## **Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="https://www.cisco.com/go/cfn">www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

### Information About IPv6 QoS: MQC Packet Classification

### Implementation Strategy for QoS for IPv6

IPv6 packets are forwarded by paths that are different from those for IPv4. QoS features supported for IPv6 environments include packet classification, queuing, traffic shaping, weighted random early detection (WRED), class-based packet marking, and policing of IPv6 packets. These features are available at both the process switching and Cisco Express Forwarding switching paths of IPv6.

All of the QoS features available for IPv6 environments are managed from the modular QoS command-line interface (MQC). The MQC allows you to define traffic classes, create and configure traffic policies (policy maps), and then attach those traffic policies to interfaces.

To implement QoS in networks that are running IPv6, follow the same steps that you would follow to implement QoS in networks running only IPv4. At a very high level, the basic steps for implementing QoS are as follows:

- Know which applications in your network need QoS.
- Understand the characteristics of the applications so that you can make decisions about which QoS features would be appropriate.
- Know your network topology so that you know how link layer header sizes are affected by changes and forwarding.
- Create classes based on the criteria that you establish for your network. In particular, if the same network is also carrying IPv4 traffic along with IPv6 traffic, decide if you want to treat both of them the same way or treat them separately and specify match criteria accordingly. If you want to treat them the same, use match statements such as **match precedence**, **match dscp**, **set precedence**, and **set dscp**. If you want to treat them separately, add match criteria such as **match protocol ip** and **match protocol ipv6** in a match-all class map.
- Create a policy to mark each class.
- Work from the edge toward the core in applying QoS features.
- Build the policy to treat the traffic.
- Apply the policy.

### Packet Classification in IPv6

Packet classification is available with both the process and Cisco Express Forwarding switching path. Classification can be based on IPv6 precedence, differentiated services control point (DSCP), and other IPv6 protocol-specific values that can be specified in IPv6 access lists in addition to other non-IPv6 values such as COS, packet length, and QoS group. Once you determine which applications need QoS, you can create classes based on the characteristics of the applications. You can use a variety of match criteria to classify traffic. You can combine various match criteria to segregate, isolate, and differentiate traffic.

The enhancements to the modular QoS CLI (MQC) allow you to create matches on precedence, DSCP, and IPv6 access group values in both IPv4 and IPv6 packets. The **match** command allows matches to be made on DSCP values and precedence for both IPv4 and IPv6 packets.

## How to Configure IPv6 QoS: MQC Packet Classification

### **Classifying Traffic in IPv6 Networks**

The **set cos** and **match cos** commands for 802.1Q (dot1Q) interfaces are supported only for packets that are switched by Cisco Express Forwarding. Packets that are process-switched, such as device-generated packets, are not marked when these options are used.

### **Using the Match Criteria to Manage IPv6 Traffic Flows**

You can use multiple match statements. Depending on the type of class, you can specify whether to match all classes or any of the classes.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- **3.** class-map {class-name | class-default}
- **4.** Do one of the following:
  - match precedence precedence-value [precedence-value]
  - match access-group name ipv6-access-group
  - match [ip] dscp dscp-value [dscp-value dscp-value dsc

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables such as privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	class-map {class-name  class-default}	Creates the specified class and enters QoS class-map configuration mode.
	Example:	
	Router(config-pmap-c)# class clsl	
Step 4	Do one of the following:  • match precedence precedence-value [precedence-value precedence-value]	Matches the precedence value. The precedence applies to both IPv4 and IPv6 packets.
	<ul> <li>match access-group name ipv6-access-group</li> <li>match [ip] dscp dscp-value [dscp-value dscp-value dscp-value dscp-value dscp-value dscp-value dscp-value</li> </ul>	Specifies the name of an IPv6 access list against whose contents packets are checked to determine if they belong to the traffic class.  or  Identifies a specific IP DSCP value as a match criterion.

Command or Action	Purpose
Example:	
example.	
Router(config-pmap-c)#	
match precedence 5	
Example:	
Router(config-pmap-c)# match ip dscp 15	

## **Confirming the Service Policy**

Ensure that the traffic flow matches the input or output parameter of the policy. For example, downloading a file from an FTP server generates congestion in the receive direction because the server sends large MTU-sized frames, and the client PC returns small acknowledgments (ACKs).

Before you begin this task, simulate congestion with an extended ping using a large ping size and a large number of pings. Also, try downloading a large file from an FTP server. The file constitutes "disturbing" data and fills the interface bandwidth.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. interface type number multipoint | point-to-point
- 4. ip address ip-address mask [secondary]
- 5. pvc [name] vpi / vci [ces | ilmi | qsaal | smds]
- 6. tx-ring-limit ring-limit
- **7. service-policy** {**input** | **output**} *policy-map-name*

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	

	Command or Action	Purpose	
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Router# configure terminal		
Step 3	interface type number multipoint   point-to-point	Enters interface configuration mode.	
	Example:		
	Router(config) # interface ethernet1/1 point-to-point		
Step 4	ip address ip-address mask [secondary]	Specifies the IP address of the interface you want to test.	
	Example:		
	Router(config-if)# ip address 10.1.1.1 255.255.255.0		
Step 5	pvc [name] vpi / vci [ces   ilmi   qsaal   smds]	Creates or assigns a name to an ATM PVC, optionally specifies the encapsulation type on an ATM PVC, and enters	
	Example:	interface-ATM-VC configuration mode.	
	Router(config-if)#		
	pvc cisco 0/5		
Step 6	tx-ring-limit ring-limit	Reduces the size of the transmit ring of the interface. Lowering this value accelerates the use of the QoS in the Cisco IOS software.	
	Example:	• Specify the ring limit as the number of packets for 2600 and	
	Router(config-if-atm-vc)# tx-ring-limit 10	3600 series routers, or as the number of memory particles for 7200 and 7500 series routers.	
Step 7	service-policy {input   output} policy-map-name	Attaches a policy map to an input interface or VC, or an output interface or VC, to be used as the service policy for that interface	
	Example:	or VC.	
	Router(config-if-atm-vc)# service-policy output policy9	<ul> <li>The packets-matched counter is a part of queueing feature and is available only on service policies attached in output direction.</li> </ul>	

# Configuration Examples for IPv6QoS: MQCPacket Classification

### **Example: Matching DSCP Value**

The following example shows how to configure the service policy called priority50 and attach service policy priority50 to an interface. In this example, the **match dscp** command includes the optional **ip** keyword, meaning that the match is for IPv4 packets only. The class map called ipdscp15 will evaluate all packets entering interface Fast Ethernet 1/0. If the packet is an IPv4 packet and has a DSCP value of 15, the packet will be treated as priority traffic and will be allocated with bandwidth of 50 kbps.

```
Router(config)#
 class-map ipdscp15
Router(config-cmap)#
match ip dscp 15
Router(config)#
exit
Router(config)#
policy-map priority50
Router(config-pmap)#
class ipdscp15
Router (config-pmap-c) #
priority 50
Router(config-pmap-c)#
Router(config-pmap)#
exit
Router(config)#
interface fa1/0
Router(config-if)#
service-policy input priority55
```

To match on IPv6 packets only, use the **match dscp** command without the **ip** keyword preceded by the **match protocol** command. Ensure that the class map has the **match-all** attribute (which is the default).

```
Router(config) #
  class-map ipdscp15
Router(config-cmap) #
  match protocol ipv6
Router(config-cmap) #
  match dscp 15
Router(config) #
  exit
```

To match packets on both IPv4 and IPv6 protocols, use the **match dscp** command:

```
Router(config) #
  class-map ipdscp15
Router(config-cmap) #
  match dscp 15
```

## Feature Information for IPv6 QoS: MQC Packet Classification

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="https://www.cisco.com/go/cfn">www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

Table 1: Feature Information for IPv6 QoS: MQC Packet Classification

Feature Name	Releases	Feature Information
IPv6 QoS: MQC Packet	12.2(33)SRA	The modular QoS CLI allows you
Classification	12.2(18)SXE2	to define traffic classes, create and configure traffic policies, and then
	12.2(13)T	attach those traffic policies to
	12.3	interfaces.
	12.3(2)T	The following commands were
	12.4	introduced or modified: match access-group name, match dscp,
	12.4(2)T	match precedence, set dscp, set
		precedence.
