CHAPTER 1

Multitopology Routing

Multitopology Routing (MTR) enables you to configure service differentiation through class-based forwarding. MTR provides multiple logical topologies over a single physical network. Service differentiation can be achieved by forwarding different traffic types over different logical topologies that could take different paths to the same destination. MTR can be used, for example, to define separate topologies for voice, video, and data traffic classes.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for Multitopology Routing

- You should have a clear understanding of the physical topology and traffic classification in your network before deploying Multitopology Routing (MTR).
- MTR should be deployed consistently throughout the network. Cisco Express Forwarding or distributed Cisco Express Forwarding and IP routing must be enabled on all networking devices.
- We recommend that you deconfigure custom route configurations such as route summarization and default routes before enabling a topology and that you reapply custom route configuration only after the topology is fully enabled. This recommendation is designed to prevent traffic interruption because some destinations might be obscured during the transition. Custom route configuration is most useful when all of the more-specific routes are available in the routing table of the topology.

Restrictions for Multitopology Routing

- Only the IPv4 (unicast and multicast) address family is supported.
- Multiple unicast topologies cannot be configured within a virtual routing and forwarding (VRF) instance. However, multiple unicast topologies and a separate multicast topology can be configured under the global address space, and a separate multicast topology can be configured within a VRF.
- All topologies share a common address space. Multitopology Routing (MTR) is not intended to enable address reuse. Configuring address reuse in separate topologies is not supported.
- IP Differentiated Services or IP Precedence can be independently configured in a network where MTR is also deployed. However, MTR requires exclusive use of some subset of the differentiated services code point (DSCP) bits in the IP packet header for specific topology traffic. For this reason, simultaneous configuration must be carefully coordinated. Re-marking DSCP bits in the IP packet header is not recommended or supported on devices that contain class-specific topologies.
- Distance Vector Multicast Routing Protocol (DVMRP) CLI and functionality are not provided in Cisco software images that provide MTR support.

Information About Multitopology Routing

MTR Overview

Use Multitopology Routing (MTR) to configure service differentiation through class-based forwarding. Two primary components comprise MTR configuration: independent topology configuration and traffic classification configuration.

A topology is defined as a subset of devices and links in a network for which a separate set of routes is calculated. The entire network itself, for which the usual set of routes is calculated, is known as the base topology. The base topology (or underlying network) is characterized by the Network Layer Reachability Information (NLRI) that a device uses to calculate the global routing table to make routing and forwarding decisions. The base topology is the default routing environment that exists prior to enabling MTR.
Any additional topologies are known as class-specific topologies and are a subset of the base topology. Each class-specific topology carries a class of traffic and is characterized by an independent set of NLRI that is used to maintain a separate Routing Information Base (RIB) and Forwarding Information Base (FIB). This design allows the device to perform independent route calculation and forwarding for each topology.

MTR creates a selection of routes within a given device upon which to forward to a given destination. The specific choice of route is based on the class of the packet being forwarded, a class that is an attribute of the packet itself. This design allows packets of different classes to be routed independently from one another. The path that the packet follows is determined by classifiers configured on the devices and interfaces in the network. The figure below shows a base topology, which is a superset of the red, blue, and green topologies.

Figure 1: MTR Base Topology

The figure below shows an MTR-enabled network that is configured using the service separation model. The base topology (shown in black) uses NLRI from all reachable devices in the network. The blue, red, and purple paths each represent a different class-specific topology. Each class-specific topology calculates a separate set of paths through the network. Routing and forwarding are independently calculated based on individual sets of NLRI that are carried for each topology.

Figure 2: Defining MTR Topologies
The figure below shows that the traffic is marked at the network edge. As the traffic traverses the network, the marking is used during classification and forwarding to constrain the traffic to its own colored topology.

**Figure 3: Traffic Follows Class-Specific Forwarding Paths**

The same topology can have configured backup paths. In the figure below, the preferential path for the voice topology is represented by the solid blue line. In case this path becomes unavailable, you can configure MTR to choose the voice backup path represented by the dotted blue line. Both of these paths represent the same topology and none overlap.

**Figure 4: MTR Backup Contingencies Within a Topology**
The figure below shows the MTR forwarding model at the system level. When a packet arrives at the incoming interface, the marking is examined. If the packet marking matches a topology, the associated topology is consulted, the next hop for that topology is determined, and the packet is forwarded. If there is no forwarding entry within a topology, the packet is dropped. If the packet does not match any classifier, it is forwarded to the base topology. The outgoing interface is a function of the colored route table in which the lookup is done.

Figure 5: MTR Forwarding at the System Level

![Diagram showing MTR forwarding model]

MTR is implemented in Cisco software according to a address family and subaddress family basis. MTR supports up to 32 unicast topologies (including the base topology) and a separate multicast topology. A topology can overlap with another or share any subset of the underlying network. You configure each topology with a unique topology ID. You configure the topology ID under the routing protocol, and the ID is used to identify and group NLRI for each topology in updates for a given protocol.

Unicast Topology Support for MTR

You can configure up to 32 unicast topologies on each device. You first define the topology by entering the global-address-family command in global configuration mode. The address family and optionally the subaddress family are specified in this step. You then enter the topology command in global address family configuration mode. This command places the device in address family topology configuration mode, and the global topology configuration parameters are applied in this mode.

For each new topology that you configure on a device, you increase the total number of routes from the global routing table by the number of routes that are in each new topology [base + topology(n)]. If the device carries a large global routing table, and you plan to add a significant number of routes through the Multitopology Routing (MTR) topology configuration, you can configure the maximum routes command in address family topology configuration mode to limit the number of routes that the device accepts for a given topology and installs into the corresponding Routing Information Base (RIB).
Per-interface topology configuration parameters override configurations applied in global address family topology configuration mode and router address family topology configuration mode.

**Interface Configuration Support for MTR**

The configuration of a Multitopology Routing (MTR) topology in interface configuration mode allows you to enable or disable MTR on a per-interface basis. By default, a class-specific topology does not include any interfaces.

You can include or exclude individual interfaces by configuring the `topology` interface configuration command. You specify the address family and the topology (base or class-specific) when entering this command. The subaddress family can be specified. If no subaddress family is specified, the unicast subaddress family is used by default.

You can include globally all interfaces on a device in a topology by entering the **all/interfaces** command in routing topology configuration mode. Per-interface topology configuration applied with the `topology` command overrides global interface configuration.

The interface configuration support for MTR has these characteristics:

- **Per-interface routing configuration:** Interior Gateway Protocol (IGP) routing and metric configurations can be applied in interface topology configuration mode. Per-interface metrics and routing behaviors can be configured for each IGP.

- **Open Shortest Path First (OSPF) interface topology configuration:** Interface mode OSPF configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure an interface cost or disable OSPF routing without removing the interface from the global topology configuration.

- **Enhanced Interior Gateway Routing Protocol (EIGRP) interface topology configuration:** Interface mode EIGRP configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure various EIGRP features.

- **Intermediate System-to-Intermediate System (IS-IS) interface topology configuration:** Interface mode IS-IS configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure an interface cost or disable IS-IS routing without removing the interface from the global topology configuration.

**MTR Deployment Models**

The base topology is the superset of all topologies in the network. It is defined by Network Layer Reachability Information (NLRI) for all reachable devices regardless of the deployment model that is used. Multitopology Routing (MTR) can be deployed using the service separation MTR model, or it can deployed using the overlapping MTR model. Each model represents a different approach to deploying MTR. However, these models are not mutually exclusive. Any level of variation of a combined model can be deployed.
Service Separation MTR Model

The figure below shows the service separation model where no topologies except for the base topology (shown in black) overlap with each other. In the service separation model, each class of traffic is constrained to its own exclusive topology. This model restricts the given class of traffic to a subset of the network. This model is less configuration intensive than the overlapping MTR model because no topology-specific metrics need to be configured.

Figure 6: Service-Separation MTR Model

Overlapping MTR Model

In the overlapping Multitopology Routing (MTR) model, all topologies are configured to run over all devices in the network. This model provides the highest level of redundancy. All classes of traffic can use all links. Per-topology metrics are then configured to bias different classes of traffic to use different parts of the network. The redundancy that this model provides, however, makes it more configuration intensive than the service separation MTR model. In the figure below, all topologies are configured to run over all network devices. In this model, per-topology metrics are configured to bias the preferred routes for each topology.

Figure 7: Overlapping MTR Model

MTR Deployment Configuration

Multitopology Routing (MTR) supports both full and incremental deployment configurations. To support these options, MTR provides two different, configurable forwarding rules: strict forwarding mode for full deployment and incremental forwarding mode for an incremental deployment.
**Strict Forwarding Mode for Full Deployment of MTR**

Strict forwarding mode is the default forwarding mode in Multitopology Routing (MTR). In this mode, the device looks for a forwarding route only in the class-specific Forwarding Information Base (FIB). If no forwarding route is found, the device drops the received packet. In this mode, the device performs a longest match lookup for the topology FIB entry. This mode is designed for full deployment, where MTR is enabled on every device in the network or every device in the topology. Strict forwarding mode should be enabled after an incremental deployment transition has been completed or when all devices in the network or topology are MTR enabled. You can enable strict forwarding mode after incremental forwarding mode by entering the `no forward-base` command in address family topology configuration mode.

**Incremental Forwarding Mode for Incremental Deployment of MTR**

Incremental forwarding mode is designed to support transitional or incremental deployment of Multitopology Routing (MTR), where devices in the network are not MTR enabled. In this mode, the device looks for a forwarding entry first in the class-specific Forwarding Information Base (FIB). If an entry is not found, the device looks for the longest match in the base topology FIB. If an entry is found in the base topology FIB, the device forwards the packet on the base topology. If a forwarding entry is not found in the base topology FIB, the device drops the packet.

This mode is designed to preserve connectivity during an incremental deployment of MTR and is recommended for use only during migration (the transition from a non-MTR to an MTR-enabled network). Class-specific traffic for a given destination is forwarded over contiguous segments of the class-specific topology containing that destination; otherwise, it is forwarded over the base topology.

This forwarding mode can be enabled to support mixed networks where some devices are not configured to run MTR. You enable incremental forwarding mode by entering the `forward-base` command in address family topology configuration mode.

**Guidelines for Enabling and Disabling MTR**

The section provides guidelines and procedures for enabling or disabling Multitopology Routing (MTR) in a production network. These guidelines assume that all participating networking devices are running a software image that supports MTR. The guidelines are designed to prevent major traffic interruptions due to misconfiguration and to minimize temporary transitional effects that can occur when you introduce or remove a topology from a network. The following guidelines must be implemented in the order that they are described:

First, create a class-specific topology on all networking devices and enable incremental forwarding mode by entering the `forward-base` command in address family topology configuration mode. Configure incremental forwarding whenever a topology is introduced or removed from the network. The topology is defined as a global container at this stage. No routing or forwarding can occur within the topology. Routing protocol support should not be configured.

Second, configure classification rules for the class-specific topology. You must consistently apply classification on all devices in the topology; each device has identical classifier configuration. You activate the topology when you attach a valid classification configuration to the global topology configuration. You can use `ping` and `traceroute` commands to verify reachability for interfaces and networking devices that are in the same topology and configured with identical classification.

Third, configure routing protocol support and static routing. Configure the devices in the topology one at a time. This configuration should include an interface, router process, and routing protocol-specific metrics and filters.
Enable routing in the topology by using a physical pattern in a contiguous manner relative to a single starting point. For example, configure all interfaces on a single device, and then all interfaces on each adjacent device. Follow this pattern until the task is complete. The starting point can be on the edge or core of the network. This recommendation is designed to increase the likelihood that class-specific traffic is forwarded on the same paths in the incremental topology as it is on the full topology when MTR is completely deployed.

If your network design requires strict forwarding mode, you should disable incremental forwarding only after you configure routing on all devices in a given topology. At this stage, MTR is fully operational. Class-specific traffic is forwarded only over devices within the topology. Traffic that is not classified or destined for the topology is dropped.

When disabling a topology, reenable incremental forwarding mode. Remove custom route configuration, such as route summarization and default routes before disabling a topology, and reapply custom route configuration only after the topology is reenabled. This recommendation is designed to prevent traffic interruption because some destinations might be obscured during the transition. Custom route configuration is most useful when all of the more-specific routes are available in the routing table of the topology.

Note: These guidelines apply only when a given classifier is enabled or disabled for a given topology. All other MTR configuration, including interface and routing protocol-specific configuration (other than the topology ID) can be modified dynamically as necessary.

How to Configure Multitopology Routing

Configuring a Unicast Topology for MTR

SUMMARY STEPS

1. enable
2. configure terminal
3. global-address-family ipv4 [multicast | unicast]
4. topology {base | topology-name}
5. all-interfaces
6. forward-base
7. maximum routes number [threshold [reinstall threshold] | warning-only]
8. shutdown
9. end
10. show topology [cache [topology-id] | ha [(detail | interface | lock | router] [all | ipv4 | ipv6 | vrf vpn-instance] [ha]]]
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Example:**  
Device> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**  
Device# configure terminal | |
| **Step 3** global-address-family ipv4 [multicast | Enters global address family topology configuration mode to configure the global topology.  
• The address family for the class-specific topology is specified in this step. The subaddress family can be specified. Unicast is the default if no subaddress family is entered. |
| unicast] | |
| **Example:**  
Device(config)# global-address-family ipv4 | |
| **Step 4** topology \{base | Configures the global topology instance and enters address family topology configuration mode.  
• The base keyword is used to configure the base topology or a multicast topology.  
• The topology-name argument is entered to label a class-specific topology. Topology names are case-sensitive. For example, VOICE and voice identify two different topologies.  
• Multitopology Routing (MTR) supports 32 unicast topologies including the base topology. |
| topology-name} | |
| **Example:**  
Device(config-af)# topology VOICE | |
| **Step 5** all-interfaces | (Optional) Configures the topology instance to use all interfaces on a device.  
• By default, no interfaces are used.  
**Note** The configuration of this command does not override the topology configuration applied in interface configuration mode. |
| **Example:**  
Device(config-af-topology)# all-interfaces | |
| **Step 6** forward-base | (Optional) Configures the forwarding mode under a topology instance.  
• Strict mode (default) configures the device to look for forwarding entries only in the topology-specific Forwarding Information Base (FIB). If an entry is not found, the packet is dropped.  
• Incremental mode (enable form) configures the device to look first in the class-specific topology FIB. If a forwarding route is not found, then the device looks in the base topology FIB. |
| **Example:**  
Device(config-af-topology)# forward-base | |

</table>

### Configuring an MTR Topology in Interface Configuration Mode

**Before You Begin**

Define a topology globally before configuring the per-interface topology configuration.

**Note**

Interfaces cannot be excluded from the base topology by design. However, an Interior Gateway Protocol (IGP) can be excluded from an interface in a base topology configuration.
SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. topology ipv4 [multicast | unicast] {topology-name [disable] | base}
5. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| **Example:** Device> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** Device# configure terminal | |
| **Step 3** interface type number | Specifies the interface type and number, and enters interface configuration mode. |
| **Example:** Device(config)# interface Ethernet 0/0 | |
| **Step 4** topology ipv4 [multicast | unicast] {topology-name [disable] | base} | Enters interface topology configuration mode to configure a Multitopology Routing (MTR) topology name on an interface.  
  • Use the disable keyword to disable the topology instance on the interface. This form is used to exclude a topology configuration from an interface.  
  • If the no form of this command is used, the topology interface configuration is removed.  
  • If the no form of this command is used with the disable keyword, the topology instance is enabled on the interface. |
| **Example:** Device(config-if)# topology ipv4 VOICE | |
| **Step 5** end | Exits interface topology configuration mode and returns to privileged EXEC mode. |
| **Example:** Device(config-if-topology)# end | |
Enabling Topology Statistics Accounting for MTR

SUMMARY STEPS

1. enable
2. configure terminal
3. global-address-family ipv4 [multicast | unicast]
4. topology accounting
5. exit
6. interface type number
7. ip topology-accounting
8. end

### Monitoring Interface and Topology IP Traffic Statistics for MTR

Use any of the following commands in any order to monitor interface and topology IP traffic statistics for Multitopology Routing (MTR).

### SUMMARY STEPS

1. enable
2. show ip interface [type number] [topology {name | all | base}] [stats]
3. show ip traffic [topology {name | all | base}]
4. clear ip interface type number [topology {name | all | base}] [stats]
5. clear ip traffic [topology {name | all | base}]

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>enable</th>
<th>Enables privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| Step 2 | show ip interface [type number] [topology {name | all | base}] [stats] | (Optional) Displays IP traffic statistics for all interfaces or statistics related to the specified interface. |

**Note:** To obtain the status of an interface for both IPv4 and IPv6, specify the interface number and topology name using the show ip interface type number topology name command. To display statistics for a specific topology, specify the type and number of the interface, and then specify the topology name. To display statistics for all topologies, specify the type and number of the interface, and then specify the topology name all. To display statistics for a specific interface, specify the type and number of the interface, and then specify the topology name base.
Purpose

Command or Action

Example:
Device# show ip interface FastEthernet 1/10 stats

• If you specify an interface type and number, information for that specific interface is displayed. If you specify no optional arguments, information for all the interfaces is displayed.
• If the topology name keyword and argument are used, statistics are limited to the IP traffic for that specific topology.
• The base keyword displays the IPv4 unicast base topology.

Step 3
show ip traffic [topology {name | all | base}] (Optional) Displays global IP traffic statistics (an aggregation of all the topologies when MTR is enabled) or statistics related to a particular topology.

Example:
Device# show ip traffic topology VOICE

• The base keyword is reserved for the IPv4 unicast base topology.

Step 4
clear ip interface type number [topology {name | all | base}] [stats] (Optional) Resets interface-level IP traffic statistics.

Example:
Device# clear ip interface FastEthernet 1/10 topology all

• If the topology keyword and a related keyword are not used, only the interface-level aggregate statistics are reset.
• If all topologies need to be reset, use the all keyword as the topology name.

Step 5
clear ip traffic [topology {name | all | base}] (Optional) Resets IP traffic statistics.

Example:
Device# clear ip traffic topology all

• If no topology name is specified, global statistics are cleared.

Testing Network Connectivity for MTR

SUMMARY STEPS

1. enable
2. ping [vrf vrf-name | topology topology-name] protocol [target-address] [source-address]
3. traceroute [vrf vrf-name | topology topology-name] [protocol] destination

### Configuration Examples for Multitopology Routing

#### Example: Global Interface Configuration

The following example shows how to create a topology instance named VOICE. This topology is configured to use all operational interfaces on the device. Per the default forwarding rule (strict), only packets destined for routes in the VOICE topology Routing Information Base (RIB) are forwarded. Packets that do not have a topology-specific forwarding entry are dropped.

```plaintext
global-address-family ipv4
  topology VOICE
  all-interfaces
end
```

#### Example: Incremental Forwarding Configuration

The following example shows how to create a topology instance named VIDEO. This topology is configured to accept and install a maximum of 1000 routes in the VIDEO topology Routing Information Base (RIB).
Incremental forwarding mode is configured so that the device forwards packets over the base topology if no forwarding entry is found in the class-specific RIB.

global-address-family ipv4
topology VIDEO
  forward-base
  maximum routes 1000
end

Example: Unicast Topology Verification

The output of the show topology detail command displays information about class-specific and base topologies. This information includes the address family, associated interfaces, interface and topology status, topology name, and associated virtual routing and forwarding (VRF) instance.

Device# show topology detail

Topology: base
  Address-family: ipv4
  Associated VPN VRF is default
  Topology state is UP
  Associated interfaces:
    Ethernet0/0, operation state: UP
    Ethernet0/1, operation state: DOWN
    Ethernet0/2, operation state: DOWN
    Ethernet0/3, operation state: DOWN
    Loopback0, operation state: UP

Topology: VIDEO
  Address-family: ipv4
  Associated VPN VRF is default
  Topology state is UP
  Topology fallback is enabled
  Topology maximum route limit 1000, warning limit 90% (900)
  Associated interfaces:

Topology: VOICE
  Address-family: ipv4
  Associated VPN VRF is default
  Topology state is UP
  Topology is enabled on all interfaces
  Associated interfaces:
    Ethernet0/0, operation state: UP
    Ethernet0/1, operation state: DOWN
    Ethernet0/2, operation state: DOWN
    Ethernet0/3, operation state: DOWN
    Loopback0, operation state: UP

Topology: base
  Address-family: ipv4 multicast
  Associated VPN VRF is default
  Topology state is DOWN
  Route Replication Enabled:
    from unicast all
  Associated interfaces:

Example: MTR Topology in Interface Configuration Mode

The following example shows how to disable the VOICE topology on Ethernet interface 0/0:

interface Ethernet 0/0
topology ipv4 VOICE disable
Examples: Monitoring Interface and Topology IP Traffic Statistics for MTR

In the following example, the `show ip interface` command displays IP traffic statistics for Fast Ethernet interface 1/10:

```
Device# show ip interface FastEthernet 1/10 stats
FastEthernet1/10
5 minutes input rate 0 bits/sec, 0 packet/sec,
5 minutes output rate 0 bits/sec, 0 packet/sec,
201 packets input, 16038 bytes
588 packets output, 25976 bytes
```

In this example, the `show ip traffic` command displays statistics related to a particular topology:

```
Device# show ip traffic topology VOICE
Topology: VOICE
5 minute input rate 0 bits/sec, 0 packet/sec,
5 minute output rate 0 bits/sec, 0 packet/sec,
100 packets input, 6038 bytes,
88 packets output, 5976 bytes.
```

Examples: Testing Network Connectivity for MTR

The following example shows how to send a ping to the 10.1.1.2 neighbor in the VOICE topology:

```
Device# ping topology VOICE ip 10.1.1.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.1.1.2, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/4 ms
```

The following example shows how to trace the 10.1.1.4 host in the VOICE topology:

```
Device# traceroute VOICE ip 10.1.1.4
Type escape sequence to abort.
Tracing the route to 10.1.1.4
1 10.1.1.2 4 msec * 0 msec
2 10.1.1.3 4 msec * 2 msec
3 10.1.1.4 4 msec * 4 msec
```

<tr>
<td>Multitopology Routing</td>
<td>12.2(33)SRB, 15.0(1)S</td>
<td>Multitopology Routing (MTR) enables you to configure service differentiation through class-based forwarding. MTR provides multiple logical topologies over a single physical network. Service differentiation can be achieved by forwarding different traffic types over different logical topologies that could take different paths to the same destination. MTR can be used, for example, to define separate topologies for voice, video, and data traffic classes. The following commands were introduced or modified: all-interfaces, clear ip interface, clear ip route topology, clear ip traffic, debug topology, exit-global-af, exit-if-topology, exit-topo, forward-base, global-address-family ipv4, ip route topology, ip topology accounting, maximum routes, ping, route replicate, show ip interface, show ip protocols topology, show ip route topology, show ip static route, show ip static route summary, show ip traffic, show topology, shutdown, topology, topology accounting, traceroute.</td>
</tr>
</tbody>
</table>

Glossary

**base topology**—The entire network for which the usual set of routes are calculated. This topology is the same as the default global routing table that exists without Multitopology Routing (MTR) being used.

**class-specific topology**—New topologies that are defined over and above the existing base topology; each class-specific topology is represented by its own Routing Information Base (RIB) and Forwarding Information Base (FIB).

**classification**—Selection and matching of traffic that needs to be provided with a different treatment based on its mark. Classification is a read-only operation.
**DSCP**—differentiated services code point. Six bits in the Type of Service (ToS) field. Two bits are used for Explicit Congestion Notification, which are used to mark the packet.

**incremental forwarding mode**—Incremental forwarding mode is designed to support transitional or incremental deployment of MTR, where devices are in the network that are not MTR enabled. In this mode, the device looks for a forwarding entry first in the class-specific FIB. If an entry is not found, the device then looks for the longest match in the base topology FIB. If an entry is found in the base topology FIB, the packet is forwarded on the base topology. If a forwarding entry is not found in the base topology FIB, the packet is dropped.

**marking**—Setting a value in the packet or frame. Marking is a read and write operation.

**multitopology**—Multitopology means that each topology routes and forward a subset of the traffic as defined by the classification criteria.

**NLRI**—Network Layer Reachability Information.

**strict forwarding mode**—Strict forwarding mode is the default forwarding mode for MTR. Only routes in the topology-specific routing table are considered. Among these, the longest match for the destination address is used. If no route containing the destination address can be found in the topology specific table, the packet is dropped.

**TID**—Topology Identifier. Each topology is configured with a unique topology ID. The topology ID is configured under the routing protocol and is used to identify and group NLRI for each topology in updates for a given protocol.
CHAPTER 2

BGP Support for MTR

The BGP Support for MTR feature provides Border Gateway Protocol (BGP) support for multiple logical topologies over a single physical network. This module describes how to configure BGP for Multitopology Routing (MTR).

- Finding Feature Information, page 23
- Prerequisites for BGP Support for MTR, page 23
- Restrictions for BGP Support for MTR, page 24

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for BGP Support for MTR

- Be familiar with all the concepts in the “Information About BGP Support for MTR” section.
- Configure and activate a global Multitopology Routing (MTR) topology configuration.
Restrictions for BGP Support for MTR

- Redistribution within a topology is permitted. Redistribution from one topology to another is not permitted. This restriction is designed to prevent routing loops. You can use topology translation or topology import functionality to move routes from one topology to another.

- Only a single multicast topology can be configured, and only the base topology can be specified if a multicast topology is created.

Information About BGP Support for MTR

Routing Protocol Support for MTR

You must enable IP routing on the device for Multitopology Routing (MTR) to operate. MTR supports static and dynamic routing in Cisco software. You can enable dynamic routing per topology to support interdomain and intradomain routing. Route calculation and forwarding are independent for each topology. MTR support is integrated into Cisco software for the following protocols:

- Border Gateway Protocol (BGP)
- Enhanced Interior Gateway Routing Protocol (EIGRP)
- Integrated Intermediate System-to-Intermediate System (IS-IS)
- Open Shortest Path First (OSPF)

You apply the per-topology configuration in router address family configuration mode of the global routing process (router configuration mode). The address family and subaddress family are specified when the device enters address family configuration mode. You specify the topology name and topology ID by entering the `topology` command in address family configuration mode.

You configure each topology with a unique topology ID under the routing protocol. The topology ID is used to identify and group Network Layer Reachability Information (NLRI) for each topology in updates for a given protocol. In OSPF, EIGRP, and IS-IS, you enter the topology ID during the first configuration of the `topology` command for a class-specific topology. In BGP, you configure the topology ID by entering the `bgp tid` command under the topology configuration.

You can configure class-specific topologies with different metrics than the base topology. Interface metrics configured on the base topology can be inherited by the class-specific topology. Inheritance occurs if no explicit inheritance metric is configured in the class-specific topology.

You configure BGP support only in router configuration mode. You configure Interior Gateway Protocol (IGP) support in router configuration mode and in interface configuration mode.

By default, interfaces are not included in nonbase topologies. For routing protocol support for EIGRP, IS-IS, and OSPF, you must explicitly configure a nonbase topology on an interface. You can override the default behavior by using the `all/interfaces` command in address family topology configuration mode. The `all/interfaces` command causes the nonbase topology to be configured on all interfaces of the device that are part of the default address space or the virtual routing and forwarding (VRF) instance in which the topology is configured.
BGP Network Scope

To implement Border Gateway Protocol (BGP) support for Multitopology Routing (MTR), the scope hierarchy is required, but the scope hierarchy is not limited to MTR use. The scope hierarchy introduces new configuration modes such as router scope configuration mode. The device enters router scope configuration mode when you configure the `scope` command in router configuration mode. When this command is entered, a collection of routing tables is created.

You configure BGP commands under the scope hierarchy for a single network (globally), or on a per-virtual routing and forwarding (VRF) basis; these configurations are referred to as scoped commands. The scope hierarchy can contain one or more address families.

MTR CLI Hierarchy Under BGP

The Border Gateway Protocol (BGP) CLI provides backward compatibility for pre-Multitopology Routing (MTR) BGP configuration and provides a hierarchical implementation of MTR. Router configuration mode is backward compatible with the pre-address family and pre-MTR configuration CLI. Global commands that affect all networks are configured in this configuration mode. For address family and topology configuration, you configure general session commands and peer templates to be used in address family configuration mode or in topology configuration mode.

After configuring any global commands, you define the scope either globally or for a specific virtual routing and forwarding (VRF) instance. The device enters address family configuration mode when you configure the `address-family` command in router scope configuration mode or in router configuration mode. Unicast is the default address family if no subaddress family identifier (SAFI) is specified. MTR supports only the IPv4 address family with a SAFI of unicast or multicast.

When the device enters address family configuration mode from router configuration mode, the software configures BGP to use pre-MTR-based CLI. This configuration mode is backward compatible with pre-existing address family configurations. Entering address family configuration mode from router scope configuration mode configures the device to use the hierarchical CLI that supports MTR. Address family configuration parameters that are not specific to a topology are entered in this address family configuration mode.

The device enters BGP topology configuration mode when you configure the `topology` command in address family configuration mode. You can configure up to 32 topologies (including the base topology) on a device. You configure the topology ID by entering the `bgp tid` command. All address family and subaddress family configuration parameters for the topology are configured here.

Note

Configuring a scope for a BGP routing process removes CLI support for pre-MTR-based configuration.

The following example shows the hierarchy levels that are used when you configure BGP for MTR implementation:

```plaintext
router bgp <autonomous-system-number>
  ! Global commands
  scope {global | vrf <vrf-name>}
    ! Scoped commands
    address-family {<afi>} [<safi>]
      ! Address family specific commands
```
BGP Sessions for Class-Specific Topologies

Multitopology Routing (MTR) is configured under the Border Gateway Protocol (BGP) on a per-session basis. The base unicast and multicast topologies are carried in the global (default) session. A separate session is created for each class-specific topology that is configured under a BGP routing process. Each session is identified by its topology ID. BGP performs a best-path calculation individually for each class-specific topology. A separate Routing Information Base (RIB) and Forwarding Information Base (FIB) are maintained for each session.

Topology Translation Using BGP

Depending on the design and policy requirements for your network, you might need to install routes from a class-specific topology on one device in a class-specific topology on a neighboring device. Topology translation functionality using the Border Gateway Protocol (BGP) provides support for this operation. Topology translation is BGP neighbor-session based. You configure the `neighbor translate-topology` command by using the IP address and topology ID from the neighbor.

The topology ID identifies the class-specific topology of the neighbor. The routes in the class-specific topology of the neighbor are installed in the local class-specific Routing Information Base (RIB). BGP performs a best-path calculation on all installed routes and installs these routes into the local class-specific RIB. If a duplicate route is translated, BGP selects and installs only one instance of the route per standard BGP best-path calculation behavior.

Topology Import Using BGP

Importing topologies using the Border Gateway Protocol (BGP) is similar to topology translation. The difference is that routes are moved between class-specific topologies on the same device. You configure this function by entering the `import topology` command and specify the name of the class-specific topology or base topology. Best-path calculations are run on the imported routes before they are installed into the topology Routing Information Base (RIB). This `import topology` command also includes a `route-map` keyword to allow you to filter routes that are moved between class-specific topologies.

How to Configure BGP Support for MTR

Activating an MTR Topology by Using BGP

Perform this task to activate a Multitopology Routing (MTR) topology inside an address family by using the Border Gateway Protocol (BGP). This task is configured on Device B in the figure below and must also be configured on Device D and Device E. In this task, a scope hierarchy is configured to apply globally, and a neighbor is configured in router scope configuration mode. Under the IPv4 unicast address family, an MTR
topology that applies to video traffic is activated for the specified neighbor. There is no interface configuration mode for BGP topologies.

**Figure 8: BGP Network Diagram**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router bgp autonomous-system-number
4. scope {global | vrf vrf-name}
5. neighbor {ip-address | peer-group-name} remote-as autonomous-system-number
6. neighbor {ip-address | peer-group-name} transport {connection-mode {active | passive} | path-mtu-discovery | multi-session | single-session}
7. address-family ipv4 {mdt | multicast | unicast}
8. topology {base | topology-name}
9. bgp tid number
10. neighbor ip-address activate
11. neighbor {ip-address | peer-group-name} translate-topology number
12. end
14. show ip bgp topology {* | topology} summary

### What to Do Next

Repeat this task for every topology that you want to enable, and repeat this configuration on all neighbor devices that are to use the topologies.

If you want to import routes from one Multitopology Routing (MTR) topology to another on the same device, see the "Importing Routes from an MTR Topology by Using BGP" section.

### Importing Routes from an MTR Topology by Using BGP

Perform this task to import routes from one Multitopology Routing (MTR) topology to another on the same device, when multiple topologies are configured on the same device. In this task, a prefix list is defined to permit prefixes from the 10.2.2.0 network, and this prefix list is used with a route map to filter routes moved from the imported topology. A global scope is configured, address family IPv4 is entered, the VIDEO topology is specified, the VOICE topology is imported, and the routes are filtered using the route map named 10NET.
### SUMMARY STEPS

1. enable
2. configure terminal
3. ip prefix-list list-name \[seq number\] \{deny \| permit\} network/length \[ge ge-length\] \[le le-length\]
4. route-map map-name \{permit \| deny\} \[sequence-number\]
5. match ip address \{access-list-number \[access-list-number ... \| access-list-name...] \| access-list-name 
   \[access-list-number ... \| access-list-name\] \| prefix-list prefix-list-name \[prefix-list-name...]\}
6. exit
7. router bgp autonomous-system-number
8. scope \{global \| vrf vrf-name\}
9. address-family ipv4 \{mdt \| multicast \| unicast\}
10. topology \{base \| topology-name\}
11. import topology \{base \| topology-name\} \[route-map map-name\]
12. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
 | Example: Device> enable |
| Step 2 configure terminal | Enters global configuration mode.  
 | Example: Device# configure terminal |
| Step 3 ip prefix-list list-name \[seq number\] \{deny \| permit\} network/length \[ge ge-length\] \[le le-length\] | Configures an IP prefix list.  
 | Example: Device(config)# ip prefix-list TEN permit 10.2.2.0/24 |
| Step 4 route-map map-name \{permit \| deny\} \[sequence-number\] | Creates a route map and enters route-map configuration mode.  
 | Example: Device(config)# route-map 10NET |
| Step 5 match ip address \{access-list-number \[access-list-number ... \| access-list-name...] \| prefix-list prefix-list-name \[prefix-list-name...]\} | Configures the route map to match a prefix that is permitted by a standard access list, an extended access list, or a prefix list.  

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`access-list-name [access-list-number ...</td>
<td>prefix-list prefix-list-name [prefix-list-name...]}`</td>
</tr>
</tbody>
</table>

**Example:**
```
Device(config-route-map)# match ip address prefix-list TEN
```

**Step 6**

<table>
<thead>
<tr>
<th>exit</th>
<th>Exits route-map configuration mode and returns to global configuration mode.</th>
</tr>
</thead>
</table>

**Example:**
```
Device(config-route-map)# exit
```

**Step 7**

<table>
<thead>
<tr>
<th>router bgp autonomous-system-number</th>
<th>Enters router configuration mode to create or configure a Border Gateway Protocol (BGP) routing process.</th>
</tr>
</thead>
</table>

**Example:**
```
Device(config)# router bgp 50000
```

**Step 8**

| scope {global | vrf vrf-name} | Defines the scope to the BGP routing process and enters router scope configuration mode. |
|-----------------------------|----------------------------------------------------------------------------------------|
|                             | • BGP general session commands that apply to a single network, or a specified virtual routing and forwarding (VRF) instance, are entered in this configuration mode. |
|                             | • Use the global keyword to specify that BGP uses the global routing table. |
|                             | • Use the vrf vrf-name keyword and argument to specify that BGP uses a specific VRF routing table. The VRF must already exist. |

**Example:**
```
Device(config-router)# scope global
```

**Step 9**

| address-family ipv4 [mdt | multicast | unicast] | Enters router scope address family configuration mode to configure an address family session under BGP. |
|------------------------|-----------------------------------------------|--------------------------------------------------------------------------------------------------|
|                        | • Nontopology-specific configuration parameters are configured in this configuration mode. |

**Example:**
```
Device(config-router-scope)# address-family ipv4
```

**Step 10**

| topology {base | topology-name} | Configures the topology instance in which BGP routes class-specific or base topology traffic, and enters router scope address family topology configuration mode. |
|--------------------------|----------------------------------------------------------------------------------------|

**Example:**
```
Device(config-router-scope-af)# topology VIDEO
```

**Step 11**

<p>| import topology {base | topology-name} [route-map map-name] | (Optional) Configures BGP to move routes from one topology to another on the same device. |
|------------------------------------------------------|----------------------------------------------------------------------------------------|</p>

### Configuration Examples for BGP Support for MTR

#### Example: BGP Topology Translation Configuration

The following example shows how to configure the Border Gateway Protocol (BGP) in the VIDEO topology and how to configure topology translation with the 192.168.2.2 neighbor:

```
router bgp 45000
  scope global
  neighbor 172.16.1.1 remote-as 50000
  neighbor 192.168.2.2 remote-as 55000
  neighbor 172.16.1.1 transport multi-session
  neighbor 192.168.2.2 transport multi-session
  address-family ipv4
    topology VIDEO
    bgp tid 100
    neighbor 172.16.1.1 activate
    neighbor 192.168.2.2 activate
    neighbor 192.168.2.2 translate-topology 200
  end
end
clear ip bgp topology VIDEO 50000
```

#### Example: BGP Global Scope and VRF Configuration

The following example shows how to configure a global scope for a unicast topology and also for a multicast topology. After the device exits the router scope configuration mode, a scope is configured for the virtual routing and forwarding (VRF) instance named DATA.

```
router bgp 45000
  scope global
  bgp default ipv4-unicast
  neighbor 172.16.1.2 remote-as 45000
  neighbor 192.168.3.2 remote-as 50000
  address-family ipv4 unicast
  topology VOICE
  bgp tid 100
  neighbor 172.16.1.2 activate
  exit
```
Examples: BGP Topology Verification

The following example shows summary output for the `show ip bgp topology` command. Information is displayed about Border Gateway Protocol (BGP) neighbors configured to use the Multitopology Routing (MTR) topology named VIDEO.

```
Device# show ip bgp topology VIDEO summary
BGP router identifier 192.168.3.1, local AS number 45000
BGP table version is 1, main routing table version 1
Neighbor   V  AS MsgRcvd MsgSent TblVer InQ OutQ Up/Down State/PfxRcd
172.16.1.2 4 45000 289 289 1 0 0 04:48:44 0
192.168.3.2 4 50000 3 3 1 0 0 00:00:27 0
```

The following partial output displays BGP neighbor information under the VIDEO topology:

```
Device# show ip bgp topology VIDEO neighbors 172.16.1.2
BGP neighbor is 172.16.1.2, remote AS 45000, internal link
  BGP version 4, remote router ID 192.168.2.1
  BGP state = Established, up for 04:56:30
  Last read 00:00:23, last write 00:00:21, hold time is 180, keepalive interval is 60 seconds
  Neighbor sessions:
    1 active, is multisession capable
  Neighbor capabilities:
    Route refresh: advertised and received(new)
    Message statistics, state Established:
      InQ depth is 0
      OutQ depth is 0
                  Sent    Rcvd
    Opens:       1       1
    Notifications: 0     0
    Updates:     0      0
    Keepalives: 296   296
    Route Refresh: 0    0
    Total: 297   297
  Default minimum time between advertisement runs is 0 seconds
  For address family: IPv4 Unicast topology VIDEO
  Session: 172.16.1.2 session 1
  BGP table version 1, neighbor version 1/0
  Output queue size : 0
  Index 1, Offset 0, Mask Ox2
  1 update-group member
  Topology identifier: 100
  ...

  Address tracking is enabled, the RIB does have a route to 172.16.1.2
  Address tracking requires at least a /24 route to the peer
  Connections established 1; dropped 0
  Last reset never
  Transport(tcp) path-mtu-discovery is enabled
  Connection state is ESTAB, I/O status: 1, unread input bytes: 0
  Minimum incoming TTL 0, Outgoing TTL 255
  Local host: 172.16.1.1, Local port: 1113
```
Example: Importing Routes from an MTR Topology by Using BGP

The following example shows how to configure an access list to be used by a route map named VOICE to filter routes imported from the Multitopology Routing (MTR) topology named VOICE. Only routes with the prefix 192.168.1.0 are imported.

```plaintext
access-list 1 permit 192.168.1.0 0.0.0.255
route-map BLUE
match ip address 1
exit
router bgp 50000
scope global
neighbor 10.1.1.2 remote-as 50000
neighbor 172.16.1.1 remote-as 60000
address-family ipv4
topology VIDEO
bgp tid 100
neighbor 10.1.1.2 activate
neighbor 172.16.1.1 activate
import topology VOICE route-map VOICE
end
clear ip bgp topology VIDEO 50000
```

Feature Information for BGP Support for MTR

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

EIGRP Support for MTR

The EIGRP Support for MTR feature provides Enhanced Interior Gateway Routing Protocol (EIGRP) support for multiple logical topologies over a single physical network. This module describes how to configure EIGRP for Multitopology Routing (MTR).

- Finding Feature Information, page 37
- Prerequisites for EIGRP Support for MTR, page 37
- Restrictions for EIGRP Support for MTR, page 38
- Information About EIGRP Support for MTR, page 38
- How to Configure EIGRP Support for MTR, page 39
- Configuration Examples for EIGRP Support for MTR, page 44

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for EIGRP Support for MTR

- Be familiar with the concepts in the "Routing Protocol Support for MTR" section.
- Configure and activate a global topology configuration.
Restrictions for EIGRP Support for MTR

Graceful restart in the Enhanced Interior Gateway Routing Protocol (EIGRP) works only for base topologies. All other service topologies reset with new adjacencies.

Information About EIGRP Support for MTR

Routing Protocol Support for MTR

You must enable IP routing on the device for Multitopology Routing (MTR) to operate. MTR supports static and dynamic routing in Cisco software. You can enable dynamic routing per topology to support interdomain and intradomain routing. Route calculation and forwarding are independent for each topology. MTR support is integrated into Cisco software for the following protocols:

- Border Gateway Protocol (BGP)
- Enhanced Interior Gateway Routing Protocol (EIGRP)
- Integrated Intermediate System-to-Intermediate System (IS-IS)
- Open Shortest Path First (OSPF)

You apply the per-topology configuration in router address family configuration mode of the global routing process (router configuration mode). The address family and subaddress family are specified when the device enters address family configuration mode. You specify the topology name and topology ID by entering the `topology` command in address family configuration mode.

You configure each topology with a unique topology ID under the routing protocol. The topology ID is used to identify and group Network Layer Reachability Information (NLRI) for each topology in updates for a given protocol. In OSPF, EIGRP, and IS-IS, you enter the topology ID during the first configuration of the `topology` command for a class-specific topology. In BGP, you configure the topology ID by entering the `bgp tid` command under the topology configuration.

You can configure class-specific topologies with different metrics than the base topology. Interface metrics configured on the base topology can be inherited by the class-specific topology. Inheritance occurs if no explicit inheritance metric is configured in the class-specific topology.

You configure BGP support only in router configuration mode. You configure Interior Gateway Protocol (IGP) support in router configuration mode and in interface configuration mode.

By default, interfaces are not included in nonbase topologies. For routing protocol support for EIGRP, IS-IS, and OSPF, you must explicitly configure a nonbase topology on an interface. You can override the default behavior by using the `all/interfaces` command in address family topology configuration mode. The `all/interfaces` command causes the nonbase topology to be configured on all interfaces of the device that are part of the default address space or the virtual routing and forwarding (VRF) instance in which the topology is configured.
Interface Configuration Support for MTR

The configuration of a Multitopology Routing (MTR) topology in interface configuration mode allows you to enable or disable MTR on a per-interface basis. By default, a class-specific topology does not include any interfaces.

You can include or exclude individual interfaces by configuring the `topology` interface configuration command. You specify the address family and the topology (base or class-specific) when entering this command. The subaddress family can be specified. If no subaddress family is specified, the unicast subaddress family is used by default.

You can include globally all interfaces on a device in a topology by entering the `all/interfaces` command in routing topology configuration mode. Per-interface topology configuration applied with the `topology` command overrides global interface configuration.

The interface configuration support for MTR has these characteristics:

- Per-interface routing configuration: Interior Gateway Protocol (IGP) routing and metric configurations can be applied in interface topology configuration mode. Per-interface metrics and routing behaviors can be configured for each IGP.

- Open Shortest Path First (OSPF) interface topology configuration: Interface mode OSPF configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure an interface cost or disable OSPF routing without removing the interface from the global topology configuration.

- Enhanced Interior Gateway Routing Protocol (EIGRP) interface topology configuration: Interface mode EIGRP configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure various EIGRP features.

- Intermediate System-to-Intermediate System (IS-IS) interface topology configuration: Interface mode IS-IS configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure an interface cost or disable IS-IS routing without removing the interface from the global topology configuration.

How to Configure EIGRP Support for MTR

Activating an MTR Topology by Using EIGRP

Only Multitopology Routing (MTR) commands are shown in this task.
SUMMARY STEPS

1. enable
2. configure terminal
3. router eigrp name
4. address-family ipv4 [unicast | multicast | vrf vrf-name] autonomous-system as-number
5. topology {base | topology-name tid number}
6. end
7. show ip protocols topology name [summary]
8. show ip eigrp topology name

</table>

**What to Do Next**
If an Intermediate System-to-Intermediate System (IS-IS) topology configuration is required, see the "IS-IS Support for MTR" feature module.
If a Border Gateway Protocol (BGP) topology configuration is required, see the "BGP Support for MTR" feature module.

**Activating an MTR Topology in Interface Configuration Mode by Using EIGRP**

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **topology ipv4 [multicast | unicast] {topology-name [disable] | base}**
5. **eigrp as-number delay value**
6. **eigrp as-number next-hop-self**
7. **eigrp as-number shutdown**
8. **eigrp as-number split-horizon**
9. **eigrp as-number summary-address ip-address wildcard-mask [distance]**
10. **end**
11. **show ip eigrp topology name interfaces**
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
- Enter your password if prompted.  |
| **Example:** Device> enable |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** Device# configure terminal |
| **Step 3** interface type number | Specifies the interface type and number, and enters interface configuration mode. |
| **Example:** Device(config)# interface Ethernet 0/0 |
| **Step 4** topology ipv4 [multicast |unicast] {topology-name [disable] | base} | Configures a Multitopology Routing (MTR) topology instance on an interface and enters interface topology configuration mode.  
**Note** Entering this command with the disable keyword disables the topology instance on the interface. This form is used to exclude a topology configuration from an interface. |
| **Example:** Device(config-if)# topology ipv4 VOICE |
| **Step 5** eigrp as-number delay value | Configures the delay value that the Enhanced Interior Gateway Routing Protocol (EIGRP) uses for interface metric calculation.  
- The value argument is entered in tens of microseconds. The example configures an interface delay metric of 100 milliseconds. |
| **Example:** Device(config-if-topology)# eigrp 1 delay 100000 |
| **Step 6** eigrp as-number next-hop-self | Configures an EIGRP process to advertise itself as the next hop.  
- This command is enabled by default. |
| **Example:** Device(config-if-topology)# eigrp 1 next-hop-self |
| **Step 7** eigrp as-number shutdown | Disables an EIGRP process on the interface without disabling the global topology configuration on the interface. |
| **Example:** Device(config-if-topology)# eigrp 1 shutdown |
| **Step 8** eigrp as-number split-horizon | Configures an EIGRP process to use split horizon. |
| **Example:** | |
### Command or Action

**Example:**

Device(config-if-topology)# eigrp 1
split-horizon

**Purpose**

- This command is enabled by default.

### Step 9

**eigrp as-number summary-address ip-address wildcard-mask [distance]**

**Example:**

Device(config-if-topology)# eigrp 1
summary-address 10.1.1.0 0.0.0.255

**Purpose**

Configures an EIGRP summary address.

- An administrative distance of 5 is applied to EIGRP summary routes if the distance is not specified.

### Step 10

**end**

**Example:**

Device(config-if-topology)# end

**Purpose**

Exits interface topology configuration mode and returns to privileged EXEC mode.

### Step 11

**show ip eigrp topology name interfaces**

**Example:**

Device# show ip eigrp topology VOICE
interfaces

**Purpose**

Displays information about interfaces, on which EIGRP is configured, in a topology.

---

### Monitoring Interface and Topology IP Traffic Statistics for MTR

Use any of the following commands in any order to monitor interface and topology IP traffic statistics for Multitopology Routing (MTR).

#### SUMMARY STEPS

1. **enable**
2. **show ip interface [type number] [topology {name | all | base}] [stats]**
3. **show ip traffic [topology {name | all | base}]**
4. **clear ip interface type number [topology {name | all | base}] [stats]**
5. **clear ip traffic [topology {name | all | base}]**

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong></td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
**Example:**
Device> enable

- Enter your password if prompted.

**Step 2**

**show ip interface [type number] [topology {name|all|base}] [stats]**

*(Optional)* Displays IP traffic statistics for all interfaces or statistics related to the specified interface.

- If you specify an interface type and number, information for that specific interface is displayed. If you specify no optional arguments, information for all the interfaces is displayed.
- If the **topology name** keyword and argument are used, statistics are limited to the IP traffic for that specific topology.
- The **base** keyword displays the IPv4 unicast base topology.

**Example:**
Device# show ip interface FastEthernet 1/10 stats

**Step 3**

**show ip traffic [topology {name|all|base}]**

*(Optional)* Displays global IP traffic statistics (an aggregation of all the topologies when MTR is enabled) or statistics related to a particular topology.

- The **base** keyword is reserved for the IPv4 unicast base topology.

**Example:**
Device# show ip traffic topology VOICE

**Step 4**

**clear ip interface type number [topology {name|all|base}] [stats]**

*(Optional)* Resets interface-level IP traffic statistics.

- If the **topology** keyword and a related keyword are not used, only the interface-level aggregate statistics are reset.
- If all topologies need to be reset, use the **all** keyword as the topology name.

**Example:**
Device# clear ip interface FastEthernet 1/10 topology all

**Step 5**

**clear ip traffic [topology {name|all|base}]**

*(Optional)* Resets IP traffic statistics.

- If no topology name is specified, global statistics are cleared.

**Example:**
Device# clear ip traffic topology all

---

### Configuration Examples for EIGRP Support for MTR

#### Examples: Activating an MTR Topology by Using EIGRP

The following example shows how to activate the VIDEO topology using the Enhanced Interior Gateway Routing Protocol (EIGRP):

```
router eigrp MTR
  address-family ipv4 autonomous-system 1
  network 10.0.0.0 0.0.0.255
```

---

Multitopology Routing Configuration Guide, Cisco IOS Release 15S
The following example shows how to display the status of routing protocols configured in the VIDEO topology. EIGRP information is shown in the output.

Device# show ip protocols topology VIDEO

*** IP Routing is NSF aware ***
Routing Protocol is "eigrp 1"
Outgoing update filter list for all interfaces is not set
Incoming update filter list for all interfaces is not set
Default networks accepted from incoming updates
Default networks flagged in outgoing updates
EIGRP metric weight K1=1, K2=0, K3=1, K4=0, K5=0
EIGRP maximum hopcount 100
EIGRP maximum metric variance 1
EIGRP graceful-restart disabled
EIGRP NSF-aware route hold timer is 240s
Topologies : 100 (VOICE) 0 (base)
Automatic network summarization is in effect
Maximum path: 4
Routing for Networks:
Routing Information Sources:
  Gateway Distance Last Update
  Distance: internal 90 external 170
The following example shows the EIGRP routing table configured under the VIDEO topology:

Device# show ip eigrp topology VIDEO

EIGRP-IPv4 Topology Table for AS(1)/ID(10.1.1.2) Routing Table: VOICE
Codes: P = Passive, A = Active, U = Update, Q = Query, R = Reply,
r = reply Status, s = sia Status
P 10.1.1.0/24, 1 successors, FD is 281600
via Connected, Ethernet0/0

Examples: MTR EIGRP Topology in Interface Configuration Mode

The following example shows how to set the Enhanced Interior Gateway Routing Protocol (EIGRP) delay calculation on interface Ethernet 0/0 to 100 milliseconds:

interface Ethernet 0/0
topology ipv4 VOICE
eigrp 1 delay 100000
eigrp 1 next-hop-self
eigrp 1 shutdown
eigrp 1 split-horizon
eigrp 1 summary-address 10.1.1.0 0.0.0.255
end

The following example shows how to display EIGRP information about interfaces in the VOICE topology:

Device# show ip eigrp topology VOICE interfaces

EIGRP-IPv4 interfaces for process 1

<table>
<thead>
<tr>
<th>Interface</th>
<th>Peers</th>
<th>Xmit Queue</th>
<th>Mean</th>
<th>Pacing Time</th>

IS-IS Support for MTR

The IS-IS Support for MTR feature provides Intermediate System-to-Intermediate System (IS-IS) support for multiple logical topologies over a single physical network. This module describes how to configure IS-IS for Multitopology Routing (MTR) for both unicast and multicast topologies.

- Finding Feature Information, page 49
- Prerequisites for IS-IS Support for MTR, page 49
- Restrictions for IS-IS Support for MTR, page 50
- Information About IS-IS Support for MTR, page 50
- How to Configure IS-IS Support for MTR, page 51
- Configuration Examples for IS-IS Support for MTR, page 56
- Additional References, page 58
- Feature Information for IS-IS Support for MTR, page 59

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for IS-IS Support for MTR

- Be familiar with the concepts in the "Routing Protocol Support for MTR" section.
- Configure and activate a global topology configuration.
• You must configure a multicast topology before activating the Intermediate System-to-Intermediate System (IS-IS) protocol in the multicast topology. For details, see the "MTR support for Multicast" feature module.

• Activate a Multitopology Routing (MTR) topology on an IS-IS device.

• Configure the MTR topology to globally configure all interfaces by using the all-interfaces address family topology configuration command, or configure the IS-IS topology in interface configuration mode to configure only IS-IS interfaces. The order in which you perform the two tasks does not matter.

Restrictions for IS-IS Support for MTR

Only the IPv4 address family (multicast and unicast) and IPv6 address family unicast are supported. For information about configuring Multitopology IS-IS for IPv6, see the IS-IS Configuration Guide.

Information About IS-IS Support for MTR

Routing Protocol Support for MTR

You must enable IP routing on the device for Multitopology Routing (MTR) to operate. MTR supports static and dynamic routing in Cisco software. You can enable dynamic routing per topology to support interdomain and intradomain routing. Route calculation and forwarding are independent for each topology. MTR support is integrated into Cisco software for the following protocols:

• Border Gateway Protocol (BGP)
• Enhanced Interior Gateway Routing Protocol (EIGRP)
• Integrated Intermediate System-to-Intermediate System (IS-IS)
• Open Shortest Path First (OSPF)

You apply the per-topology configuration in router address family configuration mode of the global routing process (router configuration mode). The address family and subaddress family are specified when the device enters address family configuration mode. You specify the topology name and topology ID by entering the topology command in address family configuration mode.

You configure each topology with a unique topology ID under the routing protocol. The topology ID is used to identify and group Network Layer Reachability Information (NLRI) for each topology in updates for a given protocol. In OSPF, EIGRP, and IS-IS, you enter the topology ID during the first configuration of the topology command for a class-specific topology. In BGP, you configure the topology ID by entering the bgp tid command under the topology configuration.

You can configure class-specific topologies with different metrics than the base topology. Interface metrics configured on the base topology can be inherited by the class-specific topology. Inheritance occurs if no explicit inheritance metric is configured in the class-specific topology.

You configure BGP support only in router configuration mode. You configure Interior Gateway Protocol (IGP) support in router configuration mode and in interface configuration mode.

By default, interfaces are not included in nonbase topologies. For routing protocol support for EIGRP, IS-IS, and OSPF, you must explicitly configure a nonbase topology on an interface. You can override the default
behavior by using the `all-interfaces` command in address family topology configuration mode. The `all-interfaces` command causes the nonbase topology to be configured on all interfaces of the device that are part of the default address space or the virtual routing and forwarding (VRF) instance in which the topology is configured.

**Interface Configuration Support for MTR**

The configuration of a Multitopology Routing (MTR) topology in interface configuration mode allows you to enable or disable MTR on a per-interface basis. By default, a class-specific topology does not include any interfaces.

You can include or exclude individual interfaces by configuring the `topology` interface configuration command. You specify the address family and the topology (base or class-specific) when entering this command. The subaddress family can be specified. If no subaddress family is specified, the unicast subaddress family is used by default.

You can include globally all interfaces on a device in a topology by entering the `all-interfaces` command in routing topology configuration mode. Per-interface topology configuration applied with the `topology` command overrides global interface configuration.

The interface configuration support for MTR has these characteristics:

- Per-interface routing configuration: Interior Gateway Protocol (IGP) routing and metric configurations can be applied in interface topology configuration mode. Per-interface metrics and routing behaviors can be configured for each IGP.
- Open Shortest Path First (OSPF) interface topology configuration: Interface mode OSPF configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure an interface cost or disable OSPF routing without removing the interface from the global topology configuration.
- Enhanced Interior Gateway Routing Protocol (EIGRP) interface topology configuration: Interface mode EIGRP configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure various EIGRP features.
- Intermediate System-to-Intermediate System (IS-IS) interface topology configuration: Interface mode IS-IS configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure an interface cost or disable IS-IS routing without removing the interface from the global topology configuration.

**How to Configure IS-IS Support for MTR**

**Activating an MTR Topology by Using IS-IS**

> **Note**

Only Multitopology Routing (MTR) commands are shown in this task.
### SUMMARY STEPS

1. enable
2. configure terminal
3. router isis [area-tag]
4. net network-entity-title
5. metric-style wide [transition] [level-1 | level-2 | level-1-2]
6. address-family ipv4 [multicast | unicast]
7. topology topology-name tid number
8. end
9. show isis neighbors detail

## Monitoring Interface and Topology IP Traffic Statistics for MTR

Use any of the following commands in any order to monitor interface and topology IP traffic statistics for Multitopology Routing (MTR).

### SUMMARY STEPS

1. enable
2. show ip interface [type number] [topology {name | all | base}] [stats]
3. show ip traffic [topology {name | all | base}]
4. clear ip interface type number [topology {name | all | base}] [stats]
5. clear ip traffic [topology {name | all | base}]

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
**Example:**
Device> enable | • Enter your password if prompted.

**Step 2**
`show ip interface [type number] [topology {name | all | base}] [stats]`

(Optional) Displays IP traffic statistics for all interfaces or statistics related to the specified interface.

**Example:**
Device# show ip interface FastEthernet 1/10 stats

• If you specify an interface type and number, information for that specific interface is displayed. If you specify no optional arguments, information for all the interfaces is displayed.

• If the `topology name` keyword and argument are used, statistics are limited to the IP traffic for that specific topology.

• The `base` keyword displays the IPv4 unicast base topology.

**Step 3**
`show ip traffic [topology {name | all | base}]`

(Optional) Displays global IP traffic statistics (an aggregation of all the topologies when MTR is enabled) or statistics related to a particular topology.

**Example:**
Device# show ip traffic topology VOICE

• The `base` keyword is reserved for the IPv4 unicast base topology.

**Step 4**
`clear ip interface type number [topology {name | all | base}] [stats]`

(Optional) Resets interface-level IP traffic statistics.

**Example:**
Device# clear ip interface FastEthernet 1/10 topology all

• If the `topology` keyword and a related keyword are not used, only the interface-level aggregate statistics are reset.

• If all topologies need to be reset, use the `all` keyword as the topology name.

**Step 5**
`clear ip traffic [topology {name | all | base}]`

(Optional) Resets IP traffic statistics.

**Example:**
Device# clear ip traffic topology all

• If no topology name is specified, global statistics are cleared.

---

**Configuration Examples for IS-IS Support for MTR**

**Example: Activating an MTR Topology by Using IS-IS**

The following example shows how to configure both the Multitopology Routing (MTR) topologies DATA and VIDEO and Intermediate System-to-Intermediate System (IS-IS) support for MTR. The DATA and VIDEO topologies are enabled on three IS-IS neighbors in a network.
Device 1

global-address-family ipv4
topology DATA
topology VOICE
end
interface Ethernet 0/0
ip address 192.168.128.2 255.255.255.0
ip router isis
topology ipv4 DATA
isis topology disable
topology ipv4 VOICE
end
router isis
net 33.3333.3333.3333.00
metric-style wide
address-family ipv4
topology DATA tid 100
topology VOICE tid 200
end

Device 2

global-address-family ipv4
topology DATA
topology VOICE
all-interfaces
forward-base
maximum routes 1000 warning-only
shutdown
end
interface Ethernet 0/0
ip address 192.168.128.1 255.255.255.0
ip router isis
topology ipv4 DATA
isis topology disable
topology ipv4 VOICE
end
interface Ethernet 1/0
ip address 192.168.130.1 255.255.255.0
ip router isis
topology ipv4 DATA
isis topology disable
topology ipv4 VOICE
end
router isis
net 32.3232.3232.3232.00
metric-style wide
address-family ipv4
topology DATA tid 100
topology VOICE tid 200
end

Device 3

global-address-family ipv4
topology DATA
topology VOICE
all-interfaces
forward-base
maximum routes 1000 warning-only
shutdown
end
interface Ethernet 1/0
ip address 192.168.131.1 255.255.255.0
ip router isis
topology ipv4 DATA
isis topology disable
Example: MTR IS-IS Topology in Interface Configuration Mode

The following example shows how to prevent the Intermediate System-to-Intermediate System (IS-IS) process from advertising interface Ethernet 1/0 as part of the DATA topology:

```conf
interface Ethernet 1/0
ip address 192.168.130.1 255.255.255.0
ip router isis
 topology ipv4 DATA
 isis topology disable
 topology ipv4 VOICE
end
```

- Feature Information for ISSU-MTR, page 62

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About ISSU-MTR

Benefits of ISSU-MTR

All protocols and applications that support Multitopology Routing (MTR) and that also support In Service Software Upgrade (ISSU) have extended their ISSU support to include the MTR functionality.

ISSU allows a high-availability (HA) system to run in stateful switchover (SSO) mode even when different versions of Cisco software are running on the active and standby Route Processors (RPs). This feature allows the system to switch over to a secondary RP that is running upgraded (or downgraded) software and to continue forwarding packets without session loss and with minimal or no packet loss.

The ISSU-MTR feature is enabled by default.

MTR Support for Multicast

The MTR Support for Multicast feature provides Multitopology Routing (MTR) support for multicast and allows you to control the path of multicast traffic in the network. This module describes how to configure MTR support for multicast.

- Finding Feature Information, page 65
- Restrictions for MTR Support for Multicast, page 65
- Information About MTR Support for Multicast, page 66
- How to Configure MTR Support for Multicast, page 67
- Configuration Examples for MTR Support for Multicast, page 69
- Additional References, page 71
- Feature Information for MTR Support for Multicast, page 71

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for MTR Support for Multicast

Only a single multicast topology can be configured, and only the topology base command can be entered when the multicast topology is created.
Information About MTR Support for Multicast

Overview of Multicast MTR in VRF

Cisco software supports legacy (pre-Multitopology Routing (MTR) IP multicast behavior by default. MTR support for IP multicast must be explicitly enabled. Legacy IP multicast uses reverse path forwarding (RPF) on routes in the unicast Routing Information Base (RIB) to build multicast distribution trees (MDTs).

MTR introduces a multicast topology that is completely independent from the unicast topology. MTR integration with multicast allows you to control the path of multicast traffic in the network.

The multicast topology maintains separate routing and forwarding tables. The following list summarizes MTR multicast support that is integrated into Cisco software:

- Conventional longest match support for multicast routes.
- RPF support for Protocol Independent Multicast (PIM).
- Border Gateway Protocol (BGP) MDT subaddress family identifier (SAFI) support for Inter-AS VPNs (SAFI number 66).
- Support for static multicast routes integrated into the `ip route topology` command (modifying the `ip mroute` command).

As in pre-MTR software, you enable multicast support by configuring the `ip multicast-routing` command in global configuration mode. You enable MTR support for multicast by configuring the `ip multicast rpf multitopology` command. After the device enters global address family configuration mode, you then enter the `topology` command with the `base` keyword; global topology configuration parameters are applied in this mode.
How to Configure MTR Support for Multicast

Configuring a Multicast Topology for MTR

SUMMARY STEPS

1. enable
2. configure terminal
3. ip multicast-routing [vrf name]
4. ip multicast rpf multitopology
5. global-address-family ipv4 [multicast | unicast]
6. topology {base | topology-name}
7. route-replicate from {multicast | unicast} [topology {base | name}] [protocol [route-map name | vrf name]"
8. use-topology unicast {base | topology-name}
9. shutdown
10. end
11. show topology [cache [topology-id] | ha [detail | interface | lock | router] [all | ipv4 | ipv6 | vrf vpn-instance]]

</tr>
<tr>
<td><strong>Example:</strong> Device# show topology detail</td>
<td></td>
</tr>
</tbody>
</table>

**What to Do Next**

The topology is not activated until classification is configured. See the "QoS-MQC Support for MTR" feature module to configure classification for a class-specific topology.

**Configuration Examples for MTR Support for Multicast**

**Examples: Route Replication Configuration**

The following example shows how to enable multicast support for Multitopology Routing (MTR) and to configure a separate multicast topology:

```
ip multicast-routing
ip multicast rpf multitopology
!
global-address-family ipv4 multicast
  topology base
end
```

The following example shows how to configure the multicast topology to replicate Open Shortest Path First (OSPF) routes from the VOICE topology. The routes are filtered through the VOICE route map before they are installed in the multicast routing table.

```
ip multicast-routing
ip multicast rpf multitopology
!
access-list 1 permit 192.168.1.0 0.0.0.255
```
route-map VOICE
  match ip address 1
  exit
!
global-address-family ipv4 multicast
topology base
  route-replicate from unicast topology VOICE ospf route-map VOICE

Example: Using a Unicast RIB for Multicast RPF Configuration

The following example shows how to configure the multicast topology to perform reverse path forwarding (RPF) calculations on routes in the VIDEO topology Routing Information Base (RIB) to build multicast distribution trees:

ip multicast-routing
ip multicast rpf multihop
!
global-address-family ipv4 multicast
topology base
  use-topology unicast VIDEO
end

Example: Multicast Verification

The following example shows that the multicast topology is configured to replicate routes from the Routing Information Base (RIB) of the VOICE topology:

Device# show topology detail
Topology: base
  Address-family: ipv4
  Associated VPN VRF is default
  Topology state is UP
  Associated interfaces:
    Ethernet0/0, operation state: UP
    Ethernet0/1, operation state: DOWN
    Ethernet0/2, operation state: DOWN
    Ethernet0/3, operation state: DOWN
    Loopback0, operation state: UP

Topology: VIDEO
  Address-family: ipv4
  Associated VPN VRF is default
  Topology state is UP
  Topology fallback is enabled
  Topology maximum route limit 1000, warning limit 90% (900)
  Associated interfaces:

Topology: VOICE
  Address-family: ipv4
  Associated VPN VRF is default
  Topology state is UP
  Topology is enabled on all interfaces
  Associated interfaces:
    Ethernet0/0, operation state: UP
    Ethernet0/1, operation state: DOWN
    Ethernet0/2, operation state: DOWN
    Ethernet0/3, operation state: DOWN
    Loopback0, operation state: UP

Topology: base
  Address-family: ipv4 multicast
  Associated VPN VRF is default
  Topology state is DOWN
  Multicast multi-topology mode is enabled.
  Route Replication Enabled:

OSPF Support for MTR

The OSPF Support for MTR feature provides Open Shortest Path First (OSPF) support for multiple logical topologies over a single physical network. This module describes how to configure OSPF for Multitopology Routing (MTR).

- Finding Feature Information, page 73
- Prerequisites for OSPF Support for MTR, page 73
- Information About OSPF Support for MTR, page 74
- How to Configure OSPF Support for MTR, page 76
- Configuration Examples for OSPF Support for MTR, page 81
- Additional References, page 82
- Feature Information for OSPF Support for MTR, page 83

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OSPF Support for MTR

- Be familiar with the concepts documented in the "Routing Protocol Support for MTR" section.
- Configure and activate a global topology configuration.
- Check your Open Shortest Path First (OSPF) device configuration and enter the topology-aware device configuration commands in router address family configuration mode.
• Several OSPF configuration commands need to be topology-aware. Before you configure OSPF Multitopology Routing (MTR), you need to enter the following commands in router address family configuration mode if they are used in your original OSPF device configuration.

  • `area area-id default-cost cost`
  • `area area-id filter-list prefix prefix-list-name {in | out}`
  • `area nssa area-id [no-redistribution] [default-information-originate [metric] [metric-type] [no-summary] [nssa-only]`
  • `area area-id range ip-address mask [advertise | not-advertise] [cost cost]`
  • `area area-id stub [no-summary]`
  • `area transit-area-id virtual-link transit-router-id topology disable`
  • `default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]`
  • `default-metric metric-value`
  • `discard-route [external | internal]`
  • `distance ospf {external dist1 | inter-area dist2 | intra-area dist3}`
  • `distribute-list in`
  • `distribute-list out`
  • `max-metric router-lsa [on-startup {seconds | wait-for-bgp}]`
  • `maximum-paths number-of-paths`
  • `neighbor ip-address [cost number]`
  • `redistribute protocol [process-id] {level-1 | level-1-2 | level-2} [as-number] [metric {metric-value | transparent}] [metric-type type-value] [match {external | internal | nssa-external}] [tag tag-value] [route-map map-tag] [subnets]`
  • `summary-address {ip-address mask | prefix mask} [not-advertise] [tag tag]`
  • `timers throttle spf spf-start spf-hold spf-max-wait`
  • `traffic-share min across-interfaces`

### Information About OSPF Support for MTR

#### Routing Protocol Support for MTR

You must enable IP routing on the device for Multitopology Routing (MTR) to operate. MTR supports static and dynamic routing in Cisco software. You can enable dynamic routing per topology to support interdomain and intradomain routing. Route calculation and forwarding are independent for each topology. MTR support is integrated into Cisco software for the following protocols:

- Border Gateway Protocol (BGP)
Enhanced Interior Gateway Routing Protocol (EIGRP)
Integrated Intermediate System-to-Intermediate System (IS-IS)
Open Shortest Path First (OSPF)

You apply the per-topology configuration in router address family configuration mode of the global routing process (router configuration mode). The address family and subaddress family are specified when the device enters address family configuration mode. You specify the topology name and topology ID by entering the topology command in address family configuration mode.

You configure each topology with a unique topology ID under the routing protocol. The topology ID is used to identify and group Network Layer Reachability Information (NLRI) for each topology in updates for a given protocol. In OSPF, EIGRP, and IS-IS, you enter the topology ID during the first configuration of the topology command for a class-specific topology. In BGP, you configure the topology ID by entering the bgp tid command under the topology configuration.

You can configure class-specific topologies with different metrics than the base topology. Interface metrics configured on the base topology can be inherited by the class-specific topology. Inheritance occurs if no explicit inheritance metric is configured in the class-specific topology.

You configure BGP support only in router configuration mode. You configure Interior Gateway Protocol (IGP) support in router configuration mode and in interface configuration mode.

By default, interfaces are not included in nonbase topologies. For routing protocol support for EIGRP, IS-IS, and OSPF, you must explicitly configure a nonbase topology on an interface. You can override the default behavior by using the all-interfaces command in address family topology configuration mode. The all-interfaces command causes the nonbase topology to be configured on all interfaces of the device that are part of the default address space or the virtual routing and forwarding (VRF) instance in which the topology is configured.

**Interface Configuration Support for MTR**

The configuration of a Multitopology Routing (MTR) topology in interface configuration mode allows you to enable or disable MTR on a per-interface basis. By default, a class-specific topology does not include any interfaces.

You can include or exclude individual interfaces by configuring the topology interface configuration command. You specify the address family and the topology (base or class-specific) when entering this command. The subaddress family can be specified. If no subaddress family is specified, the unicast subaddress family is used by default.

You can include globally all interfaces on a device in a topology by entering the all-interfaces command in routing topology configuration mode. Per-interface topology configuration applied with the topology command overrides global interface configuration.

The interface configuration support for MTR has these characteristics:

- Per-interface routing configuration: Interior Gateway Protocol (IGP) routing and metric configurations can be applied in interface topology configuration mode. Per-interface metrics and routing behaviors can be configured for each IGP.

- Open Shortest Path First (OSPF) interface topology configuration: Interface mode OSPF configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure an interface cost or disable OSPF routing without removing the interface from the global topology configuration.
• Enhanced Interior Gateway Routing Protocol (EIGRP) interface topology configuration: Interface mode EIGRP configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure various EIGRP features.

• Intermediate System-to-Intermediate System (IS-IS) interface topology configuration: Interface mode IS-IS configurations for a class-specific topology are applied in interface topology configuration mode. In this mode, you can configure an interface cost or disable IS-IS routing without removing the interface from the global topology configuration.

**How to Configure OSPF Support for MTR**

**Activating an MTR Topology by Using OSPF**

**Note**

Only Multitopology Routing (MTR) commands are shown in this task.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router ospf process-id [vrf vrf-name]
4. address-family ipv4 [multicast | unicast]
5. topology {base | topology-name tid number}
6. end
7. show ip ospf [process-id] topology-info [multicast] [topology {topology-name | base}]

### What to Do Next

If an Enhanced Interior Gateway Routing Protocol (EIGRP) topology configuration is required, see the "EIGRP Support for MTR" feature module.

If an Intermediate System-to-Intermediate System (IS-IS) topology configuration is required, see the "IS-IS Support for MTR" feature module.
Activating an MTR Topology in Interface Configuration Mode by Using OSPF

Before You Begin
Define a topology globally before performing the per-interface topology configuration.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. topology ipv4 [multicast | unicast] {topology-name [disable] | base}
5. ip ospf cost number
6. ip ospf topology disable
7. end
8. show ip ospf [process-id] interface [type number] [brief] [multicast] [topology {topology-name | base}]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>interface type number</td>
<td>Specifies the interface type and number, and enters interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# interface Ethernet 0/0</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>topology ipv4 [multicast</td>
<td>unicast] {topology-name [disable]</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# topology ipv4 VOICE</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>ip ospf cost number</td>
<td>Applies a cost to the interface in a topology instance.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>Example: Device(config-if-topology)# ip ospf cost 100</td>
<td>• The lowest cost number has the highest preference.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 6**
ip ospf topology disable

**Example:**
Device(config-if-topology)# ip ospf topology disable

Prevents Open Shortest Path First (OSPF) from advertising the interface as part of the topology without disabling the OSPF process or the topology on the interface.

**Step 7**
end

**Example:**
Device(config-if-topology)# end

Exits interface topology configuration mode and returns to privileged EXEC mode.

**Step 8**
show ip ospf [process-id] interface [type number] [brief] [multicast] [topology {topology-name | base}]

**Example:**
Device# show ip ospf 1 interface topology VOICE

(Optional) Displays OSPF-related interface information.

• Displays OSPF and interface information about the specified topology when the topology keyword is entered.

---

**Monitoring Interface and Topology IP Traffic Statistics for MTR**

Use any of the following commands in any order to monitor interface and topology IP traffic statistics for Multitopology Routing (MTR).

**SUMMARY STEPS**

1. enable
2. show ip interface [type number] [topology {name | all | base}] [stats]
3. show ip traffic [topology {name | all | base}]
4. clear ip interface type number [topology {name | all | base}] [stats]
5. clear ip traffic [topology {name | all | base}]

---

<td>• If the topology keyword and a related keyword are not used, only the interface-level aggregate statistics are reset.</td>
</tr>
<tr>
<td>Device# clear ip interface FastEthernet 1/10 topology all</td>
<td>• If all topologies need to be reset, use the all keyword as the topology name.</td>
</tr>
<tr>
<td><strong>Step 5</strong> clear ip traffic [topology {name</td>
<td>all</td>
</tr>
<tr>
<td>Example:</td>
<td>• If no topology name is specified, global statistics are cleared.</td>
</tr>
<tr>
<td>Device# clear ip traffic topology all</td>
<td></td>
</tr>
</tbody>
</table>
Configuration Examples for OSPF Support for MTR

Examples: Activating an MTR Topology by Using OSPF

The following example shows how to configure the VOICE topology in an Open Shortest Path First (OSPF) routing process and set the priority of the VOICE topology to the highest priority:

```
router ospf 1
  address-family ipv4
    topology VOICE tid 10
    priority 127
end
```

In the following example, the `show ip ospf` command is used with the `topology-info` and `topology` keywords to display OSPF information about the topology named VOICE:

```
Device# show ip ospf 1 topology-info topology VOICE
OSPF Router with ID (10.0.0.1) (Process ID 1)
VOICE Topology (MTID 66)
  Topology priority is 64
  Redistributing External Routes from, isis
  Number of areas transit capable is 0
  Initial SPF schedule delay 5000 msecs
  Minimum hold time between two consecutive SPFs 10000 msecs
  Maximum wait time between two consecutive SPFs 10000 msecs
  Area BACKBONE(0) (Inactive)
  SPF algorithm last executed 16:45:18.984 ago
  SPF algorithm executed 3 times
  Area ranges are
    Area 1
    SPF algorithm last executed 00:00:21.584 ago
    SPF algorithm executed 1 times
    Area ranges are
```

Examples: MTR OSPF Topology in Interface Configuration Mode

The following example shows how to disable Open Shortest Path First (OSPF) routing on Ethernet interface 0/0 without removing the interface from the global topology configuration:

```
interface Ethernet 0/0
  topology ipv4 VOICE
  ip ospf cost 100
  ip ospf topology disable
end
```

In the following example, the `show ip ospf interface` command is used with the `topology` keyword to display information about the topologies configured for OSPF in interface configuration mode:

```
Device# show ip ospf 1 interface topology VOICE
VOICE Topology (MTID 66)
  Serial3/0 is up, line protocol is up
  Internet Address 10.0.0.5/30, Area 1
  Process ID 1, Router ID 44.44.44.44, Network Type POINT_TO_POINT
  Topology-MTID Cost Disabled Shutdown Topology Name
    4 77 no no grc
  Transmit Delay is 1 sec, State POINT_TO_POINT
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  oob-resync timeout 40
```
Hello due in 00:00:05
Supports Link-local Signaling (LLS)
Cisco NSF helper support enabled
IETF NSF helper support enabled
Index 1/4, flood queue length 0
Next 0x0(0)/0x0(0)
Last flood scan length is 1, maximum is 1
Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 1, Adjacent neighbor count is 1
Adjacent with neighbor 10.2.2.2
Suppress hello for 0 neighbor(s)

In the following example, the **show ip ospf interface** command is used with the **brief** and **topology** keywords to display information about the topologies configured for OSPF in interface configuration mode:

```
Device# show ip ospf 1 interface brief topology VOICE

VOICE Topology (MTID 66)

</tr>
</thead>
</table>
| OSPF Support for MTR | 12.2(33)SRB  | This feature provides Open Shortest Path First (OSPF) support for multiple logical topologies over a single physical network.

The following commands were introduced or modified:
address-family ipv4, area capability default-exclusion, ip ospf cost, ip ospf topology disable, priority, router ospf, show ip ospf interface, show ip ospf topology-info, topology.
QoS-MQC Support for MTR

The QoS-MQC Support for MTR feature enables Multitopology Routing (MTR) traffic classification. Traffic classification is used to associate different classes of traffic with different topologies when multiple topologies are configured on the same device. This module describes how to configure quality of service (QoS) with modular QoS CLI (MQC) support for MTR.

- Finding Feature Information, page 85
- Prerequisites for QoS-MQC Support for MTR, page 85
- Restrictions for QoS-MQC Support for MTR, page 86
- Information About QoS-MQC Support for MTR, page 86
- How to Configure QoS-MQC Support for MTR, page 87
- Configuration Examples for QoS-MQC Support for MTR, page 90
- Additional References, page 91
- Feature Information for QoS-MQC Support for MTR, page 92
- Glossary, page 93

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for QoS-MQC Support for MTR

- Be familiar with the concepts documented in the “MTR Traffic Classification” section.
• Define a topology globally rather than at the interface level as in quality of service (QoS) before configuring traffic classification

• Ensure that all devices throughout the network have the same definition of classifiers and the same sequencing of classifiers.

• Carefully coordinate simultaneous configuration in a network where Multitopology Routing (MTR) and QoS traffic classification are configured.

Restrictions for QoS-MQC Support for MTR

• Multitopology Routing (MTR) classification values must be unique for each topology. An error message is generated if you attempt to configure overlapping values.

• A topology cannot be placed in the shutdown state if it is referenced by any active policy map.

• A subset of differentiated services code point (DSCP) bits is used to encode classification values in the IP packet header. Certain DSCP values are reserved. These DSCP values are commonly used by routing software components for purposes unrelated to MTR (for example, Open Shortest Path First [OSPF], Bidirection Forwarding Detection [BFD], and Simple Network Management Protocol [SNMP]). If you use these values for MTR classification, they are likely to interfere with correct operation of the device and is strongly discouraged. These DSCP values are:
  • DSCP 16 (cs2)
  • DSCP 48 (cs6)

Information About QoS-MQC Support for MTR

MTR Traffic Classification

Multitopology Routing (MTR) cannot be enabled on a device until traffic classification is configured, even if only one class-specific topology is configured. Traffic classification is used to configure topology-specific forwarding behaviors when multiple topologies are configured on the same device. Traffic classification must be applied consistently throughout the network. Class-specific packets are associated with the corresponding topology table forwarding entries.

Traffic classification is configured when you use the modular quality of service (QoS) CLI (MQC). MTR traffic classification is similar to QoS traffic classification. However, there is an important distinction. MTR traffic classification is defined globally for each topology, rather than at the interface level as in QoS.

A subset of differentiated services code point (DSCP) bits is used to encode classification values in the IP packet header. You configure a class map to define the traffic class by entering the `class-map class-map-name` command in global configuration mode. Only the `match-any` keyword is supported for MTR. You associate the traffic class with a policy by configuring the `policy-map type class-routing ipv4 unicast` command in global configuration mode. You activate the policy for the topology by configuring the `service-policy type class-routing` command in global address family configuration mode. Then you associate the service policy with all interfaces on the device.
You can configure MTR traffic classification and IP Differentiated Services or IP Precedence-based traffic classification in the same network. However, MTR requires exclusive use of some subset of the DSCP bits in the IP packet header for specific topology traffic. In a network where MTR and QoS traffic classification are configured, you must carefully coordinate simultaneous configuration.

How to Configure QoS-MQC Support for MTR

Configuring MTR Traffic Classification

Before You Begin

Following the correct order of the commands in this task is very important. Ensure that all configuration that affects traffic classification is complete before entering the `service-policy type class-routing` command.

SUMMARY STEPS

1. enable
2. configure terminal
3. class-map match-any class-map-name
4. match [ip] dscp dscp-value [dscp-value dscp-value dscp-value dscp-value dscp-value]
5. exit
6. policy-map type class-routing ipv4 unicast policy-map-name
7. class {class-name | class-default}
8. select-topology topology-name
9. exit
10. exit
11. global-address-family ipv4 [multicast | unicast]
12. service-policy type class-routing policy-map-name
13. end
14. show topology detail
15. show policy-map type class-routing ipv4 unicast [interface [type number]]
16. show mtm table

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Command or Action</td>

<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Example:</td>
<td>▪ Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

### Step 2

**configure terminal**

Enters global configuration mode.

**Example:**

Device# configure terminal

### Step 3

**class-map match-any class-name**

Creates a class map to be used for matching packets to a specified class and enters quality of service (QoS) class-map configuration mode.

**Example:**

Device(config)# class-map match-any VOICE-CLASS

**Note** The `match-any` keyword must be entered when configuring classification for MTR.

### Step 4

**match [ip] dscp dscp-value [dscp-value dscp-value dscp-value dscp-value dscp-value]***

Identifies a differentiated services code point (DSCP) value as a match criterion.

**Example:**

Device(config-cmap)# match ip dscp 9

**Note** Do not use the DSCP values 48 and 16. See the "Restrictions for QoS-MQC Support for MTR" section for more information.

### Step 5

**exit**

Exits QoS class-map configuration mode.

**Example:**

Device(config-cmap)# exit

### Step 6

**policy-map type class-routing ipv4 unicast policy-map-name**

Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy and enters QoS policy-map configuration mode.

**Example:**

Device(config)# policy-map type class-routing ipv4 unicast VOICE-CLASS-POLICY

### Step 7

**class {class-name | class-default}**

Specifies the name of the class whose policy you want to create or change or specifies the default class and enters policy-map class configuration mode.

**Example:**

Device(config-pmap)# class VOICE-CLASS

**Note** The class map is referenced.
## Purpose

- For a class map to be referenced in a class-routing policy map, you must first define it by using the `class-map` command as shown in Step 3.

## Command or Action | Purpose
--- | ---

### Step 8

**select-topology topology-name**

**Example:**

Device(config-pmap-c)# select-topology VOICE

Attaches the policy map to the topology.

### Step 9

**exit**

**Example:**

Device(config-pmap-c)# exit

Exits QoS policy-map class configuration mode.

### Step 10

**exit**

**Example:**

Device(config-pmap-c)# exit

Exits QoS policy-map configuration mode.

### Step 11

**global-address-family ipv4 [multicast | unicast]**

**Example:**

Device(config)# global-address-family ipv4

Enters global address family configuration mode to configure MTR.

### Step 12

**service-policy type class-routing policy-map-name**

**Example:**

Device(config-af)# service-policy type class-routing VOICE-CLASS-POLICY

Attaches the service policy to the policy map for MTR traffic classification and activates MTR.

- The `policy-map-name` argument must match the value configured in step 6.

**Note** Traffic classification is enabled after this command is entered. Ensure that all configuration that affects traffic classification is complete before entering this command.

### Step 13

**end**

**Example:**

Device(config-af)# end

Exits global address family configuration mode and returns to privileged EXEC mode.

### Step 14

**show topology detail**

**Example:**

Device# show topology detail

(Optional) Displays detailed information about class-specific and base topologies.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 15** | **show policy-map type class-routing ipv4 unicast [interface [type number]]**  
*Example:*  
Device# show policy-map type class-routing ipv4 unicast | (Optional) Displays the class-routing policy map configuration.  
*•* If you specify the interface keyword without the argument, statistics for all interfaces are displayed. |
| **Step 16** | **show mtm table**  
*Example:*  
Device# show mtm table | (Optional) Displays information about the DSCP values assigned to each topology. |

## Configuration Examples for QoS-MQC Support for MTR

### Examples: MTR Traffic Classification

The following example shows how to configure classification and activate Multitopology Routing (MTR) for two topologies:

```
global-address-family ipv4  
topology VOICE  
  all-interfaces  
  exit  
topology VIDEO  
  forward-base  
  maximum routes 1000 90  
  exit  
exit  
class-map match-any VOICE-CLASS  
match ip dscp 9  
exit  
class-map match-any VIDEO-CLASS  
match ip dscp af11  
exit  
policy-map type class-routing ipv4 unicast MTR  
class VOICE-CLASS  
select-topology VIDEO  
exit  
class VIDEO-CLASS  
select-topology VIDEO  
exit  
exit  
global-address-family ipv4  
service-policy type class-routing MTR  
end
```

The following example shows how to display detailed information about the VOICE and VIDEO topologies:

```
Device# show topology detail  
Topology: base  
  Address-family: ipv4
```
Associated VPN VRF is default
Topology state is UP
Associated interfaces:
  Ethernet0/0, operation state: UP
  Ethernet0/1, operation state: DOWN
  Ethernet0/2, operation state: DOWN
  Ethernet0/3, operation state: DOWN
  Loopback0, operation state: UP

Topology: VIDEO
Address-family: ipv4
Associated VPN VRF is default
Topology state is UP
Topology fallback is enabled
Topology maximum route limit 1000, warning limit 90% (900)
Associated interfaces:

Topology: VOICE
Address-family: ipv4
Associated VPN VRF is default
Topology state is UP
Topology is enabled on all interfaces
Associated interfaces:
  Ethernet0/0, operation state: UP
  Ethernet0/1, operation state: DOWN
  Ethernet0/2, operation state: DOWN
  Ethernet0/3, operation state: DOWN
  Loopback0, operation state: UP

Topology: base
Address-family: ipv4 multicast
Associated VPN VRF is default
Topology state is DOWN
Multicast multi-topology mode is enabled.
Route Replication Enabled:
  from unicast topology VOICE all route-map BLUE
Associated interfaces:
  Ethernet0/0, operation state: UP
  Ethernet0/1, operation state: DOWN
  Ethernet0/2, operation state: DOWN
  Ethernet0/3, operation state: DOWN
  Loopback0, operation state: UP

The following example shows how to display the classification values for the VOICE and VIDEO topologies:

Device# show mtm table

MTM Table for VRF: default, ID:0
Topology    Address Family    Associated VRF    Topo-ID
base         ipv4              default          0
VOICE        ipv4              default          2051
Classifier: ClassID:3
  DSCP: cs1
  DSCP: 9
VIDEO        ipv4              default          2054
Classifier: ClassID:4
  DSCP: af1

<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| QoS-MQC Support for MTR         | 12.2(33)SRB 15.0(1)S | This feature enables Multitopology Routing (MTR) traffic classification. Traffic classification is used to associate different classes of traffic with different topologies when multiple topologies are configured on the same device. A subset of differentiated services code point (DSCP) bits is used to encode classification values in the IP packet header and mark the packet for classification. When MTR traffic classification is enabled, MTR is activated and ready for the routing protocols to start contributing to the topologies. The following commands were introduced or modified: *policy-map type class-routing ipv4 unicast*, *select topology*, *service-policy type class-routing*, *show mtm table*, *show policy-map type class-routing ipv4 unicast*.

Glossary

**base topology**—The entire network for which the usual set of routes are calculated. This topology is the same as the default global routing table that exists without Multitopology Routing (MTR) being used.

**class-specific topology**—New topologies that are defined over and above the existing base topology; each class-specific topology is represented by its own Routing Information Base (RIB) and Forwarding Information Base (FIB).

**classification**—Selection and matching of traffic that needs to be provided with a different treatment based on its mark. Classification is a read-only operation.

**DSCP**—differentiated services code point. Six bits in the Type of Service (ToS) field. Two bits are used for Explicit Congestion Notification, which are used to mark the packet.

**incremental forwarding mode**—Incremental forwarding mode is designed to support transitional or incremental deployment of MTR, where devices are in the network that are not MTR enabled. In this mode, the device looks for a forwarding entry first in the class-specific FIB. If an entry is not found, the device then looks for the longest match in the base topology FIB. If an entry is found in the base topology FIB, the packet is forwarded on the base topology. If a forwarding entry is not found in the base topology FIB, the packet is dropped.
marking—Setting a value in the packet or frame. Marking is a read and write operation.

multitopology—Multitopology means that each topology routes and forward a subset of the traffic as defined by the classification criteria.

NLRI—Network Layer Reachability Information.

strict forwarding mode—Strict forwarding mode is the default forwarding mode for MTR. Only routes in the topology-specific routing table are considered. Among these, the longest match for the destination address is used. If no route containing the destination address can be found in the topology specific table, the packet is dropped.

TID—Topology Identifier. Each topology is configured with a unique topology ID. The topology ID is configured under the routing protocol and is used to identify and group NLRI for each topology in updates for a given protocol.
CHAPTER 9

SNMP Support for MTR

The SNMP Support for MTR feature uses context-based the Simple Network Management Protocol (SNMP) to extend support for existing MIBs from representing the management information for just the base topology to representing the same information for multiple topologies. This module describes how to configure SNMP support for Multitopology Routing (MTR).

- Finding Feature Information, page 95
- Prerequisites for SNMP Support for MTR, page 95
- Information About SNMP Support for MTR, page 96
- How to Configure SNMP Support for MTR, page 96

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for SNMP Support for MTR

Enable Simple Network Management Protocol (SNMP).
Information About SNMP Support for MTR

Network Management Support for MTR

Context-based Simple Network Management Protocol (SNMP) support is integrated into Cisco software. SNMP support for Multitopology Routing (MTR) uses context-based SNMP to extend support for existing MIBs from representing the management information for just the base topology to representing the same information for multiple topologies.

You can configure the SNMP agent software component on the device to pass a context string to existing MIB access functions. Network management applications can provide these context strings in SNMP transactions to direct those transactions to a specific VPN routing and forwarding (VRF) instance, a specific topology, or a routing protocol instance. The SNMP infrastructure on the receiving device verifies that a context string is defined for the device, and that the accompanying internal identifier is defined for that context string, before passing the context string and the internal identifier to the MIB access function.

Standard network management utilities, such as ping and traceroute, are enhanced to support MTR. You can configure a standard or extended ping using the topology name in place of a hostname or IP address. Traceroute is similarly enhanced.

```
**Example:**
```
Device(config-router-af)# topology VOICE tid 10
```
**Purpose:**
Configures the global topology instance and enters router address family topology configuration mode.

### Step 7
**Command or Action:**
```
snmp context context-name
```
**Example:**
```
Device(config-router-af-topology)# snmp context comp-protocol
```
**Purpose:**
Creates an SNMP context for MTR for a specific topology under a routing protocol.

### Step 8
**Command or Action:**
```
end
```
**Example:**
```
Device(config-router-af-topology)# end
```
**Purpose:**
Exits router address family topology configuration mode and returns to privileged EXEC mode.

### Step 9
**Command or Action:**
```
show snmp context mapping
```
**Example:**
```
Device# show snmp context mapping
```
**Purpose:**
(Optional) Displays information about SNMP contexts for MTR.

---

## Configuration Examples for SNMP Support for MTR

### Examples: SNMP Support for MTR

In the following example, the context string context-vrfA is configured to be associated with vrfA and will be passed on to the MIB access function during Simple Network Management Protocol (SNMP) transactions:

```
snmp-server community public
ip vrf vrfA
snmp context context-vrfA
end
```

In the following example, the context string context-voice is configured to be associated with the data topology named voice and will be passed on to the MIB access function during SNMP transactions:

```
global-address-family ipv4
topology voice
snmp context context-voice
end
```
In the following example, the context strings context-ospf and context-voice are configured to be associated with the Open Shortest Path First (OSPF) process and topology named voice and will be passed on to the MIB access function during SNMP transactions:

```
router ospf 3
snmp context context-ospf
address-family ipv4
topology voice tid 10
snmp context ospf-voice
end
```

The following example shows how the context strings are mapped to the specified virtual routing and forwarding (VRF), address family, topology, or protocol instance:

```
Device# show snmp context mapping
Context: ospf-voice
  VRF Name: 
  Address Family Name: ipv4
  Topology Name: voice
  Protocol Instance: OSPF-3 Router
Context: context-ospf
  VRF Name: 
  Address Family Name: 
  Topology Name: 
  Protocol Instance: OSPF-3 Router
Context: context-vrfA
  VRF Name: vrfA
  Address Family Name: 
  Topology Name: 
  Protocol Instance: 
Context: context-voice
  VRF Name: 
  Address Family Name: ipv4
  Topology Name: voice
  Protocol Instance: 
```

MTR in VRF

The MTR in VRF feature extends to IPv4 VRF contexts the Cisco IOS software's capability that allows users to configure one or more non-congruent multicast topologies in global IPv4 routing context. These contexts can be used to forward unicast and multicast traffic over different links in the network, or in the case of non-base topologies to provide a Live-Live multicast service using multiple non-congruent multicast topologies mapped to different (S,G) groups.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About MTR in VRF

MTR in VRF Overview

The MTR in VRF feature extends to IPv4 VRF contexts, Cisco IOS software's capability that allows users to configure one or more non-congruent multicast topologies in global IPv4 routing context. These contexts can
be used to forward unicast and multicast traffic over different links in the network, or in the case of non-base topologies to provide a Live-Live multicast service using multiple non-congruent multicast topologies mapped to different (S,G) groups.

The Cisco IOS Software allows a set of attributes, primarily used by BGP/MPLS L3VPNs, to be configured on a per-address family basis within a VRF. The MTR in VRF feature allows these attributes to be independently configured for the multicast sub-address families within a VRF address family.

How to Configure VRF in MTR

Configuring MTR in VRF

SUMMARY STEPS

Configuring Examples for MTR in VRF

Example for MTR in VRF

Device> enable
Device# configuration terminal
Device(config)# vrf definition vd1
Device(config-vrf)# rd 10:1
Device(config-vrf)# ipv4 multicast multitopology
Device(config-vrf)# address-family ipv4
Device(config-vrf)# exit-address-family
Device(config-vrf)# address-family ipv4 multicast
Device(config-vrf-af)# topology red
Device(config-vrf-af-topology)# all-interfaces
Device(config-vrf-af-topology)# exit
Device(config-vrf-af)# exit-address-family
Device(config-vrf)# exit
Device(config)# ip forwarding vrf1
Device(config)# ip address 10.1.10.1 255.255.255.0
Device(config)# ip pim sparse-dense-mode
Device(config)# end

Feature Information for MTR in VRF

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTR in VRF</td>
<td>Cisco IOS Release 15.4(1)S</td>
<td>The MTR in VRF feature extends to IPv4 VRF contexts the Cisco IOS software's capability that allows users to configure one or more non-congruent multicast topologies in global IPv4 routing context. These contexts can be used to forward unicast and multicast traffic over different links in the network, or in the case of non-base topologies to provide a Live-Live multicast service using multiple non-congruent multicast topologies mapped to different (S,G) groups.</td>
