Inbound Policy Marking for dVTI

This document provides conceptual information and tasks for using the Inbound Policy Marking for Dynamic Virtual Tunnel Interface feature, which allows you to attach a policy map to a dVTI so that marking instructions are applied to inbound packets.

- Finding Feature Information, on page 1
- Prerequisites for Inbound Policy Marking for dVTI, on page 1
- Restrictions for Inbound Policy Marking for dVTI, on page 1
- Information About Inbound Policy Marking for dVTI, on page 2
- How to Use Inbound Policy Marking for dVTI, on page 3

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Inbound Policy Marking for dVTI

- Policy map

Restrictions for Inbound Policy Marking for dVTI

The following are not supported:

- Policing
- Network Based Application Recognition (NBAR)-based classification
• Queuing
• Outbound policy marking

Only input QoS policy is supported. Only the marking feature is supported on the input policy. Other QoS configurations may not be blocked but will not be supported.

Information About Inbound Policy Marking for dVTI

Inbound Policy Marking

Marking is the setting of QoS information related to a packet. For the Inbound Policy Marking for dVTI feature, you can attach a policy map to a dVTI so that marking instructions are applied to inbound packets.

Dynamic Virtual Tunnel Interfaces Overview

DVTIs can provide highly secure and scalable connectivity for remote-access VPNs. The dVTI technology replaces dynamic crypto maps and the dynamic hub-and-spoke method for establishing tunnels.

DVTIs can be used for both the server and remote configuration. The tunnels provide an on-demand separate virtual access interface for each VPN session. The configuration of the virtual access interfaces is cloned from a virtual template configuration, which includes the IPsec configuration and any Cisco IOS XE software feature configured on the virtual template interface, such as QoS, NetFlow, or ACLs.

DVTIs function like any other real interface so that you can apply QoS, firewall, other security services as soon as the tunnel is active. QoS features can be used to improve the performance of various applications across the network. Any combination of QoS features offered in Cisco IOS XE software can be used to support voice, video, or data applications.

DVTIs provide efficiency in the use of IP addresses and provide secure connectivity. DVTIs allow dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. The per-group or per-user definition can be created using extended authentication (Xauth) User or Unity group, or it can be derived from a certificate. DVTIs are standards based, so interoperability in a multiple-vendor environment is supported. IPsec dVTIs allow you to create highly secure connectivity for remote access VPNs and can be combined with Cisco Architecture for Voice, Video, and Integrated Data (AVVID) to deliver converged voice, video, and data over IP networks. The dVTI simplifies VPN routing and forwarding (VRF)-aware IPsec deployment. The VRF is configured on the interface.

A dVTI requires minimal configuration on the router. A single virtual template can be configured and cloned. The dVTI creates an interface for IPsec sessions and uses the virtual template infrastructure for dynamic instantiation and management of dynamic IPsec VTIs. The virtual template infrastructure is extended to create dynamic virtual-access tunnel interfaces. DVTIs are used in hub-and-spoke configurations.

In Cisco IOS XE Release 3.4S, support for the following was added:

• Maximum of 2000 dynamic tunnels with QoS applied
• Maximum of 4000 dynamic tunnels (2000 with QoS, 2000 without QoS)
• dVTI QoS LLQ for high-speed access egress shaping with overhead accounting and queuing
Security Associations and dVTI

Security Associations (SAs) are security policy instances and keying material applied to a data flow. IPSec SAs are unidirectional and unique in each security protocol. You need multi SAs for a protected data pipe, one per direction per protocol. The Inbound Policy Marking for dVTI feature uses multi SAs. It enables multiple specific-to-specific SAs to link to one dVTI tunnel.

How to Use Inbound Policy Marking for dVTI

To use the Inbound Policy Marking for dVTI feature, first create a policy map. After creating the policy map, attach it to an interface.

Creating a Policy Map

**SUMMARY STEPS**

1. enable
2. configure terminal
3. policy-map *policy-map-name*
4. class {class-name | class-default}
5. set ip dscp *ip-dscp-value*
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enters QoS policy-map configuration mode and creates a policy map that can be attached to one or more interfaces to specify a service policy,</td>
</tr>
<tr>
<td>policy-map <em>policy-map-name</em></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# policy-map p-map</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Specifies the default class so that you can configure or modify its policy.</td>
</tr>
<tr>
<td>class {class-name</td>
<td>class-default}</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-pmap)# class class-default</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Step 5**

```bash
set ip dscp ip-dscp-value
```

**Example:**

Router(config-pmap-c)# set ip dscp af21

Marks a packet by setting the IP differentiated services code point (DSCP) value in the type of service (ToS) byte.

**Step 6**

```bash
end
```

**Example:**

Router(config-pmap-c)# end

Returns to privileged EXEC mode.

### Attaching a Policy Map to a dVTI

#### SUMMARY STEPS

1. ```enable```
2. ```configure terminal```
3. ```interface virtual-template number```
4. ```policy-map [type {control | service}] policy-map-name```
5. ```end```

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Router&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>interface virtual-template number</code></td>
<td>Creates a virtual template interface that can be configured and applied dynamically in creating virtual access interfaces.</td>
</tr>
<tr>
<td>Example: <code>Router(config)# interface virtual-template 1 type tunnel</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ```policy-map [type {control</td>
<td>service}] policy-map-name```</td>
</tr>
<tr>
<td>Example: <code>Router(config)# policy-map input policy1</code></td>
<td></td>
</tr>
</tbody>
</table>
**Inbound Policy Marking for dVTI**

**Configuration Example for Inbound Policy Marking for dVTI**

**Example 1**

```plaintext
class-map match-any RT
    match ip dscp cs5 ef
!
class-map match-any DATA
    match ip dscp cs1 cs2 af21 af22
!
policy-map CHILD
    class RT
        priority
        police 200000
            conform-action transmit exceed-action drop violate-action drop
    class DATA
        bandwidth remaining percent 100
!
policy-map PARENT
    class class-default
        shape average 1000000 account user-defined xx
        service-policy CHILD
!
interface Virtual-Template 1 type tunnel
    ip vrf forwarding Customer1
    service-policy output PARENT
```

**Example 2 Configuring Inbound Policy Marking**

This shows an example configuration of the hub side of dVTI:

```plaintext
aaa new-model
!
aaa authentication login default local
aaa authorization network default local
!
aaa session-id common
!
policy-map pm1
    class class-default
        shape average 1280000
!
crypto isakmp policy 1
    encr 3des
    authentication pre-share
    group 2
!```
crypto isakmp key cisco123 address 192.0.2.1

Feature Information for Using Inbound Policy Marking for dVTI

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Inbound Policy Marking for dVTI

<table>
<thead>
<tr>
