Configuring Route Maps to Control the Distribution of MPLS Labels Between Routers in an MPLS VPN

Route maps enable you to specify which routes are distributed with Multiprotocol Label Switching (MPLS) labels. Route maps also enable you to specify which routes with MPLS labels a router receives and adds to its Border Gateway Protocol (BGP) table.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Using Route Maps with MPLS VPNs

You can use route maps with MPLS VPN Inter-AS with Autonomous System Boundary Routers (ASBRs) exchanging IPv4 routes with MPLS labels. You cannot use route maps with MPLS VPN Inter-AS with ASBRs exchanging VPN-IPv4 addresses.
Prerequisites for Using Route Maps with MPLS VPNs

Before you configure and apply route maps, you need to create an access control list (ACL) and specify the routes that the router should distribute with MPLS labels.

Information About Route Maps in MPLS VPNs

When routers are configured to distribute routes with MPLS labels, all the routes are encoded with the multiprotocol extensions and contain MPLS labels. You can use a route map to control the distribution of MPLS labels between routers.

Route maps enable you to specify which routes are distributed with MPLS labels. Route maps also enable you to specify which routes with MPLS labels a router receives and adds to its BGP table. Route maps enable you to specify the following:

- For a router distributing MPLS labels, you can specify which routes are distributed with an MPLS label.
- For a router receiving MPLS labels, you can specify which routes are accepted and installed in the BGP table.

Route maps work with ACLs. You enter the routes into an ACL and then specify the ACL when you configure the route map. You can configure a router to accept only routes that are specified in the route map. The router checks the routes listed in the BGP update message against the list of routes in the specified ACL. If a route in the BGP update message matches a route in the ACL, the route is accepted and added to the BGP table.

How to Configure Route Maps in an MPLS VPN

Perform the following tasks to enable routers to send MPLS labels with the routes specified in the route maps:

Configuring a Route Map for Incoming Routes

Perform this task to create a route map to filter arriving routes. You create an ACL and specify the routes that the router should accept and add to the BGP table.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `route-map map-name [permit | deny] sequence-number`
5. `match ip address {access-list-number [access-list-number... | access-list-name...] access-list-name [access-list-number... | access-list-name] | prefix-list prefix-list-name [prefix-list-name...]}`
6. `match mpls-label`
7. `exit`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | **enable** | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| | **Example:**  
Router> enable | |
| **Step 2** | **configure terminal** | Enters global configuration mode. |
| | **Example:**  
Router# configure terminal | |
| **Step 3** | **router bgp as-number** | Configures a BGP routing process and enters router configuration mode.  
- The `as-number` argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535. |
| | **Example:**  
Router(config)# router bgp 100 | |
| **Step 4** | **route-map map-name [permit | deny] sequence-number** | Enters route map configuration mode and creates a route map with the name you specify.  
- The `map-name` argument identifies the name of the route map.  
- The `permit` keyword allows the actions to happen if all conditions are met.  
- A `deny` keyword prevents any actions from happening if all conditions are met.  
- The `sequence-number` argument allows you to prioritize route maps. If you have multiple route maps and want to prioritize them, assign each one a number. The route map with the lowest number is implemented first, followed by the route map with the second lowest number, and so on. |
| | **Example:**  
Router(config-router)# route-map csc-mpls-routes-in permit | |
| **Step 5** | **match ip address {access-list-number [access-list-number...] access-list-name...] access-list-name [access-list-number...] [access-list-name] | prefix-list prefix-list-name [prefix-list-name...]]** | Distributes any routes that have a destination network number address that is permitted by a standard access list, an extended access list, or a prefix list, or performs policy routing on packets.  
- The `access-list-number...` argument is a number of a standard or extended access list. It can be an integer from 1 to 199. The ellipsis indicates that multiple values can be entered. |
| | **Example:**  
Router(config-route-map)# match ip address acl-in | |
Purpose of Command or Action: The `access-list-name`... argument is a name of a standard or extended access list. It can be an integer from 1 to 199. The ellipsis indicates that multiple values can be entered.

- The `prefix-list` keyword distributes routes based on a prefix list.
- The `prefix-list-name`... argument is a name of a specific prefix list. The ellipsis indicates that multiple values can be entered.

### Step 6: match mpls-label

**Example:**

```
Router(config-route-map)# match mpls-label
```

Redistributes routes that include MPLS labels if the routes meet the conditions specified in the route map.

### Step 7: exit

**Example:**

```
Router(config-route-map)# exit
```

Exits route map configuration mode and returns to global configuration mode.

---

## Configuring a Route Map for Outgoing Routes

This configuration is optional.

Perform this task to create a route map to filter departing routes. You create an access list and specify the routes that the router should distribute with MPLS labels.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `route-map map-name [permit | deny] sequence-number`
5. `match ip address {access-list-number [access-list-number...| access-list-name...] | access-list-name [access-list-number...| access-list-name | prefix-list prefix-list-name [prefix-list-name...]}]
6. `set mpls-label`
7. `exit`

<tr>
<td>Router(config-router)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Troubleshooting Tips**

You can enter a `show route-map map-name` command to verify that the route map is applied to the PE routers.

**Note**

After you make any changes to a route map, you need to reset the BGP connection for the changes to take effect.

**Configuration Examples for Route Maps in MPLS VPNs**

**Using a Route Map in an MPLS VPN Inter-AS Network Example**

In this example, a route map is applied to an autonomous system border router (ASBR) that exchanges IPv4 routes and MPLS labels with another ASBR.

- A route map called OUT specifies that the ASBR should distribute the PE1 route (ee.ee) with labels and the RR1 route (aa.aa) without labels.

- A route map called IN specifies that the ASBR should accept the PE2 route (ff.ff) with labels and the RR2 route (bb.bb) without labels.

Using a Route Map in an MPLS VPN CSC Network Example

The following example creates two route maps, which are named:

- IN for incoming routes
- OUT for outgoing routes

The route maps specify the following:

- If an IP address in an incoming BGP update message matches an IP address in access list 99, the route is added to the BGP table.
- If an IP address in an outbound BGP update message matches an IP address in access list 88, the router distributes that route.

The route maps are applied to the CSC-PE router with the address qq.0.0.1.

address-family ipv4 vrf vpn2
neighbor qq.0.0.1 remote-as 200
neighbor qq.0.0.1 activate
neighbor qq.0.0.1 as-override
neighbor qq.0.0.1 advertisement-interval 5
neighbor qq.0.0.1 route-map IN in
neighbor qq.0.0.1 route-map OUT out
neighbor qq.0.0.1 send-label

access-list 88 permit rr.rr.rr.rr
access-list 88 permit ss.ss.ss.ss
access-list 88 permit tt.tt.tt.tt
access-list 99 permit uu.uu.uu.uu
access-list 99 permit vv.vv.vv.vv
access-list 99 permit ww ww.ww.ww

route-map IN permit 1
match ip address 99
route-map OUT permit 1
match ip address 88
set mpls-label

Feature Information for Route Maps in MPLS VPNs

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
