

MTR in VRF

The MTR in VRF feature extends to IPv4 VRF contexts the Cisco IOS software's capability that allows users to configure one or more non-congruent multicast topologies in global IPv4 routing context. These contexts can be used to forward unicast and multicast traffic over different links in the network, or in the case of non-base topologies to provide a Live-Live multicast service using multiple non-congruent multicast topologies mapped to different (S,G) groups.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About MTR in VRF

MTR in VRF Overview

The MTR in VRF feature extends to IPv4 VRF contexts, Cisco IOS software's capability that allows users to configure one or more non-congruent multicast topologies in global IPv4 routing context. These contexts can be used to forward unicast and multicast traffic over different links in the network, or in the case of non-base topologies to provide a Live-Live multicast service using multiple non-congruent multicast topologies mapped to different (S,G) groups.

The Cisco IOS Software allows a set of attributes, primarily used by BGP/MPLS L3VPNs, to be configured on a per-address family basis within a VRF. The MTR in VRF feature allows these attributes to be independently configured for the multicast sub-address families within a VRF address family.

How to Configure VRF in MTR

Configuring MTR in VRF

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. vrf definition vrf-name
- **4. rd** *route-distinguisher*
- 5. ipv4 multicast multitoplogy
- 6. address-family ipv4
- 7. exit-address-family
- 8. address-family ipv4 multicast
- **9. topology** *topology-instance-name*
- 10. all-interfaces
- **11.** exit
- 12. exit-address-family
- 13. exit
- **14. interface** *type number*
- **15**. **interface** *type number*
- **16. vrf forwarding** *vrf-name*
- 17. ip address ip-address mask
- 18. ip pim sparse-dense-modeip
- 19. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	vrf definition vrf-name	Configures a VRF routing table and enters VRF
	Example:	configuration mode.

	Command or Action	Purpose	
	Device(config)# vrf definition vd1		
Step 4	rd route-distinguisher	Creates routing and forwarding tables for a VRF.	
	Example:		
	Device(config-vrf)# rd 10:1		
Step 5	ipv4 multicast multitoplogy	Enables IPv4 multicast support for multi-topology routing	
	Example:	(MTR) in a VRF instance.	
	Device(config-vrf)# ipv4 multicast multitoplogy		
Step 6	address-family ipv4	Specifies the IPv4 address family type and enters address	
	Example:	family configuration mode.	
	Device(config-vrf)# address-family ipv4		
Step 7	exit-address-family	Exits address family configuration mode and removes the	
	Example:	IPv4 address family.	
	Device(config-vrf-af)# exit-address-family		
Step 8	address-family ipv4 multicast	Specifies the IPv4 address family multicast type and enters	
	Example:	VRF address family configuration mode.	
	Device(config-vrf)# address-family ipv4 multicast		
Step 9	topology topology-instance-name	Specifies a topology instance and a name to it and enters	
·	Example:	VRF address family topology configuration mode.	
	Device(config-vrf-af)# topology red		
Step 10	all-interfaces	Configure the topology instance to use all interfaces or	
	Example:	the device.	
	Device(config-vrf-af-topology)# all-interfaces		
Step 11	exit	Exits VRF address-family topology configuration mode	
	Example:	and enters VRF address-family configuration mode.	
	<pre>Device(config-vrf-af-topology)# exit</pre>		
Step 12	exit-address-family	Exits address family configuration mode and removes the	
	Example:	IPv4 address family.	
	Device(config-vrf-af)# exit-address-family		
Step 13	exit	Exits VRF configuration mode and enters global	
Otop 15	Example:	configuration mode.	
	Example.		
	Device(config-vrf)# exit		
Step 14	interface type number	Selects the Ethernet interface and enters the interface	
	Example:	configuration mode.	

	Command or Action	Purpose	
	Device(config)# interface ethernet 0/1		
Step 15	interface type number	Selects the Ethernet interface and enters the interface	
	Example:	configuration mode.	
	Device(config)# interface ethernet 0/1		
Step 16	vrf forwarding vrf-name	Associates a VRF instance with the interface.	
	Example:		
	Device(config-if)# vrf forwwarding vrf1		
Step 17	ip address ip-address mask	Sets a primary or secondary IP address for an interface.	
	Example:		
	Device(config-if)# ip address 10.1.10.1 255.255.255.0		
Step 18	ip pim sparse-dense-modeip	Enables Protocol Independent Multicast (PIM) on an	
	Example:	interface.	
	Device(config-if)# ip pim sparse-dense-mode		
Step 19	end	Exits the interface configuration mode and enters privileg EXEC mode.	
	Example:		
	Device(config-if)# end		

Configuring Examples for MTR in VRF

Example for MTR in VRF

```
Device> enable
Device# configuration terminal
Device(config) # vrf definition vd1
Device(config-vrf) # rd 10:1
Device(config-vrf) # ipv4 multicast multitoplogy
Device(config-vrf) # address-family ipv4
Device(config-vrf) # exit-address-family
Device(config-vrf)# address-family ipv4 multicast
Device(config-vrf-af)# topology red
Device(config-vrf-af-topology)# all-interfaces
Device (config-vrf-af-topology) # exit
Device(config-vrf-af)# exit-address-family
Device(config-vrf)# exit
Device(config) # vrf forwarding vrf1
Device (config) # ip address 10.1.10.1 255.255.255.0
Device(config) # ip pim sparse-dense-mode
Device(config)# end
```

Feature Information for MTR in VRF

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for MTR in VRF

Feature Name	Releases	Feature Information
MTR in VRF		The MTR in VRF feature extends to IPv4 VRF contexts the Cisco IOS software's capability that allows users to configure one or more non-congruent multicast topologies in global IPv4 routing context. These contexts can be used to forward unicast and multicast traffic over different links in the network, or in the case of non-base topologies to provide a Live-Live multicast service using multiple non-congruent multicast topologies mapped to different (S,G) groups.
