MPLS VPN Per VRF Label

The MPLS VPN Per VRF Label feature allows you to configure a single Virtual Private Network (VPN) label for all local routes in the entire VPN routing and forwarding (VRF) domain. This MPLS VPN Per VRF Label feature incorporates a single (per VRF) VPN label that for all local routes in the VRF table.

You can enable (or disable) the MPLS VPN Per VRF Label feature in global configuration mode.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MPLS VPN Per VRF Label

- If your virtual routing and forwarding (VRF) domain has the external/internal Border Gateway Protocol (EIBGP) multipath feature or the Carrier Supporting Carrier (CSC) feature enabled, disable those features before you configure the MPLS VPN Per VRF Label feature.

- Before configuring Multiprotocol Label Switching (MPLS) Layer 3 Virtual Private Networks (VPNs), you must install MPLS, Label Distribution Protocol (LDP), and Cisco Express Forwarding in your network. All devices in the core, including the provider edge (PE) devices, must be able to support Cisco Express Forwarding and MPLS forwarding.
Restrictions for MPLS VPN Per VRF Label

- Enabling the MPLS VPN Per VRF Label feature causes Border Gateway Protocol (BGP) reconvergence, which can result in data loss for traffic coming from the Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) core.

**Note**

You can minimize network disruption by enabling this feature during a scheduled MPLS maintenance window. Also, if possible, avoid enabling this feature on a live device.

- There is no performance degradation when you configure up to 511 VRFs; however, when you add more than 511 VRFs, your network might experience some minor performance degradation (similar to the normal degradation experienced by any of the directly connected VRF prefixes present in the device).
- Per-prefix MPLS counters for VPN prefixes are lost when you enable the MPLS VPN Per VRF Label feature.
- You cannot use this feature with Carrier Supporting Carrier (CSC) and external/internal Border Gateway Protocol (EIBGP) multipath features.

Information About MPLS VPN Per VRF Label

MPLS VPN Per VRF Label Functionality

The provider edge (PE) stores both local and remote routes and includes a label entry for each route. For distributed platforms, the per-prefix labels consume memory. When there are many virtual routing and forwarding (VRF) domains and routes, the amount of memory that the per-prefix labels consume can become an issue.

The MPLS VPN Per VRF Label feature allows the advertisement of a single Virtual Private Network (VPN) label for local routes throughout the entire VRF. The device uses a new VPN label for the VRF decoding and IP-based lookup to learn where to forward packets for the PE or customer edge (CE) interfaces.

The following conditions apply when you configure the Per VRF Label feature:

- The VRF uses one label for all local routes.
- When you enable the MPLS VPN Per VRF Label feature, any existing Per VRF Aggregate label is used. If no Per VRF Aggregate label is present, the software creates a new Per VRF label.
- When you enable the MPLS VPN Per VRF Label feature, the CE device’s learned local routes will experience some data loss.

The CE does not lose data when you disable the MPLS VPN Per VRF Label feature because when you disable the feature, the configuration reverts to the default labeling configuration, which uses the Per VRF Aggregate label from the local nonCE-sourced routes.

- When you disable the MPLS VPN Per VRF Label feature, the configuration reverts to the default configuration.
• A Per VRF label forwarding entry is deleted only if the VRF or the Border Gateway Protocol (BGP) configuration is removed.

Summarization of Label Allocation Modes

The table below defines the label allocations used with various route types.

<table>
<thead>
<tr>
<th>Route Types</th>
<th>Label Mode Default</th>
<th>Label Mode: Per VRF Label Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local to the PE (connected, static route to NULL0, BGP aggregates), redistributed to BGP</td>
<td>Per VRF Aggregate label</td>
<td>Per VRF label</td>
</tr>
<tr>
<td>Locally learned from CE (through EBGP or other PE or CE protocols)</td>
<td>Per Prefix label</td>
<td>Per VRF label</td>
</tr>
</tbody>
</table>

How to Configure MPLS VPN Per VRF Label

Configuring the Per VRF Label Feature

SUMMARY STEPS

1. enable
2. configure terminal
3. mpls label mode {vrf vrf-name | all-vrfs} protocol bgp-vpnv4 {per-prefix | per-vrf}
4. end
5. show ip vrf detail

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>

<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>mpls label mode {vrf vrf-name</td>
<td>all-vrfs} protocol bgp-vpnv4 {per-prefix</td>
</tr>
</tbody>
</table>
### Command or Action

| Device(config)# mpls label mode all-vrfs protocol bgp-vpnv4 per-vrf |

### Purpose

Step 4

**Example:**

Device(config)# end

Returns to privileged EXEC mode.

Step 5

**Example:**

Device# show ip vrf detail

Displays the VRF label mode.

### Examples

The following command example shows how to verify the MPLS VPN Per VRF Label configuration:

In this example output, the **bold** text indicates the label modes:

```
Device# show ip vrf detail
VRF vpn1; default RD 1:1; default VPNID <not set>
VRF Table ID = 1
  Interfaces:
    Ethernet0/0     Serial5/0     Loopback1
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:1:1
  Import VPN route-target communities
    RT:1:1
  No import route-map
  No export route-map
  CSC is not configured.
  **VRF label allocation mode: per-vrf (Label 19)**
VRF vpn2; default RD 2:1; default VPNID <not set>
VRF Table ID = 2
  Interfaces:
    Ethernet2/0     Loopback2
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:2:1
  Import VPN route-target communities
    RT:2:1
  No import route-map
  No export route-map
  CSC is not configured.
  **VRF label allocation mode: per-vrf (Label 20)**
VRF vpn3; default RD 3:1; default VPNID <not set>
VRF Table ID = 3
  Interfaces:
    Ethernet3/0     Loopback3
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:3:1
  Import VPN route-target communities
    RT:3:1
  No import route-map
```
Configuration Examples for MPLS VPN Per VRF Label

Example: No Label Mode Default Configuration

The following example shows the default label mode configuration (no label mode).

In this example output, the **bold** text indicates the label modes:

```
Device# show ip vrf detail
VRF vpn1; default RD 1:1; default VPNID <not set>
VRF Table ID = 1
  Interfaces:
    Ethernet0/0  Serial5/0  Loopback1
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:1:1
  Import VPN route-target communities
    RT:1:1
  No import route-map
  No export route-map
  CSC is not configured.
  VRF label allocation mode: per-prefix
    per-vrf-aggr for connected and BGP aggregates (Label 19)
```
VRF vpn2; default RD 2:1; default VPNID <not set>
VRF Table ID = 2
Interfaces:
   Ethernet2/0       Loopback2
Connected addresses are not in global routing table
Export VPN route-target communities
   RT:2:1
Import VPN route-target communities
   RT:2:1
No import route-map
No export route-map
CSC is not configured.

VRF label allocation mode: per-prefix

   per-vrf-aggr for connected and BGP aggregates (Label 20)
VRF vpn3; default RD 3:1; default VPNID <not set>
VRF Table ID = 3
Interfaces:
   Ethernet3/0       Loopback3
Connected addresses are not in global routing table
Export VPN route-target communities
   RT:3:1
Import VPN route-target communities
   RT:3:1
No import route-map
No export route-map
CSC is not configured.

VRF label allocation mode: per-prefix
   per-vrf-aggr for connected and BGP aggregates (Label 23)

Example: Mixed Mode with Global Per-Prefix

For this example, the following commands set VPN 1 for per-vrf label mode, VPN 2 for per-prefix label mode, and all remaining VPNs for per-prefix (globally).

In this example output, the **bold** text indicates the label modes:

```
Device# mpls label mode vrf vpn1 protocol bgp-vpnv4 per-vrf
Device# mpls label mode vrf vpn2 protocol bgp-vpnv4 per-prefix
```

Use the following show commands to display the label mode settings:

```
Device# show ip vrf detail
VRF vpn1; default RD 1:1; default VPNID <not set>
VRF Table ID = 1
Interfaces:
   Ethernet0/0     Serial5/0     Loopback1
Connected addresses are not in global routing table
Export VPN route-target communities
   RT:1:1
Import VPN route-target communities
   RT:1:1
No import route-map
No export route-map
CSC is not configured.
VRF label allocation mode: per-vrf (Label 26)
VRF vpn2; default RD 2:1; default VPNID <not set>
VRF Table ID = 2
Interfaces:
   Ethernet2/0     Loopback2
Connected addresses are not in global routing table
Export VPN route-target communities
   RT:2:1
Import VPN route-target communities
   RT:2:1
No import route-map
No export route-map
CSC is not configured.
VRF label allocation mode: per-prefix per-vrf-aggr for connected and BGP aggregates (Label 27)
VRF vpn3; default RD 3:1; default VPNID <not set>
VRF Table ID = 3
Interfaces:
   Ethernet3/0     Loopback3
Connected addresses are not in global routing table
Export VPN route-target communities
   RT:3:1
Import VPN route-target communities
   RT:3:1
No import route-map
No export route-map
CSC is not configured.
VRF label allocation mode: per-prefix per-vrf-aggr for connected and BGP aggregates (Label 28)
```

```
Device# show ip bgp vpnv4 all label
Network       Next Hop       In label/Out label
Route Distinguisher: 1:1 (vpn1)
```
Example: Mixed Mode with Global Per-VRF

For this example, the following commands set VPN 1 for per-vrf label mode, VPN 2 for per-prefix label mode, and all remaining VPNs for per-vrf (globally).

In this example output, the **bold** text indicates the label modes:

```
Device# mpls label mode vrf vpn1 protocol bgp-vpnv4 per-vrf
Device# mpls label mode vrf vpn2 protocol bgp-vpnv4 per-prefix
Device# mpls label mode all-vrfs protocol bgp-vpnv4 per-vrf
Device# show ip vrf detail
VRF vpn1; default RD 1:1; default VPNID <not set>
VRF Table ID = 1
  Interfaces:
  Ethernet0/0  Serial5/0  Loopback1
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:1:1
  Import VPN route-target communities
    RT:1:1
  No import route-map
  No export route-map
  CSC is not configured.
  VRF label allocation mode: per-vrf (Label 26)
VRF vpn2; default RD 2:1; default VPNID <not set>
VRF Table ID = 2
  Interfaces:
  Ethernet2/0  Loopback2
  Connected addresses are not in global routing table
```
Export VPN route-target communities
   RT:2:1
Import VPN route-target communities
   RT:2:1
No import route-map
No export route-map
CSC is not configured.

**VRF label allocation mode: per-prefix**

**per-vrf-aggr for connected and BGP aggregates** (Label 27)

VRF vpn3; default RD 3:1; default VPNID <not set>
VRF Table ID = 3
Interfaces:
  Ethernet3/0   Loopback3
Connected addresses are not in global routing table
Export VPN route-target communities
   RT:3:1
Import VPN route-target communities
   RT:3:1

Feature Information for MPLS VPN Per VRF Label

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
The MPLS VPN Per VRF Label feature allows a user to configure a single VPN label for all local routes in the entire VPN routing and forwarding (VRF) domain. The feature incorporates a single (per VRF) VPN label for all local routes in the VRF table.

In Cisco IOS Release 12.2(18)SXF2, this feature was introduced. In Cisco IOS Releases 12.2(33)SRA, 12.2(33)SXH, and 12.4(6)T, this feature was integrated. In Cisco IOS XE Release 2.2, support was added for the Cisco ASR 1000 Series Routers.

The following commands were introduced or modified:

debug ip bgp vpnv4 unicast, mpls label mode.
