CHAPTER 1

New and Changed Information  1

New and Changed Feature Information  1

PART I

Provisioning  11

CHAPTER 2

Zero-Touch Provisioning  13

Information About Zero-Touch Provisioning  13

Zero-Touch Provisioning Overview  13

DHCP Server Configuration for Zero-Touch Provisioning  14

Sample Zero-Touch Provisioning Configurations  14

Sample DHCP Server Configuration on a Management Port Using TFTP Copy  14

Sample DHCP Server Configuration on a Management Port Using HTTP Copy  14

Sample DHCP Server Configuration on an In-Band Port Using TFTP Copy  15

Sample DHCP Server Configuration on an In-Band Port Using HTTP Copy  15

Sample DHCP Server Configuration on a Linux Ubuntu Device  15

Sample Python Provisioning Script  16

Boot Log for Cisco 4000 Series Integrated Services Routers  16

Boot Log for Cisco Catalyst 9000 Series Switches  18

Feature Information for Zero-Touch Provisioning  26

CHAPTER 3

iPXE  29

Information About iPXE  29

About iPXE  29

iPXE Overview  30

IPv6 iPXE Network Boot  32

IPv6 Address Assignment in Rommon Mode  34

Programmability Configuration Guide, Cisco IOS XE Fuji 16.x
Contents

Supported ROMMON Variables 35
iPXe-Supported DHCP Options 35
DHCPv6 Unique Identifiers 37
How to Configure iPXe 37
  Configuring iPXe 37
  Configuring Device Boot 38
Configuration Examples for iPXe 39
  Example: iPXe Configuration 39
Sample iPXe Boot Logs 40
Sample DHCPv6 Server Configuration for iPXe 40
Troubleshooting Tips for iPXe 42
Additional References for iPXe 43
Feature Information for iPXe 43

PART II

Shells and Scripting 45

CHAPTER 4

Guest Shell 47
  Information About the Guest Shell 47
    Guest Shell Overview 47
      Guest Shell Vs Guest Shell Lite 48
      Guest Shell Security 48
      Hardware Requirements for the Guest Shell 48
      Guest Shell Storage Requirements 49
      Accessing Guest Shell on a Device 50
      Accessing Guest Shell Through the Management Port 50
      Stacking with Guest Shell 51
    IOx Overview 51
      IOx Tracing and Logging Overview 51
      IOXMAN Structure 51
      Logging and Tracing System Flow 52
      Logging and Tracing of Messages 54
      Example: Guest Shell Networking Configuration 55
    How to Enable the Guest Shell 55
    Managing IOx 55
CHAPTER 11  Model Based AAA  139
Model Based AAA  139
  Prerequisites for Model Based AAA  139
Initial Operation  139
  Group Membership  140
NACM Privilege Level Dependencies  141
NACM Configuration Management and Persistence  141
  Resetting the NACM Configuration  141
Sample NACM Configuration  141
Additional References for Model Based AAA  145
Feature Information for Model-Based AAA  145

CHAPTER 12  Model-Driven Telemetry  147
Model-Driven Telemetry  147
  Prerequisites for Model-Driven Telemetry  147
Information About Model-Driven Telemetry  148
  Model-Driven Telemetry Overview  148
  Subscription Overview  148
  Sample <establish-subscription> RPC  149
  RPC Support in Telemetry  150
  NETCONF Sessions in Telemetry  150
High Availability in Telemetry  151
Sample Model-Driven Telemetry RPCs  151
  Creating a Subscription  151
  Receiving a Response Code  151
  Receiving Subscription Push-Updates  151
  Retrieving Subscription Details  152
  Deleting a Subscription  153
Additional References for Model-Driven Telemetry  154
Feature Information for Model-Driven Telemetry  154

CHAPTER 13  In-Service Model Update  157
This chapter provides release-specific information about all features.

Provisioning

- Zero-Touch Provisioning, on page 13
- iPXE, on page 29
CHAPTER 2

Zero-Touch Provisioning

To address network provisioning challenges, Cisco introduces a zero-touch provisioning model. This module describes the Zero-Touch Provisioning feature.

Note
The Zero-Touch Provisioning feature is enabled automatically; no configuration is required.

- Information About Zero-Touch Provisioning, on page 13
- Sample Zero-Touch Provisioning Configurations, on page 14
- Feature Information for Zero-Touch Provisioning, on page 26

Information About Zero-Touch Provisioning

Zero-Touch Provisioning Overview

Zero-Touch Provisioning provides open bootstrap interfaces to automate network device provisioning in heterogeneous network environments.

When a device that supports Zero-Touch Provisioning boots up, and does not find the startup configuration (during initial installation), the device enters the Zero-Touch Provisioning mode. The device searches for a Dynamic Host Control Protocol (DHCP) server, bootstraps itself with its interface IP address, gateway, and Domain Name System (DNS) server IP address, and enables Guest Shell. The device then obtains the IP address or URL of an HTTP/TFTP server, and downloads the Python script from an HTTP/TFTP server to configure the device.

Guest Shell provides the environment for the Python script to run. Guest Shell executes the downloaded Python script and applies an initial configuration to the device.

After initial provisioning is complete, Guest Shell remains enabled. For more information, see the Guest Shell chapter.

Note
In case Zero-Touch Provisioning fails, the device falls back to AutoInstall to load configuration files. For more information, see Using AutoInstall and Setup.
DHCP Server Configuration for Zero-Touch Provisioning

In Zero-Touch Provisioning, a DHCP server must be running on the same network as the new device that is being provisioned. Zero-Touch Provisioning is supported on both management ports and in-band ports.

When the new device is switched on, it retrieves the IP address information of the HTTP/TFTP server where the Python script resides, and the folder path of the Python script from the DHCP server. For more information on Python Scripts, see the Python API and Python CLI Module chapters.

The DHCP server responds to DHCP discovery events with the following options:

- Option 150—(Optional) Contains a list of IP addresses that points to the HTTP/TFTP server on the management network that hosts the Python scripts to be run.

- Option 67—Contains the Python script file path on the HTTP/TFTP server.

After receiving these DHCP options, the device connects to the HTTP/TFTP server, and downloads the Python script. The device, at this point does not have any route to reach the HTTP/TFTP server, so it uses the default route provided by the DHCP server.

Sample Zero-Touch Provisioning Configurations

Sample DHCP Server Configuration on a Management Port Using TFTP Copy

The following is a sample DHCP server configuration using TFTP copy, when connected via the management port on a device:

```plaintext
Device> enable
Device# configure terminal
Device(config)# ip dhcp excluded-address 10.1.1.1
Device(config)# ip dhcp excluded-address vrf Mgmt-vrf 10.1.1.1 10.1.1.10
Device(config)# ip dhcp pool pnp_device_pool
Device(config-dhcp)# vrf Mgmt-vrf
Device(config-dhcp)# network 10.1.1.0 255.255.255.0
Device(config-dhcp)# default-router 10.1.1.1
Device(config-dhcp)# option 150 ip 203.0.113.254
Device(config-dhcp)# option 67 ascii /sample_python_dir/python_script.py
Device(config-dhcp)# exit
Device(config)# interface gigabitethernet 1/0/2
Device(config-if)# no ip dhcp client request tftp-server-address
Device(config-if)# end
```

Sample DHCP Server Configuration on a Management Port Using HTTP Copy

The following is a sample DHCP server configuration using HTTP copy, when connected via the management port on a device:

```plaintext
Device> enable
Device# configure terminal
Device(config)# ip dhcp pool pnp_device_pool
Device(config-dhcp)# vrf Mgmt-vrf
```
Sample DHCP Server Configuration on an In-Band Port Using TFTP Copy

The following is a sample DHCP server configuration using TFTP copy, when connected via the in-band port on a device:

```plaintext
Device> enable
Device# configure terminal
Device(config)# ip dhcp excluded-address 10.1.1.1
Device(config)# ip dhcp pool pnp_device_pool
Device(config-dhcp)# network 10.1.1.0 255.255.255.0
Device(config-dhcp)# default-router 10.1.1.1
Device(config-dhcp)# option 150 ip 203.0.113.254
Device(config-dhcp)# option 67 ascii /sample_python_dir/python_script.py
Device(config-dhcp)# exit
Device(config)# interface gigabitethernet 1/0/2
Device(config-if)# no ip dhcp client request tftp-server-address
Device(config-if)# end
```

Sample DHCP Server Configuration on an In-Band Port Using HTTP Copy

The following is a sample DHCP server configuration using HTTP copy, when connected via the in-band port on a device:

```plaintext
Device> enable
Device# configure terminal
Device(config)# ip dhcp excluded-address 10.1.1.1
Device(config)# ip dhcp pool pnp_device_pool
Device(config-dhcp)# network 10.1.1.0 255.255.255.0
Device(config-dhcp)# default-router 10.1.1.1
Device(config-dhcp)# option 67 ascii http://192.0.2.1:8000/sample_python_2.py
Device(config-dhcp)# end
```

Sample DHCP Server Configuration on a Linux Ubuntu Device

The following sample DHCP server configuration displays that the server is either connected to the management port or in-band port on a device, and a Python script is copied from a TFTP server.

```plaintext
root@ubuntu-server:/etc/dhcp# more dhcpd.conf
subnet 10.1.1.0 netmask 255.255.255.0 {
    range 10.1.1.2 10.1.1.255;
    host 3850 {
        fixed-address 10.1.1.246;
        hardware ethernet CC:D8:C1:85:6F:00;
        option bootfile-name !<opt 67> " /python_dir/python_script.py";
```
The following sample DHCP configuration shows that a Python script is copied from an HTTP server to the device:

```
option tftp-server-name !<opt 150> "203.0.113.254";
```

Once the DHCP server is running, boot a management-network connected device, and the rest of the configuration is automatic.

## Sample Python Provisioning Script

The following is a sample Python script can be used from either an HTTP or a TFTP server:

```python
print "

 *** Sample ZTP Day0 Python Script *** 

" # Importing cli module
import cli

print "

 *** Executing show platform *** 

"
cli_command = "show platform"
cli.executep(cli_command)

print "

 *** Executing show version *** 

"
cli_command = "show version"
cli.executep(cli_command)

print "

 *** Configuring a Loopback Interface *** 

"
cli.configurep(["interface loop 100", "ip address 10.10.10.10 255.255.255.255", "end"])

print "

 *** Executing show ip interface brief *** 

"
cli_command = "sh ip int brief"
cli.executep(cli_command)

print "

 *** ZTP Day0 Python Script Execution Complete *** 

"
```

## Boot Log for Cisco 4000 Series Integrated Services Routers

The following sample Zero-Touch Provisioning boot log displays that Guest Shell is successfully enabled, the Python script is downloaded to the Guest Shell, and the Guest Shell executes the downloaded Python script and configures the device for Day Zero.
% failed to initialize nvram

! <This message indicates that the startup configuration is absent on the device. This is the first indication that the Day Zero work flow is going to start.>

Feature Information for Zero-Touch Provisioning

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 2: Feature Information for Zero-Touch Provisioning

<table>
<thead>
<tr>

| Zero-Touch Provisioning: HTTP Download | Cisco IOS XE Fuji 16.8.1 | Zero-Touch Provisioning supports HTTP and TFTP file download. In Cisco IOS XE Everest 16.8.1, this feature was implemented on the following platforms:  
  • Cisco 4000 Series Integrated Services Routers  
  • Cisco Catalyst 3650 Series Switches  
  • Cisco Catalyst 3850 Series Switches  
  • Cisco Catalyst 9300 Series Switches  
  • Cisco Catalyst 9500 Series Switches  

In Cisco IOS XE Fuji 16.8.1a, this feature was implemented on Cisco Catalyst 9500-Series High Performance Series Switches. |
| DHCPv6 Support for Zero-Touch Provisioning | Cisco IOS XE Fuji 16.9.1 | In Cisco IOS XE Fuji 16.8.1a, this feature was implemented on the following platforms:  
  • Cisco Catalyst 9300 Series Switches  
  • Cisco Catalyst 9500 Series Switches |
iPXENetboot provides:

- IPv4 and IPv6 protocols
- FTP/HTTP/TFTP boot image download
- Embedded scripts into the image
- Stateless and stateful address auto-configuration (SLAAC) using Dynamic Host Configuration Protocol Version 4 (DHCPv4) and/or DHCPv6, boot URI, and parameters for DHCPv6 options depending on the IPv6 router advertisement.

Netboot Requirements

The following are the primary requirements for netbooting:

- DHCP server with proper configuration.
- Boot image available on the FTP/HTTP/TFTP server.
- Device configured to boot from a network-based source.
iPXE Overview

Network bootloaders support booting from a network-based source. The bootloaders boot an image located on an HTTP, FTP, or TFTP server. A network boot source is detected automatically by using an iPXE-like solution.

iPXE enables network boot for a device that is offline. The following are the three types of boot modes:

- **iPXETimeout**—Boots through iPXE network boot. Configures a timeout in seconds for iPXE network boot by using the IPXE_TIMEOUT rommon variable. Use the `boot ipxe timeout` command to configure iPXE timeout. When the timeout expires, device boot is activated.

- **iPXEForever**—Boots through iPXE network boot. The device sends DHCP requests forever, when the `boot ipxe forever` command is configured. This is an iPXE-only boot (which means that the bootloader will not fall back to a device boot or a command prompt, because it will send DHCP requests forever until it receives a valid DHCP response.)

- **Device**—Boots using the local device BOOT line configured on it. When device boot is configured, the configured IPXE_TIMEOUT rommon variable is ignored. You can activate device boot as specified below:
  - If `BOOTMODE=ipxe-forever`, device boot is not activated without user intervention (this is possible only if `ENABLE_BREAK=yes`).
  - If `BOOTMODE=ipxe-timeout`, device boot is activated when the specified IPXE_TIMEOUT variable (in seconds) has elapsed.
  - If `BOOTMODE=device`, device boot is activated. This is the default active mode.
  - Device boot can also be activated through the CLI.

---

**Note**

Device boot is the default boot mode.

---

**Note**

Manual boot is another term used in this document. Manual boot is a flag that determines whether to do a rommon reload or not. When the device is in rommon mode, you have to manually issue the `boot` command.

If manual boot is set to YES, the rommon or device prompt is activated. If manual boot is set to NO, the autoboot variable is executed; this means that the value set in the `BOOT` variable is followed.

The following section describes how an iPXE bootloader works:
1. Bootloader sends a DHCP discover message, and when the server replies, the Bootloader sends a DHCP request.

2. The DHCP response includes the IP address and boot file name. The boot file name indicates that the boot image is to be retrieved from a TFTP server (tftp://server/filename), FTP server (ftp://userid:password@server/filename), or an HTTP server (http://server/filename).

3. Bootloader downloads and boots the image from the network source.

4. If no DHCP response is received, the bootloader keeps sending DHCP requests forever or for a specified period of time, based on the boot mode configured. When a timeout occurs, the bootloader reverts to a device-based boot. The device sends DHCP requests forever only if the configured boot mode is `ipxe-forever`. If the `ipxe-timeout` boot mode command is configured, DHCP requests are sent for the specified amount of time, and when the timeout expires, device boot mode is activated.

---

**Note**

Because the current iPXE implementation works only via the management port (GigabitEthernet0/0), DHCP requests sent through the front panel ports are not supported.

When using a static network configuration to network boot, ROMMON uses the following environment variables (and all of them are required):

- **BOOT**—URLs separated by semicolon (;) to boot from.
- **IP_ADDRESS**—Statically assigned IP address of a device.
- **DEFAULT_GATEWAY**—Default gateway of the device.
- **IP_SUBNET_MASK**—IPv4 or IPv6 prefix information.
  - IPv4—Subnet mask of the device in the format WWW.XXX.YYY.ZZZ eg. 255.255.255.0.
IPv6—Subnet prefix length of the device in the format NNN eg. 64 or 112.

When manual boot is disabled, the bootloader determines whether to execute a device boot or a network boot based on the configured value of the rommon iPXE variable. Irrespective of whether manual boot is enabled or disabled, the bootloader uses the BOOTMODE variable to determine whether to do a device boot or a network boot. Manual boot means that the user has configured the `boot manual switch` command. When manual boot is disabled, and when the device reloads, the boot process starts automatically.

When iPXE is disabled, the contents of the existing BOOT variable are used to determine how to boot the device. The BOOT variable may contain a network-based uniform resource identifier (URI) (for example, http://, ftp://, tftp://), and a network boot is initiated; however DHCP is not used to get the network image path. The static network configuration is taken from the IP_ADDRESS, DEFAULT_GATEWAY, and IP_SUBNET_MASK variables. The BOOT variable may also contain a device filesystem-based path, in which case, a device filesystem-based boot is initiated.

The DHCP server used for booting can identify a device through the Product ID (PID) (available in DHCP Option 60), chassis serial number (available in DHCP option 61), or the MAC address of the device. The `show inventory` and `show switch` commands also display these values on the device.

The following is sample output from the `show inventory` command:

```
Device# show inventory
NAME:"c38xx Stack", DESCR:"c38xx Stack"
PID:WS-3850-12X-48U-L, VID:V01, SN: F0C1911V01A

NAME:"Switch 1", DESCR:"WS-C3850-12X48U-L"
PID:WS-C3850-12X48U-L, VID:V01, SN:F0C1911V01A

NAME:"Switch1 -Power Supply B", DESCR:"Switch1 -Power Supply B"
PID:PWR-C1-1100WAC, VID:V01, SN:LIT1847146Q
```

The following is sample output from the `show switch` command:

```
Device# show switch
Switch/Stack Mac Address : 046c.9d01.7d80 - Local Mac Address
Mac persistency wait time: Indefinite

<table>

</tbody>
</table>
```

The following rommon variables should be configured for iPXE:

- `BOOTMODE = ipxe-forever | ipxe-timeout | device`
- `IPXE_TIMEOUT = seconds`

**IPv6 iPXE Network Boot**

This illustration displays how IPv6 iPXE network boot works on a Cisco device:
The four elements in the above illustration are described below:

- **IPv6 Booting Device**—The device that is booting through iPXE boot.

- **Supporting Device**—A Cisco device that is configured with an IPv6 address to generate Router Advertisement (RA) messages.

**Note**

In this illustration, the IPv6 booting device, the supporting device, and the DHCP server are on the same subnet. However, if the supporting device and the DHCP server are on different subnets, then there must be a relay agent in the network.

- **DHCP server**—Any DHCP server.

- **Web server**—Any web server.

This section describes the IPv6 iPXE boot process:

1. The device sends a router solicitation Internet Control Message Protocol IPv6 (ICMPv6) type 133 packet to the IPv6 device on the local subnet.

2. The IPv6 device on the local subnet replies with a router advertisement (RA) message, ICMPv6 type 134 packet. The device that sent the router solicitation message, gets the default router and prefix information for Stateless Address AutoConfiguration (SLAAC) address completion from the RA packet.
3. The device sends a DHCPv6 solicit message to the multicast group address of ff02::1:2 for all DHCP agents.

The following sample displays the fields in a DHCPv6 solicit packet during iPXE boot:

```
DHCPv6
Message type: Solicit (1)
Transaction ID: 0x36f5f1
Client Identifier
Vendor Class
Identity Association for Non-Temporary Address
Option Request
User Class
Vendor-specific Information
```

The DHCPv6 solicit message contains the following information:

- DHCP Unique Identifier (DUID)—Identifies the client. iPXE supports DUID-EN. EN stands for Enterprise Number, and this DUID is based on the vendor-assigned unique identifier.

- DHCP and DHCPv6 Options

4. If the DHCPv6 server is configured, it responds with a DHCPv6 advertise packet that contains the 128 Bit IPv6 address, the boot file Uniform Resource Identifier (URI), the Domain Name System (DNS) server and domain search list, and the client and server IDs. The client ID contains the DUID of the client (In this illustration, the IPv6 Booting Device), and the Server ID contains the DUID of the DHCPv6 server.

5. The client then sends a DHCPv6 request packet to the multicast group address ff02::1:2, requesting for advertised parameters.

6. The server responds with a unicast DHCPv6 reply to the Link Local (FE80::) IPv6 address of the client. The following sample displays the fields in a DHCPv6 reply packet:

```
DHCPv6
Message type: Reply (7)
Transaction ID: 0x790950
Identity Association for Non-Temporary Address
Client Identifier
Server Identifier
DNS recursive name server
Boot File URL
Domain Search List
```

7. The device then sends an HTTP GET request to the web server.

8. If the requested image is available at the specified path, the web server responds with an OK for the HTTP GET request.

9. The TCP image transfer copies the image, and the device boots up.

---

**IPv6 Address Assignment in Rommon Mode**

The DHCP client uses the following order-of-precedence to decide which IPv6 address to use in rommon mode:

1. DHCP Server-assigned address
2. Stateless Address Auto-Configuration (SLAAC) address
3. Link-local address
4. Site-local address

The device uses the DHCP server-assigned address to boot an image. If the DHCPv6 server fails to assign an address, the device tries to use the SLAAC address. If both the DHCP server-assigned address and the SLAAC address are not available, the device uses the link-local address. However, the remote FTP/HTTP/TFTP servers must be on the same local subnet as that of the device for the image copy to succeed.

If the first three addresses are not available, the device uses the automatically generated site-local address.

**Supported ROMMON Variables**

The following ROMMON variables are supported in Cisco IOS XE Fuji 16.8.1:

- **BAUD**: Changes the device console BAUD rate to one of the Cisco standard baud rate; such as 1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200. Any invalid value will be rejected. If the BAUD variable is not set, the default will be 9600. The corresponding CLI command is

- **ENABLE_BREAK**: Enables a rommon break. The default value is NO.

- **MANUAL_BOOT**: If manual boot is set to 1, the rommon or device prompt is activated. If manual boot is set to 0, the device is reloaded; but rommon mode is not activated.

- **SWITCH_IGNORE_STARTUP_CFG**: If the value is 1, it causes the device to ignore the startup configuration. If the value is not set, the value is treated as zero. This is a read-only variable, and can only be modified by IOS.

**iPXESupported DHCP Options**

iPXE boot supports the following DHCPv4 and DHCPv6 options in rommon mode.

---

**Note**

Catalyst 9000 Series Switches support DHCP Option 60, Option 77, DHCPv6 Options 1, Option 15, and Option 16. DHCP Option 61 is only supported on Catalyst 9300 and 9500 Series Switches.

---

- **DHCP Option 60**—Vendor Class Identifier. This option is populated with the value of the ROMMON environment variable MODEL_NUM.

- **DHCP Option 61**—Client Identifier. This option is populated with the value of the ROMMON environment variable SYSTEM_SERIAL_NUM.

---

**Note**

This option is not supported on Catalyst 9400 Series Switches.

---

- **DHCP Option 77**—User Class Option. This option is added to a DHCP Discover packet, and contains the value equal to the string "iPXE". This option helps to isolate iPXE DHCP clients looking for an image to boot from a DHCP server.
The following is sample DHCPv4 configuration from the ISC DHCP Server that displays the use of Option 77. The `if` condition in this sample implies that if Option 77 exists, and is equal to the string iPXE, then advertise the Boot File URI for the image.

```plaintext
host Switch2 {
    fixed-address 192.168.1.20 ;
    hardware ethernet CC:D8:C1:85:6F:11 ;
    #user-class = length of string + ASCII code for iPXE
    if exists user-class and option user-class = 04:68:50:58:45 {
        filename "http://192.168.1.146/test-image.bin"
    }
}
```

- **DHCPv6 Option 1**—Client Identifier Option. This option is populated with the value of the ROMMON environment variable SYSTEM_SERIAL_NUM as specified in RFC 3315. The recommended format for the ROMMON environment variable is MAC_ADDR.

- **DHCPv6 Option 15**—User Class Option. This option is the IPv6 User Class option in a DHCPv6 solicit message, and is populated with the string, iPXE. The following sample shows Option 15 defined in the ISC DHCP server:

```plaintext
option dhcp6.user-class code 15 = string ;
```

The following is a sample DHCP Server configuration that uses the DHCPv6 Option 15:

```plaintext
#Client-specific parameters
host switch1 {
    #assigning a fixed IPv6 address
    fixed-address6 2001:DB8::CAFE ;
    #Client DUID in hexadecimal format contains: DUID-type"2" + "EN=9" + "Chassis serial number"
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:46:4F:43:31:38:33:31:58:31:41:53;
    #User class dhcp6.user-class = 00:04:69:50:58:45 is len 4 + "iPXE"
    if option dhcp6.user-class = 00:04:69:50:58:45 {
        option dhcp6.bootfile-url "http://[2001:DB8::461/platform-pxe/edi46/test-image.bin"
    }
}
```

- **DHCPv6 Option 16**—Vendor Class Option. Contains the device product ID (PID). The PID can be determined from the output of the `show inventory` command or from the MODEL_NUM rommon variable. Option 16 is not a default option in the ISC DHCP Server and can be defined as follows:

```plaintext
option dhcp6.vendor-class-data code 16 = string ;
```

The following sample configuration illustrates the use of DHCPv6 Option 16:

```plaintext
# Source: dhcpd6ConfigPD
host host1-ipxe6-auto-host1 {
    fixed-address6 2001:DB8::1234;
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:46:4F:43:31:38:33:31:58:31:41:53;
    if option dhcp6.vendor-class-data = 00:00:00:09:00:0E:57:53:2D:43:33:38:35:30:2D:32:34:50:2D:4D {
        option dhcp6.bootfile-url
```

Provisioning
"http://[2001:DB8::46]/platform-pxe/host1/17jan-polaris.bin"; 

The table below describes the significant fields shown in the display.

**Table 3: Sample Output Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp6.client-id</td>
<td>DHCP Unique Identifier (DUID) to identify the client.</td>
</tr>
<tr>
<td>dhcp6.user-class</td>
<td>DHCPv6 Option 15, the User Class option</td>
</tr>
<tr>
<td>dhcp6.vendor-class-data</td>
<td>DHCPv6 Option 16, the Vendor Class option that contains the switch Product ID (PID).</td>
</tr>
<tr>
<td>dhcp6.bootfile-url</td>
<td>DHCPv6 Option 6 to request for the Boot File URI</td>
</tr>
</tbody>
</table>

**DHCPv6 Unique Identifiers**

There are three types of DHCPv6 Identifiers (DUIDs) defined by RFC 3315; these are:

- **DUID-LLT**—DUID Link Layer address plus time, this is the link layer address of the network interface connected to the DHCP device plus the time stamp at which it is generated.

- **DUID-EN**—EN stands for Enterprise Number, this DUID is based on vendor-assigned unique ID.

- **DUID-LL**—DUID formed using the Link Layer address of any network interface that is permanently connected to the DHCP (client/server) device.

Cisco devices that support this feature use the DUID-EN (DUID Type 2) to identify the DHCP client (that is the device in the DHCPv6 Solicit packet). Catalyst 9000 Series Switches support not only DUID-EN, but also DUID-LL (DUID Type 3). DUID-EN is the preferred type; however, if switches are unable to create it, then DUID-LL is constructed and used.

**How to Configure iPXE**

**Configuring iPXE**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. • boot ipxe forever [switch number]
   • boot ipxe timeout seconds [switch number]
4. boot system {switch switch-number | all} {flash: | ftp: | http: | usbf lash0 | tftp: } 
5. end

| **Step 2**        | Enters global configuration mode. |
| configure terminal| |
| **Example:**      | |
| Device# configure terminal | |

| **Step 3**        | Configures device boot. The default boot mode is device boot. Enables default configuration on the device. |
| • no boot ipxe    | |
| • default boot ipxe| |
| **Example:**      | |
| Device(config)# no boot ipxe | |
| Device(config)# default boot ipxe | |

| **Step 4**        | Exits global configuration mode and returns to privileged EXEC mode. |
| end               | |
| **Example:**      | |
| Device(config)# end | |

## Configuration Examples for iPXE

### Example: iPXE Configuration

The following example shows that iPXE is configured to send DHCP requests forever until the device boots with an image:

```
Device# configure terminal
Device(config)# boot ipxe forever switch 2
Device(config)# end
```

The following example shows how to configure the boot mode to ipxe-timeout. The configured timeout is 200 seconds. If an iPXE boot failure occurs after the configured timeout expires, the configured device boot is activated. In this example, the configured device boot is http://[2001:db8::1]/image-filename.

```
Device# configure terminal
Device(config)# boot ipxe timeout 200 switch 2
Device(config)# boot system http://[2001:db8::1]/image-filename
Device(config)# end
```
Sample iPXE Boot Logs

The following are sample boot logs from a device in rommon mode. Here, manual boot using the `ipxe-timeout` command is configured:

```
switch: boot

pxemode: (ipxe-timeout) 60s timeout
00267.887 ipxe_get_booturl: Get URL from DHCP; timeout 60s
00267.953 ipxe_get_booturl: trying DHCPv6 (#1) for 10s

Sample DHCPv6 Server Configuration for iPXE

The following is a sample DHCPv6 server configuration taken from an Internet Systems Consortium (ISC) DHCP Server for reference. The lines preceded by the character #, are comments that explain the configuration that follows.

```
Default-least-time 600;
max-lease-time-7200;
log-facility local7;

#Global configuration
#domain search list
option dhcp6.domain-search "cisco.com";
#User-defined options:new-name code new-code = definition;
option dhcp6.user-class code 15 = string;
option dhcp6.vendor-class-data code 16 = string;

subnet6 2001:db8::/64 {
  #subnet range for clients requiring an address
  range6 2001:db8:0000:0000::/64;
```

Sample DHCPv6 Server Configuration for iPXE

The following is a sample DHCPv6 server configuration taken from an Internet Systems Consortium (ISC) DHCP Server for reference. The lines preceded by the character #, are comments that explain the configuration that follows.

```
Default-least-time 600;
max-lease-time-7200;
log-facility local7;

#Global configuration
#domain search list
option dhcp6.domain-search "cisco.com";
#User-defined options:new-name code new-code = definition;
option dhcp6.user-class code 15 = string;
option dhcp6.vendor-class-data code 16 = string;

subnet6 2001:db8::/64 {
  #subnet range for clients requiring an address
  range6 2001:db8:0000:0000::/64;
```
# DNS server options
option dhcp6.name-servers 2001:db8::46;
}

# Client-specific parameters
host switch1 {
    # assigning a fixed IPv6 address
    fixed-address6 2001:db8::cafe;
    # Client DUID in hexadecimal that contains: DUID-type "2" + "EN=9" + "Chassis serial number"
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:4f:43:31:38:33:31:58:31:41:53;
    option dhcp6.bootfile-url "http://[2001:db8::461/platform-pxe/edi46/test-image.bin";
}

For more information on DHCP server commands, see the ISC DHCP Server website.

In this sample configuration, the dhcp6.client-id option identifies the switch, and it is followed by the Enterprise Client DUID. The client DUID can be broken down for understanding as 00:02 + 00:00:00:09 + chassis serial number in hexadecimal format, where 2 refers to the Enterprise Client DUID Type, 9 refers to the reserved code for Cisco’s Enterprise DUID, followed by the ASCII code for the Chassis serial number in hexadecimal format. The chassis serial number for the switch in this sample is FOC1831X1AS.

The Boot File URI is advertised to the switch only using the specified DUID.

The DHCPv6 Vendor Class Option 16 can also be used to identify the switch on the DHCP Server. To define Option 16 as a user-defined option, configure the following:

option dhcp6.vendor-class-data code 16 = string;

The following is a sample DHCP server configuration that identifies the switch based on the DHCPv6 Vendor Class Option 16 that is formed by using the switch Product ID:

# Source: dhcp6ConfigPID
host edi-46-ipxe6-auto-edi46 {
    fixed-address6 2001:db8::1234;
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:4f:43:31:38:33:31:58:31:41:53;
    if option dhcp6.vendor-class-data = 00:00:00:09:0e:57:53:2d:43:33:38:35:30:2d:32:44:50:2d:4c {
        option dhcp6.bootfile-url "http://[2001:db8::461/platform-pxe/edi46/17jan-dev.bin";
    }
}

In this sample configuration, the dhcp6.vendor-class-data option refers to the DHCPv6 Option 16. In the dhcp6.vendor-class-data, 00:00:00:09 is Cisco’s Enterprise DUID, 0E is the length of the PID, and the rest is the PID in hexadecimal format. The PID can also be found from the output of the show inventory command or from the CFG_MODEL_NUM rommon variable. The PID used in this sample configuration is WS-C3850-24P-L.

DHCPv6 options and DUIDs in the server configuration must be specified in the hexadecimal format, as per the ISC DHCP server guidelines.
Troubleshooting Tips for iPXE

This section provides troubleshooting tips.

- When iPXE boot is enabled on power up, the device first attempts to send a DHCPv6 Solicit message, followed by a DHCPv4 Discover message. If boot mode is `ipxe-forever` the device keeps iterating between the two forever.

- If the boot-mode is iPXE timeout, the device first sends a DHCPv6 Solicit message, and then a DHCPv4 Discover message, and the device falls back to device boot after the timeout expires.

- To interrupt iPXE boot, send a serial break to the console.
  When using a UNIX telnet client, type CTRL-] and then send break. When you are using a different TELNET client, or you are directly attached to a serial port, sending a break may be triggered by a different keystroke or command.

- If the DHCP server responds with an image, but the DNS server cannot resolve the hostname, enable DNS debugs.

  ![Note](Note: We recommend the use of ISC DHCP server. This feature has not been verified on IOS DHCP.)

- To test the HTTP server connectivity, use HTTP copy to copy a small sample file from your HTTP server to your device. For example, at the rommon prompt, enter `copy http://192.168.1.1/test null:` (the flash is normally locked and you need to use the null device for testing) or `http://[2001:db8::99]/test`.

- When manual boot is enabled, and boot mode is ipxe-timeout, the device will not automatically boot on power up. Issue the `boot` command in rommon mode. To automate the boot process on power up, disable manual boot.

- Use the `net6-show` command to display the current IPv6 parameters, including IPv6 addresses and the default router in rommon mode.

  ![Note](Note: On Catalyst 9000 Series Switches, use the `net-show` show command.)

- Use the `net-dhcp` or the `net6-dhcp` commands based on your configuration. The `net-dhcp` command is a test command for DHCPv4 and the `net6-dhcp` command is for DHCPv6.

  ![Note](Note: On Catalyst 9000 Series Switches, use the `net-dhcp -6` command for DHCPv6.)

- Use the `dig` command to resolve names.

  ![Note](Note: On Catalyst 9000 Series Switches, use the `dns-lookup` commmand to resolve names.)
• Enable HTTP debug logs to view the HTTP response code from the web server.

• If Stateless Address Auto-Configuration (SLAAC) addresses are not generated, there is no router that is providing IPv6 RA messages. iPXE boot for IPv6 can still work but only with link or site-local addresses.

## Feature Information for iPXE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Shells and Scripting

• Guest Shell, on page 47
• Python API, on page 69
• CLI Python Module, on page 75
• EEM Python Module, on page 81
Guest Shell

Guest Shell is a virtualized Linux-based environment, designed to run custom Linux applications, including Python for automated control and management of Cisco devices. It also includes the automated provisioning (Day zero) of systems. This container shell provides a secure environment, decoupled from the host device, in which users can install scripts or software packages and run them.

This module describes Guest Shell and how to enable it.

- Information About the Guest Shell, on page 47
- How to Enable the Guest Shell, on page 55
- Configuration Examples for the Guest Shell, on page 61
- Additional References for Guest Shell, on page 65
- Feature Information for Guest Shell, on page 66

Information About the Guest Shell

Guest Shell Overview

The Guest Shell is a virtualized Linux-based environment, designed to run custom Linux applications, including Python for automated control and management of Cisco devices. Using the Guest Shell, you can also install, update, and operate third-party Linux applications. The guest shell is bundled with the system image and can be installed using the `guestshell enable` Cisco IOS command.

The Guest Shell environment is intended for tools, Linux utilities, and manageability rather than networking.

Guest Shell shares the kernel with the host (Cisco switches and routers) system. Users can access the Linux shell of Guest Shell and update scripts and software packages in the container rootfs. However, users within the Guest Shell cannot modify the host file system and processes.

Guest Shell container is managed using IOx. IOx is Cisco's Application Hosting Infrastructure for Cisco IOS XE devices. IOx enables hosting of applications and services developed by Cisco, partners, and third-party developers in network edge devices, seamlessly across diverse and disparate hardware platforms.

This table provides information about the various Guest Shell capabilities and the supported platforms.
### Guest Shell Vs Guest Shell Lite

The Guest Shell container allows users to run their scripts and apps on the system. The Guest Shell container on Intel x86 platforms will be a Linux container (LXC) with a CentOS 7.0 minimal rootfs. You can install other Python libraries such as, Python Version 3.0 during runtime using the Yum utility in CentOS 7.0. You can also install or update python packages using PIP.

The Guest Shell Lite container on MIPS platforms such as, Catalyst 3650 and Catalyst 3850 Series Switches have the Montavista Carrier Grade Edition (CGE) 7.0 rootfs. You can only install or run scripts in Guest Shell Lite. Yum install is not supported on these devices.

### Guest Shell Security

Cisco provides security to ensure that users or apps in the Guest Shell do not compromise the host system. Guest Shell is isolated from the host kernel, and it runs as an unprivileged container.

### Hardware Requirements for the Guest Shell

This section provides information about the hardware requirements for supported platforms. The Cisco CSR 1000v and Cisco ISRv (virtual platforms) implement these requirements in the software.
Table 6: Guest Shell Support on Catalyst Switches

<table>
<thead>
<tr>
<th>Platforms</th>
<th>Default DRAM</th>
<th>Guest Shell Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>WS-3650-xxx (all)</td>
<td>4 GB</td>
<td>Supported</td>
</tr>
<tr>
<td>WS-3850-xxx (all)</td>
<td>4 GB</td>
<td>Supported</td>
</tr>
<tr>
<td>C9300-xx-x (all)</td>
<td>8 GB</td>
<td>Supported</td>
</tr>
<tr>
<td>C9500-24Q-x (all)</td>
<td>16 GB</td>
<td>Supported</td>
</tr>
</tbody>
</table>

The minimum system requirement for Catalyst 3850 Series Switches is 4 GB DRAM.

Table 7: Guest Shell Support on ISR 4000 Series Integrated Services Routers

<table>
<thead>
<tr>
<th>Platform</th>
<th>Default DRAM</th>
<th>Guest Shell Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISR 4221</td>

</tr>
<tr>
<td>ISR 4331</td>
<td>8 GB</td>
<td>Supported</td>
</tr>
<tr>
<td></td>
<td>16 GB</td>
<td>Supported</td>
</tr>
<tr>
<td>ISR 4351</td>
<td>8 GB</td>
<td>Supported</td>
</tr>
<tr>
<td></td>
<td>16 GB</td>
<td>Supported</td>
</tr>
<tr>
<td>ISR 4431</td>
<td>8 GB</td>
<td>Supported</td>
</tr>
<tr>
<td></td>
<td>16 GB</td>
<td>Supported</td>
</tr>
<tr>
<td>ISR 4451</td>
<td>8 GB</td>
<td>Supported</td>
</tr>
<tr>
<td></td>
<td>16 GB</td>
<td>Supported</td>
</tr>
</tbody>
</table>

The minimum system requirement for ISR 4000 Series Integrated Services Routers is 8 GB DRAM.

Note

Virtual-service installed applications and Guest Shell container cannot co-exist.

The minimum system requirement for CSR 1000v and ISRv is 4GB RAM.

Guest Shell Storage Requirements

On Catalyst 3650 and Catalyst 3850 Series Switches, Guest Shell can only be installed on the flash filesystem. Bootflash of Catalyst 3850 Series Switches require 75 MB free disk space for Guest Shell to install successfully.

On Cisco 4000 Series Integrated Services Routers, the Guest Shell is installed on the Network Interface Module (NIM)-Service Set Identifier (SSD) (hard disk), if available. If the hard disk drive is available, there
is no option to select bootflash to install Guest Shell. Cisco 4000 Series Integrated Services Routers require 1100 MB free hard disk (NIM-SSID) space for Guest Shell to install successfully.

For Cisco 4000 Series Integrated Services Routers and ASR 1000 routers (when an optional hard disk has been added to that router) you can only do resource resizing if you have installed the Guest Shell on the hard disk and inserted the hard disk into the router.

A Guest Shell installed via bootflash does not allow you to do resource resizing using application hosting configuration commands.)

During Guest Shell installation, if enough hard disk space is not available, an error message is displayed.

The following is a sample error message on an ISR 4000 Series router:

% Error:guestshell_setup.sh returned error:255, message:
Not enough storage for installing guestshell. Need 1100 MB free space.

Bootflash or hard disk space can be used to store additional data by Guest Shell. On Cisco Catalyst 3850 Series Switches, Guest Shell has 18 MB of storage space available and on Cisco 4000 Series Integrated Services Routers, Guest Shell has 800 MB of storage space available. Because Guest Shell accesses the bootflash, it can use the entire space available.

<table>

**Accessing Guest Shell on a Device**

Network administrators can use IOS commands to manage files and utilities in the Guest Shell.

During the Guest Shell installation, SSH access is setup with a key-based authentication. The access to the Guest Shell is restricted to the user with the highest privilege (15) in IOS. This user is granted access into the Linux container as the guestshell Linux user, who is a sudoer, and can perform all root operations. Commands executed through the Guest Shell are executed with the same privilege that a user has when logged into the IOS terminal.

At the Guest Shell prompt, you can execute standard Linux commands.

**Accessing Guest Shell Through the Management Port**

By default, Guest Shell allows applications to access the management network. Users cannot change the management VRF networking configurations from inside the Guest Shell.
Stacking with Guest Shell

When Guest Shell is installed, a directory is automatically created in the flash filesystem. This directory is synchronized across stack members. During a switchover, only contents of this directory are synchronized across all stack members. To preserve data during high availability switchover, place data in this directory.

During a high availability switchover, the new active device creates its own Guest Shell installation and restores Guest Shell to the synchronized state; the old filesystem is not maintained. Guest shell state is internally synchronized across all stack members.

IOx Overview

IOx is a Cisco-developed end-to-end application framework that provides application hosting capabilities for different application types on Cisco network platforms. The Cisco Guest Shell, a special container deployment, is one such application, that is useful in system deployment/use.

IOx facilitates the life-cycle management of app and data exchange by providing a set of services that helps developers to package pre-built apps, and host them on a target device. IOx life-cycle management includes distribution, deployment, hosting, starting, stopping (management), and monitoring of apps and data. IOx services also include app distribution and management tools that help users discover and deploy apps to the IOx framework.

App hosting provides the following features:

- Hides network heterogeneity.
- IOx application programming interfaces (APIs), remotely manage the life cycle of applications hosted on a device.
- Centralized app life-cycle management.
- Cloud-based developer experience.

IOX Tracing and Logging Overview

IOx tracing and logging feature allows guest application to run separately on the host device that can help reporting the logging and tracing of the data to the host. The tracing data is saved into IOx tracelog, and the logging data is saved into IOS syslog on the host device.

You can redirect the tracing data to the appropriate storage device on the host device which can help in debugging of guest application.

IOXMAN Structure

Each guest application, a system LXC or a KVM instance is configured with its own syslogd and logfiles stored within a visible file system and are not accessible to the host device. To support logging data to IOS syslog and tracing data to IOx tracelog on the host, two serial devices, /dev/ttyS2 and /dev/ttyS3, are designated on the guest application for delivering data to the host as shown in the following figure.
IOXMAN is a process to establish the tracing infrastructure to provide logging or tracing services for guest application, except Libvirt that emulates serial devices. IOXMAN is based on the lifecycle of the guest application to enable and disable tracing service, to send logging data to IOS syslog, to save tracing data to IOx tracelog, and to maintain IOx tracelog for each guest application.

Logging and Tracing System Flow

The following sections describes how the IOx logging and tracing works:

LXC Logging

1. Guest OS enables /dev/ttyS2 on Guest application.
2. Guest application writes data to /dev/ttyS2.
3. Libvirt emulates /dev/ttyS2 to /dev/pts/x on the host.
4. IOXMAN gets the emulated serial device, /dev/pts/x from the XML file.
5. IOXMAN listens and reads available data from /dev/pts/x, sets the severity for the message, filters, parses and queues the message.

6. Start timer to send the message to /dev/log device on the host using errmsg.

7. Data is saved to IOS syslog.

**KVM Logging**

1. Guest OS enables /dev/ttyS2 on Guest application.
2. Guest application writes data to /dev/ttyS2.
3. Libver emulates /dev/ttyS2 to /dev/pts/x on the host.
4. IOXMAN gets the emulated TCP path from the XML file.
5. IOXMAN opens an unix socket, and connects to the remote socket.
6. IOXMAN reads available data from the socket, sets the severity for the message, filters, parses, and queues the message.
7. Start timer to send the message to /dev/log device on the host using errmsg.
8. Data is saved to IOS syslog.

**LXC Tracing**

1. Guest OS enables /dev/ttyS3 on Guest application.
2. Configures syslogd to copy message to /dev/ttyS3.
3. Guest application writes data to /dev/ttyS3.
4. Libver emulates /dev/ttyS3 to /dev/pts/y on the host.
5. IOXMAN gets the emulated serial device, /dev/pts/y from the XML file.
6. IOXMAN listens and reads available data from /dev/pts/y, filters, parses, and saves the message to IOx tracelog.
7. If IOx tracelog is full, IOXMAN rotates the tracelog file to /bootflash/tracelogs.

**KVM Tracing**

1. Guest OS enables /dev/ttyS3 on Guest application.
2. Configures syslogd to copy message to /dev/ttyS3.
3. Guest application writes data to /dev/ttyS3.
4. Libver emulates /dev/ttyS3 to TCP path on the host.
5. IOXMAN gets the emulated TCP path from the XML file.
6. IOXMAN opens an unix socket, and connects to the remote socket.
7. IOXMAN reads available data from the socket, sets the severity for the message, filters, parses, and saves the message to IOx tracelog.

8. If IOx tracelog is full, IOXMAN rotates the tracelog file to `/bootflash/tracelogs`.

Logging and Tracing of Messages

The following sections explain the logging and tracing of messages into IOS syslog.

Logging Messages in IOS Syslog

For any logging messages received from the Guest Application, IOXMAN sets the severity of the message to NOTICE by default, before sending it to IOS syslog. When a message is received by IOSd, it is displayed on the console and saved on the IOS syslog in the following message format.

*Apr 7 00:48:21.911: %IM-5-IOX_INST_NOTICE:ioxman: IOX SERVICE guestshell LOG: Guestshell test

In order to comply with IOS syslog, IOXMAN does support severity for logging message. To report logging message with severity, Guest Application needs to append the header to the front of the message.

```
[a123b234,version,severity]
```

- a123b234 is magic number.
- Severity: CRIT is 2
- ERR is 3
- WARN is 4
- NOTICE is 5
- INFO is 6
- DEBUG is 7

Following is an example of a message log:

```
echo "[a123b234,1,2]Guestshell failed" > /dev/ttyS2
```

Perform the following steps to report logging data from Guest Application to IOS syslog:

1. If you are using C programming, use `write()` to send logging data to host.

   ```c
   #define SYSLOG_TEST "syslog test"
   int fd;
   fd = open("/dev/ttyS2", O_WRONLY);
   write(fd, SYSLOG_TEST, strlen(SYSLOG_TEST));
   close(fd);
   ```

2. If you are using Shell console, use `echo` to send logging data to host.

   ```bash
   echo "syslog test" > /dev/ttyS2
   ```

**Tracing Message to IOx Tracelog**

Perform the following steps to report tracing messages from Guest Application to IOx tracelog:

1. If you are using C programming, use `write()` to send tracing message to host.
#define SYSLOG_TEST "tracelog test"
int fd;
fd = open("/dev/ttyS3", O_WRONLY);
write(fd, SYSLOG_TEST, strlen(SYSLOG_TEST));
close(fd);

2. If you are using C programming, use syslog() to send tracing message to host.

#define SYSLOG_TEST "tracelog test"
syslog(LOG_INFO, "%s\n", SYSLOG_TEST);

3. If you are using Shell console, use echo to send tracing data to host.

echo "tracelog test" > /dev/ttyS3
or
logger "tracelog test"

Example: Guest Shell Networking Configuration

For Guest Shell networking, the following configurations are required.
• Configure Domain Name System (DNS)
• Configure proxy settings
• Configure YUM or PIP to use proxy settings

How to Enable the Guest Shell

Managing IOx

Before you begin
IOx takes upto two minutes to start. CAF, IOXman, and Libirtd services must be running to enable Guest Shell successfully.

SUMMARY STEPS
1. enable
2. configure terminal
3. iox
4. exit
5. show iox-service
6. show app-hosting list

## What to do next

The following is sample output from the **show iox-service** command on an ISR 4000 Series Router:

```
Device# show iox-service

Virtual Service Global State and Virtualization Limits:

  Infrastructure version : 1.7
  Total virtual services installed : 0
  Total virtual services activated : 0

  Machine types supported : KVM, LXC
  Machine types disabled : none

  Maximum VCPUs per virtual service : 6
  Resource virtualization limits:

  Name     Quota  Committed Available
  -----------------------------------
  system CPU (%)   75   0     75
  memory (MB)    10240 0 10240
  bootflash (MB)  1000 0   1000
  harddisk (MB)   20000 0 18109
  volume-group (MB)  190768 0 170288
```
Managing the Guest Shell

Note

VirtualPortGroups are supported only on routing platforms.

Before you begin

IOx must be configured and running for Guest Shell access to work. If IOx is not configured, a message to configure IOx is displayed. Removing IOx removes access to the Guest Shell, but the rootfs remains unaffected.

An application or management interface must also be configured to enable and operate Guest Shell. See "Configuring the AppGigabitEthernet Interface for Guest Shell" and "Enabling Guest Shell on the Management Interface" sections for more information on enabling an interface for Guest Shell.

SUMMARY STEPS

1. enable
2. guestshell enable
3. guestshell run linux-executable
4. guestshell run bash
5. guestshell disable
6. guestshell destroy
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Example:** | Device> enable |
| **Step 2** | guestshell enable | Enables the Guest Shell service. |
| **Example:** | Device# guestshell enable |
| **Note** | - The `guestshell enable` command uses the management virtual routing and forwarding (VRF) instance for networking.  
- When using VirtualPortGroups (VPGs) for front panel networking, the VPG must be configured first.  
- The guest IP address and the gateway IP address must be in the same subnet. |
| **Step 3** | guestshell run `linux-executable` | Executes or runs a Linux program in the Guest Shell. |
| **Example:** | Device# guestshell run python  
or  
Device# guestshell run python3 |
| **Note** | In Cisco IOS XE Amsterdam 17.3.1 and later releases, only Python version 3 is supported. |
| **Step 4** | guestshell run bash | Starts a Bash shell to access the Guest Shell. |
| **Example:** | Device# guestshell run bash |
| **Step 5** | guestshell disable | Disables the Guest Shell service. |
| **Example:** | Device# guestshell disable |
| **Step 6** | guestshell destroy | Deactivates and uninstalls the Guest Shell service. |
| **Example:** | Device# guestshell destroy |

### Enabling and Running the Guest Shell

The `guestshell enable` command installs Guest Shell. This command is also used to reactivate Guest Shell, if it is disabled.

When Guest Shell is enabled and the system is reloaded, Guest Shell remains enabled.

**Note**

IOx must be configured before the `guestshell enable` command is used.
The `guestshell run bash` command opens the Guest Shell bash prompt. Guest Shell must already be enabled for this command to work.

**Note**
If the following message is displayed on the console, it means that IOx is not enabled; check the output of the `show iox-service` command to view the status of IOx.

The process for the command is not responding or is otherwise unavailable

For more information on how to enable Guest Shell, see the "Configuring the AppGigabitEthernet Interface for Guest Shell" and "Enabling Guest Shell on the Management Interface" sections.

### Disabling and Destroying the Guest Shell

The `guestshell disable` command shuts down and disables Guest Shell. When Guest Shell is disabled and the system is reloaded, Guest Shell remains disabled.

The `guestshell destroy` command removes the rootfs from the flash filesystem. All files, data, installed Linux applications and custom Python tools and utilities are deleted, and are not recoverable.

### Managing the Guest Shell Using Application Hosting

**Note**
This section is applicable to Cisco routing platforms. VirtualPortGroups are not supported on Cisco Catalyst Switching platforms.

IOx must be configured and running for Guest Shell access to work. If IOx is not configured, a message to configure IOx is displayed. Removing IOx removes access to the Guest Shell, but the rootfs remains unaffected.

**Note**
Use this procedure (Managing the Guest Shell Using Application Hosting) to enable the Guest Shell in Cisco IOS XE Fuji 16.7.1 and later releases. For Cisco IOS XE Everest 16.6.x and previous releases, use the procedure in Managing the Guest Shell, on page 57.

```
Device(config)# interface GigabitEthernet1
Device(config-if)# ip address dhcp
Device(config-if)# ip nat outside
Device(config-if)# exit

Device(config-if)# interface VirtualPortGroup0
Device(config-if)# ip address 192.168.35.1 255.255.255.0
Device(config-if)# ip nat inside
Device(config-if)# exit

Device(config)# ip nat inside source list GS_NAT_ACL interface GigabitEthernet1 overload
Device(config)# ip access-list standard GS_NAT_ACL
Device(config)# permit 192.168.0.0 0.0.255.255

Device(config)# app-hosting appid guestshell
Device(config-app-hosting)# app-vnic gateway1 virtualportgroup 0 guest-interface 0
        guest-ipaddress 192.168.35.2
```
For front panel networking, you must configure the GigabitEthernet and VirtualPortGroup interfaces as shown above. The Guest Shell uses a Virtualportgroup as the source interface to connect to the outside network through NAT.

The following commands are used to configure inside NAT. They allow the Guest Shell to reach the internet; for example, to obtain Linux software updates:

```
ip nat inside source list
ip access-list standard
permit
```

The `guestshell run` command in the example above, runs a python executable. You can also use the `guestshell run` command to run other Linux executables; for example, see the example `guestshell run bash` command, which starts a Bash shell or the `guestshell disable` command which shuts down and disables the Guest Shell. If the system is later reloaded, the Guest Shell remains disabled.

**Accessing the Python Interpreter**

Python can be used interactively or Python scripts can be run in the Guest Shell. Use the `guestshell run python` command to launch the Python interpreter in Guest Shell and open the Python terminal.
In releases prior to Cisco IOS XE Amsterdam 17.3.1, Python V2 is the default. Python V3 is supported in Cisco IOS XE Amsterdam 17.1.1, and Cisco IOS XE Amsterdam 17.2.1. In Cisco IOS XE Amsterdam 17.3.1 and later releases, Python V3 is the default.

Note

In Releases Prior to Cisco IOS XE Amsterdam 17.3.1

The guestshell run command is the Cisco IOS equivalent of running Linux executables, and when running a Python script from Cisco IOS, specify the absolute path. The following example shows how to specify the absolute path for the command:

```bash
Guestshell run python /flash/guest-share/sample_script.py parameter1 parameter2
```

The following example shows how to enable Python on a Cisco Catalyst 3650 Series Switch or a Cisco Catalyst 3850 Series Switch:

```bash
Device# guestshell run python
Python 2.7.11 (default, March 16 2017, 16:50:55)
[ GCC 4.7.0] on linux2
Type "help", "copyright", "credits" or "license" for more information.
```

The following example shows how to enable Python on a Cisco ISR 4000 Series Integrated Services Router:

```bash
Device# guestshell run python
Python 2.7.5 (default, Jun 17 2014, 18:11:42)
[ GCC 4.8.2 20140120 (Red Hat 4.8.2-16)] on linux2
Type "help", "copyright", "credits" or "license" for more information.
```

In Cisco IOS XE Amsterdam 17.3.1 and Later Releases

The following example shows how to enable Python on Cisco Catalyst 9000 Series Switches:

```bash
Device# guestshell run python3
Python 3.6.8 (default, Nov 21 2019, 22:10:21)
[ GCC 8.3.1 20190507 (Red Hat 8.3.1-4)] on linux
Type "help", "copyright", "credits" or "license" for more information.
```

Configuration Examples for the Guest Shell

Example: Managing the Guest Shell

The following example shows how to enable Guest Shell on a Catalyst 3850 Series Switch:
Device> enable
Device# guestshell enable

Management Interface will be selected if configured
Please wait for completion
Guestshell enabled successfully

Device# guestshell run python

Python 2.7.11 (default, Feb 21 2017, 03:39:40)
[GCC 5.3.0] on linux2
Type "help", "copyright", "credits" or "license" for more information.

Device# guestshell run bash
[guestshell@guestshell ~]$

Device# guestshell disable
Guestshell disabled successfully

Device# guestshell destroy
Guestshell destroyed successfully

### Sample VirtualPortGroup Configuration

Sample VirtualPortGroup Configuration

---

**Note**

VirtualPortGroups are supported only on Cisco routing platforms.

When using the VirtualPortGroup interface for Guest Shell networking, the VirtualPortGroup interface must have a static IP address configured. The front port interface must be connected to the Internet and Network Address Translation (NAT) must be configured between the VirtualPortGroup and the front panel port.

The following is a sample VirtualPortGroup configuration:

Device> enable
Device# configure terminal
Device(config)# interface VirtualPortGroup 0
Device(config-if)# ip address 192.168.35.1 255.255.255.0
Device(config-if)# ip nat inside
Device(config-if)# no mop enabled
Device(config-if)# no mop sysid
Device(config-if)# exit
Device(config)# interface GigabitEthernet 0/0/3
Device(config-if)# ip address 10.0.12.19 255.255.0.0
Device(config-if)# ip nat outside
Device(config-if)# negotiation auto
Device(config-if)# exit
Device(config)# ip route 0.0.0.0 0.0.0.0 10.0.0.1
Device(config)# ip route 10.0.0.0 255.0.0.0 10.0.0.1

!Port forwarding to use ports for SSH and so on.
Device(config)# ip nat inside source static tcp 192.168.35.2 7023 10.0.12.19 7023 extendable
Example: Guest Shell Usage

From the Guest Shell prompt, you can run Linux commands. The following example shows the usage of some Linux commands.

```bash
[guestshell@guestshell ~]$ pwd
/home/guestshell
[guestshell@guestshell ~]$ whoami
guestshell
[guestshell@guestshell ~]$ uname -a
Linux guestshell 3.10.101.cge-rt110 #1 SMP Sat Feb 11 00:33:02 PST 2017 mips64 GNU/Linux
```

Catalyst 3650 and Catalyst 3850 Series Switches have a defined set of Linux executables that are provided by BusyBox and Cisco 4000 Series Integrated Services Routers have commands provided by CentOS Linux release 7.1.1503.

The following example shows the usage of the `dohost` command on a Catalyst 3850 Series Switch.

```bash
[guestshell@guestshell ~]$ dohost "show version"
Cisco IOS Software [Everest], Catalyst L3 Switch Software [CAT3K_CAA-UNIVERSALK9-M], Experimental Version 16.5.2017200014[v165_throttle-BLD-BLD_V165_THROTTLE_LATEST_20170531_192849] 132
```

The `dohost` command requires the `ip http server` command to be configured on the device.
Example: Guest Shell Networking Configuration

For Guest Shell networking, the following configurations are required.

- Configure Domain Name System (DNS)
- Configure proxy settings
- Configure YUM or PIP to use proxy settings

Sample DNS Configuration for Guest Shell

The following is a sample DNS configuration for Guest Shell:

[guestshell@guestshell ~]$ cat /etc/resolv.conf
nameserver 192.0.2.1

Other Options:
[guestshell@guestshell ~]$ cat /etc/resolv.conf
domain cisco.com
search cisco.com
nameserver 192.0.2.1
search cisco.com
nameserver 198.51.100.1
nameserver 172.16.0.6
domain cisco.com
nameserver 192.0.2.1
nameserver 172.16.0.6
nameserver 192.168.255.254

Example: Configuring Proxy Environment Variables

If your network is behind a proxy, configure proxy variables in Linux. If required, add these variables to your environment.

The following example shows how to configure your proxy variables:

[guestshell@guestshell ~]$ cat /bootflash/proxy_vars.sh
export http_proxy=http://proxy.example.com:80/
export https_proxy=http://proxy.example.com:80/
export ftp_proxy=http://proxy.example.com:80/
export no_proxy=example.com
export HTTP_PROXY=http://proxy.example.com:80/
export HTTPS_PROXY=http://proxy.example.com:80/
export FTP_PROXY=http://proxy.example.com:80/
guestshell ~] source /bootflash/proxy_vars.sh

Example: Configuring Yum and PIP for Proxy Settings

The following example shows how to use Yum for setting proxy environment variables:
cat /etc/yum.conf | grep proxy
[guestshell@guestshell~]$ cat/bootflash/yum.conf | grep proxy
proxy=http://proxy.example.com:80/

PIP install picks up environment variable used for proxy settings. Use sudo with -E option for PIP installation. If the environment variables are not set, define them explicitly in PIP commands as shown in following example:

sudo pip --proxy http://proxy.example.com:80/install requests
sudo pip install --trusted-host pypi.example.com --index-url http://pypi.example.com/simple requests

The following example shows how to use PIP install for Python:

Sudo -E pip install requests
[guestshell@guestshell ~]$ python
Python 2.17.11 (default, Feb 3 2017, 19:43:44)
[GCC 4.7.0] on linux2
Type "help", "copyright", "credits" or "license" for more information
>>>import requests

Feature Information for Guest Shell

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
### Table 9: Feature Information for Guest Shell

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Guest Shell  | Cisco IOS XE Everest 16.5.1a | Guest Shell is a secure container that is an embedded Linux environment that allows customers to develop and run Linux and custom Python applications for automated control and management of Cisco switches. It also includes the automated provisioning of systems. This container shell provides a secure environment, decoupled from the host device, in which users can install scripts or software packages and run them. In Cisco IOS XE Everest 16.5.1a, this feature was implemented on the following platforms:  
  - Cisco Catalyst 3650 Series Switches  
  - Cisco Catalyst 3850 Series Switches  
  - Cisco Catalyst 9300 Series Switches  
  - Cisco Catalyst 9500 Series Switches |
|              | Cisco IOS XE Everest 16.5.1b | |
|              | Cisco IOS XE Everest 16.6.2 | In Cisco IOS XE Everest 16.6.2, this feature was implemented on Cisco Catalyst 9400 Series Switches. |
|              | Cisco IOS XE Fuji 16.7.1 | In Cisco IOS XE Fuji 16.7.1, this feature was implemented on Cisco CSR 1000v Series.  
  In Cisco IOS XE Fuji 16.7.1, for Guest Shell feature, the Logging and Tracing support was implemented on Cisco ASR 1000 Aggregation Services Routers. |

CHAPTER 5

Python API

Python programmability supports Python APIs.

- Using Python, on page 69

Using Python

Cisco Python Module

Cisco provides a Python module that provides access to run EXEC and configuration commands. You can display the details of the Cisco Python module by entering the help() command. The help() command displays the properties of the Cisco CLI module.

The following example displays information about the Cisco Python module:

```
Device# guestshell run python
Python 2.7.5 (default, Jun 17 2014, 18:11:42)
[GCC 4.8.2 20140120 (Red Hat 4.8.2-16)] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> >>> from cli import cli, clip, configure, configurep, execute, execute
>>> help(configure)
Help on function configure in module cli:
configure(configuration)
   Apply a configuration (set of Cisco IOS CLI config-mode commands) to the device and return a list of results.

configuration = '''interface gigabitEthernet 0/0
   no shutdown'''

# push it through the Cisco IOS CLI.
try:
    results = cli.configure(configuration)
    print "Success!"
except CLIConfigurationError as e:
    print "Failed configurations:"
    for failure in e.failed:
        print failure

Args:
configuration (str or iterable): Configuration commands, separated by newlines.
```
Returns:
list(ConfigResult): A list of results, one for each line.

Raisers:
CLISyntaxError: If there is a syntax error in the configuration.

```python
>>> help(configurep)
Help on function configurep in module cli:

configurep(configuration)
Apply a configuration (set of Cisco IOS CLI config-mode commands) to the device
and prints the result.

collection = """"interface gigabitEthernet 0/0
no shutdown"

# push it through the Cisco IOS CLI.
configurep(configuration)
```

Args:
configuration (str or iterable): Configuration commands, separated by newlines.

```python
>>> help(execute)
Help on function execute in module cli:

execute(command)
Execute Cisco IOS CLI exec-mode command and return the result.

command_output = execute("show version")
```

Args:
command (str): The exec-mode command to run.

Returns:
str: The output of the command.

Raisers:
CLISyntaxError: If there is a syntax error in the command.

```python
>>> help(executep)
Help on function executep in module cli:

executep(command)
Execute Cisco IOS CLI exec-mode command and print the result.

executep("show version")
```

Args:
command (str): The exec-mode command to run.

```python
>>> help(cli)
Help on function cli in module cli:

cli(command)
Execute Cisco IOS CLI command(s) and return the result.

A single command or a delimited batch of commands may be run. The
delimiter is a space and a semicolon, " ;". Configuration commands must be
in fully qualified form.

output = cli("show version")
output = cli("show version ; show ip interface brief")
output = cli("configure terminal ; interface gigabitEthernet 0/0 ; no shutdown")

Args:
    command (str): The exec or config CLI command(s) to be run.

Returns:
    string: CLI output for show commands and an empty string for
    configuration commands.

Raises:
    errors.cli_syntax_error: if the command is not valid.
    errors.cli_exec_error: if the execution of command is not successful.

>>> help(cli)
Help on function clip in module cli:

clip(command)
    Execute Cisco IOS CLI command(s) and print the result.

    A single command or a delimited batch of commands may be run. The
delimiter is a space and a semicolon, " ;". Configuration commands must be
in fully qualified form.

    >>> cli("show version")
    >>> cli("show version ; show ip interface brief")
    >>> cli("configure terminal ; interface gigabitEthernet 0/0 ; no shutdown")

    Args:
        command (str): The exec or config CLI command(s) to be run.

Cisco Python Module to Execute IOS CLI Commands

Note
Guest Shell must be enabled for Python to run. For more information, see the Guest Shell chapter.

The Python programming language uses six functions that can execute CLI commands. These functions are
available from the Python CLI module. To use these functions, execute the import cli command. The ip http
server command must be enabled for these functions to work.

Arguments for these functions are strings of CLI commands. To execute a CLI command through the Python
interpreter, enter the CLI command as an argument string of one of the following six functions:

- cli.cli(command)—This function takes an IOS command as an argument, runs the command through
the IOS parser, and returns the resulting text. If this command is malformed, a Python exception is raised.
The following is sample output from the cli.cli(command) function:

>>> import cli
>>> cli.clip('configure terminal; interface loopback 10; ip address 10.10.10.10 255.255.255.255')
state to up
>>> cli.clip('show clock')
'\n*18:11:53.989 UTC Mon Mar 13 2017\n' >>> output=cli.cli('show clock')
>>> print(output)
• **cli.clip(command)**—This function works exactly the same as the `cli.cli(command)` function, except that it prints the resulting text to `stdout` rather than returning it. The following is sample output from the `cli.clip(command)` function:

```python
>>> cli
>>> cli.clip('configure terminal; interface loopback 11; ip address 10.11.11.11 255.255.255.255')
'Mar 13 18:42:35.954: %LINEPROTO-5-UPDOWN: Line protocol on Interface Loopback11, changed state to up
'Mar 13 18:42:35.954: %LINK-3-UPDOWN: Interface Loopback11, changed state to up
>>> cli.clip('show clock')
'*18:13:35.313 UTC Mon Mar 13 2017
>>> output=cli.clip('show clock')
'*18:19:26.824 UTC Mon Mar 13 2017
>>> print (output)
None
```

• **cli.execute(command)**—This function executes a single EXEC command and returns the output; however, does not print the resulting text. No semicolons or newlines are allowed as part of this command. Use a Python list with a for-loop to execute this function more than once. The following is sample output from the `cli.execute(command)` function:

```python
>>> cli.execute("show clock")
'15:11:20.816 UTC Thu Jun 8 2017'
>>> cli.execute('show clock'; 'show ip interface brief')
File "<stdin>", line 1
  cli.execute('show clock'; 'show ip interface brief')
SyntaxError: invalid syntax
```

• **cli.executep(command)**—This function executes a single command and prints the resulting text to `stdout` rather than returning it. The following is sample output from the `cli.executep(command)` function:

```python
>>> cli.executep('show clock')
'*18:46:28.796 UTC Mon Mar 13 2017
>>> output=cli.executep('show clock')
'*18:46:36.393 UTC Mon Mar 13 2017
>>> print(output)
None
```

• **cli.configure(command)**—This function configures the device with the configuration available in commands. It returns a list of named tuples that contain the command and its result as shown below:

```python
[Think: result = (bool(success), original_command, error_information)]
```
The command parameters can be in multiple lines and in the same format that is displayed in the output of the `show running-config` command. The following is sample output from the `cli.configure(command)` function:

```python
>>> cli.configure(['interface GigabitEthernet1/0/7', 'no shutdown', 'end'])
[ConfigResult(success=True, command='interface GigabitEthernet1/0/7', line=1, output='', notes=None), ConfigResult(success=True, command='no shutdown', line=2, output='', notes=None), ConfigResult(success=True, command='end', line=3, output='', notes=None)]
```

- **cli.configurep(command)**—This function works exactly the same as the `cli.configure(command)` function, except that it prints the resulting text to `stdout` rather than returning it. The following is sample output from the `cli.configurep(command)` function:

```python
>>> cli.configurep(['interface GigabitEthernet1/0/7', 'no shutdown', 'end'])
Line 1 SUCCESS: interface GigabitEthernet1/0/7
Line 2 SUCCESS: no shut
Line 3 SUCCESS: end
```
CLI Python Module

Python Programmability provides a Python module that allows users to interact with IOS using CLIs.

- Information About Python CLI Module, on page 75
- Additional References for the CLI Python Module, on page 79
- Feature Information for the CLI Python Module, on page 79

Information About Python CLI Module

About Python

The Cisco IOS XE devices support Python Version 2.7 in both interactive and non-interactive (script) modes within the Guest Shell. The Python scripting capability gives programmatic access to a device’s CLI to perform various tasks and Zero Touch Provisioning or Embedded Event Manager (EEM) actions.

Python Scripts Overview

Python run in a virtualized Linux-based environment, Guest Shell. For more information, see the Guest Shell chapter. Cisco provides a Python module that allows user’s Python scripts to run IOS CLI commands on the host device.

Interactive Python Prompt

When you execute the guestshell run python command on a device, the interactive Python prompt is opened inside the Guest Shell. The Python interactive mode allows users to execute Python functions from the Cisco Python CLI module to configure the device.

The following example shows how to enable the interactive Python prompt:

Device# guestshell run python

Python 2.7.5 (default, Jun 17 2014, 18:11:42)  [GCC 4.8.2 20140120 (Red Hat 4.8.2-16)] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>>
Python Script

Python scripts can run in non-interactive mode by providing the Python script name as an argument in the Python command. Python scripts must be accessible from within the Guest Shell. To access Python scripts from the Guest Shell, save the scripts in bootflash/flash that is mounted within the Guest Shell.

The **ip http server** command must be configured for the **import cli** in Python to work.

The following sample Python script uses different CLI functions to configure and print **show** commands:

```python
import sys
import cli

intf = sys.argv[1];
intf = ''.join(intf[0])

print "\n\n *** Configuring interface %s with 'configurep' function *** \n\n" % intf
cli.configurep(["interface loopback55","ip address 10.55.55.55 255.255.255.0","no shut","end"])

print "\n\n *** Configuring interface %s with 'configure' function *** \n\n" % intf
cli.configure(cmd.split(','))

print "\n\n *** Printing show cmd with 'executep' function *** \n\n"
cli.executep('show ip interface brief')

print "\n\n *** Printing show cmd with 'execute' function *** \n\n"
output= cli.execute('show run interface %s' % intf)
print (output)

print "\n\n *** Configuring interface %s with 'cli' function *** \n\n" % intf
cli.cli('config terminal; interface %s; spanning-tree portfast edge default' % intf)

print "\n\n *** Printing show cmd with 'clip' function *** \n\n" % intf
cli.clip('show run interface %s' % intf)
```

To run a Python script from the Guest Shell, execute the guestshell run python /flash/script.py command at the device prompt.

The following example shows how to run a Python script from the Guest Shell:

```
Device# guestshell run python /flash/sample_script.py loop55

*** Configuring interface loop55 with 'configurep' function ***

Line 1 SUCCESS: interface loopback55
Line 2 SUCCESS: ip address 10.55.55.55 255.255.255.0
Line 3 SUCCESS: no shut
Line 4 SUCCESS: end

*** Configuring interface %s with 'configure' function ***
```
**Supported Python Versions**

Guest Shell is pre-installed with Python Version 2.7. Guest Shell is a virtualized Linux-based environment, designed to run custom Linux applications, including Python applications for automated control and management of Cisco devices. Platforms with Montavista CGE7 support Python Version 2.7.11, and platforms with CentOS 7 support Python Version 2.7.5.

The following table provides information about Python versions and the supported platforms:

<table>
<thead>
<tr>
<th>Python Version</th>
<th>Platform</th>
</tr>
</thead>
<tbody>
<tr>
<td>Python Version 2.7.5</td>
<td>All supported platforms except for Cisco Catalyst 3650 Series Switches and Cisco Catalyst 3850 Series Switches.</td>
</tr>
</tbody>
</table>
### Updating the Cisco CLI Python Module

The Cisco CLI Python module and EEM module are pre-installed on devices. However, when you update the Python version by using either Yum or prepackaged binaries, the Cisco-provided CLI module must also be updated.

**Note** When you update to Python Version 3 on a device that already has Python Version 2, both versions of Python exist on the device. Use one of the following IOS commands to run Python:

- The `guestshell run python2` command enables Python Version 2.
- The `guestshell run python3` command enables Python Version 3.
- The `guestshell run python` command enables Python Version 2.

Use one of the following methods to update the Python version:

- Standalone tarball installation
- PIP install for the CLI module

---

<table>
<thead>
<tr>
<th>Python Version</th>
<th>Platform</th>
</tr>
</thead>
</table>
| Python Version 2.7.11 | • Cisco Catalyst 3650 Series Switches  
|                   | • Cisco Catalyst 3850 Series Switches |
| Python Version 3.6 | Supported in Cisco IOS XE Amsterdam 17.1.1 and later releases.  
|                   | In Cisco IOS XE Amsterdam 17.1.1 and Cisco IOS XE Amsterdam 17.2.1, Python V2 is the default. However, in Cisco IOS XE Amsterdam 17.3.1 and later releases, Python V3 is the default.  
|                   | **Note** Cisco Catalyst 9200 Series Switches do not support Python Version 3.6 in Cisco IOS XE Amsterdam 17.1.1 and Cisco IOS XE Amsterdam 17.2.1. Cisco Catalyst 9200 Series Switches support Python V3 in Cisco IOS XE Amsterdam 17.3.1 and later releases.  
|                   | **Note** Not supported by Cisco Catalyst 3650 Series Switches and Cisco Catalyst 3850 Series Switches. |

Platforms with CentOS 7 support the installation of Redhat Package Manager (RPM) from the open source repository.

  • Cisco CSR 1000v Series Cloud Services Routers  

EEM Python Module

Embedded Event Manager (EEM) policies support Python scripts. Python scripts can be executed as part of EEM actions in EEM applets.

- Prerequisites for the EEM Python Module, on page 81
- Information About EEM Python Module, on page 81
- How to Configure the EEM Python Policy, on page 84
- Additional References EEM Python Module, on page 89
- Feature Information for EEM Python Module, on page 90

Prerequisites for the EEM Python Module

Guest Shell must be working within the container. Guest Shell is not enabled by default. For more information see the *Guest Shell* feature.

Information About EEM Python Module

Python Scripting in EEM

Embedded Event Manager (EEM) policies support Python scripts. You can register Python scripts as EEM policies, and execute the registered Python scripts when a corresponding event occurs. The EEM Python script has the same event specification syntax as the EEM TCL policy.

Configured EEM policies run within the Guest Shell. Guest Shell is a virtualized Linux-based environment, designed to run custom Linux applications, including Python for automated control and management of Cisco devices. The Guest Shell container provides a Python interpreter.

EEM Python Package

The EEM Python package can be imported to Python scripts for running EEM-specific extensions.
The EEM Python package is available only within the EEM Python script (The package can be registered with EEM, and has the EEM event specification in the first line of the script.) and not in the standard Python script (which is run using the Python script name).

The Python package includes the following application programming interfaces (APIs):

- Action APIs—Perform EEM actions and have default parameters.
- CLI-execution APIs—Run IOS commands, and return the output. The following are the list of CLI-execution APIs:
  • `eem_cli_open()`
  • `eem_cli_exec()`
  • `eem_cli_read()`
  • `eem_cli_read_line()`
  • `eem_cli_run()`
  • `eem_cli_run_interactive()`
  • `eem_cli_read_pattern()`
  • `eem_cli_write()`
  • `eem_cli_close()`
- Environment variables-accessing APIs—Get the list of built-in or user-defined variables. The following are the environment variables-accessing APIs:
  • `eem_event_reqinfo()`-Returns the built-in variables list.
  • `eem_user_variables()`-Returns the current value of an argument.

**Python-Supported EEM Actions**

The Python package (is available only within the EEM script, and not available for the standard Python script) supports the following EEM actions:

- Syslog message printing
- Send SNMP traps
- Reload the box
- Switchover to the standby device
- Run a policy
- Track Object read
- Track Object Set
- Cisco Networking Services event generation
The EEM Python package exposes the interfaces for executing EEM actions. You can use the Python script to call these actions, and they are forwarded from the Python package via Cisco Plug N Play (PnP) to the action handler.

**EEM Variables**

An EEM policy can have the following types of variables:

- Event-specific built-in variables—A set of predefined variables that are populated with details about the event that triggered the policy. The `eem_event_reqinfo()` API returns the built-in variables list. These variables can be stored in the local machine and used as local variables. Changes to local variables do not reflect in built-in variables.

- User-defined variables—Variables that can be defined and used in policies. The value of these variables can be referred in the Python script. While executing the script, ensure that the latest value of the variable is available. The `eem_user_variables()` API returns the current value of the argument that is provided in the API.

**EEM CLI Library Command Extensions**

The following CLI library commands are available within EEM for the Python script to work:

- `eem_cli_close()`—Closes the EXEC process and releases the VTY and the specified channel handler connected to the command.

- `eem_cli_exec`—Writes the command to the specified channel handler to execute the command. Then reads the output of the command from the channel and returns the output.

- `eem_cli_open`—Allocates a VTY, creates an EXEC CLI session, and connects the VTY to a channel handler. Returns an array including the channel handler.

- `eem_cli_read()`—Reads the command output from the specified CLI channel handler until the pattern of the device prompt occurs in the contents read. Returns all the contents read up to the match.

- `eem_cli_read_line()`—Reads one line of the command output from the specified CLI channel handler. Returns the line read.

- `eem_cli_read_pattern()`—Reads the command output from the specified CLI channel handler until the pattern that is to be matched occurs in the contents read. Returns all the contents read up to the match.

- `eem_cli_run()`—Iterates over the items in the `clist` and assumes that each one is a command to be executed in the enable mode. On success, returns the output of all executed commands and on failure, returns error.

- `eem_cli_run_interactive()`—Provides a sublist to the `clist` which has three items. On success, returns the output of all executed commands and on failure, returns the error. Also uses arrays when possible as a way of making things easier to read later by keeping expect and reply separated.

- `eem_cli_write()`—Writes the command that is to be executed to the specified CLI channel handler. The CLI channel handler executes the command.
How to Configure the EEM Python Policy

For the Python script to work, you must enable the Guest Shell. For more information, see the Guest Shell chapter.

Registering a Python Policy

**SUMMARY STEPS**

1. enable
2. configure terminal
3. event manager directory user policy *path*
4. event manager policy *policy-filename*
5. exit
6. show event manager policy registered
7. show event manager history events

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager directory user policy <em>path</em></td>
<td>Specifies a directory to use for storing user library files or user-defined EEM policies.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# event manager directory user policy flash:/user_library</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>You must have a policy in the specified path.</td>
</tr>
<tr>
<td></td>
<td>For example, in this step, the eem_script.py policy is available in the flash:/user_library folder or path.</td>
</tr>
<tr>
<td><strong>Step 4</strong> event manager policy <em>policy-filename</em></td>
<td>Registers a policy with EEM.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# event manager policy eem_script.py</td>
<td></td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# event manager policy eem_script.py</td>
<td></td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# event manager policy eem_script.py</td>
<td></td>
</tr>
</tbody>
</table>

- The policy is parsed based on the file extension. If the file extension is .py, the policy is registered as Python policy.
- EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When the event manager policy command is invoked, EEM examines the policy and registers it to be run when the specified event occurs.
**Purpose**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td><em>exit</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# exit</td>
</tr>
<tr>
<td></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><em>show event manager policy registered</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# show event manager policy registered</td>
</tr>
<tr>
<td></td>
<td>Displays the registered EEM policies.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><em>show event manager history events</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# show event manager history events</td>
</tr>
<tr>
<td></td>
<td>Displays EEM events that have been triggered.</td>
</tr>
</tbody>
</table>

---

**Example**

The following is sample output from the *show event manager policy registered* command:

```
Device# show event manager policy registered

No. Class  Type  Event Type  Trap  Time Registered    Name
1  script user multiple  Off  Tue Aug 2 22:12:15 2016  multi_1.py

**Running Python Scripts as Part of EEM Applet Actions**

**Python Script: eem_script.py**

An EEM applet can include a Python script with an action command. In this example, an user is trying to run a standard Python script as part of the EEM action, however; EEM Python package is
not available in the standard Python script. The standard Python script in IOS has a package named
from cli import cli,clip and this package can be used to execute IOS commands.

```python
import sys
from cli import cli,execute,executep,configure,configurep

intf = sys.argv[1:]
intf = ''.join(intf[0])

print ('This script is going to unshut interface %s and then print show ip interface
brief'%(intf))

if intf == 'loopback55':
    configurep("interface loopback55","no shutdown","end")
else :
    cmd='int %s,no shut ,end' % intf
    configurep(cmd.split(','))
executep('show ip interface brief')
```

This following is sample output from the guestshell run python command.

```
Device# guestshell run python /flash/eem_script.py loop55
This script is going to unshut interface loop55 and then print show ip interface brief
Line 1 SUCCESS: int loop55
Line 2 SUCCESS: no shut
Line 3 SUCCESS: end

Programmability Configuration Guide, Cisco IOS XE Fuji 16.8.x
Adding a Python Script in an EEM Applet

**SUMMARY STEPS**

1. enable
2. configure terminal
3. event manager applet applet-name
4. event [tag event-tag] syslog pattern regular-expression
5. action label cli command cli-string
6. action label cli command cli-string [ pattern pattern-string ]
7. end
8. show event manager policy active
9. show event manager history events
## Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager applet <em>applet-name</em></td>
<td>Registers an applet with the Embedded Event Manager (EEM) and enters applet configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# event manager applet interface_Shutdown</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> event *[tag <em>event-tag</em>] syslog pattern <em>regular-expression</em></td>
<td>Specifies a regular expression to perform the syslog message pattern match.</td>
</tr>
<tr>
<td>Example: Device(config-applet)# event syslog pattern &quot;Interface Loopback55, changed state to administratively down&quot;</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> action <em>label</em> cli command <em>cli-string</em></td>
<td>Specifies the IOS command to be executed when an EEM applet is triggered.</td>
</tr>
<tr>
<td>Example: Device(config-applet)# action 0.0 cli command &quot;en&quot;</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> action <em>label</em> cli command <em>cli-string</em> [ <em>pattern</em> <em>pattern-string</em> ]</td>
<td>Specifies the action to be specified with the <em>pattern</em> keyword.</td>
</tr>
<tr>
<td>Example: Device(config-applet)# action 1.0 cli command &quot;guestshell run python3 /bootflash/eem_script.py loop55&quot;</td>
<td>• Specify a regular expression pattern string that will match the next solicited prompt.</td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Exits applet configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config-applet)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> show event manager policy active</td>
<td>Displays EEM policies that are executing.</td>
</tr>
<tr>
<td>Example: Device# show event manager policy active</td>
<td></td>

PART III

Model-Driven Programmability

- NETCONF Protocol, on page 95
- RESTCONF Protocol, on page 109
- gNMI Protocol, on page 123
- Model Based AAA, on page 139
- Model-Driven Telemetry, on page 147
- In-Service Model Update, on page 157
Restrictions for the NETCONF Protocol

The NETCONF feature is not supported on a device running dual IOSd configuration or software redundancy.

Information About the NETCONF Protocol

Introduction to Data Models - Programmatic and Standards-Based Configuration

The traditional way of managing network devices is by using Command Line Interfaces (CLIs) for configurational (configuration commands) and operational data (show commands). For network management, Simple Network Management Protocol (SNMP) is widely used, especially for exchanging management information between various network devices. Although CLIs and SNMP are heavily used, they have several restrictions. CLIs are highly proprietary, and human intervention is required to understand and interpret their text-based specification. SNMP does not distinguish between configurational and operational data.

The solution lies in adopting a programmatic and standards-based way of writing configurations to any network device, replacing the process of manual configuration. Network devices running on Cisco IOS XE support the automation of configuration for multiple devices across the network using data models. Data models are developed in a standard, industry-defined language, that can define configuration and state information of a network.

Cisco IOS XE supports the Yet Another Next Generation (YANG) data modeling language. YANG can be used with the Network Configuration Protocol (NETCONF) to provide the desired solution of automated and programmable network operations. NETCONF (RFC 6241) is an XML-based protocol that client applications...
use to request information from and make configuration changes to the device. YANG is primarily used to model the configuration and state data used by NETCONF operations.

In Cisco IOS XE, model-based interfaces interoperate with existing device CLI, Syslog, and SNMP interfaces. These interfaces are optionally exposed northbound from network devices. YANG is used to model each protocol based on RFC 6020.

---

**Note**

To access Cisco YANG models in a developer-friendly way, clone the [GitHub repository](https://github.com/cisco), and navigate to the `vendor/cisco` subdirectory. Models for various releases of IOS-XE, IOS-XR, and NX-OS platforms are available here.

---

**NETCONF**

NETCONF provides a mechanism to install, manipulate, and delete the configuration of network devices.

It uses an Extensible Markup Language (XML)-based data encoding for the configuration data as well as the protocol messages.

NETCONF uses a simple Remote Procedure Call (RPC) based mechanism to facilitate communication between a client and a server. The client can be a script or application running as part of a network manager. The server is typically a network device (switch or router). It uses Secure Shell (SSH) as the transport layer across network devices. It uses SSH port number 830 as the default port. The port number is a configurable option.

NETCONF also supports capability discovery and model downloads. Supported models are discovered using the `ietf-netconf-monitoring` model. Revision dates for each model are shown in the capabilities response. Data models are available for optional download from a device using the `get-schema` RPC. You can use these YANG models to understand or export the data model. For more details on NETCONF, see [RFC 6241](https://tools.ietf.org/html/rfc6241).

In releases prior to Cisco IOS XE Fuji 16.8.1, an operational data manager (based on polling) was enabled separately. In Cisco IOS XE Fuji 16.8.1 and later releases, operational data works on platforms running NETCONF (similar to how configuration data works), and is enabled by default. For more information on the components that are enabled for operational data queries or streaming, see the [GitHub repository](https://github.com/cisco), to view `-oper` in the naming convention.

**NETCONF RESTCONF IPv6 Support**

Data model interfaces (DMIs) support the use of IPv6 protocol. DMI IPv6 support helps client applications to communicate with services that use IPv6 addresses. External facing interfaces will provide dual-stack support; both IPv4 and IPv6.

DMIs are a set of services that facilitate the management of network elements. Application layer protocols such as, NETCONF and RESTCONF access these DMIs over a network.

If IPv6 addresses are not configured, external-facing applications will continue to listen on IPv6 sockets; but these sockets will be unreachable.

**NETCONF Global Session Lock**

The NETCONF protocol provides a set of operations to manage device configurations and retrieve device state information. NETCONF supports a global lock, and the ability to kill non-responsive sessions are introduced in NETCONF.
To ensure consistency and prevent conflicting configurations through multiple simultaneous sessions, the owner of the session can lock the NETCONF session. The NETCONF lock RPC locks the configuration parser and the running configuration database. All other NETCONF sessions (that do not own the lock) cannot perform edit operations; but can perform read operations. These locks are intended to be short-lived and allow the owner to make changes without interaction with other NETCONF clients, non-NETCONF clients (such as, SNMP and CLI scripts), and human users.

A global lock held by an active session is revoked when the associated session is killed. The lock gives the session holding the lock exclusive write access to the configuration. When a configuration change is denied due to a global lock, the error message will specify that a NETCONF global lock is the reason the configuration change has been denied.

The `<lock>` operation takes a mandatory parameter, `<target>` that is the name of the configuration datastore that is to be locked. When a lock is active, the `<edit-config>` and `<copy-config>` operations are not allowed.

If the clear configuration lock command is specified while a NETCONF global lock is being held, a full synchronization of the configuration is scheduled and a warning syslog message is produced. This command clears only the parser configuration lock.

The following is a sample RPC that shows the `<lock>` operation:

```xml
<rpc message-id="101"
    xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
    <lock>
        <target>
            <running/>
        </target>
    </lock>
</rpc>
```

### NETCONF Kill Session

During a session conflict or client misuse of the global lock, NETCONF sessions can be monitored via the show netconf-yang sessions command, and non-responsive sessions can be cleared using the clear netconf-yang session command. The clear netconf-yang session command clears both the NETCONF lock and the configuration lock.

A `<kill-session>` request will force a NETCONF session to terminate. When a NETCONF entity receives a `<kill-session>` request for an open session, it stops all operations in process, releases all locks and resources associated with the session, and closes any associated connections.

A `<kill-session>` request requires the session-ID of the NETCONF session that is to be terminated. If the value of the session-ID is equal to the current session ID, an invalid-value error is returned. If a NETCONF session is terminated while its transaction is still in progress, the data model infrastructure will request a rollback, apply it to the network element, and trigger a synchronization of all YANG models.

If a session kill fails, and a global lock is held, enter the clear configuration lock command via the console or vty. At this point, the data models can be stopped and restarted.
How to Configure the NETCONF Protocol

NETCONF-YANG uses the primary trustpoint of a device. If a trustpoint does not exist, when NETCONF-YANG is configured, it creates a self-signed trustpoint. For more information, see the Public Key Infrastructure Configuration Guide, Cisco IOS XE Gibraltar 16.10.x.

Providing Privilege Access to Use NETCONF

To start working with NETCONF APIs, you must be a user with privilege level 15.

SUMMARY STEPS

1. enable
2. configure terminal
3. username name privilege level password password
4. aaa new-model
5. aaa authentication login default local
6. aaa authorization exec default local
7. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| configure terminal| Enters global configuration mode. |
| Example:          |         |
| Device# configure terminal | |

| **Step 3**        | Establishes a user name-based authentication system. Configure the following keywords: |
| username name privilege level password password | privilege level: Sets the privilege level for the user. For the NETCONF protocol, it must be 15. |
| Example:          |         |
| Device(config)# username example-name privilege 15 password example_password |         |

| **Step 4**        | (Optional) Enables authorisation, authentication, and accounting (AAA). |
| aaa new-model     | If the aaa new-model command is configured, AAA authentication and authorization is required. |
| Example:          |         |
| Device(config)# aaa new-model | |

| **Step 5**        | Sets the login authentication to use the local username database. |
| aaa authentication login default local |         |
| Example:          |         |
### Command or Action

Device(config)# aaa authentication login default local

### Purpose

**Note**  
Only the default AAA authentication login method is supported for the NETCONF protocol.

- For a remote AAA server, replace `local` with your AAA server.

  The `default` keyword applies the local user database authentication to all ports.

### Step 6

**aaa authorization exec default local**

**Example:**

Device(config)# aaa authorization exec default local

### Purpose

Configures user AAA authorization, check the local database, and allows the user to run an EXEC shell.

- For a remote AAA server, replace `local` with your AAA server.

  - The `default` keyword applies the local user database authentication to all ports.

### Step 7

**end**

**Example:**

Device(config)# end

### Purpose

Exits global configuration mode and returns to privileged EXEC mode.

---

## Configuring NETCONF-YANG

If the legacy NETCONF protocol is enabled on your device, the RFC-compliant NETCONF protocol does not work. Disable the legacy NETCONF protocol by using the `no netconf legacy` command.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `netconf-yang`
4. `netconf-yang feature candidate-datastore`
5. `exit`

### DETAILED STEPS

<table>

### Configuring NETCONF Options

#### Configuring SNMP

Enable the SNMP Server in IOS to enable NETCONF to access SNMP MIB data using YANG models generated from supported MIBs, and to enable supported SNMP traps in IOS to receive NETCONF notifications from the supported traps.

Perform the following steps:

**SUMMARY STEPS**

1. Enable SNMP features in IOS.
2. After NETCONF-YANG starts, enable SNMP Trap support by sending the following RPC <edit-config> message to the NETCONF-YANG port.
3. Send the following RPC message to the NETCONF-YANG port to save the running configuration to the startup configuration.

**DETAILED STEPS**

**Step 1** Enable SNMP features in IOS.

**Example:**
```bash
configure terminal
logging history debugging
logging snmp-trap emergencies
logging snmp-trap alerts
logging snmp-trap critical
logging snmp-trap errors
logging snmp-trap warnings
logging snmp-trap notifications
logging snmp-trap informational
logging snmp-trap debugging
!
```
Step 2  After NETCONF-YANG starts, enable SNMP Trap support by sending the following RPC <edit-config> message to the NETCONF-YANG port.

Example:

```xml
<?xml version="1.0" encoding="utf-8"?>
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="">
  <edit-config>
    <target>
      <running/>
    </target>
    <config>
      <netconf-yang xmlns="http://cisco.com/yang/cisco-self-mgmt">
        <cisco-ia xmlns="http://cisco.com/yang/cisco-ia">
          <snmp-trap-control>
            <trap-list>
              <trap-oid>1.3.6.1.4.1.9.9.41.2.0.1</trap-oid>
            </trap-list>
            <trap-list>
              <trap-oid>1.3.6.1.6.3.1.1.5.3</trap-oid>
            </trap-list>
            <trap-list>
              <trap-oid>1.3.6.1.6.3.1.1.5.4</trap-oid>
            </trap-list>
            </snmp-trap-control>
        </cisco-ia>
      </netconf-yang>
    </config>
  </edit-config>
</rpc>
```

Step 3  Send the following RPC message to the NETCONF-YANG port to save the running configuration to the startup configuration.

Example:

```xml
<?xml version="1.0" encoding="utf-8"?>
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="">
</rpc>
```

## Verifying the NETCONF Protocol Configuration

Use the following commands to verify your NETCONF configuration.

**SUMMARY STEPS**

1. show netconf-yang datastores
2. show netconf-yang sessions
3. show netconf-yang sessions detail
4. show netconf-yang statistics
5. show platform software yang-management process

DETAILED STEPS

Step 1  show netconf-yang datastores
Displays information about NETCONF-YANG datastores.

Example:
Device# show netconf-yang datastores

Device# show netconf-yang datastores
Datastore Name : running
Globally Locked By Session : 42
Globally Locked Time : 2018-01-15T14:25:14-05:00

Step 2  show netconf-yang sessions
Displays information about NETCONF-YANG sessions.

Example:
Device# show netconf-yang sessions

R: Global-lock on running datastore
C: Global-lock on candidate datastore
S: Global-lock on startup datastore
Number of sessions : 10
session-id transport username source-host global-lock
-------------------------------------------------------------------------------
40 netconf-ssh admin 10.85.70.224 None
42 netconf-ssh admin 10.85.70.224 None
44 netconf-ssh admin 10.85.70.224 None
46 netconf-ssh admin 10.85.70.224 None
48 netconf-ssh admin 10.85.70.224 None
50 netconf-ssh admin 10.85.70.224 None
52 netconf-ssh admin 10.85.70.224 None
54 netconf-ssh admin 10.85.70.224 None
56 netconf-ssh admin 10.85.70.224 None
58 netconf-ssh admin 10.85.70.224 None

Step 3  show netconf-yang sessions detail
Displays detailed information about NETCONF-YANG sessions.

Example:
Device# show netconf-yang sessions detail

R: Global-lock on running datastore
C: Global-lock on candidate datastore
S: Global-lock on startup datastore

Number of sessions : 1
session-id : 19
transport : netconf-ssh
username : admin
source-host : 2001:db8::1
login-time : 2018-10-26T12:37:22+00:00
in-rpcs : 0
in-bad-rpcs : 0
out-rpc-errors : 0
out-notifications : 0
global-lock : None

Step 4 show netconf-yang statistics
Displays information about NETCONF-YANG statistics.

Example:
Device# show netconf-yang statistics
netconf-start-time : 2018-01-15T12:51:14-05:00
in-rpcs : 0
in-bad-rpcs : 0
out-rpc-errors : 0
out-notifications : 0
in-sessions : 10
dropped-sessions : 0
in-bad-hellos : 0

Step 5 show platform software yang-management process
Displays the status of the software processes required to support NETCONF-YANG.

Example:
Device# show platform software yang-management process
confd : Running
nesd : Running
syncfd : Running
ncsshd : Running
dmiauthd : Running
vtyserverutilld : Running
opdatamgrd : Running
nginx : Running
ndemand : Running

Note The process nginx runs if ip http secure-server or ip http server is configured on the device. This process is not required to be in the running state for NETCONF to function properly. However, the nginx process is required for RESTCONF.

Feature Information for NETCONF Protocol

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

CHAPTER 9

RESTCONF Protocol

This chapter describes how to configure the HTTP-based Representational State Transfer Configuration Protocol (RESTCONF). RESTCONF provides a programmatic interface based on standard mechanisms for accessing configuration data, state data, data-model-specific Remote Procedure Call (RPC) operations and events, defined in the YANG model.

• Prerequisites for the RESTCONF Protocol, on page 109
• Restrictions for the RESTCONF Protocol, on page 109
• Information About RESTCONF Programmable Interface, on page 110
• How to Configure RESTCONF Programmable Interface, on page 112
• Configuration Examples for RESTCONF Programmable Interface, on page 117
• Additional References for the RESTCONF Protocol, on page 120
• Feature Information for the RESTCONF Protocol, on page 121

Prerequisites for the RESTCONF Protocol

• Enable the Cisco IOS-HTTP services for RESTCONF. For more information, see Examples for RESTCONF RPCs

Restrictions for the RESTCONF Protocol

The following restrictions apply to the RESTCONF protocol:

• Notifications and event streams
• YANG patch
• Optional query parameters, such as, filter, start-time, stop-time, replay, and action
• The RESTCONF feature is not supported on a device running dual IOSd configuration or software redundancy.
Information About RESTCONF Programmable Interface

Overview of RESTCONF

This section describes the protocols and modelling languages that enable a programmatic way of writing configurations to a network device.

- RESTCONF—Uses structured data (XML or JSON) and YANG to provide a REST-like APIs, enabling you to programmatically access different network devices. RESTCONF APIs use HTTPs methods.

- YANG—A data modelling language that is used to model configuration and operational features. YANG determines the scope and the kind of functions that can be performed by NETCONF and RESTCONF APIs.

In releases prior to Cisco IOS XE Fuji 16.8.1, an operational data manager (based on polling) was enabled separately. In Cisco IOS XE Fuji 16.8.1 and later releases, operational data works on platforms running NETCONF (similar to how configuration data works), and is enabled by default. For more information on the components that are enabled for operational data queries or streaming, see the GitHub repository, and view *-oper in the naming convention.

HTTPs Methods

The HTTPS-based RESTCONF protocol (RFC 8040), is a stateless protocol that uses secure HTTP methods to provide CREATE, READ, UPDATE, and DELETE (CRUD) operations on a conceptual datastore containing YANG-defined data, which is compatible with a server that implements NETCONF datastores.

The following table shows how the RESTCONF operations relate to NETCONF protocol operations:

<table>
<thead>
<tr>
<th>OPTIONS</th>
<th>SUPPORTED METHODS</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>Read</td>
</tr>
<tr>
<td>PATCH</td>
<td>Update</td>
</tr>
<tr>
<td>PUT</td>
<td>Create or Replace</td>
</tr>
<tr>
<td>POST</td>
<td>Create or Operations (reload, default)</td>
</tr>
<tr>
<td>DELETE</td>
<td>Deletes the targeted resource</td>
</tr>
<tr>
<td>HEAD</td>
<td>Header metadata (no response body)</td>
</tr>
</tbody>
</table>

RESTCONF Root Resource

- A RESTCONF device determines the root of the RESTCONF API through the link element: /./well-known/host-meta resource that contains the RESTCONF attribute.

- A RESTCONF device uses the RESTCONF API root resource as the initial part of the path in the request URL.
Example:

Example returning /restconf:

The client might send the following:

GET /.well-known/host-meta HTTP/1.1
Host: example.com
Accept: application/xrd+xml

The server might respond as follows:

HTTP/1.1 200 OK
Content-Type: application/xrd+xml
Content-Length: nnn

<XRD xmlns='http://docs.oasis-open.org/ns/xri/xrd-1.0'>
  <Link rel='restconf' href='/restconf'/>
</XRD>

Example of URIs:

- fields=name -
  https://10.104.50.97/restconf/data/Cisco-IOS-XE-native:native/interface/GigabitEthernet=0%2F0%2F2?fields=name

- depth=1 -

- Name and IP -

- MTU (fields) -

- MTU -

- Port-Channel -
  https://10.85.116.59/restconf/data/Cisco-IOS-XE-native:native/interface/Port-channel

- “Char” to “Hex” conversion chart: http://www.columbia.edu/kermit/ascii.html

RESTCONF API Resource

The API resource is the top-level resource located at +restconf. It supports the following media types:

- Application/YANG-Data+XML OR Application/YANG-Data+JSON

Note

Media is the type of YANG formatted RPC that is sent to the RESCONF server (XML or JSON).
The client may then retrieve the top-level API resource, using the root resource "/restconf".

GET /restconf HTTP/1.1
Host: example.com
Accept: application/yang-data+json

The server might respond as follows:

HTTP/1.1 200 OK
Date: Thu, 26 Jan 2017 20:56:30 GMT
Server: example-server
Content-Type: application/yang-data+json

{
  "ietf-restconf:restconf" : {
    "data" : {},
    "operations" : {},
    "yang-library-version" : "2016-06-21"
  }
}

For more information, refer to RFC 3986

Methods

Methods are HTTPS operations (GET/PATCH/POST/DELETE/OPTIONS/PUT) performed on a target resource. A YANG-formated RPC invokes a particular method on a given resource that pertains to a target YANG model residing in the RESTCONF server. The uniform resource identifier (URI) acts as a location identification for a given resource, so that the client RESTCONF method can locate that particular resource to take an action specified by an HTTPS method or property.

For more information, see RFC 8040 - RESTCONF Protocol

How to Configure RESTCONF Programmable Interface

Authentication of NETCONF/RESTCONF Using AAA

Before you begin

NETCONF and RESTCONF connections must be authenticated using authentication, authorization, and accounting (AAA). As a result, RADIUS or TACACS+ users defined with privilege level 15 access are allowed access into the system.

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. aaa group server radius server-name
5. server-private ip-address key key-name
6. ip vrf forwarding vrf-name
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>

## Enabling Cisco IOS HTTP Services for RESTCONF

Perform this task to use the RESTCONF interface.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `restconf`
4. `ip http secure-server`
5. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>

**Verifying RESTCONF Configuration**

When a device boots up with the startup configuration, the *nginx* process will be running. However; DMI processes are not enabled.

The following sample output from the `show platform software yang-management process monitor` command shows that the *nginx* process is running:

```
Device# show platform software yang-management process monitor

COMMAND   PID  S   VSZ     RSS  %CPU  %MEM   ELAPSED
nginx     27026 S  332356 18428  0.0   0.4     01:34
nginx     27032 S  337852 13600  0.0   0.3     01:34
```

NGINX is an internal webserver that acts as a proxy webserver. It provides Transport Layer Security (TLS)-based HTTPS. RESTCONF request sent via HTTPS is first received by the NGINX proxy web server, and the request is transferred to the confd web server for further syntax/semantics check.

The following sample output from the `show platform software yang-management process` command shows the status of all processes when a device is booted with the startup-configuration:

```
Device# show platform software yang-management process

confd : Not Running
nesd  : Not Running
syncfd: Not Running
ncsshd: Not Running
dmiauthd: Not Running
nginx : Running
ndbmand: Not Running
```
The `nginx` process gets restarted and DMI process are started, when the `restconf` command is configured.

The following sample output from the `show platform software yang-management process` command shows that the `nginx` process and DMI processes are up and running:

```
Device# show platform software yang-management process

confd : Running
nessd : Running
syncfd : Running
ncsshd : Not Running ! NETCONF-YANG is not configured, hence ncsshd process is in not running.
dmiauthd : Running
vtyserverutild : Running
opdatamgrd : Running
nginx : Running ! nginx process is up due to the HTTP configuration, and it is restarted when RESTCONF is enabled.
ndbmand : Running
```

The following sample output from the `show platform software yang-management process monitor` command displays detailed information about all processes:

```
Device# show platform software yang-management process monitor

<table>

<td>0.2</td>
<td>0.4</td>
<td>00:12</td>
</tr>
</tbody>
</table>
```

After AAA and the RESTCONF interface is configured, and nginx process and relevant DMI processes are running; the device is ready to receive RESTCONF requests.

Use the `show netconf-yang sessions` command to view the status of NETCONF/RESTCONF sessions:

```
Device# show netconf-yang sessions

R: Global-lock on running datastore
C: Global-lock on candidate datastore
S: Global-lock on startup datastore

Number of sessions : 1

session-id transport username source-host global-lock
------------------ --------------------- ---------------------- ------------------------------
19 netconf-ssh admin 2001:db8::1 None
```

Use the `show netconf-yang sessions detail` command to view detailed information about NETCONF/RESTCONF sessions:

```
Device# show netconf-yang sessions detail
```
R: Global-lock on running datastore
C: Global-lock on candidate datastore
S: Global-lock on startup datastore

Number of sessions : 1
session-id : 19
transport : netconf-ssh
username : admin
source-host : 2001:db8::1
login-time : 2018-10-26T12:37:22+00:00
in-rpcs : 0
in-bad-rpcs : 0
out-rpc-errors : 0
out-notifications : 0
global-lock : None

Configuration Examples for RESTCONF Programmable Interface

Example: Configuring the RESTCONF Protocol

RESTCONF Requests (HTTPS Verbs):

The following is a sample RESTCONF request that shows the HTTPS verbs allowed on a targeted resource. In this example, the logging monitor command is used.

root:~# curl -i -k -X "OPTIONS"

HTTP/1.1 200 OK
Server: nginx
Date: Mon, 23 Apr 2018 15:27:57 GMT
Content-Type: text/html
Content-Length: 0
Connection: keep-alive
Allow: DELETE, GET, HEAD, PATCH, POST, PUT, OPTIONS

POST (Create) Request

The POST operation creates a configuration which is not present in the targeted device.

Ensure that the logging monitor command is not available in the running configuration.

The following sample POST request uses the logging monitor alerts command.
Example: Configuring the RESTCONF Protocol

>   -H 'Content-Type: application/yang-data+json' \
>   -H 'Accept: application/yang-data+json' \
>   -u 'admin:admin' \
>   -d '${"severity": "alerts"}'}
HTTP/1.1 201 Created
Server: nginx
Date: Mon, 23 Apr 2018 14:53:51 GMT
Content-Type: text/html
Content-Length: 0
Location: https://10.85.116.30/restconf/data/Cisco-IOS-XE-native:native/logging/monitor/severity
Connection: keep-alive
Last-Modified: Mon, 23 Apr 2018 14:53:51 GMT
Cache-Control: private, no-cache, must-revalidate, proxy-revalidate
Pragma: no-cache

Device:~#

PUT: (Create or Replace) Request:

If the specified command is not present on the device, the POST request creates it; however, if it is already present in the running configuration, the command will be replaced by this request.

The following sample PUT request uses the `logging monitor warnings` command.

>   -H 'Content-Type: application/yang-data+json' \
>   -H 'Accept: application/yang-data+json' \
>   -u 'admin:admin' \
>   -d '${"severity": "warnings"}'}
HTTP/1.1 204 No Content
Server: nginx
Date: Mon, 23 Apr 2018 14:58:36 GMT
Content-Type: text/html
Content-Length: 0
Connection: keep-alive
Last-Modified: Mon, 23 Apr 2018 14:57:46 GMT
Cache-Control: private, no-cache, must-revalidate, proxy-revalidate
Pragma: no-cache

Device:~#

PATCH: (Update) Request:

The following sample PATCH request uses the `logging monitor informational` command.

>   -H 'Content-Type: application/yang-data+json' \
>   -H 'Accept: application/yang-data+json' \
>   -u 'admin:admin' \

Programmability Configuration Guide, Cisco IOS XE Fuji 16.8.x
GET Request (To Read)

The following sample GET request uses the logging monitor informational command.

   -H 'Accept: application/yang-data+json' \
   -u 'admin:admin'
HTTP/1.1 200 OK
Server: nginx
Date: Mon, 23 Apr 2018 15:10:59 GMT
Content-Type: application/yang-data+json
Transfer-Encoding: chunked
Connection: keep-alive
Cache-Control: private, no-cache, must-revalidate, proxy-revalidate
Pragma: no-cache

{  
   "Cisco-IOS-XE-native:severity": "informational"
}
Device:~#

DELETE Request (To Delete the Configuration)

   -H 'Content-Type: application/yang-data+json' \
   -H 'Accept: application/yang-data+json' \
   -u 'admin:admin'
HTTP/1.1 204 No Content
Server: nginx
Date: Mon, 23 Apr 2018 15:26:05 GMT
Content-Type: text/html
Content-Length: 0

Feature Information for the RESTCONF Protocol
CHAPTER 10

gNMI Protocol

This feature describes the model-driven configuration and retrieval of operational data using the gNMI CAPABILITIES, GET and SET RPCs. gNMI version 0.4.0 is supported.

- Restrictions for gNMI Protocol, on page 123
- Information About the gNMI Protocol, on page 124
- How to Enable the gNMI Protocol, on page 130
- Configuration Examples for Enabling the gNMI Protocol, on page 135
- Additional References for the gNMI Protocol, on page 135
- Feature Information for the gNMI Protocol, on page 136

Restrictions for gNMI Protocol

- Use of the Origin field in the path message is not supported. A non-empty value will cause an error to be returned.

- Subscribe RPC services

- JSON, BYTES, PROTO, and ASCI encoding options

  JSON keys must contain a YANG-prefix where the namespace of the following elements differs from the parent. This means that the routed-vlan derived from augmentation in openconfig-vlan.yang must be entered as oc-vlan:routed-vlan because it is different from the namespace of the parent nodes (parent nodes have the prefix, oc-if)

- GetRequest:
  - Operational data type
  - Use models

- GetResponse Notifications
  - Alias
  - Delete

- In a SetRequest, wildcards and all keys are not supported. Only fully-specified paths are supported.
Information About the gNMI Protocol

About GNMI

gNMI is gRPC network management protocol developed by Google. gNMI provides the mechanism to install, manipulate, and delete the configuration of network devices, and also to view operational data. The content provided through gNMI can be modeled using YANG.

gRPC is a remote procedure call developed by Google for low-latency, scalable distributions with mobile clients communicating to a cloud server. gRPC carries gNMI, and provides the means to formulate and transmit data and operation requests.

When a failure occurs, the gNMI broker (GNMIB) will indicate an operational change of state from up to down, and all RPCs will return a service unavailable message until the database is up and running. Upon recovery, the GNMIB will indicate a change of operation state from down to up, and resume normal handling of RPCs.

Overview of RFC 7951

RFC 7951 defines JavaScript Object Notation (JSON) encoding for YANG data trees and their subtrees. Instances of YANG data nodes (leafs, containers, leaf-lists, lists, anydata nodes, and anyxml nodes) are encoded as members of a JSON object or name/value pairs. Encoding rules are identical for all types of data trees, such as configuration data, state data, parameters of RPC operations, actions, and notifications.

Every data node instance is encoded as a name/value pair where the name is formed from the data node identifier. The value depends on the category of the data node.

The "leaf" Data Node

A leaf node has a value, but no children, in a data tree. A leaf instance is encoded as a name/value pair. The value can be a string, number, literal "true" or "false", or the special array "[null]", depending on the type of the leaf. In the case that the data item at the specified path is a leaf node (i.e., has no children, and an associated value) the value of that leaf is encoded directly - i.e., the "bare" value is specified (i.e., a JSON object is not required, and a bare JSON value is included).

The following example shows a leaf node definition:

```
leaf foo {
  type uint8;
}
```

The following is a valid JSON-encoded instance:

```
"foo": 123
```

gNMI GET Request

The gNMI GET RPC specifies how to retrieve one or more of the configuration attributes, state attributes, derived state attributes, or all attributes associated with a supported mode from a data tree. A GetRequest is sent from a client to the target to retrieve values from the data tree. A GetResponse is sent in response to a GetRequest.
The following example shows a Get Request on JSON structure:

Creating a path object for xpath: /oc-if:interfaces/interface[name=Loopback111]

+++++++ Sending get request: ++++++++  
path {
   elem {
      name: "oc-if:interfaces"
     }
   elem {
      name: "interface"
     key {
        key: "name"
        value: "Loopback111"
     }
   }
}

encoding: JSON_IETF

+++++++ Received get response: ++++++++  
notification {
   timestamp: 1521699434792345469
   update {
      path {
         elem {
            name: "oc-if:interfaces"
         }
         elem {
            name: "interface"
            key {
               key: "name"
               value: "\"Loopback111\""
            }
         }
      }
   }
   val {
      }
   }
The following example shows a GetRequest on a leaf on JSON structure:

Creating a path object for xpath:
```
/oc-if:interfaces/interface[name=Loopback111]/state/oper-status
```
+++++++ Sending get request: ++++
```
path {
  elem {
    name: "oc-if:interfaces"
  }
  elem {
    name: "interface"
    key {
      key: "name"
      value: "Loopback111"
    }
  }
  elem {
    name: "state"
  }
  elem {
    name: "oper-status"
  }
}
```

encoding: JSON_IETF

+++++++ Received get response: ++++
```
notification {
  timestamp: 1521699326012374332
  update {
    path {
      elem {
```
gNMI SetRequest

The Set RPC specifies how to set one or more configurable attributes associated with a supported model. A SetRequest is sent from a client to a target to update the values in the data tree.

In a SetRequest, only fully-specified (wildcards, and all keys-specified paths are not supported.) paths, and "json_iertf_val" or "json_val" TypedValue are supported. JSON keys must contain a YANG-prefix, in which the namespace of the following element differs from parent. The “routed-vlan” element derived from augmentation in openconfig-vlan.yang must be entered as “oc-vlan:routed-vlan”, because it is different from the namespace of the parent node (The parent node prefix is oc-if).

The total set of deletes, replace, and updates contained in any one SetRequest is treated as a single transaction. If any subordinate element of the transaction fails; the entire transaction will be disallowed and rolled back. A SetResponse is sent back for a SetRequest.

The following example shows a SetRequest on JSON structure:

```
Creating UPDATE update for /oc-if:interfaces/interface[name=Loopback111]/config/
Creating a path object for xpath: /oc-if:interfaces/interface[name=Loopback111]/config/
++++++ Sending set request: ++++
update {
  path {
    elem {
      name: "oc-if:interfaces"
    }
    elem {
      name: "interface"
      key {
        key: "name"
        value: "\"Loopback111\"
      }
    }
    elem {
      name: "config"
    }
  }
  val {
    json_iertf_val: "\"UP\"
  }
}
```
The following example shows a SetRequest on leaf on JSON structure:

Creating UPDATE update for /oc-if:interfaces/interface[name=Loopback111]/config/description
Creating a path object for xpath: /oc-if:interfaces/interface[name=Loopback111]/config/description

+++++++ Sending set request: +++++++
update {
  path {
    elem {
      name: "oc-if:interfaces"
    }
    elem {
      name: "interface"
      key {
        key: "name"
        value: "Loopback111"
      }
    }
    elem {
      name: "config"
    }
    elem {
      name: "description"
    }
  }
  val {
    json_ietf_val: "UPDATE DESCRIPTION"
  }
}

+++++++ Recevied set response: +++++++
response {
  path {
    elem {
      name: "oc-if:interfaces"
    }
    elem {
      name: "interface"
      key {
        key: "name"
        value: "Loopback111"
      }
    }
  }
  op: UPDATE

timestamp: 1521699342123890045

**gNMI JSON_ietf_val**

The JSON type indicates that the value is encoded as a JSON string as specified in RFC 7159. Additional types (such as, JSON_IETF) indicate specific additional characteristics of the encoding of the JSON data (particularly where they relate to serialisation of YANG-modeled data).

The following is a sample JSON_ietf_val message:

```json
val {
  json_ietf_val:"{
  "oc-if:config": {
   "oc-if:description": "UPDATE DESCRIPTION"
  }
  }
}
```

**gNMI Error Messages**

When errors occur, gNMI returns descriptive error messages. The following section displays some gNMI error messages.

The following sample error message is displayed when the path is invalid:

```
gNMI Error Response:
<_Rendezvous of RPC that terminated with (StatusCode.TERMINATED,
An error occurred while parsing provided xpath: unknown tag:
"someinvalidxpath" Additional information: badly formatted or nonexistent path)>
```

The following sample error message is displayed for an unimplemented error:

```
gNMI Error Response:
<_Rendezvous of RPC that terminated with (StatusCode.UNIMPLEMENTED,
Requested encoding "ASCII" not supported)>
```

The following sample error message is displayed when the data element is empty:

```
gNMI Error Response:
<_Rendezvous of RPC that terminated with (StatusCode.NOT_FOUND,
```
How to Enable the gNMI Protocol

Creating Certs with OpenSSL on Linux

Certs and trustpoint are only required for secure gNMI servers.

The following example shows how to create Certs with OpenSSL on a Linux machine:

```bash
# Setting up a CA
openssl genrsa -out rootCA.key 2048
openssl req -subj /C=/ST=/L=/O=/CN=rootCA -x509 -new -nodes -key rootCA.key -sha256 -out rootCA.pem

# Setting up device cert and key
openssl genrsa -out device.key 2048
openssl req -subj /C=/ST=/L=/O=/CN=<hostnameFQDN> -new -key device.key -out device.csr
openssl x509 -req -in device.csr -CA rootCA.pem -CAkey rootCA.key -CAcreateserial -out device.crt -sha256
# Encrypt device key - needed for input to IOS
openssl rsa -des3 -in device.key -out device.des3.key -passout pass:<password - remember this for later>

# Setting up client cert and key
openssl genrsa -out client.key 2048
openssl req -subj /C=/ST=/L=/O=/CN=gnmi_client -new -key client.key -out client.csr
openssl x509 -req -in client.csr -CA rootCA.pem -CAkey rootCA.key -CAcreateserial -out client.crt -sha256
```

Installing Certs on a Device

The following example show how to install certs on a device:

```bash
# Send:
Device# configure terminal
Device(config)# crypto pki import trustpoint1 pem terminal password password1

# Receive:
% Enter PEM-formatted CA certificate.
% End with a blank line or "quit" on a line by itself.

# Send:
# Contents of rootCA.pem, followed by newline + 'quit' + newline:
------BEGIN CERTIFICATE------
<snip>
------END CERTIFICATE------
quit

# Receive:
% Enter PEM-formatted encrypted private General Purpose key.
% End with "quit" on a line by itself.

# Send:
# Contents of device.des3.key, followed by newline + 'quit' + newline:
------BEGIN RSA PRIVATE KEY------
```
Enabling gNMI in Insecure Mode

To stop gNMI in insecure mode, use the `no gnmi-yang server` command.

---

**Note**
gNMI insecure and secure servers can run simultaneously.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `gnmi-yang`
4. `gnmi-yang server`
5. `gnmi-yang port port-number`
6. `end`
7. `show gnmi-yang state`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Starts the gNMIb process.</td>
</tr>
<tr>
<td><code>gnmi-yang</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# gnmi-yang</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enables the gNMI server in insecure mode.</td>
</tr>
<tr>

<tr>
<td><strong>Step 5</strong></td>
<td>Sets the gNMI port to listen to.</td>
</tr>
<tr>
<td><code>gnmi-yang port port-number</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>(Optional) Device(config)# gnmi-yang port 50000</td>
</tr>
<tr>
<td></td>
<td>• The default insecure gNMI port is 50052.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Displays the status of gNMI servers.</td>
</tr>
<tr>
<td><code>show gnmi-yang state</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# show gnmi-yang state</td>
</tr>
</tbody>
</table>

**Example**

The following is sample output from the `show gnmi-yang state` command:

```
Device# show gnmi-yang state
State          Status
---------------------------
Enabled          Up
```

**Enabling gNMI in Secure Mode**

To stop gNMI in secure mode, use the `no gnmi-yang secure-server` command.

---

**Note**

gNMI insecure and secure servers can run simultaneously.
## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `gnmi-yang`
4. `gnmi-yang secure-server`
5. `gnmi-yang secure-trustpoint trustpoint-name`
6. `gnmi-yang secure-client-auth`
7. `gnmi-yang secure-port`
8. `end`
9. `show gnmi-yang state`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable  
  **Example:** Device> enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Step 2** | `configure terminal`  
  **Example:** Device# configure terminal | Enters global configuration mode. |
| **Step 3** | `gnmi-yang`  
  **Example:** Device(config)# gnmi-yang | Starts the gNMIb process. |
| **Step 4** | `gnmi-yang secure-server`  
  **Example:** Device(config)# gnmi-yang secure-server | Enables the gNMI server in secure mode. |
| **Step 5** | `gnmi-yang secure-trustpoint trustpoint-name`  
  **Example:** Device(config)# gnmi-yang secure-trustpoint trustpoint1 | Specifies the trustpoint and cert set that gNMI uses for authentication. |
| **Step 6** | `gnmi-yang secure-client-auth`  
  **Example:** Device(config)# gnmi-yang secure-client-auth | (Optional) The gNMIb process authenticates the client certificate against the root certificate. |
| **Step 7** | `gnmi-yang secure-port`  
  **Example:** Device(config)# gnmi-yang secure-port | (Optional) Sets the gNMI port to listen to.  
  - The default insecure gNMI port is 50051. |
| **Step 8** | `end`  
  **Example:** Device(config)# end | Exits global configuration mode and returns to privileged EXEC mode. |
### Connecting the gNMI Client

The gNMI client is connected by using the client and root certificates that are previously configured.

The following example shows how to connect the gNMI client using Python:

```python
# gRPC Must be compiled in local dir under path below:
>>> import sys
>>> sys.path.insert(0, "reference/rpc/gnmi/")
>>> import grpc
>>> import gnmi_pb2
>>> import gnmi_pb2_grpc
>>> gnmi_dir = '/path/to/where/openssl/creds/were/generated/

# Certs must be read in as bytes
>>> with open(gnmi_dir + 'rootCA.pem', 'rb') as f:
>>>     ca_cert = f.read()
>>> with open(gnmi_dir + 'client.crt', 'rb') as f:
>>>     client_cert = f.read()
>>> with open(gnmi_dir + 'client.key', 'rb') as f:
>>>     client_key = f.read()

# Create credentials object
>>> credentials = grpc.ssl_channel_credentials(root_certificates=ca_cert,
private_key=client_key, certificate_chain=client_cert)

# Create a secure channel:
# Default port is 50052, can be changed on ios device with 'gnmi-yang secure-port ####'
>>> port = 50052
>>> host = <HOSTNAME FQDN>
>>> secure_channel = grpc.secure_channel("%s:%d" % (host, port), credentials)

# Create secure stub:
>>> secure_stub = gnmi_pb2_grpc.gNMIStub(secure_channel)

# Done! Let's test to make sure it works:
>>> secure_stub.Capabilities(gnmi_pb2.CapabilityRequest())
supported_models {<snip>
```
Configuration Examples for Enabling the gNMI Protocol

Example: Enabling the gNMI Protocol

Example: Enabling gNMI in Insecure Mode

The following example shows how to enable the gNMI server in insecure mode:

```
Device# configure terminal
Device(config)# gnmi-yang
Device(config)# gnmi-yang server
Device(config)# gnmi-yang port 50000 <The default port is 50052.>
Device(config)# end
```

Example: Enabling gNMI in Secure Mode

The following example shows how to enable the gNMI server in secure mode:

```
Device# configure terminal
Device(config)# gnmi-yang server
Device(config)# gnmi-yang secure-server
Device(config)# gnmi-yang secure-trustpoint trustpoint1
Device(config)# gnmi-yang secure-client-auth
Device(config)# gnmi-yang secure-port 50001 <The default port is 50051.>
Device(config)# end
```

Feature Information for the gNMI Protocol

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

| gNMI Protocol     | Cisco IOS XE Fuji 16.8.1a | This feature describes the model-driven configuration and retrieval of operational data using the gNMI capabilities, GET and SET RPCs. This feature was implemented on the following platforms:  
  • Cisco Catalyst 9300 Series Switches  
  • Cisco Catalyst 9400 Series Switches  
  • Cisco Catalyst 9500 Series Switches |
|                   | Cisco IOS XE Gibraltar 16.10.1 | gNMI namespaces and gNMI wildcards support were added to the following platforms:  
  • Cisco Catalyst 9300 Series Switches  
  • Cisco Catalyst 9400 Series Switches  
  • Cisco Catalyst 9500 Series Switches |
Feature Information for the gNMI Protocol
Model Based AAA

The NETCONF and RESTCONF interfaces implement the NETCONF Access Control Model (NACM). NACM is a form of role-based access control (RBAC) specified in RFC 6536.

- Model Based AAA, on page 139
- Additional References for Model Based AAA, on page 145
- Feature Information for Model-Based AAA, on page 145

Prerequisites for Model Based AAA

Working with the model based AAA feature requires prior understanding of the following:

- NETCONF-YANG
- NETCONF-YANG kill-session
- RFC 6536: Network Configuration Protocol (NETCONF) Access Control Model

Initial Operation

Upon enabling the NETCONF and/or RESTCONF services, a device that has no prior configuration of the /nacm subtree will deny read, write, and execute access to all operations and data other than the users of privilege level 15. This is described in the following configuration of the /nacm subtree:

```xml
<nacm xmlns="urn:ietf:params:xml:ns:yang:ietf-netconf-acm">
  <enable-nacm>true</enable-nacm>
  <read-default>deny</read-default>
  <write-default>deny</write-default>
  <exec-default>deny</exec-default>
  <enable-external-groups>true</enable-external-groups>
  <rule-list>
    <name>admin</name>
    <group>PRIV15</group>
    <rule>
      <name>permit-all</name>
      <module-name>*</module-name>
      <access-operations>*</access-operations>
      <action>permit</action>
    </rule>
  </rule-list>
</nacm>
```
Group Membership

The group membership of a user can come from two sources—first, from the privilege level of the user as configured on the AAA server used for authorization, and second, from those configured in the /nacm/groups subtree. The names of the groups that correspond to each privilege level are as follows:

<table>
<thead>
<tr>
<th>Privilege level</th>
<th>NACM group name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>PRIV00</td>
</tr>
<tr>
<td>1</td>
<td>PRIV01</td>
</tr>
<tr>
<td>2</td>
<td>PRIV02</td>
</tr>
<tr>
<td>3</td>
<td>PRIV03</td>
</tr>
<tr>
<td>4</td>
<td>PRIV04</td>
</tr>
<tr>
<td>5</td>
<td>PRIV05</td>
</tr>
<tr>
<td>6</td>
<td>PRIV06</td>
</tr>
<tr>
<td>7</td>
<td>PRIV07</td>
</tr>
<tr>
<td>8</td>
<td>PRIV08</td>
</tr>
<tr>
<td>9</td>
<td>PRIV09</td>
</tr>
<tr>
<td>10</td>
<td>PRIV10</td>
</tr>
<tr>
<td>11</td>
<td>PRIV11</td>
</tr>
<tr>
<td>12</td>
<td>PRIV12</td>
</tr>
<tr>
<td>13</td>
<td>PRIV13</td>
</tr>
<tr>
<td>14</td>
<td>PRIV14</td>
</tr>
<tr>
<td>15</td>
<td>PRIV15</td>
</tr>
</tbody>
</table>

Note: Traditional IOS command authorization, such as those based on privilege level, does not apply to NETCONF or RESTCONF.

Note: Access granted to a NACM group based on a privilege level do not inherently apply to NACM groups with higher privilege level. For example, rules that apply to PRIV10 do not automatically apply to PRIV11, PRIV12, PRIV13, PRIV14, and PRIV15 as well.
NACM Privilege Level Dependencies

If the AAA configuration is configured with **no aaa new-model**, the privilege level locally configured for the user is used. If the AAA configuration is configured with **aaa new-model**, the privilege level is determined by the AAA servers associated with the method list **aaa authorization exec default**.

NACM Configuration Management and Persistance

The NACM configuration can be modified using NETCONF or RESTCONF. In order for a user to be able to access the NCAM configuration, they must have explicit permission to do so, that is, through a NACM rule. Configuration under the /nacm subtree persists when the **copy running-config startup-config** EXEC command is issued, or the **cisco-ias:save-config** RPC is issued.

```xml
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <save-config xmlns="http://cisco.com/yang/cisco-ia"/>
</rpc>
```

The NACM rules that apply to a NETCONF session are those that are configured in the /nacm subtree at the time of session establishment. Modifying the /nacm subtree has no effect on NETCONF sessions as they are already established. The `<kill-session>` RPC or the **clear netconf-yang session** EXEC command can be used to forcibly end an unwanted NETCONF session. See **NETCONF Kill Session** on page 97.

**Note**

Care should be taken when crafting rules to deny access to certain data as the same data may be exposed through multiple YANG modules and data node paths. For example, interface configuration is exposed through both **Cisco-IOS-XE-native** and **ietf-interface**. Rules that may apply to one representation of the same underlying data may not apply to other representations of that data.

Resetting the NACM Configuration

Use the following command to reset the /nacm subtree configuration to the initial configuration (see **Initial Operation**).

```bash
Router#request platform software yang-management nacm reset-config
```

Sample NACM Configuration

The examples in this section are for illustrative purposes only.

The following is a sample for groups configuration.

```xml
<nacm xmlns="urn:ietf:params:xml:ns:yang:ietsconf-acm">
  <groups>
    <group>
      <name>Administrators</name>
      <user-name>admin</user-name>
      <user-name>root</user-name>
    </group>
  </groups>
</nacm>
```
Table 17: Description of the Configuration Parameters for Groups Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;name&gt;administrators&lt;/name&gt;</td>
<td>Group name</td>
</tr>
<tr>
<td>&lt;user-name&gt;admin&lt;/user-name&gt;</td>
<td>User name</td>
</tr>
<tr>
<td>&lt;user-name&gt;root&lt;/user-name&gt;</td>
<td>User name</td>
</tr>
</tbody>
</table>

The following is a sample for creating module rules.

```
<nacm xmlns="urn:ietf:params:xml:ns:yang:ietf-netconf-acm">
  <rule-list>
    <name>only-ietf-interfaces</name>
    <group>limited-permission</group>
    <rule>
      <name>deny-native</name>
      <module-name>Cisco-IOS-XE-native</module-name>
      <access-operations>*</access-operations>
      <action>deny</action>
    </rule>
    <rule>
      <name>allow-ietf-interfaces</name>
      <module-name>ietf-interfaces</module-name>
      <access-operations>*</access-operations>
      <action>permit</action>
    </rule>
  </rule-list>
</nacm>
```

Table 18: Description of the Configuration Parameters for Creating Module Rules

<table>
<thead>
<tr>
<th>Parameter</th>

</tr>
</tbody>
</table>

The following is a sample for creating data node rules.

<nacm xmlns="urn:ietf:params:xml:ns:yang:ietf-netconf-acm">
  <rule-list>
    <name>hide-enable-passwords</name>
    <group>limited-permission</group>

    <rule>
      <name>deny-enable-passwords</name>
      <access-operations>*</access-operations>
      <action>deny</action>
    </rule>
  </rule-list>
</nacm>
Table 20: Description of the Configuration Parameters for Creating Data Node Rules

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;name&gt;hide-enable-passwords&lt;/name&gt;</td>
<td>Unique rule-list name</td>
</tr>
<tr>
<td>&lt;group&gt;limited-permission&lt;/group&gt;</td>
<td>Groups that rule-list applies to</td>
</tr>
<tr>
<td>&lt;name&gt;deny-enable-passwords&lt;/name&gt;</td>
<td>Unique rule name</td>
</tr>
<tr>
<td>&lt;path xmlns:ios=&quot;http://cisco.com/ns/yang/Cisco-IOS-XE-native&quot;&gt;/ios:native/enable&lt;/path&gt;</td>
<td>Path to the data node being granted/denied</td>
</tr>
<tr>
<td>&lt;access-operations&gt;*&lt;/access-operations&gt;</td>
<td>CRUDx operation types</td>
</tr>
<tr>
<td>&lt;action&gt;deny&lt;/action&gt;</td>
<td>Permit/deny</td>
</tr>
</tbody>
</table>

The following is an example NACM configuration that permits all groups to use the standard NETCONF RPCs `<get>` and `<get-config>`, the schema download RPC `<get-schema>`, and read-only access to the data in the module `ietf-interfaces`:

```xml
<nacm xmlns="urn:ietf:params:xml:ns:yang:ietf-netconf-acm">
  <rule-list>
    <name>readonly-protocol</name>
    <group>*</group>
    <rule>
      <name>get-permit</name>
      <module-name>ietf-netconf</module-name>
      <rpc-name>get</rpc-name>
      <access-operations>exec</access-operations>
      <action>permit</action>
    </rule>
    <rule>
      <name>get-config-permit</name>
      <module-name>ietf-netconf</module-name>
      <rpc-name>get-config</rpc-name>
      <access-operations>exec</access-operations>
      <action>permit</action>
    </rule>
    <rule>
      <name>get-schema-permit</name>
      <module-name>ietf-netconf-monitoring</module-name>
      <rpc-name>get-schema</rpc-name>
      <access-operations>exec</access-operations>
      <action>permit</action>
    </rule>
  </rule-list>
  <rule-list>
    <name>readonly-data</name>
    <group>*</group>
    <rule>
      <name>ietf-interfaces-permit</name>
      <module-name>ietf-interfaces</module-name>
      <access-operations>read</access-operations>
      <action>permit</action>
    </rule>
  </rule-list>
</nacm>
```

Model-Driven Telemetry

Model-driven telemetry allows network devices to continuously stream real-time configuration and operating state information to subscribers.

Applications can subscribe to specific data items they need, by using standard-based YANG data models over NETCONF-YANG.

Structured data is published at a defined cadence, or on-change, based upon the subscription criteria and data type.

Prerequisites for Model-Driven Telemetry

• Knowledge of NETCONF-YANG and how to use it, including:
  • Establishing a NETCONF session.
  • Sending/receiving hello and capabilities messages.
  • Sending/receiving YANG XML remote procedure calls (RPCs) over the established NETCONF session. For more information, see the Configuration Example for NETCONF-YANG.

For more information on NETCONF-YANG, see the Datamodels chapter.

• Knowledge of XML, XML namespaces, and XML XPath.

• Knowledge of standards and principles defined by the IETF telemetry specification.

• NETCONF-YANG must be configured and running on the device. Verify that the following processes are running, by using the show platform software yang-management process command:

```
Device# show platform software yang-management process

confd : Running
nesd : Running
syncfd : Running
ncsshd : Running
dmialuthd : Running
```

For more information, see the Datamodels chapter.
Information About Model-Driven Telemetry

Model-Driven Telemetry Overview

Telemetry is an automated communications process by which measurements and other data are collected at remote or inaccessible points and transmitted to receiving equipment for monitoring. Model-driven telemetry provides a mechanism to stream data from a model-driven telemetry-capable device to a destination.

Telemetry uses a subscription model to identify information sources and destinations. Model-driven telemetry replaces the need for the periodic polling of network elements; instead, a continuous request for information to be delivered to a subscriber is established upon the network element. Then, either periodically, or as objects change, a subscribed set of YANG objects are streamed to that subscriber.

The data to be streamed is driven through subscriptions. Subscriptions allow applications to subscribe to updates (automatic and continuous updates) from a YANG datastore, and this enables the publisher to push and in effect stream those updates.

Dynamic subscriptions are only supported.

Subscription Overview

Subscriptions are items that create associations between telemetry roles, and define the data that is sent between them.

Specifically, a subscription is used to define the set of data that is requested as part of the telemetry data; when the data is required, how the data is to be formatted, and, when not implicit, who (which receivers) should receive the data.

Even though the maximum number of supported subscriptions is platform-dependent, currently 100 subscriptions are supported. The subscriptions can be either configured or dynamic, and use any combination of transport protocols. If too many subscriptions are operating at the same time to allow all the valid configured subscriptions to be active, the removal of an active subscription will cause one of the inactive but valid configured subscriptions to be attempted. Periodic triggered subscriptions (100 centiseconds is the default minimum) and on-change triggered subscriptions are supported.
NETCONF and other northbound programmable interfaces (such as RESTCONF or gNMI) are supported to configure subscriptions.

Two types of subscriptions are used in telemetry on Cisco IOS XE systems: dynamic and configured subscriptions.

Because dynamic subscriptions are created by clients (the subscriber) that connect into the publisher, they are considered dial-in. Configured subscriptions cause the publisher to initiate connections to receivers, and as a result, they are considered dial-out.

**Sample <establish-subscription> RPC**

The following is a sample `<establish-subscription>` RPC. The stream, xpath-filter, and period fields in the RPC are mandatory.

```xml
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
    <stream>yp:yang-push</stream>
    <yp:period>1000</yp:period>
  </establish-subscription>
</rpc>
```

**YANG-Push**

RFC 6020: YANG - A Data Modeling Language for the Network Configuration Protocol (NETCONF) and RFC 6241: Network Configuration Protocol (NETCONF) and explain YANG-push, which is the subscription and push mechanism for YANG databases. YANG-push subscriptions are defined using a data model. Using YANG-push, subscriber applications can request a continuous, customized stream of updates from YANG databases. The YANG-push encompasses all data in the configuration and operational databases that is described by the YANG model installed on a device. You must provide a filter for data, as subscription to all data is not supported.

---

**Note**

The yang-push stream must be specified.

**XPath Filter Support**

The dataset within the “yang-push” stream to be subscribed to is specified by the use of an XPath filter. However, XPath is far more expressive that is needed when specifying data for ‘yang-push’ streams, so the following limitations are placed on the XPath expression:

1. It must specify a single object. That object can be a container, a leaf, a leaf-list or a list.
2. It may have keys to specify a single entry in a list or container. The supported key specification syntax is “{key name}={key value}”. Compound keys are supported by the use of multiple key specifications. The key names and values must be exact; no ranges or wildcard values are supported.
3. The use of the union operator () is supported to allow a single subscription to support multiple objects.
Periodic Publication

With periodic subscriptions, the first push-update with the subscribed information is sent immediately; but it can be delayed if the device is busy or due to network congestion. Updates are then sent at the expiry of the configured periodic timer. For example, if the period is configured as 10 minutes, the first update is sent immediately after the subscription is created and every 10 minutes thereafter.

Period is time, in centiseconds (1/100 of a second), between periodic push updates. A period of 1000 will result in getting updates to the subscribed information every 10 seconds. The minimum period interval is 100, or one second. There is no default value. This value must be explicitly set in the <establish subscription> RPC.

Subscriptions for data that does not currently exist are permitted and run as normal subscriptions. When subscribing for empty data, empty update notifications are sent at the requested period.

Periodic updates contain a full copy of the subscribed data element or table.

RPC Support in Telemetry

The <establish-subscription> and <delete-subscription> RPCs are supported for telemetry.

When an <establish-subscription> RPC is sent, the RPC reply from a publisher contains an <rpc-reply> message with a <subscription-result> element containing a result string.

The following table displays the response and the reason for the response in an <rpc-reply> message:

<table>
<thead>
<tr>
<th>Result String</th>
<th>RPC</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>&lt;establish-subscription&gt;</td>
<td>Success</td>
</tr>
<tr>
<td></td>
<td>&lt;delete-subscription&gt;</td>
<td></td>
</tr>
<tr>
<td>error-no-such-subscription</td>
<td>&lt;delete-subscription&gt;</td>
<td>The specified subscription does not exist.</td>
</tr>
<tr>
<td>error-no-such-option</td>
<td>&lt;establish-subscription&gt;</td>
<td>The requested subscription is not supported.</td>
</tr>
<tr>
<td>error-insufficient-resources</td>
<td>&lt;establish-subscription&gt;</td>
<td>A subscription cannot be created because of the following reasons:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• There are too many subscriptions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The amount of data requested is considered too large.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The interval for a periodic subscription is too small.</td>
</tr>
<tr>
<td>error-other</td>
<td>&lt;establish-subscription&gt;</td>
<td>Some other error.</td>
</tr>
</tbody>
</table>

NETCONF Sessions in Telemetry

Telemetry subscriptions and updates are transmitted over NETCONF sessions. The NETCONF session that is used to establish a telemetry subscription receives the telemetry updates. If the NETCONF session is torn down or the connection is lost, associated telemetry subscriptions are also torn down.
All sessions are NETCONF sessions and as a result, all session limitations are specific to the NETCONF implementation.

High Availability in Telemetry

Dynamic telemetry connections are established over a NETCONF session via SSH to the active switch or a member in a switch stack, or the active route-processor in an high-availability capable router. After switchover, you must destroy and re-establish all sessions that use Crypto, including NETCONF sessions that carry telemetry subscriptions. You must also recreate all subscriptions after a switchover.

Sample Model-Driven Telemetry RPCs

Creating a Subscription

Subscriptions are created using XML RPCs over an established NETCONF session. The <establish-subscription> RPC is sent from an IETF telemetry client or collector to the network device. The stream, xpath-filter, and period fields in the RPC are mandatory.

The following is a sample subscription to the operational database subscriptions table:

```xml
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
    <stream>yp:yang-push</stream>
    <yp:period>1000</yp:period>
  </establish-subscription>
</rpc>
```

Receiving a Response Code

When a subscription is successfully created, the device responds with a subscription-result of notif-bis:ok and with a subscription ID. The following is a sample response RPC message:

```xml
<rpc-reply xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="101">
  <subscription-result xmlns="urn:ietf:params:xml:ns:yang:ietf-event-notifications">
    notif-bis:ok
  </subscription-result>
  <subscription-id xmlns="urn:ietf:params:xml:ns:yang:ietf-event-notifications">2147484201</subscription-id>
</rpc-reply>
```

Receiving Subscription Push-Updates

Subscription updates pushed from the device are in the form of an XML RPC and are sent over the same NETCONF session on which these are created. The subscribed information element or tree is returned within the datastore-contents-xml tag. The following is a sample RPC message that provides the subscribed information:

```xml
<notification xmlns="urn:ietf:params:xml:ns:netconf:notification:1.0">
</notification>
```
Retrieving Subscription Details

You can retrieve the list of current subscriptions by sending a <get> RPC to the Cisco-IOS-XE-mdt-oper model. You can also use the `show telemetry ietf subscription` command to display the list of current subscriptions.

The following is a sample <get> RPC message:

```xml
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <get>
    <filter>
      <mdt-oper-data xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-mdt-oper">
        <mdt-subscriptions/>
      </mdt-oper-data>
    </filter>
  </get>
</rpc>
```

The following is a sample RPC reply:

```xml
<rpc-reply xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="101">
  <data>
    <mdt-oper-data xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-mdt-oper">
      <mdt-subscriptions>
        <subscription-id>2147485164</subscription-id>
        <base>
          <stream>yang-push</stream>
          <encoding>encode-xml</encoding>
          <period>100</period>
          <xpath>/ios:native/router/ios-rip:rip/ios-rip:version</xpath>
        </base>
        <type>sub-type-dynamic</type>
      </mdt-subscriptions>
    </mdt-oper-data>
  </data>
</rpc-reply>
```
The following is sample output from the `show telemetry ietf subscription dynamic brief` command:

```
Device# show telemetry ietf subscription dynamic brief
Telemetry subscription brief
ID               Type      State   Filter type
--------------------------------------------------
2147483667       Dynamic   Valid   xpath
2147483668       Dynamic   Valid   xpath
2147483669       Dynamic   Valid   xpath
```

The following is sample output from the `show telemetry ietf subscription subscription-ID detail` command:

```
Device# show telemetry ietf subscription 2147483667 detail
Telemetry subscription detail:
Subscription ID: 2147483667
State: Valid
Stream: yang-push
Encoding: encode-xml
Filter:
  Filter type: xpath
  XPath: /mdt-oper:mdt-oper-data/mdt-subscriptions
Update policy:
  Update Trigger: periodic
  Period: 1000
```

**Deleting a Subscription**

You can delete a telemetry subscription in two ways. One is by sending a `<delete-subscription>` RPC with the subscription ID in the subscription-id tag, which only a subscriber can do. Also, a subscription is deleted when the parent NETCONF session is torn down or disconnected. If the network connection is interrupted, it may take some time for the SSH/NETCONF session to timeout, and subsequent subscriptions to be removed.

```
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <delete-subscription xmlns="urn:ietf:params:xml:ns:yang:ietf-event-notifications"
                       xmlns:netconf="urn:ietf:params:xml:ns:netconf:base:1.0">
    <subscription-id>2147483650</subscription-id>
  </delete-subscription>
</rpc>
```

| Model-Driven Telemetry    | Cisco IOS XE Everest 16.6.1   | Model-driven telemetry allows network devices to continuously stream real-time configuration and operating state information to subscribers. This feature was implemented on the following platforms:  
  - Cisco Catalyst 3650 Series Switches  
  - Cisco Catalyst 3850 Series Switches  
  - Cisco Catalyst 9300 Series Switches  
  - Cisco Catalyst 9500 Series Switches |
|                           | Cisco IOS XE Everest 16.6.2   | In Cisco IOS XE Everest 16.6.2, this feature was implemented on Cisco Catalyst 9400 Series Switches. |
|                           | Cisco IOS XE Fuji 16.7.1      | - Cisco Aggregation Services Routers 1000 Series  
  - Cisco Integrated Services Routers 4300 and 4400 ISR Series |
In-Service Model Update

This module describes how to update the YANG data models on a device through an In-Service Model Update.

- Restrictions for In-Service Model Update, on page 157
- Information About In-Service Model Update, on page 157
- How to Manage In-Service Model Update, on page 160
- Configuration Examples for In-Service Model Updates, on page 161
- Feature Information for In-Service Model Update, on page 165

Restrictions for In-Service Model Update

- High availability or In-Service Software Upgrade (ISSU) is not supported. After a switchover, users must install the Software Maintenance Update (SMU) on standby device.

Information About In-Service Model Update

Overview of In-Service Model Updates

In-Service Model Update adds new data models or extend functionality to existing data models. The In-Service Model Update provides YANG model enhancements outside of a release cycle. The update package is a superset of all existing models; it includes all existing models as well as updated YANG models.

The data model infrastructure implements the YANG model-defined management interfaces for Cisco IOS XE devices. The data model infrastructure exposes the NETCONF interface northbound from Cisco IOS XE devices. The supported data models include industry standard models such as IETF, and Cisco IOS XE device-specific models.

The functionality provided by the In-Service Model Update is integrated into the subsequent Cisco IOS XE software maintenance release. Data model update packages can be downloaded from the Cisco Download Software Center.

Compatibility of In-Service Model Update Packages

An update package is built on a per release basis and is specific to a platform. This means that an update package for Cisco ASR 1000 Series Aggregation Services Routers cannot be installed on Cisco CSR 1000V.
Series Cloud Services Routers. Similarly, an update package built for Cisco IOS XE Fuji 16.7.1 cannot be applied on a device that runs the Cisco IOS XE Everest 16.5.2 version.

All contents of an update package will be part of future mainline or maintenance release images. The image and platform versions are checked by the In-Service Model Update commands during the package add and activate. If an image or platform mismatch occurs, the package install fails.

### Update Package Naming Conventions

In-Service Model Updates are packaged as a .bin files. This file includes all updates for a specific release and platform and the Readme file. These files have a release date and are updated periodically with additional model updates.

The naming convention of the data model update package follows the format—platform type-license level.release version.DDTS ID-file. The following is an example of a data model update file:

- isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
- asr1000-universalk9.2017-08-23_17.48.0.CSCxxxxxxx.SSA.dmp.bin

The readme file provides the following information:

- Console and error messages during data model activation or deactivation
- Data model installation impact
- Side effects and possible workarounds
- Package(s) that the In-Service Model Update impacts
- Restart type

### Installing the Update Package

You can install the In-Service Model Update package on a device by using the `install add`, `install activate`, and `install commit` commands in privileged EXEC mode.

The `install add` command copies the update package from a remote location to the device. You can also use other methods to copy the package; however, you must still enable the `install add` command for the installation to work. For the `install activate` command to work, the package must be available in the device bootflash. Enable the `install commit` command to make updates persistent over reloads.

Installing an update replaces any previously installed data models. At any time, only one update is installed on the device. A data model package includes all updated YANG models and all existing YANG models previously installed on the device.

The following flow chart explains how the model update package works:
If NETCONG-YANG is enabled during package activation, NETCONF processes are restarted. All active NETCONF sessions are killed during package activation. Failure during a package verification terminates the activation process.

### Deactivating the Update Package

You can deactivate an update package by using the `install deactivate` command. Enable the `install commit` command to make changes persistent.

#### Table 23: Deactivating a Model Update Package

<table>
<thead>
<tr>
<th>Action</th>
<th>Command to Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>To remove a package.</td>
<td>Use the <code>install remove</code> command.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Deactivate a package before removing it.</td>
</tr>
<tr>
<td>To deactivate a package</td>
<td>Use the <code>install deactivate</code> command, followed by the <code>install commit</code> command.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The <code>install commit</code> command must be used to ensure that the deactivation of the model package is persistent across reloads. Subsequent attempts at removal of the package will fail, if the deactivation is not committed.</td>
</tr>
</tbody>
</table>

When you deactivate an update, if more than one model update package is installed, the most recently committed model update package becomes the model package used by the device. If there are no other previously committed model packages, then the base version of data models included with the standard image is used.

### Rollback of the Update Package

Rollback provides a mechanism to move a device back to the state in which it was operating prior to an update. After a rollback, NETCONF-YANG processes are restarted before changes are visible.

You can roll back an update to the base version, the last committed version, or a known commit ID by using the `install rollback` command.
How to Manage In-Service Model Update

Managing the Update Package

SUMMARY STEPS

1. enable
2. install add file tftp: filename
3. install activate file bootflash: filename
4. install commit
5. install deactivate file bootflash: filename
6. install commit
7. install rollback to {base | committed | id commit-ID}
8. install remove {file bootflash: filename | inactive}
9. show install summary

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> install add file tftp: filename</td>
<td>Copies the model update package from a remote location (via FTP, TFTP) to the device, and performs a compatibility check for the platform and image versions.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# install add file tftp://172.16.0.1//tftpboot/folder1/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin</td>
<td>• You can use other methods to copy the update package from the remote location to the device, however; you still have to execute the install add command before the package is activated.</td>
</tr>
<tr>
<td><strong>Step 3</strong> install activate file bootflash: filename</td>
<td>Validates whether the update package is added through the install add command, and restarts the NETCONF processes.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# install activate file bootflash: isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin</td>
<td>• Perform the install add operation prior to activating an update package.</td>
</tr>
<tr>
<td><strong>Step 4</strong> install commit</td>
<td>Makes the changes persistent over reload.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# install commit</td>
<td>• NETCONF processes are not restarted.</td>
</tr>
<tr>
<td><strong>Step 5</strong> install deactivate file bootflash: filename</td>
<td>Deactivates the specified update package, and restarts the NETCONF processes.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device# install deactivate file bootflash: isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin Device# install deactivate file bootflash: asr1000-universalk9.2017-08-23_17.48.0.CSCxxxxxxx.SSA.dmp.bin</td>
<td></td>
</tr>
</tbody>
</table>

**Step 6**

**install commit**  
**Example:**  
Device# install commit

**Purpose:** Makes the changes persistent over reload.  
- NETCONF processes are not restarted.

**Step 7**

**install rollback to {base | committed | id commit-ID}**  
**Example:**  
Device# install rollback to base

**Purpose:** Rollbacks the update to the base version, the last committed version, or a known commit ID, and restarts NETCONF processes.  
- Valid values for the `commit-id` argument are from 1 to 4294967295.  
- Older versions of data models updates are available for use.

**Step 8**

**install remove {file bootflash: filename | inactive}**  
**Example:**  
Device# install remove file bootflash: isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin  
Device# install remove file bootflash: asr1000-universalk9.2017-08-23_17.48.0.CSCxxxxxxx.SSA.dmp.bin

**Purpose:** Removes the specified update package from the bootflash.  
- A package must be deactivated before it is removed.

**Step 9**

**show install summary**  
**Example:**  
Device# show install summary

**Purpose:** Displays information about the active package.  
- The output of this command varies according to the `install` commands that are configured.

---

**Configuration Examples for In-Service Model Updates**

**Example: Managing an Update Package**

The sample image used in the following examples are a Cisco 4000 Series Integrated Services Router image.

The following example shows how to add a model update package file:

```
Device# install add file tftp://172.16.0.1//tftptboot/folder1/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
```

```
install_add: START Sun Feb 26 05:57:04 UTC 2017  
Downloading file tftp://172.16.0.1//tftptboot/folder1/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin  
Finished downloading file tftp://172.16.0.1//tftptboot/folder1/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin  
to bootflash:isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
```
SUCCESS: install_add /bootflash/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
Sun Feb 26 05:57:22 UTC 2017
Device#

The sample image used in the following examples are a Cisco ASR1000 Series Aggregated Services Router image.

The following example shows how to add a model update package file:

Device# install add file tftp://172.16.0.1//tftpboot/folder1/asr1000-universalk9.2017-08-23_17.48.0.CSCxxxxxxx.SSA.dmp.bin

install_add: START Sun Feb 26 05:57:04 UTC 2017
Downloading file tftp://172.16.0.1//tftpboot/folder1/asr1000-universalk9.2017-08-23_17.48.0.CSCxxxxxxx.SSA.dmp.bin
SUCCESS: install_add /bootflash/asr1000-universalk9.2017-08-23_17.48.0.CSCxxxxxxx.SSA.dmp.bin
Sun Feb 26 05:57:22 UTC 2017
Device#

The following is sample output from the show install summary command after adding an update package file to the device:

Device# show install summary

Active Packages:
No packages
Inactive Packages:
bootflash: isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
Committed Packages:
No packages
Uncommitted Packages:
No packages
Device#

The following example shows how to activate an added update package file:

Device# install activate file bootflash:

isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin

install_activate: START Sun Feb 26 05:58:41 UTC 2017
DMP package.
Netconf processes stopped
SUCCESS: install_activate /bootflash/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
Sun Feb 26 05:58:58 UTC 2017*Feb 26 05:58:47.655: %DMI-4-CONTROL_SOCKET_CLOSED:
SIP0: nesd: Confd control socket closed Lost connection to ConfD (45): EOF on socket to ConfD.
*Feb 26 05:58:47.661: %DMI-4-SUB_READ_FAIL: SIP0: vtyserverutild:
ConfD subscription socket read failed Lost connection to ConfD (45): EOF on socket to ConfD.
*Feb 26 05:58:47.667: %DMI-4-CONTROL_SOCKET_CLOSED: SIP0: syncfd:
ConfD control socket closed Lost connection to ConfD (45): EOF on socket to ConfD.
*Feb 26 05:59:43.269: %DMI-5-SYNC_START: SIP0: syncfd:
External change to running configuration detected.
The running configuration will be synchronized to the NETCONF running data store.
*Feb 26 05:59:44.624: %DMI-5-SYNC_COMPLETE: SIP0: syncfd:
The running configuration has been synchronized to the NETCONF running data store.
Device#
The following sample output from the `show install summary` command displays the status of the model package as active and uncommitted:

```bash
Device# show install summary

Active Packages:
bootflash:isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin

Inactive Packages:
No packages

Committed Packages:
No packages

Uncommitted Packages:
bootflash:isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
Device#
```

The following example shows how to execute the `install commit` command:

```bash
Device# install commit

install_commit: START Sun Feb 26 06:46:48 UTC 2017
SUCCESS: install_commit Sun Feb 26 06:46:52 UTC 2017
Device#
```

The following sample output from the `show install summary` command displays that the update package is now committed, and that it will be persistent across reboots:

```bash
Device# show install summary

Active Packages:
bootflash:isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin

Inactive Packages:
No packages

Committed Packages:
bootflash:isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin

Uncommitted Packages:
No packages
Device#
```

The following example shows how to rollback an update package to the base package:

```bash
Device# install rollback to base

install_rollback: START Sun Feb 26 06:50:29 UTC 2017
  7 install_rollback: Restarting impacted processes to take effect
  7 install_rollback: restarting confd
*Feb 26 06:50:34.957: %DMI-4-CONTROL_SOCKET_CLOSED: SIP0: syncfd:
  Confd control socket closed Lost connection to ConfD (45): EOF on socket to ConfD.
*Feb 26 06:50:34.962: %DMI-4-CONTROL_SOCKET_CLOSED: SIP0: nesd:
  Confd control socket closed Lost connection to ConfD (45): EOF on socket to ConfD.
*Feb 26 06:50:34.963: %DMI-4-SUB_READ_FAIL: SIP0: vtyserverutild:
  Confd subscription socket read failed Lost connection to ConfD (45): EOF on socket to ConfD.Netconf processes stopped
  7 install_rollback: DMP activate complete
  7 install_rollback: SUCCESS: install_rollback Sun Feb 26 06:50:41 UTC 2017
*Feb 26 06:51:28.901: %DMI-5-SYNC_START: SIP0: syncfd:
  External change to running configuration detected.
  The running configuration will be synchronized to the NETCONF running data store.
*Feb 26 06:51:30.339: %DMI-5-SYNC_COMPLETE: SIP0: syncfd:
  The running configuration has been synchronized to the NETCONF running data store.
Device#
```
The following is sample output from the `show install package` command:

```
Device# show install package bootflash:
isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
Name: isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
Version: 16.5.1.0.199.1484082952..Everest
Platform: ISR4300
Package Type: dmp
Defect ID: CSCxxxxxxx
Package State: Added
Supersedes List: {}
Smu ID: 1
Device#
```

The following sample NETCONF hello message verifies the new data model package version:

```
Getting Capabilities: (admin @ 172.16.0.1:830)

  </capabilities>
Device#
```

The following is sample output from the `show install log` command:

```
Device# show install log
[0] install_op_boot]: START Fri Feb 24 19:20:19 Universal 2017
[0] install_op_boot]: END SUCCESS Fri Feb 24 19:20:23 Universal 2017
[3] install_add( FATAL)): File path (scp) is not yet supported for this command
[4] install_add]: START Sun Feb 26 05:57:04 UTC 2017
[4] install_add]: END SUCCESS /bootflash/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
Sun Feb 26 05:57:22 UTC 2017
[5] install_activate]: START Sun Feb 26 05:58:41 UTC 2017
Device#
```

The sample image used in the following examples is a Cisco Catalyst 3000 Series Switch image.

The following example shows how to add a model update package file:
Device# install add file tftp://172.16.0.1//tftpboot//folder1/cat3k_caa-universalk9.16.06.01.CSCxxxxxxx.dmp.bin

install_add: START Sat Jul 29 05:57:04 UTC 2017
Downloading file tftp://172.16.0.1//tftpboot//folder1/cat3k_caa-universalk9.16.06.01.CSCxxxxxxx.dmp.bin
Finished downloading file tftp://172.16.0.1//tftpboot//folder1/cat3k_caa-universalk9.16.06.01.CSCxxxxxxx.SPA.smu.bin
to bootflash:cat3k_caa-universalk9.16.06.01.CSCxxxxxxx.dmp.bin
SUCCESS: install_add /bootflash/cat3k_caa-universalk9.16.06.01.CSCxxxxxxx.dmp.bin
Sat Jul 29 05:57:22 UTC 2017
Device#

The following sample output from the `show install summary` command displays that the update package is now committed, and that it will be persistent across reloads:

Device# show install summary

Active Packages:
bootflash:cat3k_caa-universalk9.16.06.01.CSCxxxxxxx.dmp.bin
Inactive Packages:
No packages
Committed Packages:
bootflash:cat3k_caa-universalk9.16.06.01.CSCxxxxxxx.dmp.bin
Uncommitted Packages:
No packages
Device#

Feature Information for In-Service Model Update

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 24: Feature Information for In-Service Model Update
