

MPLS VPN Multipath Support for Inter-AS VPNs

The MPLS VPN Multipath Support for Inter-AS VPNs feature supports Virtual Private Network (VPN)v4 multipath for Autonomous System Boundary Routers (ASBRs) in the interautonomous system (Inter-AS) Multiprotocol Label Switching (MPLS) VPN environment. It allows load balancing of VPN traffic when you use the VPNv4 peering model for Inter-AS VPNs.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for MPLS VPN Multipath Support for Inter-AS VPNs

The following restrictions apply to configuring multipath load sharing for Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) interautonomous system (Inter-AS) Autonomous System Boundary Routers (ASBRs) exchanging VPN-IPv4 routes:

- Per-packet load balancing is not supported for this feature. Load balancing for this features works on the IP source and destination hash or on the bottom label in the label stack, depending on the platform and depth of the MPLS label stack.
- If MPLS scalability is an issue for you, we recommend that you do not enable VPNv4 multipath on ASBRs.

Information About MPLS VPN Multipath Support for Inter-AS VPNs

Load Sharing with MPLS VPN Inter-AS ASBRs

Before the MPLS VPN Interautonomous System Support feature, if multiple paths existed across Autonomous System Boundary Routers (ASBRs), the Border Gateway Protocol (BGP) executed the best path algorithm and marked only one of the paths as the best path. This path was added to the routing table and became the only path that was used for forwarding traffic between ASBRs.

The MPLS VPN Multipath Support for Inter-AS VPNs feature extends the functionality of BGP so that it can pick one path as the best path and mark the other legitimate paths between ASBRs as multipath. This allows the load sharing of traffic among the different multipaths and the best path to reach the destination. No Routing Information Base (RIB) or Cisco Express Forwarding entries are associated with the Virtual Private Network (VPN)-IPv4 prefixes.

The MPLS VPN Multipath Support for Inter-AS VPNs feature applies to ASBRs that do not have a VPN routing and forwarding (VRF) instance configuration. BGP installs a number of learned VPN-IPv4 prefixes into the Multiprotocol Label Switching (MPLS) forwarding table (LFIB). VPN-IPv4 entries in the LFIB consist of the Route Distinguisher (RD) and the IPv4 prefix and are called VPNv4 entries.

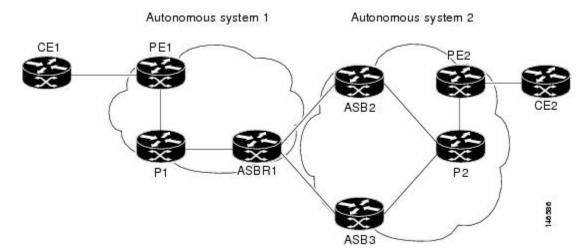

The MPLS VPN Multipath Support for Inter-AS VPNs feature requires that you configure the **maximum-paths** *number-of-paths* command in address family configuration mode. This command is used to set the number of parallel (equal-cost) routes that BGP installs in the routing table to configure multipath load sharing. The number of paths that can be configured is determined by the version of Cisco software.

The **maximum-paths** command cannot be configured with the **maximum-paths** eibgp command for the same BGP routing process.

The figure below shows an example of VPNv4 load balancing for ASBRs in an Inter-AS network. In this example, ASBR1 load balances the traffic from the CE device CE1 to CE2 using the two available links—ASBR2 and ASBR3.

Figure 1: Example of VPNv4 Load Balancing for ASBRs in an Inter-AS Network

When you configure an ASBR for VPNv4 load balancing, you must configure the **next-hop-self** command for the iBGP peers. Without this command, the next hop that is propagated to the iBGP peer is the ASBR2 address or the ASBR3 address, depending on which one BGP selects as the best path. Configuring the **next-hop-self** command provides direct VPNv4 forwarding entries in the MPLS forwarding table for the VPNv4 prefixes learned from the remote ASBRs. VPNv4 forwarding entries are not created if you do not configure the **next-hop-self** command.

Note

If the number of forwarding entries in the MPLS forwarding table on the system or on a line card is a concern for your network, we recommend that you do not enable VPNv4 multipath on ASBRs.

How to Configure MPLS VPN Multipath Support for Inter-AS VPNs

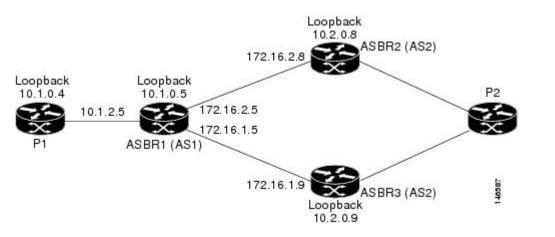

Configuring eBGP Multipath Load Sharing for MPLS VPN Inter-AS ASBRs

Perform this task to configure the external Border Gateway Protocol (eBGP) multipath load sharing for MPLS VPN Inter-AS ASBRs exchanging Virtual Private Network (VPN)-IPv4 routes. This allows for more efficient use of the label switched paths (LSPs) in an interautonomous system network because you can set up the load sharing of traffic among the different multipaths and the best path to reach the destination.

The figure below shows an eBGP multipath configuration for three VPN-IPv4 ASBRs. The links from ASBR1 to ASBR2 and ASBR3 have an eBGP VPN-IPv4 session configured. In the figure below, eBGP multipath load sharing is configured on ASBR1.

Figure 2: eBGP Multipath Configuration for Three VPN-IPv4 ASBRs

The configurations in the figure above is used as an example for this task.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. router bgp as-number
- 4. no bgp default route-target filter
- **5. neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
- 6. neighbor {*ip-address* | *peer-group-name*} update-source *interface-type interface-number*
- 7. neighbor {*ip-address* | *peer-group-name*} next-hop-self
- 8. neighbor {*ip-address* | *peer-group-name*} remote-as *as-number*
- 9. Repeat Step 8 for each BGP neighbor.
- 10. address-family vpnv4 [unicast]
- **11. neighbor** {*ip-address* | *peer-group-name*} **activate**
- **12.** neighbor {*ip-address* | *peer-group-name*} next-hop-self
- 13. neighbor {*ip-address* | *peer-group-name*} send-community [both | standard | extended]
- **14.** neighbor {*ip-address* | *peer-group-name* | *ipv6-address*} activate
- **15.** neighbor {*ip-address* | *peer-group-name*} send-community [both | standard | extended]
- 16. Repeat Steps 14 and 15 for each BGP neighbor.
- 17. maximum-paths number-paths
- 18. exit-address-family
- 19. end

DETAILED STEPS

ſ

	Command or Action	Purpose		
Step 1	enable	Enables privileged EXEC mode.		
	Example:	• Enter your password if prompted.		
	Device> enable			
Step 2	configure terminal	Enters global configuration mode.		
	Example:			
	Device# configure terminal			
Step 3	router bgp as-number	Configures an eBGP routing process and places the device in router configuration mode.		
	Example:	• The <i>as-number</i> argument indicates the number of an autonomous		
	Device(config)# router bgp 1	system that identifies the device to other BGP devices and tags the routing information passed along. The range is 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.		
Step 4	no bgp default route-target filter	Disables BGP route-target community filtering.		
	Example:	• All received VPN-IPv4 routes are accepted by the configured device. Accepting VPN-IPv4 routes is the desired behavior for a device configured as an ASBR.		
	<pre>Device(config-router)# no bgp default route-target filter</pre>	a device configured as an ASBR.		
Step 5	neighbor { <i>ip-address</i> <i>peer-group-name</i> }	Adds an entry to the BGP or multiprotocol BGP neighbor table.		
	remote-as as-number	• <i>ip-address</i> —IP address of the neighbor.		
	Example:	• <i>peer-group-name</i> —Name of a BGP peer group.		
	Device(config-router)# neighbor 10.1.0.4 remote-as 1	• <i>as-number</i> —The autonomous system to which the neighbor belongs.		
Step 6	neighbor {ip-address peer-group-name} update-source interface-type interface-number	Allows BGP sessions to use any operational interface for TCP connections.		
	Example:	• <i>ip-address</i> —IP address of the neighbor.		
	Device(config-router)# neighbor 10.1.0.4	• <i>peer-group-name</i> —Name of a BGP peer group.		
	update-source loopback 0	• <i>interface-typeinterface-number</i> —Type and number for the operational interface.		
		This example shows how to set up BGP TCP connections for the specified neighbor with the IP address of the loopback interface rather than the best local address.		

٦

	Command or Action	Purpose		
Step 7	<pre>neighbor {ip-address peer-group-name} next-hop-self</pre>	Configures the device as the next hop for a BGP neighbor or peer group.		
	<pre>Example: Device(config-router)# neighbor 10.1.0.4 next-hop-self</pre>	 <i>ip-address</i>—IP address of the BGP neighbor. <i>peer-group-name</i>—Name of a BGP peer group. 		
Step 8	<pre>neighbor {ip-address peer-group-name} remote-as as-number Example: Device(config-router)# neighbor 172.16.1.9 remote-as 2</pre>	 Adds an entry to the BGP or multiprotocol BGP neighbor table. <i>ip-address</i>—IP address of the neighbor. <i>peer-group-name</i>—Name of a BGP peer group. <i>as-number</i>—Autonomous system to which the neighbor belongs. 		
Step 9	Repeat Step 8 for each BGP neighbor.	_		
Step 10	address-family vpnv4 [unicast]	Enters address family configuration mode.		
	Example:	• unicast—Specifies a unicast prefix.		
	Device(config-router)# address-family vpnv4	This command configures a routing session to carry VPN-IPv4 addresses across the VPN backbone. Each address is globally unique by the addition of an 8-byte RD.		
Step 11	neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate	Enables the exchange of information with a neighboring device. • <i>ip-address</i> —IP address of the neighbor.		
	Example:	• <i>peer-group-name</i> —Name of a BGP peer group.		
	Device(config-router-af)# neighbor 10.1.0.4 activate			
Step 12	<pre>neighbor {ip-address peer-group-name} next-hop-self</pre>	Configures the device as the next hop for a BGP neighbor or peer group.		
	Example:	• <i>ip-address</i> —IP address of the BGP neighbor.		
	Device(config-router-af)# neighbor 10.1.0.4 next-hop-self	• <i>peer-group-name</i> —Name of a BGP peer group.		
Step 13	neighbor {ip-address peer-group-name} send-community [both standard extended]	Specifies that a communities attribute should be sent to a BGP neighbor.		
	Example: Device(config-router-af)# neighbor 10.1.0.4 send-community extended	 <i>ip-address</i>—IP address of the neighboring device. <i>peer-group-name</i>—Name of a BGP peer group. both—Specifies that both standard and extended communities will be sent. standard—Specifies that only standard communities will be sent. 		

I

	Command or Action	Purpose
		• extended—Specifies that only extended communities will be sent.
Step 14	neighbor { <i>ip-address</i> <i>peer-group-name</i> <i>ipv6-address</i> } activate	Enables the exchange of information with a BGP neighbor.
		• <i>ip-address</i> —IP address of the neighboring device.
	Example:	• <i>peer-group-name</i> —Name of a BGP peer group.
	<pre>Device(config-router-af)# neighbor 172.16.1.9 activate</pre>	• <i>ipv6-address</i> —IPv6 address of the BGP-speaking neighbor.
		This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.
Step 15	neighbor {ip-address peer-group-name} send-community [both standard extended]	Specifies that a communities attribute should be sent to a BGP neighbor.
	Example:	• <i>ip-address</i> —IP address of the neighboring device.
	Device(config-router-af)# neighbor	• <i>peer-group-name</i> —Name of a BGP peer group.
	172.16.1.9 send-community extended	• both —Specifies that both standard and extended communities will be sent.
		• standard —Specifies that only standard communities will be sent.
		• extended —Specifies that only extended communities will be sent.
Step 16	Repeat Steps 14 and 15 for each BGP neighbor.	
Step 17	maximum-paths number-paths	Configures the maximum number of parallel routes that an IP routing protocol will install into the routing table.
	Example:	• number-paths—Number of routes to install to the routing table
	Device(config-router-af)# maximum-paths 2	
Step 18	exit-address-family	Exits from address family configuration mode.
	Example:	
	<pre>Device(config-router-af)# exit-address-family</pre>	
Step 19	end	(Optional) Exits to privileged EXEC mode.
	Example:	
	Device(config-router)# end	

Example

The following example shows the configuration for external Border Gateway Protocol (eBGP) multipath for VPNv4 sessions on the ASBR1 device:

```
configure terminal
router bgp 1
no bgp default route-target filter
 neighbor 10.1.0.4 remote-as 1
neighbor 10.1.0.4 update-source Loopback 0
 neighbor 10.1.0.4 next-hop-self
 neighbor 172.16.1.9 remote-as 2
 neighbor 172.16.2.8 remote-as 2
 address-family vpnv4
 neighbor 10.1.0.4 activate
 neighbor 10.1.0.4 next-hop-self
neighbor 10.1.0.4 send-community extended
 neighbor 172.16.1.9 activate
neighbor 172.16.1.9 send-community extended
 neighbor 172.16.2.8 activate
 neighbor 172.16.2.8 send-community extended
maximum-paths 2
 exit-address-family
 end
```

Verifying eBGP Multipath Load Sharing for MPLS VPN Inter-AS ASBRs

Perform the following task to verify that the external Border Gateway Protocol (eBGP) multipath load sharing for Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) interautonomous system (Inter-AS) Autonomous System Boundary Routers (ASBRs) is operating as you expect.

The configurations in the figure above are used as an example for the task that follows.

SUMMARY STEPS

- 1. enable
- 2. show ip bgp vpnv4 all [summary]
- 3. show ip bgp vpnv4 all
- 4. show ip bgp vpnv4 [network]
- 5. show mpls forwarding-table
- 6. exit

DETAILED STEPS

Step 1

enable

Enables privileged EXEC mode. Enter your password if required.

Example:

Device> **enable** Device#

Step 2 show ip bgp vpnv4 all [summary]

Verifies that all peers are up.

Example:

Device# show ip bgp vpnv4 all summary

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
10.1.0.4	4	1	87	86	5	0	0	01:24:56	2
172.16.1.9	4	2	88	88	5	0	0	01:25:49	2
172.16.2.8	4	2	88	88	5	0	0	01:25:49	2

The output shows that all peers expected to be up are up and sending and receiving messages.

Step 3 show ip bgp vpnv4 all

Verifies that BGP has paths from both remote ASBRs.

Example:

```
Device# show ip bgp vpnv4 all
```

Network	Next Hop	Metric	LocPrf	Weight Path
•				
Route Distinguisher	: 1:105			
*>i192.168.0.1/32	10.1.0.3	11	100	0 ?
*> 192.168.0.2/32	172.16.2.8			02?
*	172.16.1.9			02?
*>i192.168.1.0	10.1.0.3	0	100	0 ?
*> 192.168.2.0	172.16.2.8			02?
*	172.16.1.9			02?

The bold entries in the output confirm that BGP has a path to ASBR2 (172.16.2.8) and to ASBR3 (172.16.1.9).

Step 4 show ip bgp vpnv4 [*network*]

Verifies that paths are marked as multipath.

Example:

Device# show ip bgp vpnv4 192.168.2.0

OSPF RT:0.0.0.0:2:0 OSPF ROUTER ID:192.168.2.2:512, mpls labels in/out 21/25

In the output, the "multipath" and "mpls labels in/out 21/25" are in bold text for example purposes only.

Step 5 show mpls forwarding-table

Verifies that MPLS forwarding is properly set up and counters are increasing when traffic is present.

Example:

Device# show mpls forwarding-table

Local Label •	2 2	Prefix or Tunnel Id	Bytes Label Switched	Outgoing interface	Next Hop
16 17 18 19 20	Pop Label Pop Label Pop Label 16 Pop Label	172.16.1.9/32 172.16.2.8/32 10.1.1.0/24 10.1.0.3/32 10.1.0.4/32	0 0 0 0	Et1/0 Et2/0 Et0/0 Et0/0 Et0/0	172.16.1.9 172.16.2.8 10.1.2.4 10.1.2.4 10.1.2.4
21	25 25	1:105:192.168.2.0 1:105:192.168.2.0	26658 1/24 \	Et1/0	172.16.1.9
22	24 24	1:105:192.168.0.2	15740	Et2/0 Et1/0	172.16.2.8 172.16.1.9
23	19	1:105:192.168.0.1	0 /32 \ 15638	Et2/0 Et0/0	172.16.2.8 10.1.2.4
24	20	1:105:192.168.1.0	32740	Et0/0	10.1.2.4

Step 6

Exits to user EXEC mode. For example:

Example:

exit

Device# **exit** Device>

Configuration Examples for MPLS VPN Multipath Support for Inter-AS VPNs

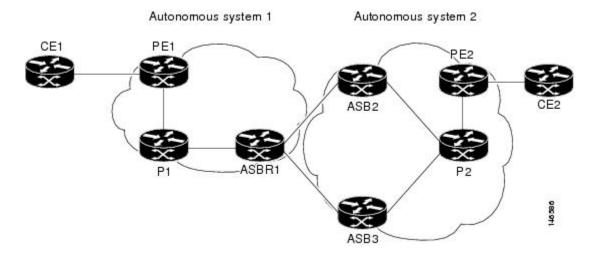

Example: Configuring eBGP Multipath Load Sharing for MPLS VPN Inter-AS ASBRs

This section includes examples that show how to configure the external Border Gateway Protocol (eBGP) multipath load sharing for Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) interautonomous system (Inter-AS) Autonomous System Boundary Routers (ASBRs) that exchange VPN-IPv4 routes.

The network topology in the figure below shows two autonomous systems, which are configured as follows:

- Autonomous system 1 contains PE1, P1, and ASBR1.
- Autonomous system 2 contains PE2, P2, ASBR2, and ASBR3.
- CE1 and CE2 belong to the same VPN, which is called VPN1.
- The P devices are route reflectors.
- ASBR1 and ASBR2 are configured with the **neighbor next-hop-self** command for the internal BGP (iBGP) neighbors.
- ASBR1 and ASBR2 are configured with the **maximum paths** commands to set up eBGP multipath load sharing.

Figure 3: Configuring eBGP Multipath Load Sharing Between MPLS Inter-AS ASBRs Exchanging VPN-IPv4 Routes

The following examples shows how to configure eBGP multipath load sharing for MPLS VPN Inter-AS ASBRs that exchange VPN-IPv4 routes. This section includes sample configurations for P1, ASBR1, ASBR2, and P2 devices.

Example: Multipath Support for Inter-AS VPNs Configuration for Autonomous System 1 CE1

The following example shows how to configure CE1 in VPN1:

```
!
hostname CE1
!
interface Loopback 1
ip address 192.168.0.1 255.255.255.255
!
interface Ethernet 1/0
description Link to PE1

The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	

Feature Information for MPLS VPN Multipath Support for Inter-AS VPNs

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Feature Name	Releases	Feature Information
MPLS VPN Multipath Support for Inter-AS VPNs	12.2(30)S 12.2(33)SRA 12.2(33)SXH 12.4(20)T	The MPLS VPN Multipath Support for Inter-AS VPNs feature supports Virtual Private Network (VPN)v4 multipath for Autonomous System Boundary Routers (ASBRs) in the interautonomous system (Inter-AS) Multiprotocol Label Switching (MPLS) VPN environment. It allows load balancing of VPN traffic when you use the VPNv4 peering model for Inter-AS VPNs. No commands were introduced or modified.

Table 1: Feature Information for MPLS VPN Multipath Support for Inter-AS VPNs

Glossary

autonomous system—A collection of networks under a common administration sharing a common routing strategy.

BGP—Border Gateway Protocol. An interdomain routing protocol that exchanges network reachability information with other BGP systems (which may be within the same autonomous system or between multiple autonomous systems).

CE device—customer edge device. A device that is part of a customer network and that interfaces to a provider edge (PE) device. CE devices do not recognize associated MPLS VPNs.

eBGP —exterior Border Gateway Protocol. A BGP between devices located within different autonomous systems. When two devices, located in different autonomous systems, are more than one hop away from one another, the eBGP session between the two devices is considered a multihop BGP.

iBGP—interior Border Gateway Protocol. A BGP between devices within the same autonomous system.

LFIB—Label Forwarding Information Base. Data structure used in MPLS to hold information about incoming and outgoing labels and associated Forwarding Equivalence Class (FEC) packets.

MPLS—Multiprotocol Label Switching. The name of the IETF working group responsible for label switching, and the name of the label switching approach it has standardized.

PE device—provider edge device. A device that is part of a service provider's network. It is connected to a customer edge (CE) device and all MPLS VPN processing occurs in the PE device.

RD—route distinguisher. An 8-byte value that is concatenated with an IPv4 prefix to create a unique VPN-IPv4 prefix.

VPN—Virtual Private Network. A secure MPLS-based network that shares resources on one or more physical networks (typically implemented by one or more service providers). A VPN contains geographically dispersed sites that can communicate securely over a shared backbone network.

VRF—VPN routing and forwarding instance. Routing information that defines a Virtual Private Network (VPN) site that is attached to a provider edge (PE) device. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table.
