# CONTENTS

## CHAPTER 1

**New and Changed Information**  
New and Changed Feature Information  1

## PART I

**Provisioning**  15

## CHAPTER 2

**Zero-Touch Provisioning**  17

- Information About Zero-Touch Provisioning  17
  - Zero-Touch Provisioning Overview  17
  - DHCP Server Configuration for Zero-Touch Provisioning  18
  - DHCPv6 Support  18
- Sample Zero-Touch Provisioning Configurations  19
  - Sample DHCP Server Configuration on a Management Port Using TFTP Copy  19
  - Sample DHCP Server Configuration on a Management Port Using HTTP Copy  19
  - Sample DHCP Server Configuration on an In-Band Port Using TFTP Copy  19
  - Sample DHCP Server Configuration on an In-Band Port Using HTTP Copy  20
  - Sample DHCP Server Configuration on a Linux Ubuntu Device  20
  - Sample DHCPv6 Server Configuration on a Management Port Using TFTP Copy  21
  - Sample Python Provisioning Script  21
  - Boot Log for Cisco 4000 Series Integrated Services Routers  22
  - Boot Log for Cisco Catalyst 9000 Series Switches  23
- Feature Information for Zero-Touch Provisioning  37

## CHAPTER 3

**iPXE**  39

- Information About iPXE  39
  - About iPXE  39
  - iPXE Overview  40
## Chapter 7: EEM Python Module

- **Prerequisites for the EEM Python Module** 91
- **Information About EEM Python Module** 91
- **Python Scripting in EEM** 91
- **EEM Python Package** 91
- **Python-Supported EEM Actions** 92
- **EEM Variables** 93
- **EEM CLI Library Command Extensions** 93
- **How to Configure the EEM Python Policy** 94
  - Registering a Python Policy 94
  - Running Python Scripts as Part of EEM Applet Actions 95
  - Adding a Python Script in an EEM Applet 97
- **Additional References EEM Python Module** 99
- **Feature Information for EEM Python Module** 100

## Part III: Model-Driven Programmability

## Chapter 8: NETCONF Protocol

- **Restrictions for the NETCONF Protocol** 105
- **Information About the NETCONF Protocol** 105
  - Introduction to Data Models - Programmatic and Standards-Based Configuration 105
- **NETCONF** 106
- **NETCONF RESTCONF IPv6 Support** 106
- **NETCONF Global Session Lock** 106
- **NETCONF Kill Session** 107
- **Candidate Config Support** 107
  - NETCONF Operations on Candidate 108
  - Candidate Support Configuration 110
- **How to Configure the NETCONF Protocol** 110
  - Providing Privilege Access to Use NETCONF 110
  - Configuring NETCONF-YANG 112
  - Configuring NETCONF Options 113
  - Configuring SNMP 113
Enabling OpenFlow Mode on a Device  190
Configuring OpenFlow  191
Configuring Interfaces in OpenFlow Mode  193
Configuration Examples for OpenFlow  194
Example: Enabling OpenFlow on a Device  194
Example: Configuring OpenFlow  194
Example: Configuring Interfaces in OpenFlow Mode  195
Verifying OpenFlow  195
Additional References for OpenFlow  198
Feature Information for OpenFlow  198
New and Changed Information

This chapter provides release-specific information about all features.

- New and Changed Feature Information, on page 1

New and Changed Feature Information

This table summarizes the new and changed features, the supported platforms, and links to features.

PART I

Provisioning

• Zero-Touch Provisioning, on page 17
• iPXE, on page 39
Zero-Touch Provisioning

To address network provisioning challenges, Cisco introduces a zero-touch provisioning model. This module describes the Zero-Touch Provisioning feature.

Note

The Zero-Touch Provisioning feature is enabled automatically; no configuration is required.

• Information About Zero-Touch Provisioning, on page 17
• Sample Zero-Touch Provisioning Configurations, on page 19
• Feature Information for Zero-Touch Provisioning, on page 37

Information About Zero-Touch Provisioning

Zero-Touch Provisioning Overview

Zero-Touch Provisioning provides open bootstrap interfaces to automate network device provisioning in heterogeneous network environments.

When a device that supports Zero-Touch Provisioning boots up, and does not find the startup configuration (during initial installation), the device enters the Zero-Touch Provisioning mode. The device searches for a Dynamic Host Control Protocol (DHCP) server, bootstraps itself with its interface IP address, gateway, and Domain Name System ( DNS) server IP address, and enables Guest Shell. The device then obtains the IP address or URL of an HTTP/TFTP server, and downloads the Python script from an HTTP/TFTP server to configure the device.

Guest Shell provides the environment for the Python script to run. Guest Shell executes the downloaded Python script and applies an initial configuration to the device.

After initial provisioning is complete, Guest Shell remains enabled. For more information, see the Guest Shell chapter.

Note

In case Zero-Touch Provisioning fails, the device falls back to AutoInstall to load configuration files. For more information, see Using AutoInstall and Setup.
DHCP Server Configuration for Zero-Touch Provisioning

In Zero-Touch Provisioning, a DHCP server must be running on the same network as the new device that is being provisioned. Zero-Touch Provisioning is supported on both management ports and in-band ports. When the new device is switched on, it retrieves the IP address information of the HTTP/TFTP server where the Python script resides, and the folder path of the Python script from the DHCP server. For more information on Python Scripts, see the Python API and Python CLI Module chapters.

The DHCP server responds to DHCP discovery events with the following options:

- Option 150—(Optional) Contains a list of IP addresses that points to the HTTP/TFTP server on the management network that hosts the Python scripts to be run.
- Option 67—Contains the Python script file path on the HTTP/TFTP server.

After receiving these DHCP options, the device connects to the HTTP/TFTP server, and downloads the Python script. The device, at this point does not have any route to reach the HTTP/TFTP server, so it uses the default route provided by the DHCP server.

DHCPv6 Support

In Cisco IOS XE Fuji 16.9.1, Dynamic Host Control Protocol Version 6 (DHCPv6) support is added to the Zero-touch provisioning feature. DHCPv6 is enabled by default, and will work on any device that boots without a startup configuration.

Note

DHCPv6 is supported by both TFTP and HTTP download of Python scripts. If the HTTP or TFTP download of Python scripts fail, the device will revert to the start (without any configuration). For both DHCPv4, and DHCPv6 to work, the correct HTTP file path must be available in the DHCP configuration.

There can be scenarios where the same interface can have both IPv4 and IPv6 addresses, or two different interfaces in the network - one can receive IPv4 traffic and the other IPv6 traffic. We recommend that you use either the DHCPv4 or DHCPv6 option in your deployment.

The following is a sample DHCPv4: /etc/dhcp/dhcpd.conf:

```plaintext
host <hostname> {  
    option dhcp-client-identifier "xxxxxxxxxxxxxxx";  
    option host-name "<hostname>".  
    option log-servers x.x.x.x;  
    fixed-address x.x.x.x;  
    if option vendor-class-identifier = "..." {  
        option vendor-class-identifier "...";  
        if exists user-class and option user-class = "iPXE" {  
            filename "http://x.x.x.x/.../<image>";  
        } else {  
            filename "http://x.x.x.x/.../<script-name>";  
        }  
    }  
}
```

The following is a sample ISC DHCPv6 server configuration:
Sample Zero-Touch Provisioning Configurations

Sample DHCP Server Configuration on a Management Port Using TFTP Copy

The following is a sample DHCP server configuration using TFTP copy, when connected via the management port on a device:

```
Device> enable
Device# configure terminal
Device(config)# ip dhcp excluded-address 10.1.1.1
Device(config)# ip dhcp excluded-address vrf Mgmt-vrf 10.1.1.1 10.1.1.10
Device(config)# ip dhcp pool pnp_device_pool
Device(config-dhcp)# vrf Mgmt-vrf
Device(config-dhcp)# network 10.1.1.0 255.255.255.0
Device(config-dhcp)# default-router 10.1.1.1
Device(config-dhcp)# option 150 ip 203.0.113.254
Device(config-dhcp)# option 67 ascii /sample_python_dir/python_script.py
Device(config-dhcp)# exit
Device(config)# interface gigabitethernet 1/0/2
Device(config-if)# no ip dhcp client request tftp-server-address
Device(config-if)# end
```

Sample DHCP Server Configuration on a Management Port Using HTTP Copy

The following is a sample DHCP server configuration using HTTP copy, when connected via the management port on a device:

```
Device> enable
Device# configure terminal
Device(config)# ip dhcp pool pnp_device_pool
Device(config-dhcp)# vrf Mgmt-vrf
Device(config-dhcp)# network 10.1.1.0 255.255.255.0
Device(config-dhcp)# default-router 10.1.1.1
Device(config-dhcp)# option 67 ascii http://198.51.100.1:8000/sample_python_2.py
Device(config-dhcp)# end
```

Sample DHCP Server Configuration on an In-Band Port Using TFTP Copy

The following is a sample DHCP server configuration using TFTP copy, when connected via the in-band port on a device:

```
Device> enable
Device# configure terminal
Device(config)# ip dhcp excluded-address 10.1.1.1
Device(config)# ip dhcp pool pnp_device_pool
Device(config-dhcp)# network 10.1.1.0 255.255.255.0
```

option dhcp6.bootfile-url "http://[2001:DB8::21]/sample_day0_script.py";
Sample DHCP Server Configuration on an In-Band Port Using HTTP Copy

The following is a sample DHCP server configuration using HTTP copy, when connected via the in-band port on a device:

Device> enable
Device# configure terminal
Device(config)# ip dhcp excluded-address 10.1.1.1
Device(config)# ip dhcp pool pnp_device_pool
Device(config-dhcp)# network 10.1.1.0 255.255.255.0
Device(config-dhcp)# default-router 10.1.1.1
Device(config-dhcp)# option 67 ascii http://192.0.2.1:8000/sample_python_2.py
Device(config-dhcp)# end

Sample DHCP Server Configuration on a Linux Ubuntu Device

The following sample DHCP server configuration displays that the server is either connected to the management port or in-band port on a device, and a Python script is copied from a TFTP server.

root@ubuntu-server:/etc/dhcp# more dhcpd.conf
subnet 10.1.1.0 netmask 255.255.255.0 {
    range 10.1.1.2 10.1.1.255;
    host 3850 {
        fixed-address 10.1.1.246 ;
        hardware ethernet CC:D8:C1:85:6F:00;
        option bootfile-name " /python_dir/python_script.py";
        option tftp-server-name "203.0.113.254";
    }
}

The following sample DHCP configuration shows that a Python script is copied from an HTTP server to the device:

Day0_with_mgmt_port_http
------------------------
subnet 192.168.1.0 netmask 255.255.255.0 {
    range 192.168.1.2 192.168.1.255;
    host C2-3850 {
        fixed-address 192.168.1.246 ;
        hardware ethernet CC:D8:C1:85:6F:00;
        option bootfile-name "http://192.168.1.46/sample_python_2.py";
    }
}
Once the DHCP server is running, boot a management-network connected device, and the rest of the configuration is automatic.

**Sample DHCPv6 Server Configuration on a Management Port Using TFTP Copy**

The following is a sample DHCPv6 server configuration using TFTP copy, when connected via the management port on a device:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 dhcp pool ztp
Device(config-dhcpv6)# address prefix 2001:DB8::1/64
Device(config-dhcpv6)# domain-name cisco.com
Device(config-dhcpv6)# bootfile-url tftp://[2001:db8::46]/sample_day0_script.py
Device(config-dhcpv6)# exit
Device(config)# interface vlan 20
Device(config-if)# ipv6 dhcp server ztp
Device(config-if)# end
```

**Sample Python Provisioning Script**

The following is a sample Python script can be used from either an HTTP or a TFTP server:

```python
print "\n\n *** Sample ZTP Day0 Python Script *** \n"
#
import cli

print "\n\n *** Executing show platform *** \n"
cli_command = "show platform"
cli.executep(cli_command)

print "\n\n *** Executing show version *** \n"
cli_command = "show version"
cli.executep(cli_command)

print "\n\n *** Configuring a Loopback Interface *** \n"
cli.configurep(['interface loop 100', "ip address 10.10.10.10 255.255.255.255", "end")

print "\n\n *** Executing show ip interface brief *** \n"
cli_command = "sh ip int brief"
cli.executep(cli_command)

print "\n\n *** ZTP Day0 Python Script Execution Complete *** \n"
```
The following sample Zero-Touch Provisioning boot log displays that Guest Shell is successfully enabled, the Python script is downloaded to the Guest Shell, and the Guest Shell executes the downloaded Python script and configures the device for Day Zero.

% failed to initialize nvram
! <This message indicates that the startup configuration is absent on the device. This is the first indication that the Day Zero work flow is going to start.>

# Feature Information for Zero-Touch Provisioning

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

- Cisco Catalyst 9500 Series Switches |
iPXEnetbootprovides:

- IPv4 and IPv6 protocols
- FTP/HTTP/TFTP boot image download
- Embedded scripts into the image
- Stateless and stateful address auto-configuration (SLAAC) using Dynamic Host Configuration Protocol Version 4 (DHCPv4) and/or DHCPv6, boot URI, and parameters for DHCPv6 options depending on the IPv6 router advertisement.

**Netboot Requirements**

The following are the primary requirements for netbooting:

- DHCP server with proper configuration.
- Boot image available on the FTP/HTTP/TFTP server.
- Device configured to boot from a network-based source.
iPXE Overview

Network bootloaders support booting from a network-based source. The bootloaders boot an image located on an HTTP, FTP, or TFTP server. A network boot source is detected automatically by using an iPXE-like solution.

iPXE enables network boot for a device that is offline. The following are the three types of boot modes:

- **iPXE Timeout**—Boots through iPXE network boot. Configures a timeout in seconds for iPXE network boot by using the IPXE_TIMEOUT rommon variable. Use the `boot ipxe timeout` command to configure iPXE timeout. When the timeout expires, device boot is activated.

- **iPXE Forever**—Boots through iPXE network boot. The device sends DHCP requests forever, when the `boot ipxe forever` command is configured. This is an iPXE-only boot (which means that the bootloader will not fall back to a device boot or a command prompt, because it will send DHCP requests forever until it receives a valid DHCP response.)

- **Device**—Boots using the local device BOOT line configured on it. When device boot is configured, the configured IPXE_TIMEOUT rommon variable is ignored. You can activate device boot as specified below:
  - If `BOOTMODE=ipxe-forever`, device boot is not activated without user intervention (this is possible only if ENABLE_BREAK=yes).
  - If `BOOTMODE=ipxe-timeout`, device boot is activated when the specified IPXE_TIMEOUT variable (in seconds) has elapsed.
  - If `BOOTMODE=device`, device boot is activated. This is the default active mode.
  - Device boot can also be activated through the CLI.

**Note**
Device boot is the default boot mode.

**Note**
Manual boot is another term used in this document. Manual boot is a flag that determines whether to do a rommon reload or not. When the device is in rommon mode, you have to manually issue the `boot` command.

If manual boot is set to YES, the rommon or device prompt is activated. If manual boot is set to NO, the autoboot variable is executed; this means that the value set in the BOOT variable is followed.

The following section describes how an iPXE bootloader works:
1. Bootloader sends a DHCP discover message, and when the server replies, the bootloader sends a DHCP request.

2. The DHCP response includes the IP address and boot file name. The boot file name indicates that the boot image is to be retrieved from a TFTP server (tftp://server/filename), FTP server (ftp://userid:password@server/filename), or an HTTP server (http://server/filename).

3. Bootloader downloads and boots the image from the network source.

4. If no DHCP response is received, the bootloader keeps sending DHCP requests forever or for a specified period of time, based on the boot mode configured. When a timeout occurs, the bootloader reverts to a device-based boot. The device sends DHCP requests forever only if the configured boot mode is `ipxe-forever`. If the `ipxe-timeout` boot mode command is configured, DHCP requests are sent for the specified amount of time, and when the timeout expires, device boot mode is activated.

---

**Note**

Because the current iPXE implementation works only via the management port (GigabitEthernet0/0), DHCP requests sent through the front panel ports are not supported.

When using a static network configuration to network boot, ROMMON uses the following environment variables (and all of them are required):

- **BOOT**—URLs separated by semicolon (;) to boot from.
- **IP_ADDRESS**—Statically assigned IP address of a device.
- **DEFAULT_GATEWAY**—Default gateway of the device.
- **IP_SUBNET_MASK**—IPv4 or IPv6 prefix information.
  - IPv4—Subnet mask of the device in the format WWW.XXX.YYY.ZZZ eg. 255.255.255.0.
IPv6—Subnet prefix length of the device in the format NNN eg. 64 or 112.

When manual boot is disabled, the bootloader determines whether to execute a device boot or a network boot based on the configured value of the rommon ipXE variable. Irrespective of whether manual boot is enabled or disabled, the bootloader uses the BOOTMODE variable to determine whether to do a device boot or a network boot. Manual boot means that the user has configured the `boot manual switch` command. When manual boot is disabled, and when the device reloads, the boot process starts automatically.

When iPXE is disabled, the contents of the existing BOOT variable are used to determine how to boot the device. The BOOT variable may contain a network-based uniform resource identifier (URI) (for example, http://, ftp://, tftp://), and a network boot is initiated; however DHCP is not used to get the network image path. The static network configuration is taken from the IP_ADDRESS, DEFAULT_GATEWAY, and IP_SUBNET_MASK variables. The BOOT variable may also contain a device filesystem-based path, in which case, a device filesystem-based boot is initiated.

The DHCP server used for booting can identify a device through the Product ID (PID) (available in DHCP Option 60), chassis serial number (available in DHCP option 61), or the MAC address of the device. The `show inventory` and `show switch` commands also display these values on the device.

The following is sample output from the `show inventory` command:

```
Device# show inventory
NAME:“c38xx Stack”, DESC:“c38xx Stack”
PID:WS-3850-12X-48U-L, VID:V01, SN: F0C1911V01A

NAME:“Switch 1”, DESC:“WS-C3850-12X48U-L”
PID:WS-C3850-12X48U-L, VID:V01, SN:F0C1911V01A

NAME:“Switch1 -Power Supply B”, DESC:“Switch1 -Power Supply B”
PID:PWR-C1-1100WAC, VID:V01, SN:LIT1847146Q
```

The following is sample output from the `show switch` command:

```
Device# show switch
Switch/Stack Mac Address : 046c.9d01.7d80 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch# Role Mac Address Priority Version State
-------------------------------------------------------------------------------------
 1 Member 046c.9d1e.1a00 1 Ready
 2 Standby 046c.9d01.7d80 1 Ready
*3 Active f8b7.e24e.9a00 1 P2B Ready
```

The following rommon variables should be configured for iPXE:

- `BOOTMODE = ipxe-forever | ipxe-timeout | device`
- `IPXE_TIMEOUT = seconds`

**IPv6 iPXE Network Boot**

This illustration displays how IPv6 iPXE network boot works on a Cisco device:
The four elements in the above illustration are described below:

• IPv6 Booting Device—The device that is booting through iPXE boot.

• Supporting Device—A Cisco device that is configured with an IPv6 address to generate Router Advertisement (RA) messages.

Note

In this illustration, the IPv6 booting device, the supporting device, and the DHCP server are on the same subnet. However, if the supporting device and the DHCP server are on different subnets, then there must be a relay agent in the network.

• DHCP server—Any DHCP server.

• Web server—Any web server.

This section describes the IPv6 iPXE boot process:

1. The device sends a router solicitation Internet Control Message Protocol IPv6 (ICMPv6) type 133 packet to the IPv6 device on the local subnet.

2. The IPv6 device on the local subnet replies with a router advertisement (RA) message, ICMPv6 type 134 packet. The device that sent the router solicitation message, gets the default router and prefix information for Stateless Address AutoConfiguration (SLAAC) address completion from the RA packet.
3. The device sends a DHCPv6 solicit message to the multicast group address of ff02::1:2 for all DHCP agents.

The following sample displays the fields in a DHCPv6 solicit packet during iPXE boot:

```
DHCPv6
Message type: Solicit (1)
Transaction ID: 0x36f5f1
Client Identifier
Vendor Class
Identity Association for Non-Temporary Address
Option Request
User Class
Vendor-specific Information
```

The DHCPv6 solicit message contains the following information:

- DHCP Unique Identifier (DUID)—Identifies the client. iPXE supports DUID-EN. EN stands for Enterprise Number, and this DUID is based on the vendor-assigned unique identifier.

- DHCP and DHCPv6 Options

4. If the DHCPv6 server is configured, it responds with a DHCPv6 advertise packet that contains the 128 Bit IPv6 address, the boot file Uniform Resource Identifier (URI), the Domain Name System (DNS) server and domain search list, and the client and server IDs. The client ID contains the DUID of the client (In this illustration, the IPv6 Booting Device), and the Server ID contains the DUID of the DHCPv6 server.

5. The client then sends a DHCPv6 request packet to the multicast group address ff02::1:2, requesting for advertised parameters.

6. The server responds with a unicast DHCPv6 reply to the Link Local (FE80::) IPv6 address of the client. The following sample displays the fields in a DHCPv6 reply packet:

```
DHCPv6
Message type: Reply (7)
Transaction ID: 0x790950
Identity Association for Non-Temporary Address
Client Identifier
Server Identifier
DNS recursive name server
Boot File URL
Domain Search List
```

7. The device then sends an HTTP GET request to the web server.

8. If the requested image is available at the specified path, the web server responds with an OK for the HTTP GET request.

9. The TCP image transfer copies the image, and the device boots up.

**IPv6 Address Assignment in Rommon Mode**

The DHCP client uses the following order-of-precedence to decide which IPv6 address to use in rommon mode:

1. DHCP Server-assigned address
2. Stateless Address Auto-Configuration (SLAAC) address
3. Link-local address
4. Site-local address

The device uses the DHCP server-assigned address to boot an image. If the DHCPv6 server fails to assign an address, the device tries to use the SLAAC address. If both the DHCP server-assigned address and the SLAAC address are not available, the device uses the link-local address. However, the remote FTP/HTTP/TFTP servers must be on the same local subnet as that of the device for the image copy to succeed.

If the first three addresses are not available, the device uses the automatically generated site-local address.

**Supported ROMMEN Variables**

The following ROMMON variables are supported in Cisco IOS XE Fuji 16.8.1:

- **BAUD**: Changes the device console BAUD rate to one of the Cisco standard baud rate; such as 1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200). Any invalid value will be rejected. If the BAUD variable is not set, the default will be 9600. The corresponding CLI command is

- **ENABLE_BREAK**: Enables a rommon break. The default value is NO.

- **MANUAL_BOOT**: If manual boot is set to 1, the rommon or device prompt is activated. If manual boot is set to 0, the device is reloaded; but rommon mode is not activated.

- **SWITCH_IGNORE_STARTUP_CFG**: If the value is 1, it causes the device to ignore the startup configuration. If the value is not set, the value is treated as zero. This is a read-only variable, and can only be modified by IOS.

**iPXE-Supported DHCP Options**

iPXE boot supports the following DHCPv4 and DHCPv6 options in rommon mode.

<table>
<thead>
<tr>
<th>Note</th>
<th>Catalyst 9000 Series Switches support DHCP Option 60, Option 77, DHCPv6 Options 1, Option 15, and Option 16. DHCP Option 61 is only supported on Catalyst 9300 and 9500 Series Switches.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• DHCP Option 60—Vendor Class Identifier. This option is populated with the value of the ROMMON environment variable MODEL_NUM.</td>
</tr>
<tr>
<td></td>
<td>• DHCP Option 61—Client Identifier. This option is populated with the value of the ROMMON environment variable SYSTEM_SERIAL_NUM.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Note</th>
<th>This option is not supported on Catalyst 9400 Series Switches.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• DHCP Option 77—User Class Option. This option is added to a DHCP Discover packet, and contains the value equal to the string iPXE. This option helps to isolate iPXE DHCP clients looking for an image to boot from a DHCP server.</td>
</tr>
</tbody>
</table>
The following is sample DHCPv4 configuration from the ISC DHCP Server that displays the use of Option 77. The if condition in this sample implies that if Option 77 exists, and is equal to the string iPXE, then advertise the Boot File URI for the image.

```plaintext
host Switch2 {
    fixed-address 192.168.1.20;
    hardware ethernet CC:D8:C1:85:6F:11;
    #user-class = length of string + ASCII code for iPXE
    if exists user-class and option user-class = 04:68:50:58:45 {
        filename "http://192.168.1.146/test-image.bin"
    }
}
```

- **DHCPv6 Option 1**—Client Identifier Option. This option is populated with the value of the ROMMON environment variable SYSTEM_SERIAL_NUM as specified in RFC 3315. The recommended format for the ROMMON environment variable is MAC_ADDR.

- **DHCPv6 Option 15**—User Class Option. This option is the IPv6 User Class option in a DHCPv6 solicit message, and is populated with the string, iPXE. The following sample shows Option 15 defined in the ISC DHCP server:

```plaintext
option dhcp6.user-class code 15 = string;
```

The following is a sample DHCP Server configuration that uses the DHCPv6 Option 15:

```plaintext
# Client-specific parameters
host switch1 {
    #assigning a fixed IPv6 address
    fixed-address6 2001:DB8::CAFE;
    #Client DUID in hexadecimal format contains: DUID-type"2" + "EN=9" + "Chassis serial number"
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:46:4F:43:31:38:33:31:58:31:41:53;
    #User class 00:04:69:50:58:45 is len 4 + "iPXE"
    if option dhcp6.user-class = 00:04:69:50:58:45 {
        option dhcp6.bootfile-url "http://[2001:DB8::461/platform-pxe/edi46/test-image.bin"
    }
}
```

- **DHCPv6 Option 16**—Vendor Class Option. Contains the device product ID (PID). The PID can be determined from the output of the `show inventory` command or from the MODEL_NUM rommon variable. Option 16 is not a default option in the ISC DHCP Server and can be defined as follows:

```plaintext
option dhcp6.vendor-class-data code 16 = string;
```

The following sample configuration illustrates the use of DHCPv6 Option 16:

```plaintext
# Source: dhcpd6ConfigPD
host host1-ipxe6-auto-host1 {
    fixed-address6 2001:DB8::1234;
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:46:4F:43:31:38:33:31:58:31:41:53;
    if option dhcp6.vendor-class-data = 00:00:00:09:00:0E:57:53:2D:43:33:38:35:30:2D:32:34:50:2D:4D {
        option dhcp6.bootfile-url "http://[2001:DB8::461/platform-pxe/edi46/test-image.bin"
    }
}
```
The table below describes the significant fields shown in the display.

Table 3: Sample Output Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp6.client-id</td>
<td>DHCP Unique Identifier (DUID) to identify the client.</td>
</tr>
<tr>
<td>dhcp6.user-class</td>
<td>DHCPv6 Option 15, the User Class option</td>
</tr>
<tr>
<td>dhcp6.vendor-class-data</td>
<td>DHCPv6 Option 16, the Vendor Class option that contains the switch Product ID (PID).</td>
</tr>
<tr>
<td>dhcp6.bootfile-url</td>
<td>DHCPv6 Option 6 to request for the Boot File URI</td>
</tr>
</tbody>
</table>

DHCPv6 Unique Identifiers

There are three types of DHCPv6 Identifiers (DUIDs) defined by RFC 3315; these are:

- DUID-LLT—DUID Link Layer address plus time, this is the link layer address of the network interface connected to the DHCP device plus the time stamp at which it is generated.
- DUID-EN—EN stands for Enterprise Number, this DUID is based on vendor-assigned unique ID.
- DUID-LL—DUID formed using the Link Layer address of any network interface that is permanently connected to the DHCP (client/server) device.

Cisco devices that support this feature use the DUID-EN (DUID Type 2) to identify the DHCP client (that is the device in the DHCPv6 Solicit packet). Catalyst 9000 Series Switches support not only DUID-EN, but also DUID-LL (DUID Type 3). DUID-EN is the preferred type; however, if switches are unable to create it, then DUID-LL is constructed and used.

How to Configure iPXE

Configuring iPXE

SUMMARY STEPS

1. enable
2. configure terminal
3. boot ipxe forever [switch number]
   boot ipxe timeout seconds [switch number]
4. boot system {switch switch-number | all} {flash: | ftp: | http: | usbflash0 | tftp: }
5. end
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> • boot ipxe forever [switch number]</td>
<td>Configures the BOOTMODE rommon variable.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# boot ipxe forever switch 2</td>
<td>• The <strong>forever</strong> keyword configures the BOOTMODE rommon variable as IPXE-FOREVER.</td>
</tr>
<tr>
<td>• boot ipxe timeout seconds [switch number]</td>
<td>• The <strong>timeout</strong> keyword configures the BOOTMODE rommon variable as IPXE-TIMEOUT.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# boot ipxe timeout 30 switch 2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> boot system {switch switch-number</td>
<td>all} {flash:</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# boot system switch 1 <a href="http://192.0.2.42/image-filename">http://192.0.2.42/image-filename</a></td>
<td>• You can either use an IPv4 or an IPv6 address for the remote FTP/HTTP/TFTP servers.</td>
</tr>
<tr>
<td>or</td>
<td>• You must enter the IPv6 address inside the square brackets (as per RFC 2732); if not the device will not boot.</td>
</tr>
<tr>
<td>Device(config)# boot system switch 1 http://[2001:db8::1]/image-filename</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring Device Boot

You can either use the **no boot ipxe** or the **default boot ipxe** command to configure device boot.

### SUMMARY STEPS

1. enable
2. configure terminal
3. • no boot ipxe
   • default boot ipxe
4. end
### DETAILED STEPS

<table>

### Configuration Examples for iPXE

**Example: iPXE Configuration**

The following example shows that iPXE is configured to send DHCP requests forever until the device boots with an image:

```
Device# configure terminal
Device(config)# boot ipxe forever switch 2
Device(config)# end
```

The following example shows how to configure the boot mode to ipxe-timeout. The configured timeout is 200 seconds. If an iPXE boot failure occurs after the configured timeout expires, the configured device boot is activated. In this example, the configured device boot is http://[2001:db8::1]/image-filename.

```
Device# configure terminal
Device(config)# boot ipxe timeout 200 switch 2
Device(config)# boot system http://[2001:db8::1]/image-filename
Device(config)# end
```
Sample iPXE Boot Logs

The following are sample boot logs from a device in rommon mode. Here, manual boot using the `ipxe-timeout` command is configured:

```
switch: boot

pxemod:(ipxe-timeout) 60s timeout

00267.887 ipxe_get_booturl: Get URL from DHCP; timeout 60s
00267.953 ipxe_get_booturl: trying DHCPv6 (#1) for 10s

Sample DHCPv6 Server Configuration for iPXE

The following is a sample DHCPv6 server configuration taken from an Internet Systems Consortium (ISC) DHCP Server for reference. The lines preceded by the character #, are comments that explain the configuration that follows.

```
default-lease-time 600;
max-lease-time 7200;
log-facility local7;

#Global configuration
#domain search list
option dhcp6.domain-search "cisco.com";
#User-defined options:new-name code new-code = definition;
option dhcp6.user-class code 15 = string;
option dhcp6.vendor-class-data code 16 = string;

subnet6 2001:db8::/64 {
   #subnet range for clients requiring an address
   range6 2001:db8:0000:0000::/64;
```
#DNS server options
option dhcp6.name-servers 2001:db8::46;
}

#Client-specific parameters
host switch1 {
    #assigning a fixed IPv6 address
    fixed-address6 2001:DB8::CAFE;
    #Client DUID in hexadecimal that contains: DUID-type "2" + "EN-9" + "Chassis serial number"
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:46:4F:43:31:38:33:31:58:31:41:53;
    option dhcp6.bootfile-url "http://[2001:DB8::461/platform-pxe/edi46/test-image.bin";
}

For more information on DHCP server commands, see the ISC DHCP Server website.

In this sample configuration, the dhcp6.client-id option identifies the switch, and it is followed by
the Enterprise Client DUID. The client DUID can be broken down for understanding as 00:02 +
00:00:00:09 + chassis serial number in hexadecimal format, where 2 refers to the Enterprise Client
DUID Type, 9 refers to the reserved code for Cisco's Enterprise DUID, followed by the ASCII code
for the Chassis serial number in hexadecimal format. The chassis serial number for the switch in this
sample is FOC1831X1AS.

The Boot File URI is advertised to the switch only using the specified DUID.

The DHCPv6 Vendor Class Option 16 can also be used to identify the switch on the DHCP Server.
To define Option 16 as a user-defined option, configure the following:

option dhcp6.vendor-class-data code 16 = string;

The following is a sample DHCP server configuration that identifies the switch based on the DHCPv6
Vendor Class Option 16 that is formed by using the switch Product ID:

# Source: dhcp6ConfigPID
host edi-46-pxe6-auto-edi46 {  
    fixed-address6 2001:DB8::1234;
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:46:4F:43:31:38:33:31:58:31:41:53;
    if option dhcp6.vendor-class-data = 00:00:00:09:00:0E:57:53:2D:43:38:35:30:2D:32:45:02:4C {  
        option dhcp6.bootfile-url "http://[2001:DB8::461/platform-pxe/edi46/17jan-dev.bin";
    }
}

In this sample configuration, the dhcp6.vendor-class-data option refers to the DHCPv6 Option 16.
In the dhcp6.vendor-class-data, 00:00:00:09 is Cisco's Enterprise DUID, 0E is the length of the PID,
and the rest is the PID in hexadecimal format. The PID can also be found from the output of the
show inventory command or from the CFG_MODEL_NUM rommon variable. The PID used in
this sample configuration is WS-C3850-24P-L.

DHCPv6 options and DUIDs in the server configuration must be specified in the hexadecimal format,
as per the ISC DHCP server guidelines.
Troubleshooting Tips for iPXE

This section provides troubleshooting tips.

• When iPXE boot is enabled on power up, the device first attempts to send a DHCPv6 Solicit message, followed by a DHCPv4 Discover message. If boot mode is **ipxe-forever** the device keeps iterating between the two forever.

• If the boot-mode is iPXE timeout, the device first sends a DHCPv6 Solicit message, and then a DHCPv4 Discover message, and the device falls back to device boot after the timeout expires.

• To interrupt iPXE boot, send a serial break to the console.

  When using a UNIX telnet client, type CTRL-\] and then send break. When you are using a different TELNET client, or you are directly attached to a serial port, sending a break may be triggered by a different keystroke or command.

• If the DHCP server responds with an image, but the DNS server cannot resolve the hostname, enable DNS debugs.

**Note** We recommend the use of ISC DHCP server. This feature has not been verified on IOS DHCP.

• To test the HTTP server connectivity, use HTTP copy to copy a small sample file from your HTTP server to your device. For example, at the rommon prompt, enter `copy http://192.168.1.1/test null:` (the flash is normally locked and you need to use the null device for testing) or `http://[2001:db8::99]/test`.

• When manual boot is enabled, and boot mode is ipxe-timeout, the device will not automatically boot on power up. Issue the `boot` command in rommon mode. To automate the boot process on power up, disable manual boot.

• Use the `net6-show` command to display the current IPv6 parameters, including IPv6 addresses and the default router in rommon mode.

**Note** On Catalyst 9000 Series Switches, use the `net-show` show command.

• Use the `net-dhcp` or the `net6-dhcp` commands based on your configuration. The `net-dhcp` command is a test command for DHCPv4 and the `net6-dhcp` command is for DHCPv6.

**Note** On Catalyst 9000 Series Switches, use the `net-dhcp -6` command for DHCPv6.

• Use the `dig` command to resolve names.

**Note** On Catalyst 9000 Series Switches, use the `dns-lookup` command to resolve names.
• Enable HTTP debug logs to view the HTTP response code from the web server.
• If Stateless Address Auto-Configuration (SLAAC) addresses are not generated, there is no router that is providing IPv6 RA messages. iPXE boot for IPv6 can still work but only with link or site-local addresses.

## Feature Information for iPXE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Guest Shell

Guestshell is a virtualized Linux-based environment, designed to run custom Linux applications, including Python for automated control and management of Cisco devices. It also includes the automated provisioning (Day zero) of systems. This container shell provides a secure environment, decoupled from the host device, in which users can install scripts or software packages and run them.

This module describes Guest Shell and how to enable it.

- Information About the Guest Shell, on page 57
- How to Enable the Guest Shell, on page 65
- Configuration Examples for the Guest Shell, on page 71

Information About the Guest Shell

Guest Shell Overview

The Guest Shell is a virtualized Linux-based environment, designed to run custom Linux applications, including Python for automated control and management of Cisco devices. Using the Guest Shell, you can also install, update, and operate third-party Linux applications. The guest shell is bundled with the system image and can be installed using the `guestshell enable` Cisco IOS command.

The Guest Shell environment is intended for tools, Linux utilities, and manageability rather than networking.

Guest Shell shares the kernel with the host (Cisco switches and routers) system. Users can access the Linux shell of Guest Shell and update scripts and software packages in the container rootfs. However, users within the Guest Shell cannot modify the host file system and processes.

Guest Shell container is managed using IOx. IOx is Cisco's Application Hosting Infrastructure for Cisco IOS XE devices. IOx enables hosting of applications and services developed by Cisco, partners, and third-party developers in network edge devices, seamlessly across diverse and disparate hardware platforms.

This table provides information about the various Guest Shell capabilities and the supported platforms.

**Guest Shell Vs Guest Shell Lite**

The Guest Shell container allows users to run their scripts and apps on the system. The Guest Shell container on Intel x86 platforms will be a Linux container (LXC) with a CentOS 7.0 minimal rootfs. You can install other Python libraries such as, Python Version 3.0 during runtime using the Yum utility in CentOS 7.0. You can also install or update python packages using PIP.

The Guest Shell Lite container on MIPS platforms such as, Catalyst 3650 and Catalyst 3850 Series Switches have the Montavista Carrier Grade Edition (CGE) 7.0 rootfs. You can only install or run scripts in Guest Shell Lite. Yum install is not supported on these devices.

**Guest Shell Security**

Cisco provides security to ensure that users or apps in the Guest Shell do not compromise the host system. Guest Shell is isolated from the host kernel, and it runs as an unprivileged container.

**Hardware Requirements for the Guest Shell**

This section provides information about the hardware requirements for supported platforms. The Cisco CSR 1000v and Cisco ISRv (virtual platforms) implement these requirements in the software.
Table 6: Guest Shell Support on Catalyst Switches

<table>
<thead>
<tr>
<th>Platforms</th>
<th>Default DRAM</th>
<th>Guest Shell Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>WS-3650-xxx (all)</td>

<td>Supported</td>
</tr>
<tr>
<td>ISR 4451</td>
<td>8 GB</td>
<td>Supported</td>
</tr>
<tr>
<td></td>
<td>16 GB</td>
<td>Supported</td>
</tr>
</tbody>
</table>

The minimum system requirement for ISR 4000 Series Integrated Services Routers is 8 GB DRAM.

Note: Virtual-service installed applications and Guest Shell container cannot co-exist.

The minimum system requirement for CSR 1000v and ISRv is 4GB RAM.

Guest Shell Storage Requirements

On Catalyst 3650 and Catalyst 3850 Series Switches, Guest Shell can only be installed on the flash filesystem. Bootflash of Catalyst 3850 Series Switches require 75 MB free disk space for Guest Shell to install successfully.

On Cisco 4000 Series Integrated Services Routers, the Guest Shell is installed on the Network Interface Module (NIM)-Service Set Identifier (SSD) (hard disk), if available. If the hard disk drive is available, there
Accessing Guest Shell on a Device

Network administrators can use IOS commands to manage files and utilities in the Guest Shell.

During the Guest Shell installation, SSH access is setup with a key-based authentication. The access to the Guest Shell is restricted to the user with the highest privilege (15) in IOS. This user is granted access into the Linux container as the guestshell Linux user, who is a sudoer, and can perform all root operations. Commands executed through the Guest Shell are executed with the same privilege that a user has when logged into the IOS terminal.

At the Guest Shell prompt, you can execute standard Linux commands.

Accessing Guest Shell Through the Management Port

By default, Guest Shell allows applications to access the management network. Users cannot change the management VRF networking configurations from inside the Guest Shell.
For platforms without a management port, a VirtualPortGroup can be associated with Guest Shell in the IOS configuration. For more information, see the Sample VirtualPortGroup Configuration section.

**Stacking with Guest Shell**

When Guest Shell is installed, a directory is automatically created in the flash filesystem. This directory is synchronized across stack members. During a switchover, only contents of the this directory are synchronized across all stack members. To preserve data during high availability switchover, place data in this directory.

During a high availability switchover, the new active device creates its own Guest Shell installation and restores Guest Shell to the synchronized state; the old filesystem is not maintained. Guestshell state is internally synchronized across all stack members.

**IOx Overview**

IOx is a Cisco-developed end-to-end application framework that provides application hosting capabilities for different application types on Cisco network platforms. The Cisco Guest Shell, a special container deployment, is one such application, that is useful in system deployment/use.

IOx facilitates the life-cycle management of app and data exchange by providing a set of services that helps developers to package pre-built apps, and host them on a target device. IOx life-cycle management includes distribution, deployment, hosting, starting, stopping (management), and monitoring of apps and data. IOx services also include app distribution and management tools that help users discover and deploy apps to the IOx framework.

App hosting provides the following features:

- Hides network heterogeneity.
- IOx application programming interfaces (APIs), remotely manage the life cycle of applications hosted on a device.
- Centralized app life-cycle management.
- Cloud-based developer experience.

**IOx Tracing and Logging Overview**

IOx tracing and logging feature allows guest application to run separately on the host device that can help reporting the logging and tracing of the data to the host. The tracing data is saved into IOx tracelog, and the logging data is saved into IOS syslog on the host device.

You can redirect the tracing data to the appropriate storage device on the host device which can help in debugging of guest application.

**IOXMAN Structure**

Each guest application, a system LXC or a KVM instance is configured with its own syslogd and logfiles stored within a visible file system and are not accessible to the host device. To support logging data to IOS syslog and tracing data to IOx tracelog on the host, two serial devices, /dev/ttyS2 and /dev/ttyS3, are designated on the guest application for delivering data to the host as shown in the following figure.
IOXMAN is a process to establish the tracing infrastructure to provide logging or tracing services for guest application, except Libvirt that emulates serial devices. IOXMAN is based on the lifecycle of the guest application to enable and disable tracing service, to send logging data to IOS syslog, to save tracing data to IOx tracelog, and to maintain IOx tracelog for each guest application.

Logging and Tracing System Flow

The following sections describes how the IOx logging and tracing works:

**LXC Logging**

1. Guest OS enables /dev/ttyS2 on Guest application.
2. Guest application writes data to /dev/ttyS2.
3. Libvirt emulates /dev/ttyS2 to /dev/pts/x on the host.
4. IOXMAN gets the emulated serial device, /dev/pts/x from the XML file.
5. IOXMAN listens and reads available data from /dev/pts/x, sets the severity for the message, filters, parses and queues the message.

6. Start timer to send the message to /dev/log device on the host using errmsg.

7. Data is saved to IOS syslog.

**KVM Logging**

1. Guest OS enables /dev/ttyS2 on Guest application.
2. Guest application writes data to /dev/ttyS2.
3. Libvert emulates /dev/ttyS2 to /dev/pts/x on the host.
4. IOXMAN gets the emulated TCP path from the XML file.
5. IOXMAN opens an unix socket, and connects to the remote socket.
6. IOXMAN reads available data from the socket, sets the severity for the message, filters, parses, and queues the message.
7. Start timer to send the message to /dev/log device on the host using errmsg.
8. Data is saved to IOS syslog.

**LXC Tracing**

1. Guest OS enables /dev/ttyS3 on Guest application.
2. Configures syslogd to copy message to /dev/ttyS3.
3. Guest application writes data to /dev/ttyS3.
4. Libvert emulates /dev/ttyS3 to /dev/pts/y on the host.
5. IOXMAN gets the emulated serial device, /dev/pts/y from the XML file.
6. IOXMAN listens and reads available data from /dev/pts/y, filters, parses, and saves the message to IOx tracelog.
7. If IOx tracelog is full, IOXMAN rotates the tracelog file to /bootflash/tracelogs.

**KVM Tracing**

1. Guest OS enables /dev/ttyS3 on Guest application.
2. Configures syslogd to copy message to /dev/ttyS3.
3. Guest application writes data to /dev/ttyS3.
4. Libvert emulates /dev/ttyS3 to TCP path on the host.
5. IOXMAN gets the emulated TCP path from the XML file.
6. IOXMAN opens an unix socket, and connects to the remote socket.
7. IOXMAN reads available data from the socket, sets the severity for the message, filters, parses, and saves the message to IOx tracelog.

8. If IOx tracelog is full, IOXMAN rotates the tracelog file to /bootflash/tracelogs.

Logging and Tracing of Messages

The following sections explains the logging and tracing of messages in to IOS syslog.

Logging Messages in IOS Syslog

For any logging messages received from the Guest Application, IOXMAN sets the severity of the message to NOTICE by default, before sending it to IOS syslog. When a message is received by IOSd, it is displayed on the console and saved on the IOS syslog in the following message format.

*Apr 7 00:48:21.911: %IM-5-IOX_INST_NOTICE:ioxman: IOX SERVICE guestshell LOG: Guestshell test

In order to comply with IOS syslog, IOXMAN does support severity for logging message. To report logging message with severity, Guest Application needs to append the header to the front of the message.

[a123b234,version,severity]

a123b234 is magic number.
Severity: CRIT is 2
ERR is 3
WARN is 4
NOTICE is 5
INFO is 6
DEBUG is 7

Following is an example of a message:

echo “[a123b234,1,2]Guestshell failed” > /dev/ttyS2

Perform the following steps to report logging data from Guest Application to IOS syslog:

1. If you are using C programming, use write() to send logging data to host.

```c
#include <stdio.h>

int main()
{
    #define SYSLOG_TEST "syslog test"
    int fd;
    fd = open("/dev/ttyS2", O_WRONLY);
    write(fd, SYSLOG_TEST, strlen(SYSLOG_TEST));
    close(fd);
    return 0;
}
```

2. If you are using Shell console, use echo to send logging data to host.

```bash
echo "syslog test" > /dev/ttyS2
```

**Tracing Message to IOx Tracelog**

Perform the following steps to report tracing messages from Guest Application to IOx tracelog:

1. If you are using C programming, use write() to send tracing message to host.
```c
#define SYSLOG_TEST "tracelog test"
int fd;
    fd = open("/dev/ttyS3", O_WRONLY);
    write(fd, SYSLOG_TEST, strlen(SYSLOG_TEST));
    close(fd);
```

2. If you are using C programming, use `syslog()` to send tracing message to host.

```c
#define SYSLOG_TEST "tracelog test"
syslog(LOG_INFO, "%s\n", SYSLOG_TEST);
```

3. If you are using Shell console, use `echo` to send tracing data to host.

```bash
echo "tracelog test" > /dev/ttyS3
or
logger "tracelog test"
```

**Example: Guest Shell Networking Configuration**

For Guest Shell networking, the following configurations are required.

- Configure Domain Name System (DNS)
- Configure proxy settings
- Configure YUM or PIP to use proxy settings

**How to Enable the Guest Shell**

**Managing IOx**

**Before you begin**

IOx takes up to two minutes to start. CAF, IOXman, and Libirtd services must be running to enable Guest Shell successfully.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. iox
4. exit
5. show iox-service
6. show app-hosting list
# DETAILED STEPS

```
Managing the Guest Shell

Note: VirtualPortGroups are supported only on routing platforms.

Before you begin

IOx must be configured and running for Guest Shell access to work. If IOx is not configured, a message to configure IOx is displayed. Removing IOx removes access to the Guest Shell, but the rootfs remains unaffected.

An application or management interface must also be configured to enable and operate Guest Shell. See "Configuring the AppGigabitEthernet Interface for Guest Shell" and "Enabling Guest Shell on the Management Interface" sections for more information on enabling an interface for Guest Shell.

SUMMARY STEPS

1. enable
2. guestshell enable
3. guestshell run linux-executable
4. guestshell run bash
5. guestshell disable
6. guestshell destroy
### Enabling and Running the Guest Shell

The `guestshell enable` command installs Guest Shell. This command is also used to reactivate Guest Shell, if it is disabled.

When Guest Shell is enabled and the system is reloaded, Guest Shell remains enabled.

<table>
<thead>
<tr>
<th>Command or Action</th>

</tr>
</tbody>
</table>
IOx must be configured before the `guestshell enable` command is used.

The `guestshell run bash` command opens the Guest Shell bash prompt. Guest Shell must already be enabled for this command to work.

If the following message is displayed on the console, it means that IOx is not enabled; check the output of the `show iox-service` command to view the status of IOx.

The process for the command is not responding or is otherwise unavailable

For more information on how to enable Guest Shell, see the "Configuring the AppGigabitEthernet Interface for Guest Shell" and "Enabling Guest Shell on the Management Interface" sections.

Disabling and Destroying the Guest Shell

The `guestshell disable` command shuts down and disables Guest Shell. When Guest Shell is disabled and the system is reloaded, Guest Shell remains disabled.

The `guestshell destroy` command removes the rootfs from the flash filesystem. All files, data, installed Linux applications and custom Python tools and utilities are deleted, and are not recoverable.

Managing the Guest Shell Using Application Hosting

This section is applicable to Cisco routing platforms. VirtualPortGroups are not supported on Cisco Catalyst Switching platforms.

IOx must be configured and running for Guest Shell access to work. If IOx is not configured, a message to configure IOx is displayed. Removing IOx removes access to the Guest Shell, but the rootfs remains unaffected.

Use this procedure (Managing the Guest Shell Using Application Hosting) to enable the Guest Shell in Cisco IOS XE Fuji 16.7.1 and later releases. For Cisco IOS XE Everest 16.6.x and previous releases, use the procedure in Managing the Guest Shell, on page 67.

```
Device(config)# interface GigabitEthernet1
Device(config-if)# ip address dhcp
Device(config-if)# ip nat outside
Device(config-if)# exit

Device(config-if)# interface VirtualPortGroup0
Device(config-if)# ip address 192.168.35.1 255.255.255.0
Device(config-if)# ip nat inside
Device(config-if)# exit

Device(config)# ip nat inside source list GS_NAT_ACL interface GigabitEthernet1 overload
```
Device(config)# ip access-list standard GS_NAT_ACL
Device(config)# permit 192.168.0.0 0.0.255.255

Device(config)# app-hosting appid guestshell
Device(config-app-hosting)# app-vnic gateway1 virtualportgroup 0 guest-interface 0
guest-ipaddress 192.168.35.2
netmask 255.255.255.0 gateway 192.168.35.1 name-server 8.8.8.8 default
Device(config-app-hosting)# app-resource profile custom cpu 1500 memory 512
Device(config-app-hosting)# end

Device# guestshell enable
Device# guestshell run python

Figure 3: Managing the Guest Shell using Application Hosting

For front panel networking, you must configure the GigabitEthernet and VirtualPortGroup interfaces as shown above. The Guest Shell uses a Virtualportgroup as the source interface to connect to the outside network through NAT.

The following commands are used to configure inside NAT. They allow the Guest Shell to reach the internet; for example, to obtain Linux software updates:

```
ip nat inside source list
ip access-list standard
permit
```

The `guestshell run` command in the example above, runs a python executable. You can also use the `guestshell run` command to run other Linux executables; for example, see the example `guestshell run bash` command, which starts a Bash shell or the `guestshell disable` command which shuts down and disables the Guest Shell. If the system is later reloaded, the Guest Shell remains disabled.

**Accessing the Python Interpreter**

Python can be used interactively or Python scripts can be run in the Guest Shell. Use the `guestshell run python` command to launch the Python interpreter in Guest Shell and open the Python terminal.

**Note**

In releases prior to Cisco IOS XE Amsterdam 17.3.1, Python V2 is the default. Python V3 is supported in Cisco IOS XE Amsterdam 17.1.1, and Cisco IOS XE Amsterdam 17.2.1. In Cisco IOS XE Amsterdam 17.3.1 and later releases, Python V3 is the default.
In Releases Prior to Cisco IOS XE Amsterdam 17.3.1

The `guestshell run` command is the Cisco IOS equivalent of running Linux executables, and when running a Python script from Cisco IOS, specify the absolute path. The following example shows how to specify the absolute path for the command:

```
Guestshell run python /flash/guest-share/sample_script.py parameter1 parameter2
```

The following example shows how to enable Python on a Cisco Catalyst 3650 Series Switch or a Cisco Catalyst 3850 Series Switch:

```
Device# guestshell run python
```

```
Python 2.7.11 (default, March 16 2017, 16:50:55)
[GCC 4.7.0] on linux2
Type "help", "copyright", "credits" or "license" for more information.
```

The following example shows how to enable Python on a Cisco ISR 4000 Series Integrated Services Router:

```
Device# guestshell run python
```

```
Python 2.7.5 (default, Jun 17 2014, 18:11:42)
[GCC 4.8.2 20140120 (Red Hat 4.8.2-16)] on linux2
Type "help", "copyright", "credits" or "license" for more information.
```

In Cisco IOS XE Amsterdam 17.3.1 and Later Releases

The following example shows how to enable Python on Cisco Catalyst 9000 Series Switches:

```
Device# guestshell run python3
```

```
Python 3.6.8 (default, Nov 21 2019, 22:10:21)
[GCC 8.3.1 20190507 (Red Hat 8.3.1-4)] on linux
Type "help", "copyright", "credits" or "license" for more information.
```

Configuration Examples for the Guest Shell

Example: Managing the Guest Shell

The following example shows how to enable Guest Shell on a Catalyst 3850 Series Switch:

```
Device> enable
Device# guestshell enable

Management Interface will be selected if configured
Please wait for completion
Guestshell enabled successfully
```
Device# guestshell run python
Python 2.7.11 (default, Feb 21 2017, 03:39:40)
[GCC 5.3.0] on linux2
Type "help", "copyright", "credits" or "license" for more information.
Device# guestshell run bash
[guestshell@guestshell ~]$  
Device# guestshell disable
Guestshell disabled successfully
Device# guestshell destroy
Guestshell destroyed successfully

Sample VirtualPortGroup Configuration

---

**Note**

VirtualPortGroups are supported only on Cisco routing platforms.

When using the VirtualPortGroup interface for Guest Shell networking, the VirtualPortGroup interface must have a static IP address configured. The front port interface must be connected to the Internet and Network Address Translation (NAT) must be configured between the VirtualPortGroup and the front panel port.

The following is a sample VirtualPortGroup configuration:

Device> enable  
Device# configure terminal  
Device(config)# interface VirtualPortGroup 0  
Device(config-if)# ip address 192.168.35.1 255.255.255.0  
Device(config-if)# ip nat inside  
Device(config-if)# no mop enabled  
Device(config-if)# no mop sysid  
Device(config-if)# exit  
Device(config)# interface GigabitEthernet 0/0/3  
Device(config-if)# ip address 10.0.12.19 255.255.0.0  
Device(config-if)# ip nat outside  
Device(config-if)# negotiation auto  
Device(config-if)# exit  
Device(config)# ip route 0.0.0.0 0.0.0.0 10.0.0.1  
Device(config)# ip route 10.0.0.0 255.0.0.0 10.0.0.1  
! Port forwarding to use ports for SSH and so on.  
Device(config)# ip nat inside source static tcp 192.168.35.2 7023 10.0.12.19 7023 extendable  
Device(config)# ip nat outside source list NAT_ACL interface GigabitEthernet 0/0/3 overload  
Device(config)# ip access-list standard NAT_ACL  
Device(config-std-nacl)# permit 192.168.0.0 0.0.255.255  
Device(config-std-nacl)# exit  
Device(config)# 

! App-hosting configuration  
Device(config)# app-hosting appid guestshell  
Device(config-app-hosting)# app-vnic gateway1 virtualportgroup 0 guest-interface 0
Example: Guest Shell Usage

From the Guest Shell prompt, you can run Linux commands. The following example shows the usage of some Linux commands.

```
[guestshell@guestshell-~]$ pwd
/home/guestshell

[guestshell@guestshell-~]$ whoami
guestshell

[guestshell@guestshell-~]$ uname -a
Linux guestshell 3.10.101.cge-rt110 #1 SMP Sat Feb 11 00:33:02 PST 2017 mips64 GNU/Linux
```

Catalyst 3650 and Catalyst 3850 Series Switches have a defined set of Linux executables that are provided by BusyBox and Cisco 4000 Series Integrated Services Routers have commands provided by CentOS Linux release 7.1.1503.

The following example shows the usage of the `dohost` command on a Catalyst 3850 Series Switch.

```
[guestshell@guestshell ~]$ dohost "show version"
Cisco IOS Software [Everest], Catalyst L3 Switch Software [CAT3K_CAA-UNIVERSALK9-M), Experimental Version 16.5.2017200014[v165_throttle-BLD-BLD_V165_THROTTLE_LATEST_20170531_192849 132]
```

Note: The `dohost` command requires the `ip http server` command to be configured on the device.

Example: Guest Shell Networking Configuration

For Guest Shell networking, the following configurations are required.

- Configure Domain Name System (DNS)
- Configure proxy settings
Sample DNS Configuration for Guest Shell

The following is a sample DNS configuration for Guest Shell:

```
[guestshell@guestshell ~]$ cat /etc/resolv.conf
nameserver 192.0.2.1

Other Options:
[guestshell@guestshell ~]$ cat /etc/resolv.conf
domain cisco.com
search cisco.com
nameserver 192.0.2.1
search cisco.com
nameserver 198.51.100.1
search cisco.com
nameserver 172.16.0.6
domain cisco.com
nameserver 192.0.2.1
nameserver 172.16.0.6
nameserver 192.168.255.254
```

Example: Configuring Proxy Environment Variables

If your network is behind a proxy, configure proxy variables in Linux. If required, add these variables to your environment.

The following example shows how to configure your proxy variables:

```
[guestshell@guestshell ~]$ cat /bootflash/proxy_vars.sh
export http_proxy=http://proxy.example.com:80/
export https_proxy=http://proxy.example.com:80/
export ftp_proxy=http://proxy.example.com:80/
export no_proxy=example.com
export HTTP_PROXY=http://proxy.example.com:80/
export HTTPS_PROXY=http://proxy.example.com:80/
export FTP_PROXY=http://proxy.example.com:80/
guestshell ~] source /bootflash/proxy_vars.sh
```

Example: Configuring Yum and PIP for Proxy Settings

The following example shows how to use Yum for setting proxy environment variables:

```
cat /etc/yum.conf | grep proxy
[guestshell@guestshell~]$ cat /bootflash/yum.conf | grep proxy
```
proxy=http://proxy.example.com:80/

PIP install picks up environment variable used for proxy settings. Use sudo with -E option for PIP installation. If the environment variables are not set, define them explicitly in PIP commands as shown in following example:

```
sudo pip --proxy http://proxy.example.com:80/install requests
sudo pip install --trusted-host pypi.example.com --index-url http://pypi.example.com/simple requests
```

The following example shows how to use PIP install for Python:

```
Sudo -E pip install requests
[guestshell@guestshell ~]$ python
Python 2.7.11 (default, Feb 3 2017, 19:43:44)
[GCC 4.7.0] on linux2
Type "help", "copyright", "credits" or "license" for more information
>>>import requests
```

| Guest Shell    | Cisco IOS XE Everest 16.5.1a  | Guest Shell is a secure container that is an embedded Linux environment that allows customers to develop and run Linux and custom Python applications for automated control and management of Cisco switches. It also includes the automated provisioning of systems. This container shell provides a secure environment, decoupled from the host device, in which users can install scripts or software packages and run them. In Cisco IOS XE Everest 16.5.1a, this feature was implemented on the following platforms:  
  - Cisco Catalyst 3650 Series Switches  
  - Cisco Catalyst 3850 Series Switches  
  - Cisco Catalyst 9300 Series Switches  
  - Cisco Catalyst 9500 Series Switches |
<p>|                | Cisco IOS XE Everest 16.5.1b  |                                                                                                                                                      |
|                | Cisco IOS XE Everest 16.6.2    | In Cisco IOS XE Everest 16.6.2, this feature was implemented on Cisco Catalyst 9400 Series Switches.                                                      |

Python programmability supports Python APIs.

- Using Python, on page 79

Using Python

Cisco Python Module

Cisco provides a Python module that provides access to run EXEC and configuration commands. You can display the details of the Cisco Python module by entering the `help()` command. The `help()` command displays the properties of the Cisco CLI module.

The following example displays information about the Cisco Python module:

```
Device# guestshell run python
Python 2.7.5 (default, Jun 17 2014, 18:11:42)
[GCC 4.8.2 20140120 (Red Hat 4.8.2-16)] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> from cli import cli,clip,configure,configurep, execute, executep
>>> help(configure)
Help on function configure in module cli:
configure(configuration)  
Apply a configuration (set of Cisco IOS CLI config-mode commands) to the device 
and return a list of results.

configuration = '''interface gigabitEthernet 0/0
no shutdown'''

# push it through the Cisco IOS CLI.
try:
    results = cli.configure(configuration)
    print "Success!"
except CLIConfigurationError as e:
    print "Failed configurations:"
    for failure in e.failed:
        print failure

Args:
configuration (str or iterable): Configuration commands, separated by newlines.
```
Returns:
list(ConfigResult): A list of results, one for each line.

Raises:
CLISyntaxError: If there is a syntax error in the configuration.

```python
>>> help(configurep)
Help on function configurep in module cli:

configurep(configuration)
Apply a configuration (set of Cisco IOS CLI config-mode commands) to the device
and prints the result.

configuration = """"interface gigabitEthernet 0/0
no shutdown"
# push it through the Cisco IOS CLI.
configurep(configuration)

Args:
configuration (str or iterable): Configuration commands, separated by newlines.
```

```python
>>> help(execute)
Help on function execute in module cli:

execute(command)
Execute Cisco IOS CLI exec-mode command and return the result.

command_output = execute("show version")

Args:
command (str): The exec-mode command to run.

Returns:
str: The output of the command.

Raises:
CLISyntaxError: If there is a syntax error in the command.
```

```python
>>> help(executep)
Help on function executep in module cli:

executep(command)
Execute Cisco IOS CLI exec-mode command and print the result.

executep("show version")

Args:
command (str): The exec-mode command to run.
```

```python
>>> help(cli)
Help on function cli in module cli:

cli(command)
Execute Cisco IOS CLI command(s) and return the result.

A single command or a delimited batch of commands may be run. The
delimiter is a space and a semicolon, " ;". Configuration commands must be
in fully qualified form.

output = cli("show version")
output = cli("show version ; show ip interface brief")
```
output = cli("configure terminal ; interface gigabitEthernet 0/0 ; no shutdown")

Args:
    command (str): The exec or config CLI command(s) to be run.

Returns:
    string: CLI output for show commands and an empty string for
configuration commands.

Raises:
    errors.cli_syntax_error: if the command is not valid.
    errors.cli_exec_error: if the execution of command is not successful.

>>> help(clip)
Help on function clip in module cli:

clip(command)
    Execute Cisco IOS CLI command(s) and print the result.
    A single command or a delimited batch of commands may be run. The
delimiter is a space and a semicolon, " ;". Configuration commands must be
in fully qualified form.

    cli("show version")
    cli("show version ; show ip interface brief")
    cli("configure terminal ; interface gigabitEthernet 0/0 ; no shutdown")

Args:
    command (str): The exec or config CLI command(s) to be run.

---

Cisco Python Module to Execute IOS CLI Commands

Note

Guest Shell must be enabled for Python to run. For more information, see the Guest Shell chapter.

The Python programming language uses six functions that can execute CLI commands. These functions are
available from the Python CLI module. To use these functions, execute the import cli command. The ip http
server command must be enabled for these functions to work.

Arguments for these functions are strings of CLI commands. To execute a CLI command through the Python
interpreter, enter the CLI command as an argument string of one of the following six functions:

- cli.cli(command)—This function takes an IOS command as an argument, runs the command through
the IOS parser, and returns the resulting text. If this command is malformed, a Python exception is raised.

The following is sample output from the cli.cli(command) function:

>>> import cli
>>> cli.clip('configure terminal; interface loopback 10; ip address 10.10.10.10 255.255.255.255')
'Mar 13 10:39:48.518: %LINEPROTO-5-UPDOWN: Line protocol on Interface Loopback, changed state to up
>>> cli.clip('show clock')
'\n*18:11:53.989 UTC Mon Mar 13 2017\n' >>> output=cli.cli('show clock')
>>> print(output)
• **cli.clip(command)**—This function works exactly the same as the `cli.cli(command)` function, except that it prints the resulting text to `stdout` rather than returning it. The following is sample output from the `cli.clip(command)` function:

```python
>>> cli.clip('configure terminal; interface loopback 11; ip address 10.11.11.11 255.255.255.255')
*Mar 13 18:42:35.954: %LINEPROTO-5-UPDOWN: Line protocol on Interface Loopback11, changed state to up
*Mar 13 18:42:35.954: %LINK-3-UPDOWN: Interface Loopback11, changed state to up
>>> cli.clip('show clock')
*18:13:35.313 UTC Mon Mar 13 2017
>>> output = cli.clip('show clock')
*18:19:26.824 UTC Mon Mar 13 2017
>>> print(output)
None
```

• **cli.execute(command)**—This function executes a single EXEC command and returns the output; however, does not print the resulting text. No semicolons or newlines are allowed as part of this command. Use a Python list with a for-loop to execute this function more than once. The following is sample output from the `cli.execute(command)` function:

```python
>>> cli.execute("show clock")
'15:11:20.816 UTC Thu Jun 8 2017'
>>> cli.execute('show clock'; 'show ip interface brief')
    File "<stdin>", line 1
        cli.execute('show clock'; 'show ip interface brief')
SyntaxError: invalid syntax
```

• **cli.executep(command)**—This function executes a single command and prints the resulting text to `stdout` rather than returning it. The following is sample output from the `cli.executep(command)` function:

```python
>>> cli.executep('show clock')
*18:46:28.796 UTC Mon Mar 13 2017
>>> output = cli.executep('show clock')
*18:46:36.399 UTC Mon Mar 13 2017
>>> print(output)
None
```

• **cli.configure(command)**—This function configures the device with the configuration available in commands. It returns a list of named tuples that contains the command and its result as shown below:

```python
[Think: result = (bool(success), original_command, error_information)]
```
The command parameters can be in multiple lines and in the same format that is displayed in the output of the `show running-config` command. The following is sample output from the `cli.configure(command)` function:

```python
>>> cli.configure(['interface GigabitEthernet1/0/7', 'no shutdown', 'end'])
[ConfigResult(success=True, command='interface GigabitEthernet1/0/7', line=1, output='', notes=None), ConfigResult(success=True, command='no shutdown', line=2, output='', notes=None), ConfigResult(success=True, command='end', line=3, output='', notes=None)]
```

- **cli.configurep(command)**—This function works exactly the same as the `cli.configure(command)` function, except that it prints the resulting text to `stdout` rather than returning it. The following is sample output from the `cli.configurep(command)` function:

```python
>>> cli.configurep(['interface GigabitEthernet1/0/7', 'no shutdown', 'end'])
Line 1 SUCCESS: interface GigabitEthernet1/0/7
Line 2 SUCCESS: no shut
Line 3 SUCCESS: end
```
Cisco Python Module to Execute IOS CLI Commands
CHAPTER 6

CLI Python Module

Python Programmability provides a Python module that allows users to interact with IOS using CLIs.

- Information About Python CLI Module, on page 85
- Additional References for the CLI Python Module, on page 89
- Feature Information for the CLI Python Module, on page 89

Information About Python CLI Module

About Python

The Cisco IOS XE devices support Python Version 2.7 in both interactive and non-interactive (script) modes within the Guest Shell. The Python scripting capability gives programmatic access to a device’s CLI to perform various tasks and Zero Touch Provisioning or Embedded Event Manager (EEM) actions.

Python Scripts Overview

Python run in a virtualized Linux-based environment, Guest Shell. For more information, see the Guest Shell chapter. Cisco provides a Python module that allows user’s Python scripts to run IOS CLI commands on the host device.

Interactive Python Prompt

When you execute the guestshell run python command on a device, the interactive Python prompt is opened inside the Guest Shell. The Python interactive mode allows users to execute Python functions from the Cisco Python CLI module to configure the device.

The following example shows how to enable the interactive Python prompt:

Device# guestshell run python

Python 2.7.5 (default, Jun 17 2014, 18:11:42) [GCC 4.8.2 20140120 (Red Hat 4.8.2-16)] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> 

Device#
Python Script

Python scripts can run in non-interactive mode by providing the Python script name as an argument in the Python command. Python scripts must be accessible from within the Guest Shell. To access Python scripts from the Guest Shell, save the scripts in bootflash/flash that is mounted within the Guest Shell.

Note

The ip http server command must be configured for the import cli in Python to work.

The following sample Python script uses different CLI functions to configure and print show commands:

Device# more flash:sample_script.py

```python
import sys
import cli

intf= sys.argv[1:]
intf = ''.join(intf[0])

print "\n\n *** Configuring interface %s with 'configurep' function *** \n\n" %intf
cli.configurep(['interface loopback55','ip address 10.55.55.55 255.255.255.0','no shut','end'])

print "\n\n *** Configuring interface %s with 'configure' function *** \n\n" cmd='interface %s,logging event link-status ,end' % intf
cli.configure(cmd.split(','))

print "\n\n *** Printing show cmd with 'executep' function *** \n\n"
cli.executep('show ip interface brief')

print "\n\n *** Printing show cmd with 'execute' function *** \n\n"
output= cli.execute('show run interface %s' %intf)
print (output)

print "\n\n *** Configuring interface %s with 'cli' function *** \n\n"
cli.cli('config terminal; interface %s; spanning-tree portfast edge default' % intf)

print "\n\n *** Printing show cmd with 'clip' function *** \n\n"
cli.clip('show run interface %s' %intf)
```

To run a Python script from the Guest Shell, execute the guestshell run python /flash/script.py command at the device prompt.

The following example shows how to run a Python script from the Guest Shell:

Device# guestshell run python /flash/sample_script.py loop55

```bash
*** Configuring interface loop55 with 'configurep' function ***

Line 1 SUCCESS: interface loopback55
Line 2 SUCCESS: ip address 10.55.55.55 255.255.255.0
Line 3 SUCCESS: no shut
Line 4 SUCCESS: end

*** Configuring interface %s with 'configure' function ***
```
*** Printing show cmd with 'executep' function ***

## Supported Python Versions

Guest Shell is pre-installed with Python Version 2.7. Guest Shell is a virtualized Linux-based environment, designed to run custom Linux applications, including Python applications for automated control and management of Cisco devices. Platforms with Montavista CGE7 support Python Version 2.7.11, and platforms with CentOS 7 support Python Version 2.7.5.

The following table provides information about Python versions and the supported platforms:

### Table 10: Python Version Support

<table>
<thead>
<tr>
<th>Python Version</th>
<th>Platform</th>
</tr>
</thead>
<tbody>
<tr>
<td>Python Version 2.7.5</td>
<td>All supported platforms except for Cisco Catalyst 3650 Series Switches and Cisco Catalyst 3850 Series Switches.</td>
</tr>
</tbody>
</table>
### Updating the Cisco CLI Python Module

The Cisco CLI Python module and EEM module are pre-installed on devices. However, when you update the Python version by using either Yum or prepackaged binaries, the Cisco-provided CLI module must also be updated.

#### Note

When you update to Python Version 3 on a device that already has Python Version 2, both versions of Python exist on the device. Use one of the following IOS commands to run Python:

- The `guestshell run python2` command enables Python Version 2.
- The `guestshell run python3` command enables Python Version 3.
- The `guestshell run python` command enables Python Version 2.

Use one of the following methods to update the Python version:

- Standalone tarball installation
- PIP install for the CLI module

---

### Platforms

<table>
<thead>
<tr>
<th>Python Version</th>
<th>Platform</th>
</tr>
</thead>
</table>
| Python Version 2.7.11 | • Cisco Catalyst 3650 Series Switches  
                         • Cisco Catalyst 3850 Series Switches |
| Python Version 3.6  | Supported in Cisco IOS XE Amsterdam 17.1.1 and later releases.  
                        In Cisco IOS XE Amsterdam 17.1.1 and Cisco IOS XE Amsterdam 17.2.1, Python V2 is the default. However, in Cisco IOS XE Amsterdam 17.3.1 and later releases, Python V3 is the default. |

#### Note

Cisco Catalyst 9200 Series Switches do not support Python Version 3.6 in Cisco IOS XE Amsterdam 17.1.1 and Cisco IOS XE Amsterdam 17.2.1. Cisco Catalyst 9200 Series Switches support Python V3 in Cisco IOS XE Amsterdam 17.3.1 and later releases.

Note

Not supported by Cisco Catalyst 3650 Series Switches and Cisco Catalyst 3850 Series Switches.

Platforms with CentOS 7 support the installation of Redhat Package Manager (RPM) from the open source repository.

Feature Information for the CLI Python Module

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
### Table 11: Feature Information for the CLI Python Module

<table>
<thead>
<tr>
<th>Feature Name</th>

</thead>
</table>
| CLI Python Module     | Cisco IOS XE Everest 16.5.1a   | Python programmability provides a Python module that allows users to interact with IOS using CLIs. **In Cisco IOS XE Everest 16.5.1a,** this feature was implemented on the following platforms:  
  • Cisco Catalyst 3650 Series Switches
  • Cisco Catalyst 3850 Series Switches
  • Cisco Catalyst 9300 Series Switches
  • Cisco Catalyst 9500 Series Switches
  **In Cisco IOS XE Everest 16.5.1b,** this feature was implemented on the following platforms:  
  • Cisco 4000 Series Integrated Services Routers                                                                                                      |
|                       | Cisco IOS XE Everest 16.6.2     | This feature was implemented on Cisco Catalyst 9400 Series Switches.                                                                                                                                              |
|                       | Cisco IOS XE Fuji 16.7.1        | This feature was implemented on the following platforms:  
  • Cisco ASR 1000 Aggregation Services Routers
  • Cisco CSR 1000v Series Cloud Services Routers                                                                                                                                                                 |
CHAPTER 7

EEM Python Module

Embedded Event Manager (EEM) policies support Python scripts. Python scripts can be executed as part of EEM actions in EEM applets.

- Prerequisites for the EEM Python Module, on page 91
- Information About EEM Python Module, on page 91
- How to Configure the EEM Python Policy, on page 94
- Additional References EEM Python Module, on page 99
- Feature Information for EEM Python Module, on page 100

Prerequisites for the EEM Python Module

Guest Shell must be working within the container. Guest Shell is not enabled by default. For more information see the Guest Shell feature.

Information About EEM Python Module

Python Scripting in EEM

Embedded Event Manager (EEM) policies support Python scripts. You can register Python scripts as EEM policies, and execute the registered Python scripts when a corresponding event occurs. The EEM Python script has the same event specification syntax as the EEM TCL policy.

Configured EEM policies run within the Guest Shell. Guest Shell is a virtualized Linux-based environment, designed to run custom Linux applications, including Python for automated control and management of Cisco devices. The Guest Shell container provides a Python interpreter.

EEM Python Package

The EEM Python package can be imported to Python scripts for running EEM-specific extensions.
The EEM Python package is available only within the EEM Python script (The package can be registered with EEM, and has the EEM event specification in the first line of the script.) and not in the standard Python script (which is run using the Python script name).

The Python package includes the following application programming interfaces (APIs):

- **Action APIs**—Perform EEM actions and have default parameters.

- **CLI-execution APIs**—Run IOS commands, and return the output. The following are the list of CLI-execution APIs:
  - eem_cli_open()
  - eem_cli_exec()
  - eem_cli_read()
  - eem_cli_read_line()
  - eem_cli_run()
  - eem_cli_run_interactive()
  - eem_cli_read_pattern()
  - eem_cli_write()
  - eem_cli_close()

- **Environment variables-accessing APIs**—Get the list of built-in or user-defined variables. The following are the environment variables-accessing APIs:
  - eem_event_reqinfo()-Returns the built-in variables list.
  - eem_user_variables()-Returns the current value of an argument.

### Python-Supported EEM Actions

The Python package (is available only within the EEM script, and not available for the standard Python script) supports the following EEM actions:

- Syslog message printing
- Send SNMP traps
- Reload the box
- Switchover to the standby device
- Run a policy
- Track Object read
- Track Object Set
- Cisco Networking Services event generation
The EEM Python package exposes the interfaces for executing EEM actions. You can use the Python script to call these actions, and they are forwarded from the Python package via Cisco Plug N Play (PnP) to the action handler.

EEM Variables

An EEM policy can have the following types of variables:

- Event-specific built-in variables—A set of predefined variables that are populated with details about the event that triggered the policy. The `eem_event_reqinfo()` API returns the built-in variables list. These variables can be stored in the local machine and used as local variables. Changes to local variables do not reflect in built-in variables.

- User-defined variables—Variables that can be defined and used in policies. The value of these variables can be referred in the Python script. While executing the script, ensure that the latest value of the variable is available. The `eem_user_variables()` API returns the current value of the argument that is provided in the API.

EEM CLI Library Command Extensions

The following CLI library commands are available within EEM for the Python script to work:

- `eem_cli_close()`—Closes the EXEC process and releases the VTY and the specified channel handler connected to the command.

- `eem_cli_exec`—Writes the command to the specified channel handler to execute the command. Then reads the output of the command from the channel and returns the output.

- `eem_cli_open`—Allocates a VTY, creates an EXEC CLI session, and connects the VTY to a channel handler. Returns an array including the channel handler.

- `eem_cli_read()`—Reads the command output from the specified CLI channel handler until the pattern of the device prompt occurs in the contents read. Returns all the contents read up to the match.

- `eem_cli_read_line()`—Reads one line of the command output from the specified CLI channel handler. Returns the line read.

- `eem_cli_read_pattern()`—Reads the command output from the specified CLI channel handler until the pattern that is to be matched occurs in the contents read. Returns all the contents read up to the match.

- `eem_cli_run()`—Iterates over the items in the `clist` and assumes that each one is a command to be executed in the enable mode. On success, returns the output of all executed commands and on failure, returns error.

- `eem_cli_run_interactive()`—Provides a sublist to the `clist` which has three items. On success, returns the output of all executed commands and on failure, returns the error. Also uses arrays when possible as a way of making things easier to read later by keeping expect and reply separated.

- `eem_cli_write()`—Writes the command that is to be executed to the specified CLI channel handler. The CLI channel handler executes the command.
How to Configure the EEM Python Policy

For the Python script to work, you must enable the Guest Shell. For more information, see the Guest Shell chapter.

Registering a Python Policy

**SUMMARY STEPS**

1. enable
2. configure terminal
3. event manager directory user policy path
4. event manager policy policy-filename
5. exit
6. show event manager policy registered
7. show event manager history events

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies a directory to use for storing user library files or user-defined EEM policies.</td>
</tr>
<tr>
<td>event manager directory user policy path</td>
<td>Note: You must have a policy in the specified path. For example, in this step, the eem_script.py policy is available in the flash:/user_library folder or path.</td>
</tr>
<tr>
<td>Example: Device(config)# event manager directory user policy flash:/user_library</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Registers a policy with EEM.</td>
</tr>
<tr>
<td>event manager policy policy-filename</td>
<td>• The policy is parsed based on the file extension. If the file extension is .py, the policy is registered as Python policy.</td>
</tr>
<tr>
<td>Example: Device(config)# event manager policy eem_script.py</td>
<td>• EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When the event manager policy command is invoked, EEM examines the policy and registers it to be run when the specified event occurs.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 5</th>
<th>exit</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> Device(config)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Purpose:</strong> Exits global configuration mode and returns to privileged EXEC mode.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>show event manager policy registered</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> Device# show event manager policy registered</td>
<td></td>
</tr>
<tr>
<td><strong>Purpose:</strong> Displays the registered EEM policies.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>show event manager history events</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> Device# show event manager history events</td>
<td></td>
</tr>
<tr>
<td><strong>Purpose:</strong> Displays EEM events that have been triggered.</td>
<td></td>
</tr>
</tbody>
</table>

### Example

The following is sample output from the `show event manager policy registered` command:

```
Device# show event manager policy registered

No. Class Type Event Type Trap Time Registered Name
1 script user multiple Off Tue Aug 2 22:12:15 2016 multi_1.py
  1: syslog: pattern {COUNTER}
  2: none: policyname {multi_1.py} sync {yes}

     trigger
     correlate event 1 or event 2
     nice 0 queue-priority normal maxrun 100.000 scheduler rp_primary Secu none

3 script user multiple Off Tue Aug 2 22:13:31 2016 multi.tcl
  1: syslog: pattern {COUNTER}
  2: none: policyname {multi.tcl} sync {yes}
     trigger
     correlate event 1 or event 2
     attribute tag 1 occurs 1
     nice 0 queue-priority normal maxrun 100.000 scheduler rp_primary Secu none
```

### Running Python Scripts as Part of EEM Applet Actions

**Python Script: eem_script.py**

An EEM applet can include a Python script with an action command. In this example, an user is trying to run a standard Python script as part of the EEM action, however; EEM Python package is
not available in the standard Python script. The standard Python script in IOS has a package named
from cli import cli,clip and this package can be used to execute IOS commands.

```python
import sys
from cli import cli, clip, execute, executep, configure, configurep

intf = sys.argv[1:]
intf = ','.join(intf[0])

print ('This script is going to unshut interface %s and then print show ip interface
brief' % intf)

if intf == 'loopback55':
    configurep(['interface loopback55', 'no shutdown', 'end'])
else:
    cmd = 'int %s, no shut, end' % intf
    configurep(cmd.split(','))

executep('show ip interface brief')
```

This following is sample output from the `guestshell run python` command.

```
Device# guestshell run python /flash/eem_script.py loop55

This script is going to unshut interface loop55 and then print show ip interface brief
Line 1 SUCCESS: int loop55
Line 2 SUCCESS: no shut
Line 3 SUCCESS: end
Interface IP-Address OK? Method Status Protocol
Vlan1 unassigned YES NVRAM administratively down down

Tel/1/2 unassigned YES unset down down
Tel/1/3 unassigned YES unset down down
```

Programmability Configuration Guide, Cisco IOS XE Fuji 16.9.x
The following is a sample script for printing messages to the syslog. This script must be stored in a file, copied to the file system on the device, and registered using the event manager policy file.

```py
::cisco::eem::event_register_syslog tag "1" pattern COUNTER maxrun 200
import eem
import time
eem.action_syslog("SAMPLE SYSLOG MESSAGE","6","TEST")
```

The following is a sample script to print EEM environment variables. This script must be stored in a file, copied to the file system on the device, and registered using the event manager policy file.

```py
::cisco::eem::event_register_syslog tag "1" pattern COUNTER maxrun 200
import eem
import time

c = eem.env_reginfo()

print "EEM Environment Variables"
for k,v in c.iteritems():
    print "KEY : " + k + str(" ---> ") + v

print "Built in Variables"
for i,j in a.iteritems() :
    print "KEY : " + i + str(" ---> ") + j
```

## Adding a Python Script in an EEM Applet

### SUMMARY STEPS

1. enable
2. configure terminal
3. event manager applet applet-name
4. event [tag event-tag] syslog pattern regular-expression
5. action label cli command cli-string
6. action label cli command cli-string [ pattern pattern-string ]
7. end
8. show event manager policy active
9. show event manager history events
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>

</tbody>
</table>
**What to do next**

The following example shows how to trigger the Python script configured in the task:

```
Device(config)# interface loopback 55
Device(config-if)# shutdown
Device(config-if)# end
Device#
```

```
Mar 13 10:53:22.358 EDT: %SYS-5-CONFIG_I: Configured from console by console
Mar 13 10:53:27.319 EDT: %LINK-3-UPDOWN: Interface Loopback55, changed state to administratively down
Enter configuration commands, one per line. End with CNTL/Z.
Mar 13 10:53:35.38 EDT: %LINEPROTO-5-UPDOWN: Line protocol on Interface Loopback55, changed state to up

Feature Information for EEM Python Module

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for the NETCONF Protocol

The NETCONF feature is not supported on a device running dual IOSd configuration or software redundancy.

Information About the NETCONF Protocol

Introduction to Data Models - Programmatic and Standards-Based Configuration

The traditional way of managing network devices is by using Command Line Interfaces (CLIs) for configurational (configuration commands) and operational data (show commands). For network management, Simple Network Management Protocol (SNMP) is widely used, especially for exchanging management information between various network devices. Although CLIs and SNMP are heavily used, they have several restrictions. CLIs are highly proprietary, and human intervention is required to understand and interpret their text-based specification. SNMP does not distinguish between configurational and operational data.

The solution lies in adopting a programmatic and standards-based way of writing configurations to any network device, replacing the process of manual configuration. Network devices running on Cisco IOS XE support the automation of configuration for multiple devices across the network using data models. Data models are developed in a standard, industry-defined language, that can define configuration and state information of a network.

Cisco IOS XE supports the Yet Another Next Generation (YANG) data modeling language. YANG can be used with the Network Configuration Protocol (NETCONF) to provide the desired solution of automated and programmable network operations. NETCONF (RFC 6241) is an XML-based protocol that client applications
use to request information from and make configuration changes to the device. YANG is primarily used to model the configuration and state data used by NETCONF operations.

In Cisco IOS XE, model-based interfaces interoperate with existing device CLI, Syslog, and SNMP interfaces. These interfaces are optionally exposed northbound from network devices. YANG is used to model each protocol based on RFC 6020.

---

**Note**

To access Cisco YANG models in a developer-friendly way, clone the GitHub repository, and navigate to the `vendor/cisco` subdirectory. Models for various releases of IOS-XE, IOS-XR, and NX-OS platforms are available here.

---

**NETCONF**

NETCONF provides a mechanism to install, manipulate, and delete the configuration of network devices. It uses an Extensible Markup Language (XML)-based data encoding for the configuration data as well as the protocol messages.

NETCONF uses a simple Remote Procedure Call (RPC) based mechanism to facilitate communication between a client and a server. The client can be a script or application running as part of a network manager. The server is typically a network device (switch or router). It uses Secure Shell (SSH) as the transport layer across network devices. It uses SSH port number 830 as the default port. The port number is a configurable option.

NETCONF also supports capability discovery and model downloads. Supported models are discovered using the `ietf-netconf-monitoring` model. Revision dates for each model are shown in the capabilities response. Data models are available for optional download from a device using the `get-schema` RPC. You can use these YANG models to understand or export the data model. For more details on NETCONF, see RFC 6241.

In releases prior to Cisco IOS XE Fuji 16.8.1, an operational data manager (based on polling) was enabled separately. In Cisco IOS XE Fuji 16.8.1 and later releases, operational data works on platforms running NETCONF (similar to how configuration data works), and is enabled by default. For more information on the components that are enabled for operational data queries or streaming, see the GitHub repository, to view `-oper` in the naming convention.

**NETCONF RESTCONF IPv6 Support**

Data model interfaces (DMIs) support the use of IPv6 protocol. DMI IPv6 support helps client applications communicate with services that use IPv6 addresses. External facing interfaces will provide dual-stack support; both IPv4 and IPv6.

DMIs are a set of services that facilitate the management of network elements. Application layer protocols such as, NETCONF and RESTCONF access these DMIs over a network.

If IPv6 addresses are not configured, external-facing applications will continue to listen on IPv6 sockets; but these sockets will be unreachable.

**NETCONF Global Session Lock**

The NETCONF protocol provides a set of operations to manage device configurations and retrieve device state information. NETCONF supports a global lock, and the ability to kill non-responsive sessions are introduced in NETCONF.
To ensure consistency and prevent conflicting configurations through multiple simultaneous sessions, the owner of the session can lock the NETCONF session. The NETCONF lock RPC locks the configuration parser and the running configuration database. All other NETCONF sessions (that do not own the lock) cannot perform edit operations; but can perform read operations. These locks are intended to be short-lived and allow the owner to make changes without interaction with other NETCONF clients, non-NETCONF clients (such as, SNMP and CLI scripts), and human users.

A global lock held by an active session is revoked when the associated session is killed. The lock gives the session holding the lock exclusive write access to the configuration. When a configuration change is denied due to a global lock, the error message will specify that a NETCONF global lock is the reason the configuration change has been denied.

The `<lock>` operation takes a mandatory parameter, `<target>` that is the name of the configuration datastore that is to be locked. When a lock is active, the `<edit-config>` and `<copy-config>` operations are not allowed.

If the clear configuration lock command is specified while a NETCONF global lock is being held, a full synchronization of the configuration is scheduled and a warning syslog message is produced. This command clears only the parser configuration lock.

The following is a sample RPC that shows the `<lock>` operation:

```
<rpc message-id="101"
   xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <lock>
    <target>
      <running/>
    </target>
  </lock>
</rpc>
```

**NETCONF Kill Session**

During a session conflict or client misuse of the global lock, NETCONF sessions can be monitored via the show netconf-yang sessions command, and non-responsive sessions can be cleared using the clear netconf-yang session command. The clear netconf-yang session command clears both the NETCONF lock and the configuration lock.

A `<kill-session>` request will force a NETCONF session to terminate. When a NETCONF entity receives a `<kill-session>` request for an open session, it stops all operations in process, releases all locks and resources associated with the session, and closes any associated connections.

A `<kill-session>` request requires the session-ID of the NETCONF session that is to be terminated. If the value of the session-ID is equal to the current session ID, an invalid-value error is returned. If a NETCONF session is terminated while its transaction is still in progress, the data model infrastructure will request a rollback, apply it to the network element, and trigger a synchronization of all YANG models.

If a session kill fails, and a global lock is held, enter the clear configuration lock command via the console or vty. At this point, the data models can be stopped and restarted.

**Candidate Config Support**

The Candidate Config Support feature enables support for candidate capability by implementing RFC 6241 with a simple commit option.
Candidate datastore provides a temporary work space in which a copy of the device's running configuration is stored. You can create and modify the running configuration before committing the running configuration to the device. Candidate capability is indicated by the following NETCONF capability: urn:ietf:params:netconf:capability:candidate:1.0. This NETCONF capability indicates that the device supports Candidate Datastore. This is a shared data store which enables the user to create, add, delete and make changes to the device configuration without effecting the running configuration on the device. A commit operation pushes the configuration from “candidate” to the “running” configuration on the device. When “candidate” data store is enabled, the Running data store is NOT writable through NETCONF sessions, all configurations get committed ONLY through Candidate. In other words, the writable-running NETCONF capability is not enabled with Candidate.

**Note**

It must be kept in mind that candidate datastore is a shared data store. Multiple NETCONF sessions can modify it contents simultaneously. Therefore, it is important to lock the datastore before modifying its contents, to prevent conflicting commits which can eventually lead to losing any configuration changes.

### NETCONF Operations on Candidate

The following operations can be performed on the candidate data store.

**Note**

The information in this section has been referenced from section 8.3.4 of RFC 6241. Please refer to the RFC for more details and the exact RPCs.

#### Lock

A `<lock>` RPC is used to lock the target data store. This prevents others users from modifying the configuration in the locked data store. Both candidate and running data can be locked through the lock operation.

**Note**

Locking the candidate datastore does not affect the Cisco IOS config lock or the running configuration lock and vice versa.

#### Commit

A `<commit>` RPC, copies the candidate configuration to the device’s running configuration. A commit operation must be performed after you have updated the candidate configuration to push the configuration to the device.

If either the running or the candidate datastore is locked by another NETCONF session, the `<commit>` RPC will fail with an RPC error reply. The `<error-tag>` should be `<in-use>` and `<error-info>` should have the session ID of the NETCONF session holding the lock. You can also lock the running configuration by using the global lock by entering the conf’ t lock mode, but, the commit operation will fail with an RPC error reply, with error-tag value `<in-use>` and the session-id will be “0”.

#### Edit-config

The candidate configuration can be used as a target for the edit-config operation to modify a configuration. You can change the candidate configuration without affecting the running configuration on the device.
Discard

To remove the changes made to the candidate configuration, perform a discard operation to revert the candidate configuration to running configuration.

If contents of the candidate datastore are modified by NETCONF session A, and session B tries to lock the candidate datastore, the lock fails. NETCONF session B must perform a `<discard>` operation to remove any outstanding configuration changes on the candidate datastore from other NETCONF sessions before locking a candidate.

Unlock

After working on candidate configuration, such as, lock, edit-config, or commit operations, you can unlock the datastore, by specifying candidate as target in the unlock RPC. The candidate datastore is now available for all operations in other sessions.

If a failure occurs with outstanding changes to the candidate datastore, it can be challenging to recover the configuration, and may create problems for other sessions. To avoid any issues, outstanding changes must be discarded when the lock is released—either implicitly on “NETCONF session failure” or explicitly by using the unlock operation.

Get-config, Copy-config, Validate

The candidate datastore can be used as a source or target for any of the get-config, copy-config or validate config operations. If you do not want to commit the changes in the candidate datastore to the device; but only to validate the configuration, you can use the `<validate>` RPC followed by a discard operation.

Modifying the Candidate Datastore

The following diagram explains the recommended best practice when modifying the device configuration through candidate datastore:

*Figure 4: Modifying Candidate Datastore Steps*

1. Lock the running datastore.
2. Lock the candidate datastore.
3. Make modifications to the candidate configuration through edit-config RPCs with the target candidate.
4. Commit the candidate configuration to the running configuration.
5. Unlock the candidate and running datastores.
Candidate Support Configuration

The candidate datastore functionality can be enabled by using the `netconf-yang feature candidate-datastore` command. When the datastore state changes from “running” to “candidate” or back, a warning message will be displayed notifying the user that a restart of netconf-yang or restconf will occur in order for the change to take effect. When candidate is enabled, The running data store is not writable through Netconf sessions, all configurations get committed only through candidate. In other words, the writable-running Netconf capability is not enabled with candidate.

If the selection of candidate or running datastore, is specified in the configuration when a netconf-yang or restconf confd process starts, a warning appears as shown below.

Device(config)# netconf-yang feature candidate-datastore
netconf-yang initialization in progress - datastore transition not allowed, please try again after 30 seconds

If the selection of candidate or running is made after netconf-yang or restconf confd process starts, the following apply:

- If the `netconf-yang feature candidate-datastore` command is configured, the command enables the “candidate” datastore and prints the following warning:
  
  “netconf-yang and/or restconf is transitioning from running to candidate netconf-yang and/or restconf will now be restarted, and any sessions in progress will be terminated”.

- If the `netconf-yang feature candidate-datastore` command is removed, the command disables the “candidate” datastore, enables the “running” datastore and prints the following warning:
  
  netconf-yang and/or restconf is transitioning from candidate to running netconf-yang and/or restconf will now be restarted, and any sessions in progress will be terminated”.

- When netconf-yang or restconf are restarted, sessions in progress will be lost.

**Note**

Candidate data store is a shared data store, that is, multiple Netconf sessions can modify the contents simultaneously. Therefore, it is important for a user to lock the data store before modifying its contents, to prevent conflicting commits which can eventually lead to losing any configuration changes; wherein another user overwrites the configuration by modifying the configuration and issuing a commit.

How to Configure the NETCONF Protocol

NETCONF-YANG uses the primary trustpoint of a device. If a trustpoint does not exist, when NETCONF-YANG is configured, it creates a self-signed trustpoint. For more information, see the Public Key Infrastructure Configuration Guide, Cisco IOS XE Gibraltar 16.10.x.

Providing Privilege Access to Use NETCONF

To start working with NETCONF APIs, you must be a user with privilege level 15.
### SUMMARY STEPS

1. enable
2. configure terminal
3. username name privilege level password password
4. aaa new-model
5. aaa authentication login default local
6. aaa authorization exec default local
7. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<td>Device(config)# username example-name privilege 15 password example_password</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) Enables authorisation, authentication, and accounting (AAA). If the aaa new-model command is configured, AAA authentication and authorization is required.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# aaa new-model</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Sets the login authentication to use the local username database. Only the default AAA authentication login method is supported for the NETCONF protocol.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# aaa authentication login default local</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Configures user AAA authorization, check the local database, and allows the user to run an EXEC shell.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# aaa authorization exec default local</td>
</tr>
</tbody>
</table>
### Configuring NETCONF-YANG

If the legacy NETCONF protocol is enabled on your device, the RFC-compliant NETCONF protocol does not work. Disable the legacy NETCONF protocol by using the `no netconf legacy` command.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `netconf-yang`
4. `netconf-yang feature candidate-datastore`
5. `exit`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
`enable`  
**Example:**  
Device> `enable` | Enables privileged EXEC mode.
- Enter your password if prompted. |
| **Step 2**
`configure terminal`  
**Example:**  
Device# `configure terminal` | Enters global configuration mode. |
| **Step 3**
`netconf-yang`  
**Example:**  
Device (config)# `netconf-yang` | Enables the NETCONF interface on your network device.  
**Note**  
After the initial enablement through the CLI, network devices can be managed subsequently through a model based interface. The complete activation of model-based interface processes may require up to 90 seconds. |
| **Step 4**
`netconf-yang feature candidate-datastore`  
**Example:**  
Device(config)# `netconf-yang feature candidate-datastore` | Enables candidate datastore. |
### Purpose

Command or Action | Purpose
--- | ---
**Step 5** |  
exit | Exits global configuration mode.

### Configuring NETCONF Options

#### Configuring SNMP

Enable the SNMP Server in IOS to enable NETCONF to access SNMP MIB data using YANG models generated from supported MIBs, and to enable supported SNMP traps in IOS to receive NETCONF notifications from the supported traps.

Perform the following steps:

**SUMMARY STEPS**

1. Enable SNMP features in IOS.
2. After NETCONF-YANG starts, enable SNMP Trap support by sending the following RPC `<edit-config>` message to the NETCONF-YANG port.
3. Send the following RPC message to the NETCONF-YANG port to save the running configuration to the startup configuration.

**DETAILED STEPS**

**Step 1**

Enable SNMP features in IOS.

**Example:**

```plaintext
configure terminal
logging history debugging
logging snmp-trap emergencies
logging snmp-trap alerts
logging snmp-trap critical
logging snmp-trap errors
logging snmp-trap warnings
logging snmp-trap notifications
logging snmp-trap informational
logging snmp-trap debugging
snmp-server community public RW
snmp-server trap link ietf
snmp-server enable traps snmp authentication linkdown linkup
snmp-server enable traps syslog
snmp-server manager
exit
```

**Step 2**

After NETCONF-YANG starts, enable SNMP Trap support by sending the following RPC `<edit-config>` message to the NETCONF-YANG port.

**Example:**

```xml
<?xml version="1.0" encoding="utf-8"?>
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id=""
```
Verifying the NETCONF Protocol Configuration

Use the following commands to verify your NETCONF configuration.

SUMMARY STEPS

1. show netconf-yang datastores
2. show netconf-yang sessions
3. show netconf-yang sessions detail
4. show netconf-yang statistics
5. show platform software yang-management process

DETAILED STEPS

Step 1  show netconf-yang datastores
Displays information about NETCONF-YANG datastores.

Example:
Device# show netconf-yang datastores

Device# show netconf-yang datastores
Datastore Name : running
Globally Locked By Session : 42
Globally Locked Time : 2018-01-15T14:25:14-05:00

Step 2  show netconf-yang sessions

Displays information about NETCONF-YANG sessions.

Example:
Device# show netconf-yang sessions
R: Global-lock on running datastore
C: Global-lock on candidate datastore
S: Global-lock on startup datastore
Number of sessions : 10

session-id transport username source-host global-lock
-------------------------------------------------------------------------------
40 netconf-ssh admin 10.85.70.224 None
42 netconf-ssh admin 10.85.70.224 None
44 netconf-ssh admin 10.85.70.224 None
46 netconf-ssh admin 10.85.70.224 None
48 netconf-ssh admin 10.85.70.224 None
50 netconf-ssh admin 10.85.70.224 None
52 netconf-ssh admin 10.85.70.224 None
54 netconf-ssh admin 10.85.70.224 None
56 netconf-ssh admin 10.85.70.224 None
58 netconf-ssh admin 10.85.70.224 None

Step 3  show netconf-yang sessions detail

Displays detailed information about NETCONF-YANG sessions.

Example:
Device# show netconf-yang sessions detail
R: Global-lock on running datastore
C: Global-lock on candidate datastore
S: Global-lock on startup datastore

Number of sessions : 1

session-id : 19
transport : netconf-ssh
username : admin
source-host : 2001:db8::1
login-time : 2018-10-26T12:37:22+00:00
in-rpcs : 0
in-bad-rpcs : 0
out-rpc-errors : 0
out-notifications : 0
global-lock : None

Step 4  show netconf-yang statistics

Displays information about NETCONF-YANG statistics.
Example:

Device# show netconf-yang statistics

netconf-start-time : 2018-01-15T12:51:14-05:00
in-rpcs : 0
in-bad-rpcs : 0
out-rpc-errors : 0
out-notifications : 0
in-sessions : 10
dropped-sessions : 0
in-bad-hellos : 0

Step 5  show platform software yang-management process

Displays the status of the software processes required to support NETCONF-YANG.

Example:

Device# show platform software yang-management process

confd : Running
nesd : Running
syncfd : Running
ncsshd : Running
dmiauthd : Running
vtyserverutild : Running
opdatamgrd : Running
nginx : Running
ndbmand : Running

Note  The process nginx runs if **ip http secure-server** or **ip http server** is configured on the device. This process is not required to be in the running state for NETCONF to function properly. However, the nginx process is required for RESTCONF.

CHAPTER 9

RESTCONF Protocol

This chapter describes how to configure the HTTP-based Representational State Transfer Configuration Protocol (RESTCONF). RESTCONF provides a programmatic interface based on standard mechanisms for accessing configuration data, state data, data-model-specific Remote Procedure Call (RPC) operations and events, defined in the YANG model.

- Prerequisites for the RESTCONF Protocol, on page 123
- Restrictions for the RESTCONF Protocol, on page 123
- Information About RESTCONF Programmable Interface, on page 124
- How to Configure RESTCONF Programmable Interface, on page 126
- Configuration Examples for RESTCONF Programmable Interface, on page 131
- Additional References for the RESTCONF Protocol, on page 134
- Feature Information for the RESTCONF Protocol, on page 135

Prerequisites for the RESTCONF Protocol

- Enable the Cisco IOS-HTTP services for RESTCONF. For more information, see Examples for RESTCONF RPCs

Restrictions for the RESTCONF Protocol

The following restrictions apply to the RESTCONF protocol:

- Notifications and event streams
- YANG patch
- Optional query parameters, such as, filter, start-time, stop-time, replay, and action
- The RESTCONF feature is not supported on a device running dual IOSd configuration or software redundancy.
Information About RESTCONF Programmable Interface

Overview of RESTCONF

This section describes the protocols and modelling languages that enable a programmatic way of writing configurations to a network device.

- **RESTCONF**—Uses structured data (XML or JSON) and YANG to provide a REST-like APIs, enabling you to programmatically access different network devices. RESTCONF APIs use HTTPs methods.

- **YANG**—A data modelling language that is used to model configuration and operational features. YANG determines the scope and the kind of functions that can be performed by NETCONF and RESTCONF APIs.

In releases prior to Cisco IOS XE Fuji 16.8.1, an operational data manager (based on polling) was enabled separately. In Cisco IOS XE Fuji 16.8.1 and later releases, operational data works on platforms running NETCONF (similar to how configuration data works), and is enabled by default. For more information on the components that are enabled for operational data queries or streaming, see the GitHub repository, and view `-oper` in the naming convention.

HTTPs Methods

The HTTPS-based RESTCONF protocol (RFC 8040), is a stateless protocol that uses secure HTTP methods to provide CREATE, READ, UPDATE, and DELETE (CRUD) operations on a conceptual datastore containing YANG-defined data, which is compatible with a server that implements NETCONF datastores.

The following table shows how the RESTCONF operations relate to NETCONF protocol operations:

<table>
<thead>
<tr>
<th>OPTIONS</th>
<th>SUPPORTED METHODS</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>Read</td>
</tr>
<tr>
<td>PATCH</td>
<td>Update</td>
</tr>
<tr>
<td>PUT</td>
<td>Create or Replace</td>
</tr>
<tr>
<td>POST</td>
<td>Create or Operations (reload, default)</td>
</tr>
<tr>
<td>DELETE</td>
<td>Deletes the targeted resource</td>
</tr>
<tr>
<td>HEAD</td>
<td>Header metadata (no response body)</td>
</tr>
</tbody>
</table>

RESTCONF Root Resource

- A RESTCONF device determines the root of the RESTCONF API through the link element: `/.well-known/host-meta` resource that contains the RESTCONF attribute.

- A RESTCONF device uses the RESTCONF API root resource as the initial part of the path in the request URL.
Example:

Example returning /restconf:

The client might send the following:

```
GET /.well-known/host-meta HTTP/1.1
Host: example.com
Accept: application/xrd+xml
```

The server might respond as follows:

```
HTTP/1.1 200 OK
Content-Type: application/xrd+xml
Content-Length: nnn

<XRD xmlns='http://docs.oasis-open.org/ns/xri/xrd-1.0'>
  <Link rel='restconf' href='/restconf'/>
</XRD>
```

Example of URIs:

- GigabitEthernet0/0/2 -  
  https://10.104.50.97/restconf/data/Cisco-IOS-XE-native:native/interface/GigabitEthernet=0%2F0%2F2

- fields=name –  
  https://10.104.50.97/restconf/data/Cisco-IOS-XE-native:native/interface/GigabitEthernet=0%2F0%2F2?fields=name

- depth=1 -  

- Name and IP -  

- MTU (fields) -  

- MTU -  

- Port-Channel -  
  https://10.85.116.59/restconf/data/Cisco-IOS-XE-native/native/interface/Port-channel

- “Char” to “Hex” conversion chart: http://www.columbia.edu/kermit/ascii.html

**RESTCONF API Resource**

The API resource is the top-level resource located at +restconf. It supports the following media types:

- Application/YANG-Data+XML
- Application/YANG-Data+JSON

- The API resource contains the RESTCONF root resource for the RESTCONF DATASTORE and OPERATION resources. For example:
The client may then retrieve the top-level API resource, using the root resource "/restconf".

GET /restconf HTTP/1.1
Host: example.com
Accept: application/yang-data+json

The server might respond as follows:

HTTP/1.1 200 OK
Date: Thu, 26 Jan 2017 20:56:30 GMT
Server: example-server
Content-Type: application/yang-data+json

{}
  "ietf-restconf:restconf" : {
    "data" : {},
    "operations" : {},
    "yang-library-version" : "2016-06-21"
  }
}

For more information, refer to RFC 3986

Methods

Methods are HTTPS operations (GET/PATCH/POST/DELETE/OPTIONS/PUT) performed on a target resource. A YANG-formatted RPC invokes a particular method on a given resource that pertains to a target YANG model residing in the RESTCONF server. The uniform resource identifier (URI) acts as a location identification for a given resource, so that the client RESTCONF method can locate that particular resource to take an action specified by an HTTPS method or property.

For more information, see RFC 8040 - RESTCONF Protocol

How to Configure RESTCONF Programmable Interface

Authentication of NETCONF/RESTCONF Using AAA

Before you begin

NETCONF and RESTCONF connections must be authenticated using authentication, authorization, and accounting (AAA). As a result, RADIUS or TACACS+ users defined with privilege level 15 access are allowed access into the system.

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. aaa group server radius server-name
5. server-private ip-address key key-name
6. ip vrf forwarding vrf-name
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode  
*Example:* Device> enable  
- Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode.  
*Example:* Device# configure terminal |
| **Step 3** aaa new-model | Enables AAA.  
*Example:* Device(config)# aaa new-model |
| **Step 4** aaa group server radius server-name | Adds the RADIUS server and enters server group RADIUS configuration mode.  
*Example:* Device(config)# aaa group server radius ISE  
  - The *server-name* argument specifies the RADIUS server group name. |
| **Step 5** server-private ip-address key key-name | Configures a IP address and encryption key for a private RADIUS server.  
*Example:* Device(config-sg-radius)# server-private 172.25.73.76 key Cisco123 |
| **Step 6** ip vrf forwarding vrf-name | Configures the virtual routing and forwarding (VRF) reference of a AAA RADIUS or TACACS+ server group.  
*Example:* Device(config-sg-radius)# ip vrf forwarding Mgmt-intf |
| **Step 7** exit | Exits server group RADIUS configuration mode and returns to global configuration mode.  
*Example:* Device(config-sg-radius)# exit |
| **Step 8** aaa authentication login default group group-name local | Sets the specified group name as the default local AAA authentication during login.  
*Example:*

Enabling Cisco IOS HTTP Services for RESTCONF

Perform this task to use the RESTCONF interface.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. restconf
4. ip http secure-server
5. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

**Step 2**

**configure terminal**

**Example:**

Device# configure terminal

Enters global configuration mode.

**Step 3**

**restconf**

**Example:**

Device(config)# restconf

Enables the RESTCONF interface on your network device.

**Step 4**

**ip http secure-server**

**Example:**

Device(config)# ip http secure-server

Enables a secure HTTP (HTTPS) server.

**Step 5**

**end**

**Example:**

Device(config)# end

Exits global configuration mode and enters privileged EXEC mode

---

**Verifying RESTCONF Configuration**

When a device boots up with the startup configuration, the `nginx` process will be running. However; DMI processes are not enabled.

The following sample output from the `show platform software yang-management process monitor` command shows that the `nginx` process is running:

```
Device# show platform software yang-management process monitor

COMMAND       PID   S        VSZ    RSS  %CPU  %MEM   ELAPSED
nginx         27026 S  332356  18428 0.0    0.4     01:34
nginx         27032 S  337852  13600 0.0    0.3     01:34
```

NGINX is an internal webserver that acts as a proxy webserver. It provides Transport Layer Security (TLS)-based HTTPS. RESTCONF request sent via HTTPS is first received by the NGINX proxy web server, and the request is transferred to the confd web server for further syntax/semantics check.

The following sample output from the `show platform software yang-management process` command shows the status of the all processes when a device is booted with the startup-configuration:

```
Device# show platform software yang-management process

confd   : Not Running
nssd    : Not Running
syncfd  : Not Running
ncsshd  : Not Running
dmiauthd: Not Running
nginx   : Running
ndbman  : Not Running
```
The nginx process gets restarted and DMI process are started, when the restconf command is configured.

The following sample output from the show platform software yang-management process command shows that the nginx process and DMI processes are up and running:

Device# show platform software yang-management process

confd : Running
nssd : Running
syncfd : Running
ncsshd : Not Running! NETCONF-YANG is not configured, hence ncsshd process is not running.
dmi : Running
vtyserverutild : Running
opdatamgrd : Running
nginx : Running! nginx process is up due to the HTTP configuration, and it is restarted when RESTCONF is enabled.
ndbmand : Running

The following sample output from the show platform software yang-management process monitor command displays detailed information about all processes:

Device# show platform software yang-management process monitor

<table>
<thead>

</tr>
</tbody>
</table>

After AAA and the RESTCONF interface is configured, and nginx process and relevant DMI processes are running; the device is ready to receive RESTCONF requests.

Use the show netconf-yang sessions command to view the status of NETCONF/RESTCONF sessions:

Device# show netconf-yang sessions

R: Global-lock on running datastore
C: Global-lock on candidate datastore
S: Global-lock on startup datastore

Number of sessions : 1

<table>
<thead>
<tr>
<th>session-id</th>
<th>transport</th>
<th>username</th>
<th>source-host</th>
<th>global-lock</th>
</tr>
</thead>
<tbody>
<tr>
<td>19</td>
<td>netconf-ssh</td>
<td>admin</td>
<td>2001:db8::1</td>
<td>None</td>
</tr>
</tbody>
</table>

Use the show netconf-yang sessions detail command to view detailed information about NETCONF/RESTCONF sessions:

Device# show netconf-yang sessions detail
R: Global-lock on running datastore
C: Global-lock on candidate datastore
S: Global-lock on startup datastore

Number of sessions : 1
session-id : 19
transport : netconf-ssh

login-time : 2018-10-26T12:37:22+00:00
in-rpcs : 0
in-bad-rpcs : 0
out-rpc-errors : 0
out-notifications : 0
global-lock : None

Configuration Examples for RESTCONF Programmable Interface

Example: Configuring the RESTCONF Protocol

RESTCONF Requests (HTTPS Verbs):
The following is a sample RESTCONF request that shows the HTTPS verbs allowed on a targeted resource. In this example, the logging monitor command is used..

```
root:~# curl -i -k -X "OPTIONS"
  \   -H 'Accept: application/yang-data+json' \
  > -u 'admin:admin'
HTTP/1.1 200 OK
Server: nginx
Date: Mon, 23 Apr 2018 15:27:57 GMT
Content-Type: text/html
Content-Length: 0
Connection: keep-alive
Allow: DELETE, GET, HEAD, PATCH, POST, PUT, OPTIONS

POST (Create) Request

The POST operation creates a configuration which is not present in the targeted device.

Note: Ensure that the logging monitor command is not available in the running configuration.

The following sample POST request uses the logging monitor alerts command.
> -H 'Content-Type: application/yang-data+json' \
> -H 'Accept: application/yang-data+json' \
> -u 'admin:admin' \
> -d $'{
>   "severity": "alerts"
> }'
HTTP/1.1 201 Created
Server: nginx
Date: Mon, 23 Apr 2018 14:53:51 GMT
Content-Type: text/html
Content-Length: 0
Location: https://10.85.116.30/restconf/data/Cisco-IOS-XE-native:native/logging/monitor/severity
Connection: keep-alive
Last-Modified: Mon, 23 Apr 2018 14:53:51 GMT
Cache-Control: private, no-cache, must-revalidate, proxy-revalidate
Pragma: no-cache
Device:~#

PUT: (Create or Replace) Request:

If the specified command is not present on the device, the POST request creates it; however, if it is already present in the running configuration, the command will be replaced by this request.

The following sample PUT request uses the `logging monitor warnings` command.

> -H 'Content-Type: application/yang-data+json' \
> -H 'Accept: application/yang-data+json' \
> -u 'admin:admin' \
> -d $'{
>   "severity": "warnings"
> }'
HTTP/1.1 204 No Content
Server: nginx
Date: Mon, 23 Apr 2018 14:58:36 GMT
Content-Type: text/html
Content-Length: 0
Location: https://10.85.116.30/restconf/data/Cisco-IOS-XE-native:native/logging/monitor/severity
Connection: keep-alive
Last-Modified: Mon, 23 Apr 2018 14:57:46 GMT
Cache-Control: private, no-cache, must-revalidate, proxy-revalidate
Pragma: no-cache
Device:~#

PATCH: (Update) Request

The following sample PATCH request uses the `logging monitor informational` command.

> -H 'Content-Type: application/yang-data+json' \
> -H 'Accept: application/yang-data+json' \
> -u 'admin:admin' \
> -d $'

GET Request (To Read)

The following sample GET request uses the **logging monitor informational** command.

```
Device:~# curl -i -k -X "GET" \\
\> -H 'Accept: application/yang-data+json' \\
\> -u 'admin:admin'
```

```
HTTP/1.1 200 OK
Server: nginx
Date: Mon, 23 Apr 2018 15:10:59 GMT
Content-Type: application/yang-data+json
Transfer-Encoding: chunked
Connection: keep-alive
Cache-Control: private, no-cache, must-revalidate, proxy-revalidate
Pragma: no-cache

{
    "Cisco-IOS-XE-native:severity": "informational"
}
```

```
Device:~#
```

DELETE Request (To Delete the Configuration)

```
Device:~# curl -i -k -X "DELETE" \\
\> -H 'Content-Type: application/yang-data+json' \\
\> -H 'Accept: application/yang-data+json' \\
\> -u 'admin:admin'
```

```
HTTP/1.1 204 No Content
Server: nginx
Date: Mon, 23 Apr 2018 15:26:05 GMT
Content-Type: text/html
Content-Length: 0
```

```
Device:~#
```

Feature Information for the RESTCONF Protocol

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
### Feature Information for the RESTCONF Protocol

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| RESTCONF Protocol | Cisco IOS XE Everest 16.6.1 | RESTCONF provides a programmatic interface based on standard mechanisms for accessing configuration data, state data, data-model-specific RPC operations and event notifications defined in the YANG model. This feature was introduced on the following platforms:  
  - Cisco 4000 Series Integrated Services Router  
  - Cisco ASR 1000 Aggregation Services Routers  
  - Cisco Cloud Services Router 1000V Series  
  The following commands were introduced or modified: `ip http server` and `restconf` |
| Cisco IOS XE Fuji 16.8.1a | In Cisco IOS XE Fuji 16.8.1a, this feature was implemented on the following platforms:  
  - Cisco 1000 Series Integrated Services Routers  
  - Cisco ASR 900 Series Aggregation Services Routers  
  - Cisco ASR 920 Series Aggregation Services Router  
  - Cisco Catalyst 3650 Series Switches  
  - Cisco Catalyst 3850 Series Switches  
  - Cisco Catalyst 9300 Series Switches  
  - Cisco Catalyst 9400 Series Switches  
  - Cisco Catalyst 9500 and 9500-High Performance Series Switches  
  - Cisco cBR-8 Converged Broadband Router  
  - Cisco Network Convergence System 4200 Series |
| Cisco IOS XE Fuji 16.9.2 | In Cisco IOS XE Fuji 16.9.2, this feature was implemented on the following platforms:  
  - Cisco Catalyst 9200 and 9200L Series Switches  
  - Cisco Catalyst 9300L SKUs |
CHAPTER 10

gNMI Protocol

This feature describes the model-driven configuration and retrieval of operational data using the gNMI CAPABILITIES, GET and SET RPCs. gNMI version 0.4.0 is supported.

- Restrictions for gNMI Protocol, on page 137
- Information About the gNMI Protocol, on page 138
- How to Enable the gNMI Protocol, on page 144
- Configuration Examples for Enabling the gNMI Protocol, on page 149
- Additional References for the gNMI Protocol, on page 150
- Feature Information for the gNMI Protocol, on page 150

Restrictions for gNMI Protocol

- Use of the Origin field in the path message is not supported. A non-empty value will cause an error to be returned.

- Subscribe RPC services

- JSON, BYTES, PROTO, and ASCI encoding options
  JSON keys must contain a YANG-prefix where the namespace of the following elements differs from the parent. This means that the routed-vlan derived from augmentation in openconfig-vlan.yang must be entered as oc-vlan:routed-vlan because it is different from the namespace of the parent nodes (parent nodes have the prefix, oc-if)

- GetRequest:
  - Operational data type
  - Use models

- GetResponse Notifictions
  - Alias
  - Delete

- In a SetRequest, wildcards and all keys are not supported. Only fully-specified paths are supported.
Information About the gNMI Protocol

About GNMI

gNMI is gRPC network management protocol developed by Google. gNMI provides the mechanism to install, manipulate, and delete the configuration of network devices, and also to view operational data. The content provided through gNMI can be modeled using YANG.

gRPC is a remote procedure call developed by Google for low-latency, scalable distributions with mobile clients communicating to a cloud server. gRPC carries gNMI, and provides the means to formulate and transmit data and operation requests.

When a failure occurs, the gNMI broker (GNMIB) will indicate an operational change of state from up to down, and all RPCs will return a service unavailable message until the database is up and running. Upon recovery, the GNMIB will indicate a change of operation state from down to up, and resume normal handling of RPCs.

Overview of RFC 7951

RFC 7951 defines JavaScript Object Notation (JSON) encoding for YANG data trees and their subtrees. Instances of YANG data nodes (leafs, containers, leaf-lists, lists, anydata nodes, and anyxml nodes) are encoded as members of a JSON object or name/value pairs. Encoding rules are identical for all types of data trees, such as configuration data, state data, parameters of RPC operations, actions, and notifications.

Every data node instance is encoded as a name/value pair where the name is formed from the data node identifier. The value depends on the category of the data node.

The "leaf" Data Node

A leaf node has a value, but no children, in a data tree. A leaf instance is encoded as a name/value pair. The value can be a string, number, literal "true" or "false", or the special array "[null]", depending on the type of the leaf. In the case that the data item at the specified path is a leaf node (i.e., has no children, and an associated value) the value of that leaf is encoded directly - i.e., the "bare" value is specified (i.e., a JSON object is not required, and a bare JSON value is included).

The following example shows a leaf node definition:

```plaintext
leaf foo {
  type uint8;
}
```

The following is a valid JSON-encoded instance:

```json
"foo": 123
```

gNMI GET Request

The gNMI GET RPC specifies how to retrieve one or more of the configuration attributes, state attributes, derived state attributes, or all attributes associated with a supported mode from a data tree. A GetRequest is sent from a client to the target to retrieve values from the data tree. A GetResponse is sent in response to a GetRequest.
The following example shows a Get Request on JSON structure:

Creating a path object for xpath: /oc-if:interfaces/interface[name=Loopback111]

++++++ Sending get request: ++++++++ 
path {
  elem {
    name: "oc-if:interfaces"
  }
  elem {
    name: "interface"
    key {
      key: "name"
      value: "Loopback111"
    }
  }
}

encoding: JSON_IETF

++++++ Received get response: ++++++++ 
notification {
  timestamp: 1521699434792345469
  update {
    path {
      elem {
        name: "oc-if:interfaces"
      }
      elem {
        name: "interface"
        key {
          key: "name"
          value: "Loopback111"
        }
      }
    }
    val {
      openconfig-interfaces:name: "Loopback111",
      openconfig-interfaces:config: {
        openconfig-interfaces:type: "ianaift:softwareLoopback",
        openconfig-interfaces:name: "Loopback111",
        openconfig-interfaces:enabled: true,
        openconfig-interfaces:state: {
          openconfig-interfaces:type: "ianaift:softwareLoopback",
          openconfig-interfaces:name: "Loopback111",
          openconfig-interfaces:enabled: true,
          openconfig-interfaces:ifindex: 52,
          openconfig-interfaces:admin-status: "UP",
          openconfig-interfaces:oper-status: "UP",
          openconfig-interfaces:last-change: 2018,
          openconfig-interfaces:counters: {
            openconfig-interfaces:in-octets: 0,
            openconfig-interfaces:in-unicast-pkts: 0,
            openconfig-interfaces:in-broadcast-pkts: 0,
            openconfig-interfaces:in-multicast-pkts: 0,
            openconfig-interfaces:in-discards: 0,
            openconfig-interfaces:in-errors: 0,
            openconfig-interfaces:last-clear: 2018,
            openconfig-interfaces:subinterfaces: {
              openconfig-interfaces:subinterface: {
                openconfig-platform:hardware-port: "Loopback111"
              }
            }
          }
        }
      }
    }
  }
}
The following example shows a GetRequest on a leaf on JSON structure:

Creating a path object for xpath:
```
/oc-if:interfaces/interface[name=Loopback111]/state/oper-status
```
++++++++ Sending get request: ++++++++```

gNMI SetRequest

The Set RPC specifies how to set one or more configurable attributes associated with a supported model. A SetRequest is sent from a client to a target to update the values in the data tree.

In a SetRequest, only fully-specified (wildcards, and all keys-specified paths are not supported.) paths, and "json_i etf_val" or "json_val" TypedValue are supported. JSON keys must contain a YANG-prefix, in which the namespace of the following element differs from parent. The “routed-vlan” element derived from augmentation in openconfig-vlan.yang must be entered as “oc-vlan:routed-vlan”, because it is different from the namespace of the parent node (The parent node prefix is oc-if).

The total set of deletes, replace, and updates contained in any one SetRequest is treated as a single transaction. If any subordinate element of the transaction fails; the entire transaction will be disallowed and rolled back. A SetResponse is sent back for a SetRequest.

The following example shows a SetRequest on JSON structure:

Creating UPDATE update for /oc-if:interfaces/interface[name=Loopback111]/config/
Creating a path object for xpath: /oc-if:interfaces/interface[name=Loopback111]/config/
++++++++++++ Sending set request: ++++++++ update {
  path {
    elem {
      name: "oc-if:interfaces"
    }
    elem {
      name: "interface"
      key {
        key: "name"
        value: "\"Loopback111\"
      }
    }
    elem {
      name: "config"
    }
  }
  val {
    json_i etf_val: "\"UP\"
  }
}

The following example shows a SetRequest on leaf on JSON structure:

Creating UPDATE update for /oc-if:interfaces/interface[name=Loopback111]/config/description
Creating a path object for xpath:
/oc-if:interfaces/interface[name=Loopback111]/config/description

+++++++ Sending set request: ++++++++

update {
  path {
    elem {
      name: "oc-if:interfaces"
    }
    elem {
      name: "interface"
      key {
        key: "name"
        value: "Loopback111"
      }
    }
    elem {
      name: "config"
    }
    elem {
      name: "description"
    }
  }
  val {
    json_ietf_val: "\"UPDATE DESCRIPTION\""
  }
}

+++++++ Received set response: ++++++++
value: "Loopback111"
}
}
elem {
  name: "config"
}
elem {
  name: "description"
}
}
op: UPDATE
}
timestamp: 1521699342123890045

**gNMI JSON_ietf_val**

The JSON type indicates that the value is encoded as a JSON string as specified in RFC 7159. Additional types (such as, JSON_IETF) indicate specific additional characteristics of the encoding of the JSON data (particularly where they relate to serialisation of YANG-modeled data).

The following is a sample JSON_ietf_val message:

```json
val {
  json_ietf_val:"{
    "oc-if:config": {
      "oc-if:description": "UPDATE DESCRIPTION"
    }
  }
}
```

**gNMI Error Messages**

When errors occur, gNMI returns descriptive error messages. The following section displays some gNMI error messages.

The following sample error message is displayed when the path is invalid:

```
gNMI Error Response:
< Rendezvous of RPC that terminated with (StatusCode.TERMINATED,
   An error occurred while parsing provided xpath: unknown tag:
     "someinvalidxpath" Additional information: badly formatted or nonexistent path)>
```

The following sample error message is displayed for an unimplemented error:

```
gNMI Error Response:
< Rendezvous of RPC that terminated with (StatusCode.UNIMPLEMENTED,
   Requested encoding "ASCII" not supported)>
```

The following sample error message is displayed when the data element is empty:

```
gNMI Error Response:
< Rendezvous of RPC that terminated with (StatusCode.NOT_FOUND,
   "oc-if:config": "",
  "oc-if:description": "UPDATE DESCRIPTION"
}
```

Programmability Configuration Guide, Cisco IOS XE Fuji 16.9.x
How to Enable the gNMI Protocol

Creating Certs with OpenSSL on Linux

Certs and trustpoint are only required for secure gNMI servers.

The following example shows how to create Certs with OpenSSL on a Linux machine:

```
# Setting up a CA
openssl genrsa -out rootCA.key 2048
openssl req -subj /C=/ST=/L=/O=/CN=rootCA -x509 -new -nodes -key rootCA.key -sha256 -out rootCA.pem

# Setting up device cert and key
openssl genrsa -out device.key 2048
openssl req -subj /C=/ST=/L=/O=/CN=<hostnameFQDN> -new -key device.key -out device.csr
openssl x509 -req -in device.csr -CA rootCA.pem -CAkey rootCA.key -CAcreateserial -out device.crt -sha256
# Encrypt device key - needed for input to IOS
openssl rsa -des3 -in device.key -out device.des3.key -passout pass:<password - remember this for later>

# Setting up client cert and key
openssl genrsa -out client.key 2048
openssl req -subj /C=/ST=/L=/O=/CN=gnmi_client -new -key client.key -out client.csr
openssl x509 -req -in client.csr -CA rootCA.pem -CAkey rootCA.key -CAcreateserial -out client.crt -sha256
```

Installing Certs on a Device

The following example show how to install certs on a device:

```
# Send:
Device# configure terminal
Device(config)# crypto pki import trustpoint1 pem terminal password password1

# Receive:
% Enter PEM-formatted CA certificate.
% End with a blank line or "quit" on a line by itself.

# Send:
# Contents of rootCA.pem, followed by newline + 'quit' + newline:
-----BEGIN CERTIFICATE-----
<snip>
-----END CERTIFICATE-----
quit

# Receive:
% Enter PEM-formatted encrypted private General Purpose key.
% End with "quit" on a line by itself.

# Send:
# Contents of device.des3.key, followed by newline + 'quit' + newline:
-----BEGIN RSA PRIVATE KEY-----
Enabling gNMI in Insecure Mode

Note This task is applicable in Cisco IOS XE Fuji 16.8.1 through Amsterdam 17.2.x.

In a Day Zero setup, first enable the device in insecure mode, then disable it, and enable the secure mode. To stop gNMI in insecure mode, use the no gnmi-yang server command.

Note gNMI insecure and secure servers can run simultaneously.

SUMMARY STEPS

1. enable
2. configure terminal
3. gnmi-yang
4. gnmi-yang server
5. gnmi-yang port port-number
6. end
7. show gnmi-yang state
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  
| Example: | Device> enable | - Enter your password if prompted. |
| 2    | configure terminal | Enters global configuration mode. |
| Example: | Device# configure terminal | |
| 3    | gnmi-yang         | Starts the gNMI process. |
| Example: | Device(config)# gnmi-yang | |
| 4    | gnmi-yang server  | Enables the gNMI server in insecure mode. |
| Example: | Device(config)# gnmi-yang server | |
| 5    | gnmi-yang port *port-number* | Sets the gNMI port to listen to.  
| Example: | (Optional) Device(config)# gnmi-yang port 50000 | - The default insecure gNMI port is 9339. |
| 6    | end               | Exits global configuration mode and returns to privileged EXEC mode. |
| Example: | Device(config)# end | |
| 7    | show gnmi-yang state | Displays the status of gNMI servers. |
| Example: | Device# show gnmi-yang state | |

**Example**

The following is sample output from the **show gnmi-yang state** command:

```
Device# show gnmi-yang state
State Status
-------------------------
Enabled Up
```
Enabling gNMI in Secure Mode

Note
This task is applicable in Cisco IOS XE Fuji 16.8.1 through Amsterdam 17.2.x.

To stop gNMI in secure mode, use the no gnmi-yang secure-server command.

Note
gNMI in insecure and secure servers can run simultaneously.

SUMMARY STEPS

1. enable
2. configure terminal
3. gnmi-yang
4. gnmi-yang secure-server
5. gnmi-yang secure-trustpoint trustpoint-name
6. gnmi-yang secure-client-auth
7. gnmi-yang secure-port
8. end
9. show gnmi-yang state

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

</table>

### Example

The following is sample output from the `show gnmi-yang state` command:

```
Device# show gnmi-yang state
State Status
----------------------------------
Enabled Up
```

### Connecting the gNMI Client

The gNMI client is connected by using the client and root certificates that are previously configured.

The following example shows how to connect the gNMI client using Python:

```
# gRPC Must be compiled in local dir under path below:
>>> import sys
>>> sys.path.insert(0, "reference/rpc/gnmi/")
>>> import grpc
>>> import gnmi_pb2
>>> import gnmi_pb2_grpc
>>> gnmi_dir = '/path/to/where/openssl/creds/were/generated/

# Certs must be read in as bytes
>>> with open(gnmi_dir + 'rootCA.pem', 'rb') as f:
>>>     ca_cert = f.read()
>>> with open(gnmi_dir + 'client.crt', 'rb') as f:
>>>     client_cert = f.read()
>>> with open(gnmi_dir + 'client.key', 'rb') as f:
>>>     client_key = f.read()

# Create credentials object
```
>>> credentials = grpc.ssl_channel_credentials(root_certificates=ca_cert,
private_key=client_key, certificate_chain=client_cert)

# Create a secure channel:
# Default port is 50052, can be changed on ios device with 'gnmi-yang secure-port ###'
>>> port = 50052
>>> host = <HOSTNAME FQDN>
>>> secure_channel = grpc.secure_channel("%s:%d" % (host, port), credentials)

# Create secure stub:
>>> secure_stub = gnmi_pb2_grpc.gNMIStub(secure_channel)

# Done! Let's test to make sure it works:
>>> secure_stub.Capabilities(gnmi_pb2.CapabilityRequest())
supported_models {
<snip>
supported_encodings: <snip>
gNMI_version: "0.4.0"

---

### Configuration Examples for Enabling the gNMI Protocol

#### Example: Enabling the gNMI Protocol

This example is applicable in Cisco IOS XE Fuji 16.8.1 through Amsterdam 17.2.x.

---

#### Example: Enabling gNMI in Insecure Mode

The following example shows how to enable the gNMI server in insecure mode:

Device# configure terminal
Device(config)# gnmi-yang
Device(config)# gnmi-yang server
Device(config)# gnmi-yang port 50000 <The default port is 9339.>
Device(config)# end
Device#

#### Example: Enabling gNMI in Secure Mode

The following example shows how to enable the gNMI server in secure mode:

Device# configure terminal
Device(config)# gnmi-yang server
Device(config)# gnmi-yang secure-server
Device(config)# gnmi-yang secure-trustpoint trustpoint1
Device(config)# gnmi-yang secure-client-auth

## Feature Information for the gNMI Protocol

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
### Table 16: Feature Information for the gNMI Protocol

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| gNMI Protocol    | Cisco IOS XE Fuji 16.8.1a | This feature describes the model-driven configuration and retrieval of operational data using the gNMI capabilities, GET and SET RPCs. This feature was implemented on the following platforms:  
• Cisco Catalyst 9300 Series Switches  
• Cisco Catalyst 9400 Series Switches  
• Cisco Catalyst 9500 Series Switches |
| Cisco IOS XE Gibraltar 16.10.1 | gNMI namespaces and gNMI wildcards support were added to the following platforms:  
• Cisco Catalyst 9300 Series Switches  
• Cisco Catalyst 9400 Series Switches  
• Cisco Catalyst 9500 Series Switches |
Model Based AAA

The NETCONF and RESTCONF interfaces implement the NETCONF Access Control Model (NACM). NACM is a form of role-based access control (RBAC) specified in RFC 6536.

- Model Based AAA, on page 153
- Additional References for Model Based AAA, on page 159
- Feature Information for Model-Based AAA, on page 159

Prerequisites for Model Based AAA

Working with the model based AAA feature requires prior understanding of the following:

- NETCONF-YANG
- NETCONF-YANG kill-session
- RFC 6536: Network Configuration Protocol (NETCONF) Access Control Model

Initial Operation

Upon enabling the NETCONF and/or RESTCONF services, a device that has no prior configuration of the /nacm subtree will deny read, write, and execute access to all operations and data other than the users of privilege level 15. This is described in the following configuration of the /nacm subtree:

```
<nacm xmlns="urn:ietf:params:xml:ns:yang:ietf-netconf-acm">
  <enable-nacm>true</enable-nacm>
  <read-default>deny</read-default>
  <write-default>deny</write-default>
  <exec-default>deny</exec-default>
  <enable-external-groups>true</enable-external-groups>
  <rule-list>
    <name>admin</name>
    <group>PRIV15</group>
    <rule>
      <name>permit-all</name>
      <module-name>*</module-name>
      <access-operations>*</access-operations>
      <action>permit</action>
  </rule>
</nacm>
```
Group Membership

The group membership of a user can come from two sources—first, from the privilege level of the user as configured on the AAA server used for authorization, and second, from those configured in the /nacm/groups subtree. The names of the groups that correspond to each privilege level are as follows:

<table>
<thead>
<tr>
<th>Privilege level</th>
<th>NACM group name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>PRIV00</td>
</tr>
<tr>
<td>1</td>
<td>PRIV01</td>
</tr>
<tr>
<td>2</td>
<td>PRIV02</td>
</tr>
<tr>
<td>3</td>
<td>PRIV03</td>
</tr>
<tr>
<td>4</td>
<td>PRIV04</td>
</tr>
<tr>
<td>5</td>
<td>PRIV05</td>
</tr>
<tr>
<td>6</td>
<td>PRIV06</td>
</tr>
<tr>
<td>7</td>
<td>PRIV07</td>
</tr>
<tr>
<td>8</td>
<td>PRIV08</td>
</tr>
<tr>
<td>9</td>
<td>PRIV09</td>
</tr>
<tr>
<td>10</td>
<td>PRIV10</td>
</tr>
<tr>
<td>11</td>
<td>PRIV11</td>
</tr>
<tr>
<td>12</td>
<td>PRIV12</td>
</tr>
<tr>
<td>13</td>
<td>PRIV13</td>
</tr>
<tr>
<td>14</td>
<td>PRIV14</td>
</tr>
<tr>
<td>15</td>
<td>PRIV15</td>
</tr>
</tbody>
</table>

Note: Traditional IOS command authorization, such as those based on privilege level, does not apply to NETCONF or RESTCONF.

Note: Access granted to a NACM group based on a privilege level do not inherently apply to NACM groups with higher privilege level. For example, rules that apply to PRIV10 do not automatically apply to PRIV11, PRIV12, PRIV13, PRIV14, and PRIV15 as well.
NACM Privilege Level Dependencies

If the AAA configuration is configured with `no aaa new-model`, the privilege level locally configured for the user is used. If the AAA configuration is configured with `aaa new-model`, the privilege level is determined by the AAA servers associated with the method list `aaa authorization exec default`.

NACM Configuration Management and Persistance

The NACM configuration can be modified using NETCONF or RESTCONF. In order for a user to be able to access the NCAM configuration, they must have explicit permission to do so, that is, through a NACM rule. Configuration under the `/nacm` subtree persists when the `copy running-config startup-config` EXEC command is issued, or the `cisco-ia:save-config` RPC is issued.

```xml
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <save-config xmlns="http://cisco.com/yang/cisco-ia"/>
</rpc>
```

Note: The NACM rules that apply to a NETCONF session are those that are configured in the `/nacm` subtree at the time of session establishment. Modifying the `/nacm` subtree has no effect on NETCONF sessions as they are already established. The `<kill-session>` RPC or the `clear netconf-yang session` EXEC command can be used to forcibly end an unwanted NETCONF session. See NETCONF Kill Session, on page 107.

Note: Care should be taken when crafting rules to deny access to certain data as the same data may be exposed through multiple YANG modules and data node paths. For example, interface configuration is exposed through both `Cisco-IOS-XE-native` and `ietf-interface`. Rules that may apply to one representation of the same underlying data may not apply to other representations of that data.

Resetting the NACM Configuration

Use the following command to reset the `/nacm` subtree configuration to the initial configuration (see Initial Operation).

```
Router#request platform software yang-management nacm reset-config
```

Sample NACM Configuration

Note: The examples in this section are for illustrative purposes only.

The following is a sample for groups configuration.

```xml
<nacm xmlns="urn:ietf:params:xml:ns:yang:ietsconf-ncm">
  <groups>
    <group>
      <name>administrators</name>
      <user-name>admin</user-name>
      <user-name>root</user-name>
```

Programmability Configuration Guide, Cisco IOS XE Fuji 16.9.x
Table 17: Description of the Configuration Parameters for Groups Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;name&gt;administrators&lt;/name&gt;</code></td>
<td>Group name</td>
</tr>
<tr>
<td><code>&lt;user-name&gt;admin&lt;/user-name&gt;</code></td>
<td>User name</td>
</tr>
<tr>
<td><code>&lt;user-name&gt;root&lt;/user-name&gt;</code></td>
<td>User name</td>
</tr>
</tbody>
</table>

The following is a sample for creating module rules.

```
<nacm xmlns="urn:ietf:params:xml:ns:yang:iqet-netconf-acm">
  <rule-list>
    <name>only-ietf-interfaces</name>
    <group>limited-permission</group>
    <rule>

<td>CRUDx operation types</td>
</tr>
<tr>
<td><code>&lt;action&gt;deny&lt;/action&gt;</code></td>
<td>Permit/deny</td>
</tr>
</tbody>
</table>

The following is a sample for creating protocol operation rules.
<nacm xmlns="urn:ietf:params:xml:ns:yang:ietf-netconf-acm">
  <rule-list>
    <name>only-get</name>
    <group>limited-permission</group>
    
    <rule>
      <name>deny-edit-config</name>
      <module-name>ietf-netconf</module-name>
      <rpc-name>edit-config</rpc-name>
      <access-operations>exec</access-operations>
      <action>deny</action>
    </rule>
    
    <rule>
      <name>allow-get</name>
      <module-name>ietf-netconf</module-name>
      <rpc-name>get</rpc-name>
      <access-operations>exec</access-operations>
      <action>permit</action>
    </rule>
  </rule-list>
</nacm>

Table 19: Description of the Configuration Parameters for Creating Protocol Operation Rules

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;name&gt;only-get&lt;/name&gt;</td>
<td>Unique rule-list name</td>
</tr>
<tr>
<td>&lt;group&gt;limited-permission&lt;/group&gt;</td>
<td>Groups that rule-list applies to</td>
</tr>
<tr>
<td>&lt;name&gt;deny-edit-config&lt;/name&gt;</td>
<td>Unique rule name</td>
</tr>
<tr>
<td>&lt;module-name&gt;ietf-netconf&lt;/module-name&gt;</td>
<td>Name of module containing the RPC</td>
</tr>
<tr>
<td>&lt;rpc-name&gt;edit-config&lt;/rpc-name&gt;</td>
<td>Name of the RPC</td>
</tr>
<tr>
<td>&lt;access-operations&gt;exec&lt;/access-operations&gt;</td>
<td>Execute permission for the RPC</td>
</tr>
<tr>
<td>&lt;action&gt;deny&lt;/action&gt;</td>
<td>Permit/deny</td>
</tr>
</tbody>
</table>

The following is a sample for creating data node rules.

<nacm xmlns="urn:ietf:params:xml:ns:yang:ietf-netconf-acm">
  <rule-list>
    <name>hide-enable-passwords</name>
    <group>limited-permission</group>
    
    <rule>
      <name>deny-enable-passwords</name>
      <access-operations>*</access-operations>
      <action>deny</action>
    </rule>
  </rule-list>
</nacm>
### Table 20: Description of the Configuration Parameters for Creating Data Node Rules

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;name&gt;hide-enable-passwords&lt;/name&gt;</code></td>
<td>Unique rule-list name</td>
</tr>
<tr>
<td><code>&lt;group&gt;limited-permission&lt;/group&gt;</code></td>
<td>Groups that rule-list applies to</td>
</tr>
<tr>
<td><code>&lt;name&gt;deny-enable-passwords&lt;/name&gt;</code></td>
<td>Unique rule name</td>
</tr>
<tr>
<td><code>&lt;path xmlns:ios=&quot;http://cisco.com/ns/yang/Cisco-IOS-XE-native&quot;&gt;ios:native/enable&lt;/path&gt;</code></td>
<td>Path to the data node being granted/denied</td>
</tr>
<tr>
<td><code>&lt;access-operations&gt;*&lt;/access-operations&gt;</code></td>
<td>CRU Dx operation types</td>
</tr>
<tr>
<td><code>&lt;action&gt;deny&lt;/action&gt;</code></td>
<td>Permit/deny</td>
</tr>
</tbody>
</table>

The following is an example NACM configuration that permits all groups to use the standard NETCONF RPCs `<get>` and `<get-config>`, the schema download RPC `<get-schema>`, and read-only access to the data in the module `ietf-interfaces`:

```xml
<nacm xmlns="urn:ietf:params:xml:ns:yang:ietf-netconf-acm">
  <rule-list>
    <name>readonly-protocol</name>
    <group>*</group>
    <rule>
      <name>get-permit</name>
      <module-name>ietf-netconf</module-name>
      <rpc-name>get</rpc-name>
      <access-operations>exec</access-operations>
      <action>permit</action>
    </rule>
    <rule>
      <name>get-config-permit</name>
      <module-name>ietf-netconf</module-name>
      <rpc-name>get-config</rpc-name>
      <access-operations>exec</access-operations>
      <action>permit</action>
    </rule>
    <rule>
      <name>get-schema-permit</name>
      <module-name>ietf-netconf-monitoring</module-name>
      <rpc-name>get-schema</rpc-name>
      <access-operations>exec</access-operations>
      <action>permit</action>
    </rule>
  </rule-list>
  <rule-list>
    <name>readonly-data</name>
    <group>*</group>
    <rule>
      <name>ietf-interfaces-permit</name>
      <module-name>ietf-interfaces</module-name>
      <access-operations>read</access-operations>
      <action>permit</action>
    </rule>
  </rule-list>
</nacm>
```

Model-Driven Telemetry

Model-driven telemetry allows network devices to continuously stream real-time configuration and operating state information to subscribers.

Applications can subscribe to specific data items they need, by using standard-based YANG data models over NETCONF-YANG.

Structured data is published at a defined cadence, or on-change, based upon the subscription criteria and data type.

Prerequisites for Model-Driven Telemetry

- Knowledge of NETCONF-YANG and how to use it, including:
  - Establishing a NETCONF session.
  - Sending/receiving hello and capabilities messages.
  - Sending/receiving YANG XML remote procedure calls (RPCs) over the established NETCONF session. For more information, see the Configuration Example for NETCONF-YANG.

For more information on NETCONF-YANG, see the Datamodels chapter.

- Knowledge of XML, XML namespaces, and XML XPath.

- Knowledge of standards and principles defined by the IETF telemetry specification.

- NETCONF-YANG must be configured and running on the device. Verify that the following processes are running, by using the show platform software yang-management process command:

Device# show platform software yang-management process

<table>
<thead>
<tr>
<th>Process</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>confd</td>
<td>Running</td>
</tr>
<tr>
<td>nesd</td>
<td>Running</td>
</tr>
<tr>
<td>syncfd</td>
<td>Running</td>
</tr>
<tr>
<td>ncsshd</td>
<td>Running</td>
</tr>
<tr>
<td>dmiauthd</td>
<td>Running</td>
</tr>
</tbody>
</table>
The process pubd is the model-driven telemetry process, and if it is not running, model-driven telemetry will not work.

- The urn:ietf:params:netconf:capability:notification:1.1 capability must be listed in the hello message. This capability is advertised only on devices that support IETF telemetry.

### Information About Model-Driven Telemetry

#### Model-Driven Telemetry Overview

Telemetry is an automated communications process by which measurements and other data are collected at remote or inaccessible points and transmitted to receiving equipment for monitoring. Model-driven telemetry provides a mechanism to stream data from a model-driven telemetry-capable device to a destination.

Telemetry uses a subscription model to identify information sources and destinations. Model-driven telemetry replaces the need for the periodic polling of network elements; instead, a continuous request for information to be delivered to a subscriber is established upon the network element. Then, either periodically, or as objects change, a subscribed set of YANG objects are streamed to that subscriber.

The data to be streamed is driven through subscriptions. Subscriptions allow applications to subscribe to updates (automatic and continuous updates) from a YANG datastore, and this enables the publisher to push and in effect stream those updates.

#### Subscription Overview

Subscriptions are items that create associations between telemetry roles, and define the data that is sent between them.

Specifically, a subscription is used to define the set of data that is requested as part of the telemetry data; when the data is required, how the data is to be formatted, and, when not implicit, who (which receivers) should receive the data.

Even though the maximum number of supported subscriptions is platform-dependent, currently 100 subscriptions are supported. The subscriptions can be either configured or dynamic, and use any combination of transport protocols. If too many subscriptions are operating at the same time to allow all the valid configured subscriptions to be active, the removal of an active subscription will cause one of the inactive but valid configured subscriptions to be attempted. Periodic triggered subscriptions (100 centiseconds is the default minimum) and on-change triggered subscriptions are supported.
NETCONF and other northbound programmable interfaces (such as RESTCONF or gNMI) are supported to configure subscriptions.

Two types of subscriptions are used in telemetry on Cisco IOS XE systems: dynamic and configured subscriptions.

Because dynamic subscriptions are created by clients (the subscriber) that connect into the publisher, they are considered dial-in. Configured subscriptions cause the publisher to initiate connections to receivers, and as a result, they are considered dial-out.

**Sample <establish-subscription> RPC**

The following is a sample `<establish-subscription>` RPC. The stream, xpath-filter, and period fields in the RPC are mandatory.

```
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <establish-subscription
    xmlns="urn:ietf:params:xml:ns:yang:ietf-event-notifications"
    <stream>yp:yang-push</stream>
    <yp:period>1000</yp:period>
  </establish-subscription>
</rpc>
```

**YANG-Push**

RFC 6020: YANG - A Data Modeling Language for the Network Configuration Protocol (NETCONF) and RFC 6241: Network Configuration Protocol (NETCONF) and explain YANG-push, which is the subscription and push mechanism for YANG databases. YANG-push subscriptions are defined using a data model. Using YANG-push, subscriber applications can request a continuous, customized stream of updates from YANG databases. The YANG-push encompasses all data in the configuration and operational databases that is described by the YANG model installed on a device. You must provide a filter for data, as subscription to all data is not supported.

---

**Note**

The yang-push stream must be specified.

**XPath Filter Support**

The dataset within the “yang-push” stream to be subscribed to is specified by the use of an XPath filter. However, XPath is far more expressive than what is needed when specifying data for the ‘yang-push’ streams, so the following limitations are placed on the XPath expression:

1. It must specify a single object. That object can be a container, a leaf, a leaf-list or a list.

2. It may have keys to specify a single entry in a list or container. The supported key specification syntax is “{key name}={key value}”. Compound keys are supported by the use of multiple key specifications. The key names and values must be exact; no ranges or wildcard values are supported.

3. The use of the union operator (|) is supported to allow a single subscription to support multiple objects. The union operator only works for NETCONF transport and not for gRPC.
Periodic Publication

With periodic subscriptions, the first push-update with the subscribed information is sent immediately; but it can be delayed if the device is busy or due to network congestion. Updates are then sent at the expiry of the configured periodic timer. For example, if the period is configured as 10 minutes, the first update is sent immediately after the subscription is created and every 10 minutes thereafter.

Period is time, in centiseconds (1/100 of a second), between periodic push updates. A period of 1000 will result in getting updates to the subscribed information every 10 seconds. The minimum period interval is 100, or one second. There is no default value. This value must be explicitly set in the <establish subscription> RPC.

Subscriptions for data that does not currently exist are permitted and run as normal subscriptions. When subscribing for empty data, empty update notifications are sent at the requested period.

Periodic updates contain a full copy of the subscribed data element or table.

RPC Support in Telemetry

The <establish-subscription> and <delete-subscription> RPCs are supported for telemetry.

When an <establish-subscription> RPC is sent, the RPC reply from a publisher contains an <rpc-reply> message with a <subscription-result> element containing a result string.

The following table displays the response and the reason for the response in an <rpc-reply> message:

<table>
<thead>
<tr>
<th>Result String</th>
<th>RPC</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>

</table>

NETCONF Sessions in Telemetry

Telemetry subscriptions and updates are transmitted over NETCONF sessions. The NETCONF session that is used to establish a telemetry subscription receives the telemetry updates. If the NETCONF session is torn down or the connection is lost, associated telemetry subscriptions are also torn down.
All sessions are NETCONF sessions and as a result, all session limitations are specific to the NETCONF implementation.

**High Availability in Telemetry**

Dynamic telemetry connections are established over a NETCONF session via SSH to the active switch or a member in a switch stack, or the active route-processor in an high-availability capable router. After switchover, you must destroy and re-establish all sessions that use Crypto, including NETCONF sessions that carry telemetry subscriptions. You must also recreate all subscriptions after a switchover.

**Sample Model-Driven Telemetry RPCs**

**Creating a Subscription**

Subscriptions are created using XML RPCs over an established NETCONF session. The `<establish-subscription>` RPC is sent from an IETF telemetry client or collector to the network device. The stream, xpath-filter, and period fields in the RPC are mandatory.

The following is a sample subscription to the operational database subscriptions table:

```xml
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
        <stream>yp:yang-push</stream>
        <yp:period>1000</yp:period>
    </establish-subscription>
</rpc>
```

**Receiving a Response Code**

When a subscription is successfully created, the device responds with a subscription-result of notif-bis:ok and with a subscription ID. The following is a sample response RPC message:

```xml
<rpc-reply xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="101">
    <subscription-id xmlns="urn:ietf:params:xml:ns:yang:ietf-event-notifications">2147484201</subscription-id>
</rpc-reply>
```

**Receiving Subscription Push-Updates**

Subscription updates pushed from the device are in the form of an XML RPC and are sent over the same NETCONF session on which these are created. The subscribed information element or tree is returned within the `datastore-contents-xml` tag. The following is a sample RPC message that provides the subscribed information:

```xml
<notification xmlns="urn:ietf:params:xml:ns:netconf:notification:1.0">
```

Programmability Configuration Guide, Cisco IOS XE Fuji 16.9.x
Retrieving Subscription Details

You can retrieve the list of current subscriptions by sending a <get> RPC to the Cisco-IOS-XE-mdt-oper model. You can also use the `show telemetry ietf subscription` command to display the list of current subscriptions.

The following is a sample <get> RPC message:

```xml
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <get>
    <filter>
      <mdt-oper-data xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-mdt-oper">
        <mdt-subscriptions/>
      </mdt-oper-data>
    </filter>
  </get>
</rpc>
```

The following is a sample RPC reply:

```xml
<rpc-reply xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="101">
  <data>
    <mdt-oper-data xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-mdt-oper">
      <mdt-subscriptions>
        <subscription-id>2147485164</subscription-id>
        <base>
          <stream>yang-push</stream>
          <encoding>encode-xml</encoding>
          <period>100</period>
          <xpath>/ios-native/router/ios-rip/ios-rip:version</xpath>
        </base>
        <type>sub-type-dynamic</type>
      </mdt-subscriptions>
    </mdt-oper-data>
  </data>
</rpc-reply>
```
The following is sample output from the `show telemetry ietf subscription dynamic brief` command:

```
Device# show telemetry ietf subscription dynamic brief
Telemetry subscription brief

ID  Type      State  Filter type
-----------------------------
2147483667 Dynamic  Valid  xpath
2147483668 Dynamic  Valid  xpath
2147483669 Dynamic  Valid  xpath
```

The following is sample output from the `show telemetry ietf subscription subscription-ID detail` command:

```
Device# show telemetry ietf subscription 2147483667 detail
Telemetry subscription detail:
Subscription ID: 2147483667
State: Valid
Stream: yang-push
Encoding: encode-xml
Filter:
  Filter type: xpath
  XPath: /mdt-oper:mdt-oper-data/mdt-subscriptions
Update policy:
  Update Trigger: periodic
  Period: 1000
Notes:
```

### Deleting a Subscription

You can delete a telemetry subscription in two ways. One is by sending a `<delete-subscription>` RPC with the subscription ID in the subscription-id tag, which only a subscriber can do. Also, a subscription is deleted when the parent NETCONF session is torn down or disconnected. If the network connection is interrupted, it may take some time for the SSH/NETCONF session to timeout, and subsequent subscriptions to be removed.

```
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <delete-subscription xmlns="urn:ietf:params:xml:ns:yang:ietf-event-notifications"
    xmlns:netconf="urn:ietf:params:xml:ns:netconf:base:1.0">
    <subscription-id>2147483650</subscription-id>
  </delete-subscription>
</rpc>
```

Feature Information for Model-Driven Telemetry

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

In-Service Model Update

This module describes how to update the YANG data models on a device through an In-Service Model Update.

- Restrictions for In-Service Model Update, on page 173
- Information About In-Service Model Update, on page 173
- How to Manage In-Service Model Update, on page 176
- Configuration Examples for In-Service Model Updates, on page 177
- Feature Information for In-Service Model Update, on page 181

Restrictions for In-Service Model Update

- High availability or In-Service Software Upgrade (ISSU) is not supported. After a switchover, users must install the Software Maintenance Update (SMU) on standby device.

Information About In-Service Model Update

Overview of In-Service Model Updates

In-Service Model Update adds new data models or extend functionality to existing data models. The In-Service Model Update provides YANG model enhancements outside of a release cycle. The update package is a superset of all existing models; it includes all existing models as well as updated YANG models.

The data model infrastructure implements the YANG model-defined management interfaces for Cisco IOS XE devices. The data model infrastructure exposes the NETCONF interface northbound from Cisco IOS XE devices. The supported data models include industry standard models such as IETF, and Cisco IOS XE device-specific models.

The functionality provided by the In-Service Model Update is integrated into the subsequent Cisco IOS XE software maintenance release. Data model update packages can be downloaded from the Cisco Download Software Center.

Compatibility of In-Service Model Update Packages

An update package is built on a per release basis and is specific to a platform. This means that an update package for Cisco ASR 1000 Series Aggregation Services Routers cannot be installed on Cisco CSR 1000V.
Series Cloud Services Routers. Similarly, an update package built for Cisco IOS XE Fuji 16.7.1 cannot be applied on a device that runs the Cisco IOS XE Everest 16.5.2 version.

All contents of an update package will be part of future mainline or maintenance release images. The image and platform versions are checked by the In-Service Model Update commands during the package add and activate. If an image or platform mismatch occurs, the package install fails.

### Update Package Naming Conventions

In-Service Model Updates are packaged as a .bin files. This file includes all updates for a specific release and platform and the Readme file. These files have a release date and are updated periodically with additional model updates.

The naming convention of the data model update package follows the format—platform type-license level.release version.DDTS ID-file. The following is an example of a data model update file:

- `isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin`
- `asr1000-universalk9.2017-08-23_17.48.0.CSCxxxxxxx.SSA.dmp.bin`

The readme file provides the following information:

- Console and error messages during data model activation or deactivation
- Data model installation impact
- Side effects and possible workarounds
- Package(s) that the In-Service Model Update impacts
- Restart type

### Installing the Update Package

You can install the In-Service Model Update package on a device by using the `install add`, `install activate`, and `install commit` commands in privileged EXEC mode.

The `install add` command copies the update package from a remote location to the device. You can also use other methods to copy the package; however, you must still enable the `install add` command for the installation to work. For the `install activate` command to work, the package must be available in the device bootflash. Enable the `install commit` command to make updates persistent over reloads.

Installing an update replaces any previously installed data models. At any time, only one update is installed on the device. A data model package includes all updated YANG models and all existing YANG models previously installed on the device.

The following flow chart explains how the model update package works:
If NETCONG-YANG is enabled during package activation, NETCONF processes are restarted. All active NETCONF sessions are killed during package activation. Failure during a package verification terminates the activation process.

### Deactivating the Update Package

You can deactivate an update package by using the `install deactivate` command. Enable the `install commit` command to make changes persistent.

#### Table 23: Deactivating a Model Update Package

<table>
<thead>
<tr>
<th>Action</th>
<th>Command to Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>To remove a package</td>
<td>Use the <code>install remove</code> command. Note: Deactivate a package before removing it.</td>
</tr>
<tr>
<td>To deactivate a package</td>
<td>Use the <code>install deactivate</code> command, followed by the <code>install commit</code> command. Note: The <code>install commit</code> command must be used to ensure that the deactivation of the model package is persistent across reloads. Subsequent attempts at removal of the package will fail, if the deactivation is not committed.</td>
</tr>
</tbody>
</table>

When you deactivate an update, if more than one model update package is installed, the most recently committed model update package becomes the model package used by the device. If there are no other previously committed model packages, then the base version of data models included with the standard image is used.

### Rollback of the Update Package

Rollback provides a mechanism to move a device back to the state in which it was operating prior to an update. After a rollback, NETCONF-YANG processes are restarted before changes are visible.

You can roll back an update to the base version, the last committed version, or a known commit ID by using the `install rollback` command.
How to Manage In-Service Model Update

Managing the Update Package

**SUMMARY STEPS**

1. enable
2. install add file tftp: `filename`
3. install activate file bootflash: `filename`
4. install commit
5. install deactivate file bootflash: `filename`
6. install commit
7. install rollback to {base | committed | id `commit-ID`}
8. install remove {file bootflash: `filename` | inactive}
9. show install summary

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> install add file tftp: <code>filename</code></td>
<td>Copies the model update package from a remote location (via FTP, TFTP) to the device, and performs a compatibility check for the platform and image versions.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# install add file tftp://172.16.0.1/tftpboot/folder1/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin</td>
<td>• You can use other methods to copy the update package from the remote location to the device, however; you still have to execute the <strong>install add</strong> command before the package is activated.</td>
</tr>
<tr>
<td><strong>Step 3</strong> install activate file bootflash: <code>filename</code></td>
<td>Validates whether the update package is added through the <strong>install add</strong> command, and restarts the NETCONF processes.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# install activate file bootflash: isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin</td>
<td>• Perform the <strong>install add</strong> operation prior to activating an update package.</td>
</tr>
<tr>
<td><strong>Step 4</strong> install commit</td>
<td>Makes the changes persistent over reload.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# install commit</td>
<td>• NETCONF processes are not restarted.</td>
</tr>
<tr>
<td><strong>Step 5</strong> install deactivate file bootflash: <code>filename</code></td>
<td>Deactivates the specified update package, and restarts the NETCONF processes.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| Device# install deactivate file bootflash: isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin  
Device# install deactivate file bootflash: asr1000-universalk9.2017-08-23_17.48.0.CSCxxxxxxx.SSA.dmp.bin | |

**Step 6**
install commit  
Example:  
Device# install commit  
Makes the changes persistent over reload.  
- NETCONF processes are not restarted.

**Step 7**
install rollback to {base | committed | id commit-ID}  
Example:  
Device# install rollback to base  
Rollbacks the update to the base version, the last committed version, or a known commit ID, and restarts NETCONF processes.  
- Valid values for the commit-id argument are from 1 to 4294967295.  
- Older versions of data models updates are available for use.

**Step 8**
install remove {file bootflash: filename | inactive}  
Example:  
Device# install remove file bootflash: isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin  
Device# install remove file bootflash: asr1000-universalk9.2017-08-23_17.48.0.CSCxxxxxxx.SSA.dmp.bin  
Removes the specified update package from the bootflash.  
- A package must be deactivated before it is removed.

**Step 9**
show install summary  
Example:  
Device# show install summary  
Displays information about the active package.  
- The output of this command varies according to the install commands that are configured.

---

### Configuration Examples for In-Service Model Updates

#### Example: Managing an Update Package

The sample image used in the following examples are a Cisco 4000 Series Integrated Services Router image.

The following example shows how to add a model update package file:

```bash
Device# install add file tftp://172.16.0.1//tftpboot/folder1/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
```

```
install_add: START Sun Feb 26 05:57:04 UTC 2017  
Downloading file  
tftp://172.16.0.1//tftpboot/folder1/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin   
Finished downloading file  
tftp://172.16.0.1//tftpboot/folder1/isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin  
to bootflash:isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
```
The sample image used in the following examples is a Cisco ASR1000 Series Aggregated Services Router image.

The following example shows how to add a model update package file:

```
Device# install add file tftp://172.16.0.1//tftpboot/folder1/asr1000-universalk9.2017-08-23_17.48.0.CSCxxxxxxx.SSA.dmp.bin
```

The following is sample output from the `show install summary` command after adding an update package file to the device:

```
Active Packages:
No packages
Inactive Packages:
bootflash: isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
Committed Packages:
No packages
Uncommitted Packages:
No packages
```

The following example shows how to activate an added update package file:

```
Device# install activate file bootflash:
```

The following sample output from the `show install summary` command displays the status of the model package as active and uncommitted:

```
Device# show install summary

Active Packages:
bootflash:isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin

Inactive Packages:
No packages

Committed Packages:
No packages

Uncommitted Packages:
bootflash:isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
```

The following example shows how to execute the `install commit` command:

```
Device# install commit

install_commit: START Sun Feb 26 06:46:48 UTC 2017
SUCCESS: install_commit Sun Feb 26 06:46:52 UTC 2017
```

The following sample output from the `show install summary` command displays that the update package is now committed, and that it will be persistent across reloads:

```
Device# show install summary

Active Packages:
bootflash:isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin

Inactive Packages:
No packages

Committed Packages:
bootflash:isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin

Uncommitted Packages:
No packages
```

The following example shows how to rollback an update package to the base package:

```
Device# install rollback to base

install_rollback: START Sun Feb 26 06:50:29 UTC 2017
7 install_rollback: Restarting impacted processes to take effect
7 install_rollback: restarting confd
*Feb 26 06:50:34.957: %DMI-4-CONTROL_SOCKET_CLOSED: SIP0: syncfd:
Confd control socket closed Lost connection to ConfD (45): EOF on socket to ConfD.
*Feb 26 06:50:34.962: %DMI-4-CONTROL_SOCKET_CLOSED: SIP0: nesd:
Confd control socket closed Lost connection to ConfD (45): EOF on socket to ConfD.
*Feb 26 06:50:34.963: %DMI-4-SUB_READ_FAIL: SIP0: vtyserverutil:
Confd subscription socket read failed Lost connection to ConfD (45):
EOF on socket to ConfD.Netconf processes stopped
7 install_rollback: DMP activate complete
SUCCESS: install_rollback Sun Feb 26 06:50:41 UTC 2017
*Feb 26 06:51:28.901: %DMI-5-SYNC_START: SIP0: syncfd:
External change to running configuration detected.
The running configuration will be synchronized to the NETCONF running data store.
*Feb 26 06:51:30.339: %DMI-5-SYNC_COMPLETE: SIP0: syncfd:
The running configuration has been synchronized to the NETCONF running data store.
```

Example: Managing an Update Package
The following is sample output from the `show install package` command:

```
Device# show install package bootflash:
isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin

Name: isr4300-universalk9.16.05.01.CSCxxxxxxx.dmp.bin
Version: 16.5.1.0.199.1484082952..Everest
Platform: ISR4300
Package Type: dmp
Defect ID: CSCxxxxxxx
Package State: Added
Supersedes List: {}
Smu ID: 1
Device#
```

The following sample NETCONF hello message verifies the new data model package version:

```
Getting Capabilities: (admin @ 172.16.0.1:830)
PROTOCOL netconf
<?xml version="1.0" encoding="UTF-8"?>
<hello xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <capabilities>
    <capability>urn:ietf:params:netconf:base:1.0</capability>
    <capability>urn:ietf:params:netconf:base:1.1</capability>
    <capability>urn:ietf:params:netconf:capability:writable-running:1.0</capability>

Feature Information for In-Service Model Update

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

OpenFlow

• OpenFlow, on page 185
OpenFlow

This module describes how to enable and configure OpenFlow on a device.

- Prerequisites for OpenFlow, on page 185
- Restrictions for OpenFlow, on page 185
- Information About OpenFlow, on page 186
- How to Configure OpenFlow, on page 190
- Configuration Examples for OpenFlow, on page 194
- Verifying OpenFlow, on page 195
- Additional References for OpenFlow, on page 198
- Feature Information for OpenFlow, on page 198

Prerequisites for OpenFlow

The device must be booted up in OpenFlow mode.

OpenFlow mode is enabled, when you configure the `boot mode openflow` command on a switch. All ports will be in this mode, and the switch will not support any regular Cisco IOS XE features.

Restrictions for OpenFlow

- When enabling OpenFlow mode on a device, erase all prior configurations, and delete the vlan.dat and stby-vlan.dat files from the flash filesystem.

  When the device is in Openflow mode, do not enable other control plane protocols (protocols such as Border Gateway Protocol [BGP], Spanning Tree Protocol [STP], Port Channels, StackWise and so on) that work when the device is in normal mode.
Information About OpenFlow

OpenFlow Overview

OpenFlow is a specification from the Open Networking Foundation (ONF) that defines a flow-based forwarding infrastructure and a standardized application-programmatic interface. OpenFlow allows a controller to direct the forwarding functions of a device through a secure channel.

OpenFlow is the protocol between the controller (control plane) and the Ethernet switch (data plane). The switch/device has flow tables arranged into a pipeline. Flows are rules to examine packets that reach these tables.

An OpenFlow agent on the switch communicates with the controller using the OpenFlow protocol. The agent supports both OpenFlow 1.0 (wire protocol 0x1) and OpenFlow 1.3 (wire protocol 0x4). It can have up to 8 controller connections. These connections are not preserved across switchover, and the controller will have to reconnect to the agent.

The OpenFlow implementation on Cisco Catalyst 9400 Series Switches is stateless; and non-stop forwarding (NSF) is not supported. The standby supervisor does not sync to the flow database.

OpenFlow Controller

The OpenFlow controller is an entity that interacts with the OpenFlow switch using the OpenFlow protocol. In most cases, the controller is a software that manages many OpenFlow logical switches. Controllers offer a centralized view of the network, and enable administrators to dictate to the underlying systems (switches and routers) on how to handle the network traffic. A controller typically runs on a Linux server, and must have IP connectivity to OpenFlow-capable switches.

The controller manages the switch, and inserts and deletes flows on the switch. These flows support a subset of OpenFlow 1.3 and 1.0 match and action criteria.

The switch connects to the controller using the management port. The management port is in the management virtual routing and forwarding (VRF) instance, and hence provides a secure connection to the controller. To connect a controller to the switch, configure the IP address and port number on which the controller can be reached.

Flow Management

A flow entry is an element in a flow table that is used to match and process packets. It contains a priority for matching precedence, a set of match fields for matching packets, a set of instructions to apply, and packet and byte counters. A timeout is also associated with each flow (a hard timeout or an inactivity timeout), which is used to automatically remove flows.

Cisco Catalyst 9000 Series Switches support a maximum of 9 flow tables.

Each flow provides the following information:

- Priority: High priority flows are matched first. Any flow update requires all flows to be prioritized based on the configured priority.

- Match fields: A part of a flow entry against which a packet is matched. Match fields can match the various packet header fields. If no match information is provided for a field; a wildcard is used.
• Action: An operation that acts on a packet.

OpenFlow Pipeline

An OpenFlow pipeline is a set of linked flow tables that provide matching, forwarding, and packet modification in an OpenFlow switch. A port is where packets enter and exit the pipeline.

Packets are received on an ingress port and processed by the OpenFlow pipeline that forwards it to output ports. The packet ingress port is owned by the packet throughout the pipeline, and represents the port on which the packet was received into the switch. The ingress port can also be used as a match field in a flow.

Flow actions allow packets to be sent to subsequent tables in the pipeline for further processing, and allow information to be communicated between tables. Pipeline processing stops when the action associated with a matching flow entry does not specify the next table. At this point, the packet is usually modified and forwarded. The packet can also be dropped.

Flow tables of an OpenFlow switch are sequentially numbered, starting from 0. Pipeline processing always starts by matching the packet against flow entries of flow table 0. Other flow tables may be used depending on the outcome of the match and actions in the first table, which could result in matching the packet against flow entries in subsequent tables.

Supported Match Fields and Actions

Match Field is a field against which a packet is matched, including packet headers, and the ingress port. A match field can be a wildcard (match any value) and have a bit mask to match selected bits of the field.

Action is an operation that forwards a packet to a port or subsequent tables, or modifies a packet field. Actions may be specified as part of the instructions associated with a flow entry, or an action bucket associated with a group entry. A group entry is a collection of actions that can be shared by multiple flows.

The action specified in one or more flow entries can direct packets to a base action called a group action. The purpose of the group action is to share a set of actions among multiple flows. A group consists of one or more buckets, and in turn, a bucket can have a set of actions (set, pop, or output). Cisco Catalyst 9000 Series Switches support group types, all and indirect.

This section lists the supported match fields and actions:

</table>

### Supported Actions

A flow can send a packet to:

- The controller
- Any interface of the switch (including the incoming interface)
- A subsequent flow table (after table 0) for another lookup
Flow Operations

This section describes the operations that take place when a flow is sent by the controller to be programmed in the OpenFlow device.

The device has flow tables arranged into a pipeline. The pipeline capabilities information specifies the structure of the pipeline, such as the number of tables/stages, what each stage is capable of doing (match/actions), and the size of each table.

When the controller sends a flow request, the OpenFlow agent verifies whether the flow can be handled by the hardware. It compares the flow against the capabilities of the hardware that are defined when the switch is booted up. If the flow is valid, it is then programmed in the appropriate flow table.

If the new pipeline is validated (whether the hardware can support the pipeline), it becomes the new set of capabilities that is used to check if a flow can be installed or not.

Once the pipeline is instantiated and flows are installed, packets are forwarded by the switch. Ingress packets are matched against flows in each flow table, until the highest-priority matching flow entry is found. Packet matching may be exact (match all fields of the table exactly), or partial (match some or all fields, and fields with bit masks may be partially matched). Packets may be modified or forwarded based on the configured actions. Actions can be applied at any time in the pipeline. The action may determine the next flow table to match, the set of egress ports for the packet, and whether the packet should be routed to the controller.

OpenFlow Table Pipeline

OpenFlow table feature request messages allow an OpenFlow controller to query the capabilities of existing flow tables of an OpenFlow-managed device, or configure these tables to match the supplied configuration.

All tables may be configured with any subset of the match and action capabilities. Table sizes can also be modified at runtime. When a new flow table configuration is successfully applied, flow entries from old flow tables are removed without any notification. Dynamically configured flow tables are not persistent across reboot. The default pipeline comes up when the device boots up.

While configuring a new flow table based on a request from the OpenFlow controller, any ongoing traffic flowing via the existing flows are dropped.
How to Configure OpenFlow

Enabling OpenFlow Mode on a Device

If the switch is operating in normal mode, we recommend that you configure the `write erase` command to delete the previous configuration.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `boot mode openflow`
4. `exit`
5. `write erase`
6. `delete flash: vlan.dat`
    • `delete flash: stby-vlan.dat`
7. `reload`
8. `enable`
9. `show boot mode`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>boot mode openflow</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Enables OpenFlow forwarding mode.</td>
</tr>
<tr>
<td>Device(config)# boot mode openflow</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Exits global configuration mode and enters privileged EXEC mode.</td>
</tr>
<tr>
<td>Device(config)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>write erase</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Erases all files in the NVRAM.</td>
</tr>
<tr>
<td>Device# write erase</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>• <code>delete flash: vlan.dat</code></td>
</tr>
<tr>
<td></td>
<td>Deletes the vlan.dat file that stores the VLAN information.</td>
</tr>
</tbody>
</table>
**OpenFlow**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• delete flash:stby-vlan.dat</td>
<td>• Delete the stby-vlan.dat file, if you have a standby device.</td>
</tr>
</tbody>
</table>

**Example:**
Device# delete flash:vlan.dat
Device# delete flash:stby-vlan.dat

**Step 7**
load

**Example:**
Device# reload

**Step 8**
enable

**Example:**
Device> enable

**Step 9**
show boot mode

**Example:**
Device# show boot mode

Example
The following sample output from the `show boot mode` command shows that the device is in OpenFlow mode:

Device# show boot mode
System initialized in openflow forwarding mode
System configured to boot in openflow forwarding mode

What to do next
To go back to normal mode, configure the `no boot mode openflow` command and then reload the device.

**Configuring OpenFlow**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. feature openflow
4. openflow
5. switch 1 pipeline 1
6. controller ipv4 `ip-address` `port` `port-number` `vrf` `vrf-name` security {none | tls}
7. datapath-id `ID`
8. `tls` trustpoint local `name` remote `name`
9. end
## DETAILED STEPS

<table>

### Configuration Examples for OpenFlow

#### Example: Enabling OpenFlow on a Device

```
Device> enable
Device# configure terminal
Device(config)# boot mode openflow
Device(config)# exit
Device# write erase
Device# delete flash:vlan.dat
Device# reload
Device> enable
Device# show boot mode
```

#### Example: Configuring OpenFlow

```
Device# configure terminal
Device(config)# feature openflow
Device(config)# openflow
Device(config-openflow)# switch 1 pipeline 1
Device(config-openflow-switch)# controller ipv4 10.2.2.2 port 6633 vrf Mgmt-vrf security tls
Device(config-openflow-switch)# datapath-id 0x12345678
Device(config-openflow-switch)# tls trustpoint local trustpoint1 remote trustpoint1
Device(config-openflow-switch)# end
```
Example: Configuring Interfaces in OpenFlow Mode

You can either configure a Layer 2 or Layer 3 interface in OpenFlow mode. When using a Layer 3 interface, configure the `no switchport` command in interface configuration mode. Perform the following task when using a Layer 2 interface.

Device> `enable`
Device# `configure terminal`
Device(config)# feature openflow
Device(config)# interface gigabitethernet 1/0/3
Device(config-if)# switchport mode trunk
Device(config-if)# switchport nonnegotiate
Device(config-if)# no keepalive
Device(config-if)# spanning-tree bpdufilter enable
Device(config-if)# end

Verifying OpenFlow

SUMMARY STEPS

1. `enable`
2. `show openflow hardware capabilities`
3. `show openflow switch 1 controller`
4. `show openflow switch 1 ports`
5. `show openflow switch 1 flows list`

DETAILED STEPS

Step 1  `enable`
Enables privileged EXEC mode.

- Enter your password if prompted.

Example:
Device> `enable`

Step 2  `show openflow hardware capabilities`
Displays the hardware capabilities of an OpenFlow device.

Example:
Device# `show openflow hardware capabilities`

Max Interfaces: 1000
Aggregated Statistics: YES

Pipeline ID: 1
    Pipeline Max Flows: 2322
    Max Flow Batch Size: 100
Statistics Max Polling Rate (flows/sec): 10000
Pipeline Default Statistics Collect Interval: 5

Flow table ID: 0
Max Flow Batch Size: 100

### Step 5  
**show openflow switch 1 flows list**

Displays OpenFlow entries.

The following sample output displays a flow that is installed in table 0, where *match any* goes to Table 1. *(Match any means that all packets go to Table 1.)* In table 1, the destination MAC address 00:00:01:00:00:01 is matched, and the output port is set to 36.

**Example:**

```
Device# show openflow switch 1 flows list

Logical Switch Id: 1
Total flows: 8

Flow: 1 Match: any Actions: goto_table:1, Priority: 9000, Table: 0, Cookie: 0x1, Duration: 2382.117s, Packets: 34443, Bytes: 3359315

Flow: 2 Match: any Actions: drop, Priority: 0, Table: 0, Cookie: 0x0, Duration: 2382.118s, Packets: 294137, Bytes: 28806211

Flow: 3 Match: any Actions: drop, Priority: 0, Table: 1, Cookie: 0x0, Duration: 2382.118s, Packets: 34443, Bytes: 3359315

Flow: 4 Match: dl_dst=00:00:01:00:00:01 Actions: output:36, Priority: 9000, Table: 1, Cookie: 0x1, Duration: 2382.116s, Packets: 0, Bytes: 0
```

Feature Information for OpenFlow

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.
