3.18.1SP, Flex LSP supports inter-area tunnels with non co-routed mode.

Signaling Methods and Object Association for Flex LSPs

This section provides an overview of the association signaling methods for the bidirectional LSPs. Two unidirectional LSPs can be bound to form an associated bidirectional LSP in the following scenarios:

- No unidirectional LSP exists, and both must be established.
- Both unidirectional LSPs exist, but the association must be established.
- One unidirectional LSP exists, but the reverse associated LSP must be established.
Associated Bidirectional Non Co-routed and Co-routed LSPs

This section provides an overview of associated bidirectional non co-routed and co-routed LSPs. Establishment of MPLS TE-LSP involves computation of a path between a head-end node to a tail-end node, signaling along the path, and modification of intermediate nodes along the path. The signaling process ensures bandwidth reservation (if signaled bandwidth is lesser than 0 and programming of forwarding entries).

Path computation is performed by the head-end nodes of both the participating LSPs using Constrained Shortest Path First (CSPF). CSPF is the 'shortest path (measured in terms of cost) that satisfies all relevant LSP TE constraints or attributes, such as required bandwidth, priority and so on.

**Associated Bidirectional Non Co-routed LSPs:** A non co-routed bidirectional TE LSP follows two different paths, that is, the forward direction LSP path is different than the reverse direction LSP path. Here is an illustration.

In the above topology:

- The outer paths (in green) are working LSP pairs.
- The inner paths (in red) are protecting LSP pairs.
- Router 1 sets up working LSP to Router 3 and protecting LSP to Router 3 independently.
- Router 3 sets up working LSP to Router 1 and protecting LSP to Router 1 independently.

Non co-routed bidirectional TE LSP is available by default, and no configuration is required.

---

**Note**

In case of non co-routed LSPs, the head-end nodes relax the constraint on having identical forward and reverse paths. Hence, depending on network state you can have identical forward and reverse paths, though the bidirectional LSP is co-routed.

**Associated Bidirectional Co-routed LSPs:** A co-routed bidirectional TE LSP denotes a bidirectional tunnel where the forward direction LSP and reverse direction LSP must follow the same path, for example, the same nodes and paths. Here is an illustration.
In the above topology:

- Paths at the top of the figure (in green) indicate working co-routed LSP pairs.
- Paths at the bottom of the figure (in red) indicate protecting co-routed LSP pairs.
- Router 1 sets up working LSP to Router 3 (in red) after performing bidirectional CSPF and sends reverse explicit route object (ERO) to Router 3. Node Router 3 uses the received reverse ERO to set up reverse red working LSP to Router 1.
- Router 3 sets up protecting LSP to Router 1 (in green) after performing bidirectional CSPF and sends reverse ERO to Router 1. Node Router 1 uses the received reverse ERO to set up reverse green protecting LSP to Router 3.

**Restrictions for Flex LSP**

- Exp-null over Flex-LSP is not supported.
- Flex-LSP does not support tunnel statistics.
- VC (layer 2 VPN ckts) statistics are not supported.
- It is recommended to configure for the following timers for Flex-LSP deployments:
  
  ```
  mpls traffic-eng reoptimize timers frequency 120
  mpls traffic-eng reoptimize timers delay installation 30
  mpls traffic-eng reoptimize timers delay cleanup 90
  ```
- The `no mpls ip propagate-tcl` command is not recommended with Flex-LSP. The PREC value of BFD control packet is set to “0”. Therefore, packet prioritization cannot be done at mid-points and BFD flap can occur with traffic congestions.
- It is recommended to configure BFD timers as 10x3 during cable pull testing or in Flex LSP feature deployments.
- 50 msec convergence is not guaranteed for local shut.
- 50 msec convergence is not guaranteed without WRAP protection. WRAP protection is mandatory to achieve 50 msec convergence for remote failures.
- With scale and multiple other feature mix-up, it is possible to see higher convergence.
- TE NSR and IGP NSR are mandatory for RSP switchover.
- Flex LSP is supported with the IPv4 template.
- The `ip rsvp signalling hello` command is not mandatory and it can cause a large punt during the cutover and can lead to unexpected results like BFD flapping.
Restrictions for Non Co-routed Inter-Area Flex LSP Tunnels

- The dynamic path option feature for TE tunnels (`tunnel mpls traffic-eng path-option number dynamic`) is not supported for inter-area tunnels. An explicit path identifying the area border routers (ABRs) is required.
- The MPLS TE AutoRoute feature (`tunnel mpls traffic-eng autoroute announce`) is not supported for inter-area tunnels.
- Tunnel affinity (`tunnel mpls traffic-eng affinity`) is not supported for inter-area tunnels.
- Tunnel metric (`tunnel mpls traffic-eng path-selection metric`) is not supported for inter-area tunnels.
- The re-optimization of tunnel paths is not supported for inter-area tunnels.

How to Configure Co-routed Flex LSPs

A co-routed bidirectional packet LSP is a combination of two LSPs (one in the forward direction and the other in reverse direction) sharing the same path between a pair of ingress and egress nodes. It is established using the extensions to RSVP-TE. This type of LSP can be used to carry any of the standard types of MPLS-based traffic, including Layer 2 VPNs and Layer 2 circuits. You can configure a single BFD session for the bidirectional LSP (that is, you do not need to configure a BFD session for each LSP in each direction). You can also configure a single standby bidirectional LSP to provide a backup for the primary bidirectional LSP.

The configuration includes the following steps:

1. Enable basic MPLS Traffic Engineering on hostname PE1.
2. Map L2VPN pseudowire to a specific FLEX LSP tunnel.
3. Configure Flex LSP.
4. Enable BFD.
5. Enable Wrap and Fault OAM.
6. Enable BDIs on a core-facing interface.

Configuring Co-routed Flex LSPs

Before you begin

- You must have symmetric source and destination TE router IDs in order for bidirectional LSPs to be associated.
Tunnels attributes must be configured identically on both sides of co-routed bidirectional LSP.

Up to 250 Flex LSP tunnels are supported.

**Procedure**

1. **Enable basic MPLS Traffic Engineering on hostname PE1:**
   ```
   mpls traffic-eng tunnels
   mpls traffic-eng fault-oam
   mpls traffic-eng nsr
   router ospf 100
   router-id 1.1.1.1
   nsr
   mpls traffic-eng router-id Loopback0
   mpls traffic-eng area 0
   ```

2. **Map L2VPN pseudowire to a specific Flex LSP tunnel:**
   ```
   template type pseudowire mpls-te1 (mpls-te1 can be any name)
   encapsulation mpls
   preferred-path interface Tunnel1 disable-fallback
   bandwidth 100
   ```
   ```
   template type pseudowire mpls-te4
   encapsulation mpls
   preferred-path interface Tunnel4 disable-fallback
   bandwidth 100
   ```

3. **Configure Flex LSP:**
   ```
   interface Tunnel1
   bandwidth 1000
   ip unnumbered Loopback0
   tunnel mode mpls traffic-eng
   tunnel destination 22.22.22.22
   tunnel mpls traffic-eng autoroute announce
   tunnel mpls traffic-eng priority 7 7
   tunnel mpls traffic-eng bandwidth 1000
   tunnel mpls traffic-eng path-option 1 explicit name BDI1 bandwidth 1000
   tunnel mpls traffic-eng path-option protect 1 explicit name BACKUP1 bandwidth 1000
   tunnel mpls traffic-eng bidirectional association id 1 source-address 11.11.11.11 global-id 1
   ```
   **NOTE:** To bring up the bi-directional tunnels, association ID, source address and global ID must match on both sides of the tunnel.

   ```
   tunnel mpls traffic-eng bidirectional association type co-routed
   ip explicit-path name BD11 enable
   next-address 1.11.1.1
   next-address 10.1.2.2
   ```
   ```
   tunnel mpls traffic-eng bidirectional association type co-routed
   ip explicit-path name BACKUP1 enable
   next-address 10.3.11.10
   next-address 10.4.22.22
   ```

4. **Enable BFD**
   ```
   bfd-template single-hop BFD_FLEX
   interval min-tx 50 min-rx 50 multiplier 3
   interface Tunnel1
   ```
tunnel mpls traffic-eng bfd encap-mode gal BFD_FLEX

5. Enable Wrap and Fault OAM

interface Tunnel1
tunnel mpls traffic-eng bidirectional association type co-routed fault-oam wrap-protection

6. Enable BDIs on core-facing interface:
NOTE: Since VLANs are not supported, to represent a VLAN interface, BDI must be used towards core-facing interface.

interface BDI1
ip address 1.11.1.11 255.255.255.0
ip ospf 1 area 0
mpls traffic-eng tunnels

interface BDI4
ip address 1.11.4.11 255.255.255.0
ip ospf 1 area 0
mpls traffic-eng tunnels

Verifying the Co-routed Flex LSP Configuration

To verify the FLEX LSP tunnel summary, use the show mpls traffic-eng tunnels bidirectional-associated concise command in MPLS tunnel-te interface.

Router# show mpls traffic-eng tunnels summary
RP/0/RSP0/CP00:NCS4K-R1# show mpls traffic-eng tunnels summary

Path Selection Tiebreaker: Min-fill (default)
LSP Tunnels Process: running
RSVP Process: running
Forwarding: enabled
Periodic reoptimization: every 3600 seconds, next in 1716 seconds

How to Configure Non Co-routed Inter-area Flex LSP Tunnels

The working and protect LSPs for PE1 (head-end) is different from PE2 (tail-end).

At PE1 (head-end):

```bash
interface Tunnel1001
  ip unnumbered Loopback0
  mpls ip
  tunnel mode mpls traffic-eng
  tunnel destination 1.1.1.1
  tunnel mpls traffic-eng priority 7 7
  tunnel mpls traffic-eng bandwidth 200
  tunnel mpls traffic-eng path-option 1 explicit name ThruHunG verbatim
  tunnel mpls traffic-eng path-option protect 1 explicit name PROT1 verbatim
  tunnel mpls traffic-eng bidirectional association id 1001 source-address 1.1.1.1 global-id 1001

interface Tunnel1002
  ip unnumbered Loopback0
  mpls ip
  tunnel mode mpls traffic-eng
  tunnel destination 1.1.1.1
  tunnel mpls traffic-eng priority 7 7
  tunnel mpls traffic-eng bandwidth 200
  tunnel mpls traffic-eng path-option 1 explicit name ThruHunG verbatim
  tunnel mpls traffic-eng path-option protect 1 explicit name PROT1 verbatim
  tunnel mpls traffic-eng bidirectional association id 1002 source-address 1.1.1.1 global-id 1002

ip explicit-path name ThruTenG enable
  next-address loose 22.1.1.2
  next-address loose 10.1.1.1
  next-address loose 1.1.1.1

! ip explicit-path name ThruHunG enable
```

**Tspec:** avg rate=4K, burst=1K, peak rate=4K

**RSVP Resv Info:**
- OutLabel: GigabitEthernet0/2/0/2, 16012
- FRR OutLabel: No intf, No label
- Record Route: None
- Fspec: avg rate=8K, burst=1K, peak rate=8K
Configuring OSFP for Non Co-routed Flex LSP

**Note**

Add the new area into OSPF based on where you want the Inter-area to run.

```
router ospf 1
router-id 3.3.3.3
nsr
nsf cisco
microloop avoidance
passive-interface Loopback0
```
Verifying the Non Co-routed Inter-area Flex LSP Tunnels

At the PE1

Router# show mpls traffic-eng tunnels tunnel 1001

    10.3.2.1/32, Flags:0x0 (No Local Protection)
    Status: Policy: Accepted. Policy source(s): MPLS/TE

Step 4: Verifying Wrap Functionality

Router# show mpls traffic-eng tunnels
P2P TUNNELS/LSPs:
Name: R1_t15 (Tunnel15) Destination: 10.255.255.8
Status:
  Admin: up Oper: up Path: valid Signalling: connected
  path option 1, type explicit Primary (Basis for Setup, path weight 60)
  path option 2, type dynamic
  Path Protection: 0 Common Link(s), 0 Common Node(s)
  path protect option 1, type explicit Secondary (Basis for Protect, path weight 40)
  Lockout Info:
    Locked Out: No
Config Parameters:
  Bandwidth: 0 kbps (Global) Priority: 7 7 Affinity: 0x0/0xFFFF
  Metric Type: TE (default)
  AutoRoute: enabled LockDown: disabled Loadshare: 0 [0] bw-based
  auto-bw: disabled
  Association Type: Single Sided Bidirectional LSPs, Co-routed: YES
  Association ID: 1, Source: 1.1.1.1
  Fault-OAM: enabled, Path-Protection: ready, Wrap-Protection: enabled, Wrap-Capable: Yes

FlexLSP Event History:
Active Path Option Parameters:
Router# show mpls traffic-eng tunnels protection
P2P TUNNELS:
R1_t15
LSP Head, Tunnel15, Admin: up, Oper: up
Src 10.255.255.1, Dest 10.255.255.8, Instance 34
Fast Reroute Protection: None
Lockout Info:
Locked Out: No
Path Protection: Backup lsp in use.
Prior Working LSP details:
  LSP ID: 33 (Delayed Clean)
  Deactivates In: (2796) ms
  InLabel : -
  OutLabel : Ethernet0/1, 16
  Next Hop : 10.1.4.2
Reverse Associated LSP Information:
  Signaled Name: 10.255.255.8 15
  Tunnel: 15, Source: 10.255.255.8, Dest: 10.255.255.1, LSP: 29 State: Up
Lockout Info:
Locked out: No
Lockout Originated By: None
Association:
  Association Type: Single Sided Bidirectional LSPs
  Association ID: 1 Source: 1.1.1.1

Step 5: Verifying BFD and OAM Operations

Router# show mpls traffic-eng tunnels detail | sec Fault
Fault-OAM: enabled, Path-Protection: no protection, Wrap-Protection: disabled,
Wrap-Capable: No
Fault-OAM Events:
  LSP 4638 (deleted) bfd-delete,
    at 07:32:00 IST Fri Jun 3 2016 (1 days, 8 hours, 35 mins, 30 secs ago)
  LSP 4638 (deleted) fault-delete,
    at 07:32:08 IST Fri Jun 3 2016 (1 days, 8 hours, 35 mins, 30 secs ago)
  LSP 4638 (working) bfd-up,
    at 10:15:31 IST Thu Jun 2 2016 (2 days, 5 hours, 52 mins, 7 secs ago)
  LSP 4637 (working) bfd-delete,
    at 10:15:20 IST Thu Jun 2 2016 (2 days, 5 hours, 52 mins, 18 secs ago)
  LSP 4637 (working) fault-delete,
    at 10:15:20 IST Thu Jun 2 2016 (2 days, 5 hours, 52 mins, 18 secs ago)
  LSP 4636 (working) bfd-delete,
    at 10:15:17 IST Thu Jun 2 2016 (2 days, 5 hours, 52 mins, 21 secs ago)
  LSP 4636 (working) fault-delete,
    at 10:15:17 IST Thu Jun 2 2016 (2 days, 5 hours, 52 mins, 21 secs ago)

Router# show mpls fault-oam session end-point detail
MPLS Fault-OAM End-point Sessions

Session handle : 0x6

-------Full Output not provided ~-------

Step 6: Verifying that Pseudowire is in UP State

Router# show mpls l2transport vc vcid 1

(HEAD router)

Local intf    Local circuit    Dest address    VC ID    Status
------------- ---------------------- ------------- --------- ----------
Gi6           Eth VLAN 30       53.0.0.1        1          UP

#show mpls l2transport vc vcid 1 detail
Local interface: Gi6 up, line protocol up, Eth VLAN 30 up
Interworking type is Ethernet
Destination address: 53.0.0.1, VC ID: 1, VC status: up
   Output interface: Tu10, imposed label stack {29 29780}
   Preferred path: Tunnel10, active
   Required BW = 15000, Admitted BW = 15000
   Default path: ready
Next hop: point2point
Create time: 00:01:13, last status change time: 00:01:13
Last label FSM state change time: 00:01:13
Signaling protocol: LDP, peer 53.0.0.1:0 up
   Targeted Hello: 52.0.0.1(LDP Id) -> 53.0.0.1, LDP is UP
Graceful restart: configured and enabled
Non stop routing: configured and not enabled
-------Full Output not provided ~-------

Use the show adjacency tunnel internal command to view the software forwarding of the tunnel:

Router# show adjacency tunnel1 internal | i lsp-num

GigabitEthernet0/5/2 55.0.0.1 label 21 lsp-num 20
Path protected by GigabitEthernet0/5/3 label 22 lsp-num 21
Reopt of working: Null0 0.0.0.0 label none lsp-num 0
Reopt of protect: Null0 label none lsp-num 0
