

NETCONF and **RESTCONF** Service-Level ACLs

This module describes the service-levels ACLs supported on NETCONF and RESTCONF, and how to configure it.

- Information About NETCONF and RESTCONF Service-Level ACLs, on page 1
- How to Configure NETCONF and RESTCONF Service-Level ACLs, on page 1
- Configuration Examples for NETCONF and RESTCONF Service-Level ACLs, on page 4
- Additional References for NETCONF and RESTCONF Service-Level ACLs, on page 5
- Feature Information for NETCONF and RESTCONF Service-Level ACLs, on page 5

Information About NETCONF and RESTCONF Service-Level ACLs

Overview of NETCONF and RESTCONF Service-Level ACLs

You can configure an IPv4 or IPv6 access control list (ACL) for NETCONF and RESTCONF sessions. Clients that do not conform to the configured ACLs are not allowed to access the NETCONF or RESTCONF subsystems. When service-level ACLs are configured, NETCONF-YANG and RESTCONF connection requests are filtered based on the source IP address.

If no service-level ACLs are configured, all NETCONF-YANG and RESTCONF connection requests are permitted into the subsystems.

Note

Only named ACLs are supported; numbered ACLs are not supported.

How to Configure NETCONF and RESTCONF Service-Level ACLs

Configuring an ACL for a NETCONF-YANG Session

You can either configure an IP access-list or an IPv6 access list for your NETCONF-YANG session.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ip access-list {standard | extended} access-list-name
 - ipv6 access-list access-list-name
- **4. permit** {host-address | host-name | **any**} [wildcard]
- **5. deny** {host-address | host-name | **any**} [wildcard]
- 6. exit
- 7. **netconf-yang ssh** {{ipv4 | ipv6 }access-list name access-list-name} | port port-number}
- 8 end

DETAILED STEPS

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	Enter your password if prompted.	
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	• ip access-list {standard extended} access-list-name • ipv6 access-list access-list-name	Specifies a standard IP access list and enters standard access-list configuration mode.	
		- Company of the comp	
	<pre>Example: Device(config)# ip access-list standard acl1_permit</pre>	• Specifies an IPv6 access list and enters IPv6 access-list configuration mode.	
	political (confirming to account from the first form)		
	Device(config)# ipv6 access-list ipv6-acl1_permit		
Step 4	permit {host-address host-name any} [wildcard]	Sets conditions in an IP/IPv6 access list that will permit packets.	
	Example:		
	Device(config-std-nacl)# permit 192.168.255.0 0.0.0.255		
Step 5	deny {host-address host-name any} [wildcard]	Sets conditions in an IP or IPv6 access list that will deny	
	Example:	packets.	
	Device(config-std-nacl)# deny any		
Step 6	exit	Exits standard access-list configuration mode and returns to global configuration mode.	
	Example:		
	Device(config-std-nacl)# exit		
Step 7	netconf-yang ssh {{ipv4 ipv6 }access-list name access-list-name} port port-number}	Configures an ACL for the NETCONF-YANG session.	
	Example:		

	Command or Action	Purpose
	Device(config)# netconf-yang ssh ipv4 access-list name acl1_permit	
Step 8	end	Exits global configuration mode and returns to privileged
	Example:	EXEC mode.
	Device(config)# end	

Configuring an ACL for a RESTCONF Session

You can either configure an IP access list or an IPv6 access list for your RESTCONF session.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ip access-list {standard | extended} access-list-name
 - ipv6 access-list access-list-name
- **4. permit** {protocol-number | ipv6-source-address | ipv6-source-prefix | protocol} any
- **5. deny** {protocol-number | ipv6-source-address | ipv6-source-prefix | protocol} any any
- 6. exit
- 7. restconf {ipv4 | ipv6 } access-list name access-list-name
- 8. end

DETAILED STEPS

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	• ip access-list {standard extended} access-list-name	Specifies a standard IP access list and enters stand	
	• ipv6 access-list access-list-name	access-list configuration mode.	
	Example:	Specifes an IPv6 access list and enters IPv6 access list	
	Device(config)# ip access-list standard acl1_permit	configuration mode.	
	Device(config)# ipv6 access-list ipv6-acl1_permit		
Step 4	permit {protocol-number ipv6-source-address	Sets conditions in an IPv6 access list that will permit	
	ipv6-source-prefix protocol} any	packets.	
	Example:		

	Command or Action	Purpose	
	Device(config-ipv6-acl)# permit ipv6 2001:db8::1/32 any	2	
Step 5	deny {protocol-number ipv6-source-address ipv6-source-prefix protocol} any any	Sets conditions in an IPv6 access list that will deny packets.	
	Example:		
	Device(config-ipv6-acl)# deny ipv6 any any		
Step 6	exit	Exits IPv6 access list configuration mode and returns to	
	Example:	global configuration mode.	
	Device(config-ipv6-acl)# exit		
Step 7	restconf {ipv4 ipv6 } access-list name access-list-name	Configures an ACL for the RESTCONF session.	
	Example:		
	<pre>Device(config)# restconf ipv6 access-list name ipv6-acl1_permit</pre>		
Step 8	end	Exits global configuration mode and returns to privileged	
	Example:	EXEC mode.	
	Device(config)# end		

Configuration Examples for NETCONF and RESTCONF Service-Level ACLs

Example: Configuring an ACL for a NETCONF Session

```
Device# enable

Device# configure terminal

Device(config)# ip access-list standard acl1_permit

Device(config-std-nacl)# permit 192.168.255.0 0.0.0.255

Device(config-std-nacl)# deny any

Device(config-std-nacl)# exit

Device(config)# netconf-yang ssh ipv4 access-list name acl1_permit

Device(config)# end
```

Example: Configuring an ACL for a RESTCONF Session

```
Device# enable
Device# configure terminal
Device(config)# ipv6 access-list ipv6-acl1_permit
Device(config-ipv6-acl)# permit ipv6 2001:db8::1/32 any
Device(config-ipv6-acl)# deny ipv6 any any
```

```
Device(config-ipv6-acl)# exit
Device(config)# restconf ipv6 access-list name ipv6-acl1_permit
Device(config)# end
```

Feature Information for NETCONF and RESTCONF Service-Level ACLs

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for NETCONF and RESTCONF Service-Level ACLs

Feature Name	Releases	Feature Information
NETCONF and RESTCONF Service-Level	Cisco IOS XE Everest 16.11.1	You can configure an access control list (ACL) for NETCONF and RESTCONF sessions. Clients that do not conform to the configured ACL are not allowed to access the NETCONF or RESTCONF subsystems.
ACLs		The following commands were introduced or modified: netconf-yang ssh access-list and restconf access-list
		Cisco ASR 900 Series Aggregation Services Routers
