AutoQoS for the Enterprise

The AutoQoS for the Enterprise feature automates the deployment of quality of service (QoS) policies in a general business environment, particularly for midsize companies and branch offices of larger companies. Existing QoS policies may be present during the first configuration phase of this feature, that is, during the Auto-Discovery (data collection) phase. However, any existing QoS policies must be removed before the AutoQoS-generated policies are applied during the second configuration phase of this feature.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for the AutoQoS for the Enterprise Feature

- Ensure that no QoS policies (service policies) are attached to the interface. This feature cannot be configured if a QoS policy is attached to the interface.
• To include Simple Network Management Protocol (SNMP) traps (monitored events), the SNMP server must be enabled.
• To apply the AutoQoS for the Enterprise feature, the interface must be supported by a Programmable Intelligent Services Accelerator (PISA).

Restrictions for the AutoQoS for the Enterprise Feature

General Restrictions

• The AutoQoS for the Enterprise feature is supported on the following interfaces, data-link connection identifiers (DLCIs), and permanent virtual circuits (PVCs) only:
  • Serial interfaces with PPP or High-Level Data Link Control (HDLC)
  • Frame Relay DLCIs in point-to-point subinterfaces only
  • Frame Relay-to-ATM Interworking links
  • ATM PVCs

The AutoQoS for the Enterprise feature is supported on low-speed and high-speed ATM PVCs in point-to-point subinterfaces.

Note

An ATM PVC is classified as low speed if its bandwidth is less than or equal to 768 Kb/s; an ATM PVC is classified as high speed if its bandwidth is greater than 768 Kb/s.

Serial Interface Restrictions

• For a serial interface with a low-speed link, Multilink PPP (MLP) is configured automatically. The serial interface must have an IP address. When MLP is configured, this IP address is removed and put on the MLP bundle. To ensure that the traffic goes through the low-speed link, the following conditions must be met:
  • The AutoQoS for the Enterprise feature must be configured at the both ends of the link.
  • The amount of bandwidth configured must be the same on both ends of the link.

Frame Relay DLCI Restrictions

• The AutoQoS for the Enterprise feature cannot be configured on a Frame Relay DLCI if a map class is attached to the DLCI.
• If a Frame Relay DLCI is already assigned to one subinterface, the AutoQoS for the Enterprise feature cannot be configured from a different subinterface.
• For low-speed Frame Relay DLCIs configured for use on Frame Relay-to-ATM networks, MLP over Frame Relay (MLPoFR) is configured automatically. The subinterface must have an IP address.
When MLPoFR is configured, this IP address is removed and put on the MLP bundle. The AutoQoS for the Enterprise feature must also be configured on the ATM side of the network.

- For low-speed Frame Relay DLCIs with Frame Relay-to-ATM Interworking, the AutoQoS for the Enterprise feature cannot be configured if a virtual template is already configured for the DLCI.

**ATM PVC Restrictions**

- For a low-speed ATM PVC, the AutoQoS for the Enterprise feature cannot be configured if a virtual template is already configured for the ATM PVC.

- For low-speed ATM PVCs, MLP over ATM (MLPoATM) is configured automatically. The subinterface must have an IP address.

When MLPoATM is configured, this IP address is removed and put on the MLP bundle. The AutoQoS for the Enterprise feature must also be configured on the ATM side of the network.

**Release Specific Restrictions**

Depending on your release, the following restrictions may apply:

- Ingress QoS is not supported.

- AutoQoS is supported on L3 routed interfaces, but Auto QoS is not supported on L2 interfaces.

- Only the following commands are supported:
  - `auto discover qos`
  - `auto qos`

## Information About the AutoQoS for the Enterprise Feature

**Benefits of the AutoQoS for the Enterprise Feature**

The key benefits of the AutoQoS for the Enterprise feature include the following:

- You can implement the QoS features required for voice, video, and data traffic without an in-depth knowledge of the following underlying technologies:
  - PPP
  - Frame Relay
  - ATM
  - Service policies
  - Link efficiency mechanisms (LEM), such as Link Fragmentation and Interleaving (LFI)

- The AutoQoS for the Enterprise feature simplifies QoS implementation and speeds up the provisioning of QoS technology over a Cisco network. It reduces human error and lowers training costs.
Design Considerations

General QoS Requirements

- Recommended methods and values are configured to meet the QoS requirements for voice traffic.
- The AutoQoS for the Enterprise feature takes the interface type and bandwidth into consideration when implementing the following QoS features:
  - Low latency queueing (LLQ)/Priority Queueing (PQ). The LLQ (specifically, PQ) is applied to the voice packets to meet the latency requirements.
  - Compressed Real-Time Protocol (cRTP). With cRTP, the 40-byte IP header of the voice packet is reduced from 2 to 4 bytes, thereby reducing voice bandwidth requirements. cRTP must be applied at both ends of a network link.
  - Link Fragmentation and Interleaving (LFI). LFI is used to reduce the jitter of voice packets by preventing voice packets from getting delayed behind large data packets in a queue. LFI must be applied at both ends of a network link.

Bandwidth Implications

The bandwidth of the serial interface determines the speed of the link. The speed of the link, in turn, determines the configurations generated by the AutoQoS for the Enterprise feature.

Note

Changing the bandwidth after configuring the AutoQoS for the Enterprise feature is not recommended.

The AutoQoS for the Enterprise feature uses the bandwidth that is allocated at the time the feature is configured. The AutoQoS for the Enterprise feature does not respond to changes made to bandwidth after the feature is configured.

For example, if the auto qos command is used to configure the AutoQoS for the Enterprise feature on an interface with 1000 Kb/s, the AutoQoS for the Enterprise feature generates configurations for high-speed interfaces. However, if the bandwidth is later changed to 500 Kb/s, the AutoQoS for the Enterprise feature will not use the lower bandwidth. The AutoQoS for the Enterprise feature retains the higher bandwidth and continues to use the generated configurations for high-speed interfaces.

To force the AutoQoS for the Enterprise feature to generate configurations for the low-speed interfaces, perform the following tasks:

1. Use the no auto qos command to remove the AutoQoS for the Enterprise feature.
2. Use the no auto discovery qos command to stop the Auto-Discovery (data collection) configuration phase.
3. Use the auto discovery qos command to resume the Auto-Discovery (data collection) phase.
4 Use the `auto qos` command to begin the AutoQoS template generation and installation configuration phase.

**Fragmentation for Frame Relay Networks**

For Frame Relay networks, fragmentation is configured using a delay of 10 milliseconds (ms) and a minimum fragment size of 60 bytes. This configuration ensures that the VoIP packets are not fragmented. However, when the G.711 coder-decoder (codec) is used on low-speed links, the fragment size configured by the AutoQoS for the Enterprise feature could be smaller than the size of the G.711 Voice over IP (VoIP) packet.

To solve this potential problem, choose one of the following:

- Change the fragment size to the required value.
- Change the size of the G.711 VoIP packet to a smaller value.

For example, if the AutoQoS for the Enterprise feature is configured on a Frame Relay DLCI with 128 Kbps, the fragment size configured by the AutoQoS for the Enterprise feature will be 160 bytes. The size of the G.711 VoIP packet will be 160 bytes, minus the bytes in the packet headers for the layers. The workaround is to either change the fragment size from 160 bytes to 220 bytes or change the size of the G.711 VoIP packet from 160 bytes to 80 bytes.

**Configuration Phases**

The AutoQoS for the Enterprise feature consists of two configuration phases, completed in the following order:

- Auto-Discovery (data collection)

The Auto-Discovery phase uses network-based application recognition (NBAR)-based protocol discovery to detect the applications on the network and performs statistical analysis on the network traffic.

- AutoQoS template generation and installation

This phase generates templates from the data collected during the Auto-Discovery phase and installs the templates on the interface. Then these templates are used as the basis for creating the class maps and policy maps for your network. After the class maps and policy maps are created, they are then installed on the interface.

Depending on your release, when AutoQos is configured, a global macro is also applied to the interface to perform LAN-queueing actions. This macro contains commands to configure bandwidth, queue limit, and thresholds based on the traffic type, its priority and its rate. This data is collected during the Auto-Discovery phase.
The figure below illustrates the top-level processes for configuring the AutoQoS for Enterprise feature. The dotted lines indicate optional processes.

**Figure 1: Top-Level Processes for Configuring the AutoQoS for the Enterprise Feature**

First, start the Auto-Discovery (data collection) phase by using the `auto discovery qos [trust]` command. Note the following points about the Auto-Discovery phase:

- If you want to stop the Auto-Discovery phase, use the `no auto discovery qos` command. This command stops data collection and removes any data collection reports that have been generated.
- If you want to view the Auto-Discovery phase in progress, use the `show auto discovery qos` command. This command displays the results of the data collected during the Auto-Discovery phase.

Second, start the AutoQoS template generation phase by using the `auto qos` command. This phase generates templates from the data collected during the Auto-Discovery phase. It then uses those templates as the basis for creating and installing the class maps and policy maps for your network.

**Note**

After the `auto qos` command has finished creating and installing the templates, creating the class maps and policy maps, and installing the class maps and policy maps on the interface, you can view the class maps and policy maps by using the `show auto qos` command.

Detailed information about the Auto-Discovery phase and the AutoQoS template generation phase is provided below.

**Auto-Discovery (Data Collection) Phase**

The Auto-Discovery (data collection) phase uses NBAR to detect network applications as they arrive at an interface, collect data from the offered traffic, and perform statistical analysis.
The data collected should be a representative sampling of the volume and type of voice, video, and data on your network. Therefore, the amount of time devoted to data collection varies from network to network. Run the Auto-Discovery phase for as long as necessary. The length of time needed will vary, depending on the volume and nature of traffic on your network.

**AutoQoS Template Generation and Installation Phase**

This phase generates templates from the data collected during the Auto-Discovery phase and installs the templates on the interface. Then these templates are used as the basis for creating the class maps and policy maps for your network. After the class maps and policy maps are created, they are then installed on the interface.

During this phase, the AutoQoS for the Enterprise also assigns the appropriate bandwidth amounts and sets the appropriate scheduling parameters for the network traffic.

Depending on your release, a macro that contains MLS QOS commands to configure bandwidth, queue limit, and thresholds gets applied. To view these commands, use `show run interface` command. The commands will not be displayed as part of the `show auto qos` command.

AutoQoS can be applied on an interface with input service policy applied, but no output service policy can be applied on the interface while applying AutoQoS on it.

**Class-Map Templates**

The AutoQoS for the Enterprise feature creates a number of class-map templates, used for the following purposes:

- To classify applications and map them to classes for DiffServ per-hop behavior (PHB) mapping.
- To define the class-based QoS policy templates.

Depending on your release, the PISA MQC is limited to eight filters per class-map. To accommodate this, additional AutoQoS classes have been added to honor the eight filter per class limitation. Transactional, Bulk, Scavenger, and Management AutoQoS classes have been split.

**AutoQoS Classes**

The AutoQoS for the Enterprise feature defines ten AutoQoS classes, designed to accommodate various enterprise applications. The table below lists the AutoQoS class name, the type of traffic defined for the class, and the differentiated services code point (DSCP) value for the type of traffic, if applicable.

**Table 1: Class Definitions for the AutoQoS for the Enterprise Feature**

<table>
<thead>
<tr>
<th>AutoQoS Class Name</th>
<th>Traffic Type</th>
<th>DSCP Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Routing</td>
<td>Network control traffic, such as routing protocols</td>
<td>CS6</td>
</tr>
<tr>
<td>Interactive Voice</td>
<td>Inactive voice-bearer traffic</td>
<td>EF</td>
</tr>
<tr>
<td>Interactive Video</td>
<td>Interactive video data traffic</td>
<td>AF41</td>
</tr>
<tr>
<td>Streaming Video</td>
<td>Streaming media traffic</td>
<td>CS4</td>
</tr>
<tr>
<td>AutoQoS Class Name</td>
<td>Traffic Type</td>
<td>DSCP Value</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>

<td>CS1</td>
</tr>
<tr>
<td>Best Effort</td>
<td>Default class; all non-critical traffic; HTTP; all miscellaneous traffic</td>
<td>0</td>
</tr>
</tbody>
</table>

These classes are used with the modular quality of service (QoS) command-line interface (MQC) to configure class maps, once the classification (match) criteria are determined. The match criteria can be configured using the appropriate match protocol commands.

These classes are also chosen to meet the scheduling requirement in compliance with the DiffServ recommendations. Each class will be associated with an egress (output) queue. The applications mapped to a class will be put into the same queue and receive the same (weighted) queueing scheduling.

**Note**

The actual number of queues created corresponds to the number of applications (and then classes) discovered during AutoQoS-Discovery.

**AutoQoS Classification Using NBAR**

NBAR is the classification mechanism for the AutoQoS for the Enterprise feature. NBAR is a Cisco product that classifies network traffic using information about the application such as protocol type, URL, and dynamically assigned ports.

All the NBAR-supported applications are mapped to the AutoQoS classes described in the “Class Map Templates” section.

The AutoQoS for the Enterprise feature provides static default mapping rules used to build the AutoQoS class-map templates. The table below lists each AutoQoS class, the application to which it is mapped, and the Cisco match protocol command used in a policy map to establish the mapping.
### Table 2: AutoQoS Classes, Applications, and match protocol Command

1. In some releases on the Cisco Catalyst 6500 series switch that is equipped with a Supervisor 32/PISA
tenpresence-media and telepresence-control packets are classified under AutoQos Class Interactive Video.
The table below lists the best-effort AutoQoS class (Best Effort), the application category for this class, and
the NBAR protocols associated with this class.
Table 3: Best Effort Class, Application Categories, and Associated NBAR Protocols

<table>
<thead>
<tr>
<th>AutoQoS Class</th>
<th>Application Category</th>
<th>NBAR Protocols</th>
</tr>
</thead>
<tbody>
<tr>
<td>Best Effort</td>
<td>Known</td>
<td>HTTP, HTTPS, Gopher, NFS, SunRPC, NTP, and RCMD</td>
</tr>
<tr>
<td>Note</td>
<td>Unknown</td>
<td>All applications not identified by NBAR</td>
</tr>
</tbody>
</table>

Note: The class-default does not need a match statement in the policy map.

NBAR allows new applications to be defined and added to the network by using different tools such as a Packet Description Language Module (PDLM). The AutoQoS class mapping cannot be predetermined for these applications. Therefore, these new applications will be viewed as unknown and put into the AutoQoS default (that is, Best Effort) class.

The table below lists the AutoQoS network routing protocol class (IP Routing), the application category for this class, and the NBAR protocols associated with this class.

Table 4: IP Routing Class, Application Categories, and Associated NBAR Protocols

<table>
<thead>
<tr>
<th>AutoQoS Class</th>

<td>All supported network routing and signaling protocols.</td>
</tr>
<tr>
<td></td>
<td>The Type of Service (ToS) byte is always marked as 0x11000000.</td>
<td>The list of NBAR supported protocols includes BGP, EIGRP, RIP, RSVP.</td>
</tr>
</tbody>
</table>

Note: The table below lists each AutoQoS management class (Network Management), the application to which it is mapped, and the Cisco match protocol command used in a policy map to establish the mapping.
Table 5: Network Management Class, Application Categories, and match protocol Command

<table>
<thead>
<tr>
<th>AutoQoS Class</th>
<th>Application Category</th>
<th>match protocol Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Management</td>
<td>Network Management</td>
<td>match protocol snmp&lt;br&gt;match protocol syslog&lt;br&gt;match protocol systat&lt;br&gt;match protocol dhcp&lt;br&gt;match protocol dns&lt;br&gt;match protocol ldap&lt;br&gt;match protocol secure-ldap&lt;br&gt;match protocol socks&lt;br&gt;match protocol imap&lt;br&gt;match protocol secure-imap&lt;br&gt;match protocol kerberos&lt;br&gt;match protocol tacacs&lt;br&gt;match protocol daytime&lt;br&gt;match protocol time&lt;br&gt;match protocol npp&lt;br&gt;match protocol echo&lt;br&gt;match protocol isakmp&lt;br&gt;match protocol clearcase&lt;br&gt;match protocol lockd</td>
</tr>
</tbody>
</table>

These AutoQoS classes and mapping scheme are used as the basic building blocks for packet classification. If these classes and this mapping scheme are not correct for your particular network, you can change them using the standard Cisco commands and the MQC.

**Trusted Boundary**

A trusted boundary is the location in the network where the QoS marking is established. AutoQoS can be enabled with the `trust` keyword of the `auto discovery qos` command when the data collection phase is enabled.

---

**Note**

Some releases do not support the trusted boundary feature.

The AutoQoS classification for trusted marking will use DSCP match statements specified in the table below. When a marking is trusted, the following DSCP values are used in the match statements in the policy maps.
### Table 6: DSCP Values in Match Statements for Trusted Boundaries

### Policy-Map Templates

The policy-map templates created by the AutoQoS for the Enterprise feature are used to define the following three components:

- Queue scheduling
- Minimum guaranteed bandwidth
- Default Weighted Random Early Detection (WRED) for the applicable classes

These components are designed according to “best practice” recommendations and include QoS features for specific link types, such as low- and high-speed Frame Relay DLCIs.

### How to Configure the AutoQoS for the Enterprise Feature

#### Enabling the Auto-Discovery Phase

**Before You Begin**

Before using the `auto discovery qos` command at an interface or an ATM PVC, ensure that the following prerequisites have been met:

- Cisco Express Forwarding (CEF) must be enabled.
If the interface or subinterface has a link speed of 768 kb/s or lower, configure the primary or secondary IP address of the interface by using the `ip address` command.

For all interfaces or subinterfaces, configure the amount of bandwidth by using the `bandwidth` command. The amount of bandwidth allocated should be based on the link speed of the interface.

For an ATM PVC, configure the variable bit rate (VBR) by using either the `vbr-nrt` command or the `vbr-rt` command or configure the constant bit rate (CBR) by using the `cbr` command.

### Note

- The `auto discovery qos` command is not supported on subinterfaces.
- Do not change the bandwidth of the interface when using the `auto discovery qos` command.
- All previously attached policies must be removed from the interface.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `bandwidth kilobits`
5. `vbr-nrt output-pcr output-scr output-mbs [input-pcr] [input-scr] [input-mbs]`
6. `vbr-rt peak-rate average-rate burst`
7. `cbr rate`

</tbody>
</table>
| `ip address ip-address mask [secondary]` | (Optional) Sets a primary or secondary IP address for an interface.  
**Note**  
This step applies only to ATM PVCs. It is not required for interfaces or subinterfaces.  
**Example:**  
Device(config-if)# ip address 10.10.100.1 255.255.255.0 |
| **Step 10** |  |
| `frame-relay interface-dlci dlci ietf | cisco | [voice-cir cir] [ppp `virtual-template-name` |  
**Example:**  
Device(config-if)# frame-relay interface-dlci 100 |  
(Optional) Assigns a DLCI to a specified Frame Relay subinterface on the device or access server, or assigns a specific PVC to a DLCI, or applies a virtual template configuration for a PPP session.  
**Note**  
This step applies only to Frame Relay interfaces (either low-speed or high-speed).  
**Example:**  
Device(config-if)# frame-relay interface-dlci 100 | |
| **Step 11** |  |
| `auto discovery qos [trust]` | Configures the data discovery phase of the AutoQoS for the Enterprise feature.  
**Note**  
The optional `trust` keyword indicates that the DSCP markings of the packet are trust (that is, relied on) for classification of the voice, video, and data traffic. For more information, see the “Enabling the Auto Discovery Phase” section.  
**Example:**  
Device(config-if)# auto discovery qos | |
| **Step 12** |  |
| `end` | (Optional) Returns to privileged EXEC mode.  
**Example:**  
Device(config-if)# end | |

**What to Do Next**

Use the `auto qos` command to generate and install the AutoQoS templates. These templates are generated on the basis of the data collected in the Auto-Discovery phase, and will be used to create and install the corresponding class maps and policy maps.
Enabling the AutoQoS Template Generation and Installation Phase

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. bandwidth kilobits
5. vbr-nrt output-pcr output-scr output-mbs [input-pcr] [input-scr] [input-mbs]
6. vbr-rt peak-rate average-rate burst

</thead>
</table>
| Step 5 | vbr-nrt output-pcr output-scr output-mbs [input-pcr] [input-scr] [input-mbs] | (Optional) Configures the VBR-NRT and specifies the output PCR, output SCR, and output MBS for an ATM PVC, PVC range, SVC, VC class, or VC bundle member.  
- Enter the output PCR, SCR, and MBS. |
| **Example:** | Device(config-if)# vbr-nrt 10000 5000 32 20000 10000 64 |  |
| **Note** | This step applies only to ATM PVCs. It is not required for interfaces or subinterfaces. |
| Step 6 | vbr-rt peak-rate average-rate burst | (Optional) Configures the real-time VBR for Voice over ATM connections.  
- Enter the PIR, the AIR, and the burst size. |
| **Example:** | Device(config-if)# vbr-rt 640 56 80 |  |
| **Note** | This step applies only to ATM PVCs. It is not required for interfaces or subinterfaces. |
| Step 7 | cbr rate | (Optional) Configures the CBR for the ATM CES for an ATM PVC.  
This command can be used in different modes, including ATM-VC configuration mode (for ATM PVCs and SVCs), ATM PVC range configuration mode (for an ATM PVC range), or ATM PVC-in-range configuration mode (for an individual PVC within a PVC range).  
- Enter the CBR. |
| **Example:** | Device(config-if-atm-vc)# cbr 56 |  |
| **Note** | This step applies only to ATM PVCs. It is not required for interfaces or subinterfaces. |
| Step 8 | pvc [name] vpi / vci [ces | ilmi | qsaal | smds] | (Optional) Creates or assigns a name to an ATM PVC and specifies the encapsulation type on an ATM PVC.  
- Enter the ATM network VPI and the ATM network VCI for the ATM PVC. |
| **Example:** | Device(config-if)# pvc 1/32 |  |
| **Note** | This step applies only to ATM PVCs. It is not required for interfaces or subinterfaces. |
| Step 9 | ip address ip-address mask [secondary] | (Optional) Sets a primary or secondary IP address for an interface.  
Note Applies only to low-speed interfaces (that is, interfaces with link speeds of 768 Kbps or lower). |
| **Example:** | Device(config-if)# ip address 10.10.100.1 255.255.255.0 |  |
| Step 10 | frame-relay interface-dlci dlci [ietf | cisco] [voice-cir cir] [ppp virtual-template-name] | (Optional) Assigns a DLCI to a specified Frame Relay subinterface on the device or access server, or assigns a specific PVC to a DLCI, or applies a virtual template configuration for a PPP session.  
- Enter the DLCI number. |
| **Example:** | Device(config-if)# frame-relay interface-dlci 100 |  |
| **Note** | This step applies only to Frame Relay interfaces (either low-speed or high-speed). |
### Troubleshooting Tips

Below are answers to frequently asked questions (FAQs) and tips for troubleshooting situations that you may encounter when configuring or using the AutoQoS for the Enterprise feature.

**Why can't I configure the AutoQoS for the Enterprise feature?**
To configure the feature, CEF must be enabled. Verify that CEF is enabled on your network.

**Why isn't the AutoQoS for the Enterprise feature supported on my device?**
The AutoQoS for the Enterprise feature is supported only on the IP Plus image for low-end platforms. Verify that you have the IP Plus image installed on your device.

**Why are some of my QoS configurations still present after I disable the AutoQoS for the Enterprise feature?**
You have to manually disable any QoS configurations that were modified by the AutoQoS for the Enterprise feature.

**Why did my low-speed network link go down when I enabled the AutoQoS for the Enterprise feature?**
Ensure that the AutoQoS for the Enterprise feature is enabled on both sides of the network link.

**Why can't I establish an end-to-end connection on the Frame Relay link?**
Check the bandwidth on both sides of the Frame Relay link. The bandwidth on both sides of the link must be the same; otherwise a fragmentation size mismatch occurs, and a connection cannot be established.
What to Do Next

If the policy maps and class maps created (on the basis of the templates generated by the AutoQoS for the Enterprise feature) do not meet the needs of your network, the policy maps and class maps can be modified using the appropriate Cisco commands.

Although you can modify the policy maps and class maps, they may not be removed properly when the AutoQoS for the Enterprise feature is disabled using the `no auto qos` command. You may have to manually remove any modified policy maps and class maps. For more information about the `no auto qos` command, see the Cisco IOS Quality of Service Solutions Command Reference.

Verifying the AutoQoS for the Enterprise Configuration

SUMMARY STEPS

1. `enable`
2. `show auto qos [interface [interface type]]`
3. `show auto discovery qos [interface [type number]]`
4. `show policy-map interface [type number]`
5. `exit`

</tbody>
</table>
### Purpose

Command or Action | Purpose |
--- | --- |
**Step 4** | show policy-map interface [type number]  
Example:  
Device# show policy-map interface serial4/0 |
(Optional) Displays the packet statistics of all classes that are configured for all service policies either on the specified interface or subinterface or on a specific PVC on the interface.  
- The packet statistics can be displayed for a specific interface, subinterface, PVC, or all interfaces, subinterfaces, or PVCs. |
**Step 5** | exit  
Example:  
Device# exit |
(Optional) Exits privileged EXEC mode. |
Example Verifying the AutoQoS for the Enterprise Configuration

The AutoQoS template generation phase of the AutoQoS for the Enterprise feature automatically generates templates that are, in turn, used to create policy maps and class maps. These policy maps and class maps configure the QoS features on your network.

The output of the `show auto discovery qos` command, the `show auto qos` command, and the `show policy-map interface` command can be used to verify the contents of the policy maps and class maps created by this AutoQoS for the Enterprise feature. The following section contains sample output for each of these commands.

The following is sample output from the `show auto discovery qos` command. This example displays the data collected during the Auto-Discovery (data discovery) phase.

```
Device# show auto discovery qos

Serial2/1.1
AutoQoS Discovery enabled for applications
Discovery up time: 55 minutes, 52 seconds
AutoQoS Class information:
Class VoIP:
  Recommended Minimum Bandwidth: 517 Kbps/50% (PeakRate).
  Detected applications and data:
  Application/ AverageRate PeakRate Total
  Protocol (kbps/%) (kbps/%) (bytes)
  rtp audio 2/<1 517/50 703104

Class Interactive Video:
  Recommended Minimum Bandwidth: 24 Kbps/2% (AverageRate).
  Detected applications and data:
  Application/ AverageRate PeakRate Total
  Protocol (kbps/%) (kbps/%) (bytes)
  rtp video 24/2 5337/52 704574

Feature Information for AutoQoS for the Enterprise

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 7: Feature Information for AutoQoS for the Enterprise

<table>
<thead>
<tr>
<th>Feature Name</th>

</table>
AutoQoS—VoIP

The AutoQoS—VoIP feature allows you to automate the delivery of quality of service (QoS) on your network and provides a means for simplifying the implementation and provisioning of QoS for Voice over IP (VoIP) traffic.

- Finding Feature Information, page 29
- Prerequisites for AutoQoS—VoIP, page 29
- Restrictions for AutoQoS—VoIP, page 30
- Information About AutoQoS—VoIP, page 31
- How to Configure the AutoQoS—VoIP Feature, page 33

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for AutoQoS—VoIP

- Ensure that no QoS policies (service policies) are attached to the interface. This feature cannot be configured if a QoS policy (service policy) is attached to the interface.
- To include Simple Network Management Protocol (SNMP) traps (monitored events), the SNMP server must be enabled.
Restrictions for AutoQoS—VoIP

General Restrictions

• The AutoQoS—VoIP feature is supported on the following interfaces, data-link connection identifiers (DLCIs), and permanent virtual circuits (PVCs) only:
  • Serial interfaces with PPP or High-Level Data Link Control (HDLC)
  • Frame Relay DLCIs in point-to-point subinterfaces only
  • ATM PVCs

The AutoQoS—VoIP feature is supported on low-speed ATM PVCs in point-to-point subinterfaces only. The AutoQoS—VoIP feature is supported on high-speed ATM PVCs in any type of subinterface.

Note

An ATM PVC is classified as low-speed if its bandwidth is less than or equal to 768 kb/s; an ATM PVC is classified as high-speed if its bandwidth is greater than 768 kb/s.

• Frame Relay-to-ATM Interworking links

Serial Interface Restrictions

• For a serial interface with a low-speed link, Multilink PPP (MLP) is configured automatically. The serial interface must have an IP address. When MLP is configured, this IP address is removed and put on the MLP bundle. To ensure that the traffic goes through the low-speed link, the following conditions must be met:
  • The AutoQoS—VoIP feature must be configured at the both ends of the link.
  • The amount of bandwidth configured must be the same on both ends of the link.

Frame Relay DLCI Restrictions

• The AutoQoS—VoIP feature cannot be configured on a Frame Relay DLCI if a map class is attached to the DLCI.

• If a Frame Relay DLCI is already assigned to one subinterface, the AutoQoS—VoIP feature cannot be configured from a different subinterface.

• For low-speed Frame Relay DLCIs configured for use on Frame Relay-to-ATM networks, MLP over Frame Relay (MLPoFR) is configured automatically. The subinterface must have an IP address.

When MLPoFR is configured, this IP address is removed and put on the MLP bundle. The AutoQoS—VoIP feature must also be configured on the ATM side of the network.

• For low-speed Frame Relay DLCIs with Frame Relay-to-ATM Interworking, the AutoQoS—VoIP feature cannot be configured if a virtual template is already configured for the DLCI.
ATM PVC Restrictions

• For a low-speed ATM PVC, the AutoQoS—VoIP feature cannot be configured if a virtual template is already configured for the ATM PVC.

• For low-speed ATM PVCs, MLP over ATM (MLPoATM) is configured automatically. The subinterface must have an IP address.

When MLPoATM is configured, this IP address is removed and put on the MLP bundle. The AutoQoS—VoIP feature must also be configured on the ATM side of the network.

Information About AutoQoS—VoIP

Benefits of AutoQoS—VoIP

The key benefits of the AutoQoS—VoIP feature include the following:

• You can implement the QoS features required for VoIP traffic without an in-depth knowledge of the following underlying technologies:
  • PPP
  • Frame Relay
  • ATM
  • Service policies
  • Link efficiency mechanisms (LEM), such as Link Fragmentation and Interleaving (LFI)

• The AutoQoS—VoIP feature simplifies QoS implementation and speeds up the provisioning of QoS technology over a Cisco network. It reduces human error and lowers training costs. With the AutoQoS—VoIP feature, one command (the `auto qos` command) enables QoS for VoIP traffic across every Cisco device.

• You can also use existing Cisco commands to modify the configurations automatically generated by the AutoQoS—VoIP feature as needed to meet specific requirements.

Design Considerations

General QoS Requirements

• Recommended methods and values are configured to meet the QoS requirements for voice traffic.

• The AutoQoS—VoIP feature takes the interface type and bandwidth into consideration when implementing the following QoS features:
  • Classification, used to differentiate the voice packets from the data packets and handle the voice packets appropriately.
• Low latency queueing (LLQ)/Priority Queueing (PQ). This feature (specifically, PQ) is applied to the voice packets to meet the latency requirements.

• Compressed Real-Time Protocol (cRTP). With cRTP, the 40-byte IP header of the voice packet is reduced from 2 to 4 bytes, thereby reducing voice bandwidth requirements. cRTP must be applied at both ends of a network link.

• LFI, used to reduce the jitter of voice packets by preventing voice packets from getting delayed behind large data packets in a queue. LFI must be applied at both ends of a network link.

**Bandwidth Implications**

- The bandwidth of the serial interface determines the speed of the link. The speed of the link in turn determines the configurations generated by the AutoQoS—VoIP feature.

---

**Note**

Changing the bandwidth after configuring the AutoQoS—VoIP feature is not recommended.

The AutoQoS—VoIP feature uses the bandwidth at the time the feature is configured. AutoQoS—VoIP does not respond to changes made to bandwidth after the feature is configured.

For example, if the `auto qos voip` command is used to configure the AutoQoS—VoIP feature on an interface with 1000 kb/s, the AutoQoS—VoIP feature generates configurations for high-speed interfaces. However, if the bandwidth is later changed to 500 kb/s, the AutoQoS—VoIP feature will not use the lower bandwidth. The AutoQoS—VoIP feature retains the higher bandwidth and continues to use the generated configurations for high-speed interfaces.

To force the AutoQoS—VoIP feature to use the lower bandwidth (and thus generate configurations for the low-speed interfaces), use the `no auto qos voip` command to remove the AutoQoS—VoIP feature and then reconfigure the feature.

**Fragmentation for Frame Relay Networks**

- For Frame Relay networks, fragmentation is configured using a delay of 10 milliseconds (ms) and a minimum fragment size of 60 bytes. This ensures that the VoIP packets are not fragmented. However, when the G.711 coder-decoder (codec) is used on low-speed links, the fragment size configured by the AutoQoS—VoIP feature could be smaller than the size of the G.711 VoIP packet.

To solve this potential problem, choose one of the following:

- Change the fragment size to the required value.
- Change the size of the G.711 VoIP packet to a smaller value.

For example, if the AutoQoS—VoIP feature is configured on a Frame Relay DLCI with 128 kb/s, the fragment size configured by the AutoQoS—VoIP feature will be 160 bytes. The size of the G.711 VoIP packet will be 160 bytes, minus the bytes in the packet headers for the layers. The workaround is to either change the fragment size from 160 bytes to 220 bytes or change the size of the G.711 VoIP packet from 160 bytes to 80 bytes.

**Signaling Protocols**

The AutoQoS—VoIP feature currently identifies the following signaling protocols:
• H.323
• H.225 (Unicast only)
• Session Initiation Protocol (SIP)
• "Skinny" gateway protocol
• Media Gateway Control Protocol (MGCP)

Note
Access control lists (ACLs) can be configured to identify any additional signaling protocols that may be needed.

Configurations for the Interface Configurations Policy Maps Class Maps and ACLs

The AutoQoS—VoIP feature automatically creates configurations that are then used for the interface configurations, policy maps, class maps, and ACLs. The interface configurations, policy maps, class maps, and ACLs are created to classify VoIP packets and to provide the appropriate QoS treatment for the network traffic.

This feature also creates interface-specific (or PVC-specific) configurations. These interface-specific (or PVC-specific) configurations are created according to the interface type and the link speed.

Note
Links with bandwidths lower than or equal to 768 kb/s are considered low-speed links; links with bandwidths higher than 768 kb/s are considered high-speed links.

How to Configure the AutoQoS—VoIP Feature

Enabling the AutoQoS—VoIP Feature

Before You Begin
Before using the auto qos command at an interface or an ATM PVC, ensure that the following prerequisites have been met:

• Cisco Express Forwarding (CEF) must be enabled at the interface or ATM PVC.
• If the interface or subinterface has a link speed of 768 kb/s or lower, configure the primary or secondary IP address of the interface by using the ip address command.
• For all interfaces or subinterfaces, configure the amount of bandwidth by using the bandwidth command. The amount of bandwidth allocated should be based on the link speed of the interface.
For an ATM PVC, configure the variable bit rate (VBR) by using either the vbr-nrt command or the vbr-rt command or configure the constant bit rate (CBR) by using the cbr command.

**Note**
- The auto qos voip command is not supported on subinterfaces.
- Do not change the bandwidth of the interface before using the auto qos command.

**SUMMARY STEPS**

1. `enable`  
2. `configure terminal`  
3. `interface` type number  
4. `bandwidth` kilobits  
5. `vbr-nrt` output-pcr output-scr output-mbs [input-pcr] [input-scr] [input-mbs]  
6. `vbr-rt` peak-rate average-rate burst  
7. `cbr` rate  
8. `pvc` [name] vpi / vci [ces | ilmi | qsaal | smds]  
9. `ip address` ip-address mask secondary  
10. `frame-relay interface-dlci` dlci [ietf | cisco] [voice-cir cir] [ppp virtual-template-name]  
11. `auto qos voip` [trust] [fr-atm]  
12. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>Enters your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Enters privileged EXEC mode.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>Device&gt; enable</td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| configure terminal| Enters global configuration mode. |
| **Example:**      | Enters global configuration mode. |
| Device# configure terminal | Device# configure terminal |

| **Step 3**        | Configures an interface (or subinterface) type and enters interface configuration mode. |
| interface type number | Configures an interface (or subinterface) type and enters interface configuration mode. |
| **Example:**      | Configures an interface (or subinterface) type and enters interface configuration mode. |
| Device(config-if)# interface serial 4/0 | Device(config-if)# interface serial 4/0 |

<p>| <strong>Step 4</strong>        | (Optional) Sets a bandwidth value for an interface. |
| bandwidth kilobits | (Optional) Sets a bandwidth value for an interface. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# bandwidth 1540</td>
<td>• Enter the bandwidth value in kb/s.</td>
</tr>
<tr>
<td>Note</td>
<td>This step applies only to interfaces and subinterfaces. It is not required for ATM PVCs.</td>
</tr>
</tbody>
</table>

Step 5

Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>vbr-nrt output-pcr output-scr output-mbs</td>
<td>(Optional) Configures the variable bit rate-nonreal time (VBR-NRT) QoS and specifies the output peak cell rate (PCR), output sustainable cell rate (SCR), and output maximum burst cell size (MBS) for an ATM PVC, PVC range, switched virtual circuit (SVC), virtual circuit (VC) class, or VC bundle member.</td>
</tr>
<tr>
<td>[input-pcr] [input-scr] [input-mbs]</td>
<td>• Enter the output PCR, SCR, and MBS.</td>
</tr>
</tbody>
</table>

Note: This step applies only to ATM PVCs. It is not required for interfaces or subinterfaces.

Step 6

Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>vbr-rt peak-rate average-rate burst</td>
<td>(Optional) Configures the real-time VBR for Voice over ATM connections.</td>
</tr>
<tr>
<td>[peak-rate] [average-rate] [burst]</td>
<td>• Enter the peak information rate (PIR), the average information rate (AIR), and the burst size.</td>
</tr>
</tbody>
</table>

Note: This step applies only to ATM PVCs. It is not required for interfaces or subinterfaces.

Step 7

Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbr rate</td>
<td>(Optional) Configures the CBR for the ATM circuit emulation service (CES) for an ATM PVC.</td>
</tr>
<tr>
<td>[rate]</td>
<td>This command can be used in different modes, including ATM-VC configuration mode (for ATM PVCs and SVCs), ATM PVC range configuration mode (for an ATM PVC range), or ATM PVC-in-range configuration mode (for an individual PVC within a PVC range).</td>
</tr>
<tr>
<td>[cbcrate]</td>
<td>• Enter the CBR in kb/s.</td>
</tr>
</tbody>
</table>

Note: This step applies only to ATM PVCs. It is not required for interfaces or subinterfaces.

Step 8

Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>pvc [name] vpi / vci [ces] [ilmi] [qsaal] [smds]</td>
<td>(Optional) Creates or assigns a name to an ATM PVC and specifies the encapsulation type on an ATM PVC.</td>
</tr>
<tr>
<td>[pvcname] [vpi] / [vci]</td>
<td>• Enter the ATM network virtual path identifier (VPI) and the ATM network virtual channel identifier (VCI) for the ATM PVC.</td>
</tr>
</tbody>
</table>

Note: This step applies only to ATM PVCs. It is not required for interfaces or subinterfaces.

Step 9

Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip address [ip-address] mask [secondary]</td>
<td>(Optional) Sets a primary or secondary IP address for an interface.</td>
</tr>
<tr>
<td>[ipaddress]</td>
<td>Applies only to low-speed interfaces (that is, interfaces with link speeds of 768 kb/s or lower.)</td>
</tr>
</tbody>
</table>

Note: This step applies only to ATM PVCs. It is not required for interfaces or subinterfaces.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 10</strong></td>
<td>(Optional) Assigns a DLCI to a specified Frame Relay subinterface on the device or access server, or assigns a specific PVC to a DLCI, or applies a virtual template configuration for a PPP session.</td>
</tr>
<tr>
<td>`frame-relay interface-dlci dlci [ietf</td>
<td>cisco] [voice-cir cir] [ppp virtual-template-name]`</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>This step applies only to Frame Relay interfaces (either low-speed or high-speed).</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-if)# frame-relay interface-dlci 100</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Configures the AutoQoS—VoIP feature.</td>
</tr>
<tr>
<td><code>auto qos voip [trust] [fr-atm]</code></td>
<td><strong>Note</strong> For low-speed Frame Relay DLCIs interconnected with ATM PVCs in the same network, the <code>fr-atm</code> keyword must be explicitly configured in the <code>auto qos voip</code> command to configure the AutoQoS—VoIP feature properly. That is, the command must be configured as <code>auto qos voip fr-atm</code>.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-if)# auto qos voip</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>(Optional) Returns to interface configuration mode.</td>
</tr>
<tr>
<td><code>exit</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-if)# exit</td>
</tr>
</tbody>
</table>

**FAQs and Troubleshooting Tips**

Below are answers to frequently asked questions (FAQs) and tips for troubleshooting situations that you may encounter when configuring or using the AutoQoS—VoIP feature.

**Why can’t I configure the AutoQoS—VoIP feature?**

- To configure the feature, CEF must be is enabled. Verify that CEF is enabled on your network.
- Also, the feature cannot be enabled if a service policy is already attached to the interface. Determine whether there is a service policy attached to the interface. If so, remove the service policy from the interface.

**Why isn’t the AutoQoS—VoIP feature supported on my device?**

- The AutoQoS—VoIP feature is supported only on the IP Plus image for lower-end platforms. Verify that you have the IP Plus image installed on your device.

**Why are some of my QoS configurations still present after I disable the AutoQoS—VoIP feature?**

- You have to manually disable any QoS configurations that were modified by the AutoQoS—VoIP feature.
Why did my low-speed network link go down when I enabled the AutoQoS—VoIP feature?

- Ensure that AutoQoS—VoIP is enabled on both sides of the network link.

Why can’t I establish an end-to-end connection on the Frame Relay link?

- Check the bandwidth on both sides of the Frame Relay link. The bandwidth on both sides of the link must be the same, otherwise a fragmentation size mismatch occurs and a connection cannot be established.

What to Do Next

If the interface configurations, policy maps, class maps, and ACLs created (on the basis of the configurations created by the AutoQoS—VoIP feature) do not meet the needs of your network, the interface configurations, policy maps, class maps, and ACLs can be modified using the appropriate Cisco commands.

Note

While you can modify the interface configurations, policy maps, class maps, and ACLs, they may not be removed properly when the AutoQoS—VoIP feature is disabled using the no auto qos command. You may need to manually remove any modified interface configurations, policy maps, class maps, and ACLs. For more information about the no auto qos command, see the Cisco IOS Quality of Service Solutions Command Reference.

Verifying the Configuration

SUMMARY STEPS

1. enable
2. show auto qos [interface [interface type]]
3. show policy-map interface [interface type]
4. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

<p>| Step 2 show auto qos [interface [interface type]] | (Optional) Displays the interface configurations, policy maps, class maps, and ACLs created on the basis of automatically generated configurations. |
| Example: Device# show auto qos interface s4/0 |   |
| Example: | The interface configurations, policy maps, class maps, and ACLs can be displayed for a specific interface or all interfaces. |</p>
<table>

</tr>
<tr>
<td>Example: Device# show policy-map interface s4/0</td>
<td>• The packet statistics can be displayed for a specific interface, subinterface, PVC, or all interfaces, subinterfaces, or PVCs.</td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>(Optional) Exits privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device# exit</td>
<td></td>
</tr>
</tbody>
</table>

### Configuration Examples for AutoQoS—VoIP

#### Examples: Configuring the AutoQoS—VoIP Feature

When the `auto qos voip` command is used to configure the AutoQoS—VoIP feature, configurations are generated. These configurations are then used to create interface configurations, policy maps, class maps, and ACLs.

This section contains examples of configuring the AutoQoS—VoIP feature on the interfaces, PVCs, and links.

**Example: Configuring the AutoQoS—VoIP Feature on a High-Speed Serial Interface**

In this example, the AutoQoS—VoIP feature is configured on the high-speed serial interface 1/2.

```
Device> enable
Device# configure terminal
Device(config)# interface serial 1/2
Device(config-if)# bandwidth 1540
Device(config-if)# auto qos voip
Device(config-if)# exit
```

**Example: Configuring the AutoQoS—VoIP Feature on a Low-Speed Serial Interface**

In this example, the AutoQoS—VoIP feature is configured on the low-speed serial interface 1/3.

```
Device# configure terminal
Device(config)# interface serial 1/3
Device(config-if)# bandwidth 512
Device(config-if)# ip address 10.10.100.1 255.255.255.0
Device(config-if)# auto qos voip
Device(config-if)# exit
```
Example: Configuring the **AutoQoS—VoIP Feature on High-Speed Frame Relay Interfaces**

In this example, the AutoQoS—VoIP feature is configured on the high-speed serial point-to-point Frame Relay subinterface 4/1.2.

```
Device> enable
Device# configure terminal
Device(config)# interface serial 4/1.2 point-to-point
Device(config-if)# bandwidth 1540
Device(config-if)# frame-relay interface-dlci 100
Device(config-fr-dlci)# auto qos voip
Device(config-if)# exit
```

Example: Configuring the **AutoQoS—VoIP Feature on Low-Speed Frame Relay Interfaces**

In this example, the AutoQoS—VoIP feature is configured on the low-speed point-to-point Frame Relay subinterface 4/2.1.

```
Device# configure terminal
Device(config)# interface serial 4/2.1 point-to-point
Device(config-if)# bandwidth 512
Device(config-if)# ip address 10.10.100.1 255.255.255.0
Device(config-if)# frame-relay interface-dlci 100
Device(config-fr-dlci)# auto qos voip
Device(config-if)# exit
```

Example: Configuring the **AutoQoS—VoIP Feature on a High-Speed ATM PVC**

In this example, the AutoQoS—VoIP feature is configured on the high-speed point-to-point ATM PVC ATM5/0.1.

```
Device# configure terminal
Device(config)# interface ATM5/0.1 point-to-point
Device(config-if)# pvc 1/32
Device(config-if)# vbr-nrt 1540 1540
Device(config-if)# auto qos voip
Device(config-if)# exit
```

Example: Configuring the **AutoQoS—VoIP Feature on a Low-Speed ATM PVC**

In this example, the AutoQoS—VoIP feature is configured on a low-speed point-to-point ATM PVC ATM5/0.2.

```
Device# configure terminal
Device(config)# interface ATM5/0.2 point-to-point
Device(config-if)# ip address 10.10.100.1 255.255.255.0
Device(config-if)# pvc 1/32
Device(config-if)# vbr-nrt 512 512
Device(config-if)# auto qos voip
Device(config-if)# exit
```

Example: Configuring the **AutoQoS—VoIP Feature for Frame Relay-to-ATM Interworking**

In this example, the AutoQoS—VoIP feature is configured for Frame Relay-to-ATM Interworking. The AutoQoS—VoIP feature is configured on the serial point-to-point subinterface 1/3.1.

```
Device# configure terminal
Device(config)# interface serial 1/3.1 point-to-point
Device(config-if)# bandwidth 512
Device(config-if)# ip address 10.10.100.1 255.255.255.0
Device(config-if)# frame-relay interface-dlci 100
```
Device(config-if)# auto qos voip fr-atm
Device(config-if)# exit
In this configuration, the optional \texttt{fr-atm} keyword is used to enable the AutoQoS—VoIP feature for the Frame Relay-to-ATM Interworking.

\textbf{Note}

The ATM-to-ATM side of the network needs no special configuration to distinguish it from the ATM-to-Frame Relay side of the network.

\section*{Examples: Verifying the AutoQoS—VoIP Feature Configuration}

When the \texttt{auto qos voip} command is used to configure the AutoQoS—VoIP feature, configurations are generated. These configurations are then used to create interface configurations, policy maps, class maps, and ACLs. The \texttt{show auto qos interface} command can be used to verify the contents of the interface configurations, policy maps, class maps, and ACLs.

This section contains the following sample output of the \texttt{show auto qos interface} command for interfaces, PVCs, and links.

\textbf{Note}

The \texttt{show auto qos interface} command output displays only those configurations created by the AutoQoS—VoIP feature.

\subsection*{Sample show auto qos interface Command Output for a High-Speed Serial Interface}

The following is sample output from the \texttt{show auto qos} command for a high-speed serial interface:

\verbatimverbatim
Device# show auto qos interface serial 6/0
Serial6/0 -
  !
  interface Serial6/0
  service-policy output AutoQoS-Policy-UnTrust
\verbatimverbatim

\subsection*{Sample show auto qos interface Command Output for a Low-Speed Serial Interface}

The following is sample output from the \texttt{show auto qos} command for a low-speed serial interface:

\verbatimverbatim
Device# show auto qos interface serial 6/0
Serial6/0 -
  !
  interface Serial6/0
  no ip address
  encapsulation ppp
  no fair-queue
  ppp multilink
  multilink-group 2001100126
  !
  interface Multilink2001100126
  bandwidth 512
  ip address 10.10.100.1 255.255.255.0
  service-policy output AutoQoS-Policy-UnTrust
  ppp multilink
  ppp multilink fragment-delay 10
\verbatimverbatim
ppp multilink interleave
ip rtp header-compression iphc-format

Sample show auto qos interface Command Output for a High-Speed Frame Relay Interface

The following is sample output from the show auto qos command for a high-speed Frame Relay interface:

Device# show auto qos interface serial6/1.1

Serial6/1.1: DLCI 100 -
! interface Serial6/1
frame-relay traffic-shaping
!
interface Serial6/1.1 point-to-point
frame-relay interface-dlci 100
  class AutoQoS-VoIP-FR-Serial6/1-100
!
map-class frame-relay AutoQoS-VoIP-FR-Serial6/1-100
frame-relay cir 1540000
frame-relay bc 15400
frame-relay be 0
frame-relay mincir 1540000
service-policy output AutoQoS-Policy-UnTrust

Note
The output from the show auto qos interface command for high-speed Frame Relay interfaces is similar to the output for low-speed Frame Relay interfaces. The only difference is that Frame Relay Fragmentation and cRTP are not configured for high-speed Frame Relay interfaces.

Sample show auto qos interface Command Output for a Low-Speed Frame Relay Interface

The following is sample output from the show auto qos command for a low-speed Frame Relay interface:

Device# show auto qos interface serial 6/1.1

Serial6/1.1: DLCI 100 -
! interface Serial6/1
frame-relay traffic-shaping
!
interface Serial6/1.1 point-to-point

Sample show auto qos interface Command Output for a High-Speed ATM PVC

The following is sample output from the show auto qos command for a high-speed ATM PVC:

Device# show auto qos interface atm 2/0.1

ATM2/0.1: PVC 1/100 -
! interface ATM2/0.1 point-to-point
pvc 1/100
tx-ring-limit 3
service-policy output AutoQoS-Policy-UnTrust

Sample show auto qos interface Command Output for a Low-Speed ATM PVC

The following is sample output from the `show auto qos` command for a low-speed ATM PVC:

Device# show auto qos interface atm 2/0.1
ATM2/0.1: PVC 1/100 -
  !
  interface ATM2/0.1 point-to-point
  pvc 1/100
    tx-ring-limit 3

Feature Information for AutoQoS—VoIP

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note

The table below lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
The AutoQoS—VoIP feature allows you to automate the delivery of quality of service (QoS) on your network and provides a means for simplifying the implementation and provisioning of QoS for Voice over IP (VoIP) traffic.

The following commands are new or modified: `auto qos voip`, `show auto qos`.

In Cisco IOS XE 3.1.0SG, this feature was integrated.
