

Routed Pseudo-Wire and Routed VPLS

This feature module explains how to configure Routed Pseudo-Wire and Routed VPLS .

- [Finding Feature Information, page 1](#)
- [Configuring Routed Pseudo-Wire and Routed VPLS, page 1](#)
- [Verifying Routed Pseudo-Wire and Routed VPLS Configuration, page 2](#)
- [Feature Information for Routed Pseudo-Wire and Routed VPLS, page 3](#)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Configuring Routed Pseudo-Wire and Routed VPLS

RPW and Routed VPLS can route Layer 3 traffic as well as switch Layer 2 frames for pseudowire connections between provider edge (PE) devices. Both point-to-point PE connections, in the form of Ethernet over MPLS (EoMPLS), and Virtual Private LAN Services (VPLS) multipoint PE connections are supported. The ability to route frames to and from these interfaces supports termination of a pseudowire into a Layer 3 network (VPN or global) on the same switch, or to tunnel Layer 3 frames over a Layer 2 tunnel (EoMPLS or VPLS). The feature supports faster network convergence in the event of a physical interface or device failure through the MPLS Traffic Engineering (MPLS-TE) and Fast Reroute (FRR) features. In particular, the feature enables MPLS TE-FRR protection for Layer 3 multicast over a VPLS domain.

When the RPW is configured in A-VPLS mode, TE/FRR is not supported because A-VPLS runs over ECMP and the ECMP convergence is comparable to TE/FRR.

To configure routing support for the pseudowire, configure an IP address and other Layer 3 features for the Layer 3 domain (VPN or global) in the virtual LAN (VLAN) interface configuration. The following example

assigns the IP address 10.10.10.1 to the VLAN 100 interface, and enables Multicast PIM. (Layer 2 forwarding is defined by the VFI VFI100.)

```
interface bdi 100
```

```
ip address 10.10.10.1 255.255.255.0
```

The following example assigns an IP address 20.20.20.1 of the VPN domain VFI200. (Layer 2 forwarding is defined by the VFI VFI200.)

```
interface bdi 200
```

```
ip address 20.20.20.1 255.255.255.0
```

Verifying Routed Pseudo-Wire and Routed VPLS Configuration

You can use the **show mpls platform** command to view information about a routed pseudowire and routed VPLS configuration.

The following example shows how to display information about a routed pseudowire and routed VPLS configuration:

SUMMARY STEPS

1. show mpls platform vpls 100

DETAILED STEPS

```
show mpls platform vpls 100
```

Example:

```
Device# show mpls platform vpls 100
```

```
-----

Feature Information for Routed Pseudo-Wire and Routed VPLS

Table 1: Feature Information for Routed Pseudo-Wire and Routed VPLS

Feature Name	Releases	Feature Information
Routed Pseudo-Wire and Routed VPLS	12.2(33)SRB 12.2(33)SXJ1 15.0(1)SY 15.2(4)M Cisco IOS XE Release 3.6S	<p>This feature routes Layer 3 traffic as well as switch Layer 2 frames for pseudowire connections between provider edge (PE) devices.</p> <p>In Cisco IOS Release 12.2(33)SRB, this feature was introduced on the Cisco 7600 series routers.</p> <p>In Cisco IOS Release 12.2(33)SXJ1, this feature was integrated. This feature is supported on WAN cards. The following command was modified: show mpls platform</p> <p>In Cisco IOS Release 15.0(1)SY, this feature was integrated.</p> <p>In Cisco IOS Release 15.2(4)M, this feature was integrated.</p> <p>In Cisco IOS XE Release 3.6S, support was added for the Cisco ASR 1000 Series Routers.</p>
