Dynamic Multipoint VPN

The Dynamic Multipoint VPN (DMVPN) feature allows users to better scale large and small IP Security (IPsec) Virtual Private Networks (VPNs) by combining generic routing encapsulation (GRE) tunnels, IPsec encryption, and Next Hop Resolution Protocol (NHRP).

Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Dynamic Multipoint VPN (DMVPN)

• Before a multipoint GRE (mGRE) and IPsec tunnel can be established, you must define an Internet Key Exchange (IKE) policy by using the crypto isakmp policy command.
For the NAT-Transparency Aware enhancement to work, you must use IPsec transport mode on the transform set. Also, even though NAT-Transparency can support two peers (IKE and IPsec) being translated to the same IP address (using the User Datagram Protocol [UDP] ports to differentiate them [that is, Peer Address Translation (PAT)]), this functionality is not supported for DMVPN. All DMVPN spokes must have a unique IP address after they have been NAT translated. They can have the same IP address before they are NAT translated.

To enable 25470DMPVN--Traffic Segmentation Within DMVPN you must configure multiprotocol label switching (MPLS) by using the `mpls ip` command.

**Restrictions for Dynamic Multipoint VPN (DMVPN)**

If you use the Dynamic Creation for Spoke-to-Spoke Tunnels benefit of this feature, you must use IKE certificates or wildcard preshared keys for Internet Security Association Key Management Protocol (ISAKMP) authentication.

It is highly recommended that you do not use wildcard preshared keys because the attacker will have access to the VPN if one spoke router is compromised.

- GRE tunnel keepalives (that is, the `keepalive` command under a GRE interface) are not supported on point-to-point or multipoint GRE tunnels in a DMVPN Network.

- For best DMVPN functionality, it is recommended that you run the latest Cisco IOS software Release 12.4 mainline, 12.4T, or 12.2(18)SXF.

- If one spoke is behind one NAT device and another different spoke is behind another NAT device, and Peer Address Translation (PAT) is the type of NAT used on both NAT devices, then a session initiated between the two spokes cannot be established.

One example of a PAT configuration on a NAT interface is:

```
ip nat inside source list nat_acl interface FastEthernet0/1 overload
```

**DMVPN Support on the Cisco 6500 and Cisco 7600**

**Blade-to-Blade Switchover on the Cisco 6500 and Cisco 7600**

DMVPN does not support blade-to-blade switchover on the Cisco 6500 and Cisco 7600.

**Cisco 6500 or Cisco 7600 As a DMVPN Hub**

A Cisco 6500 or Cisco 7600 that is functioning as a DMVPN hub cannot be located behind a NAT router.

If a Cisco 6500 or Cisco 7600 is functioning as a DMVPN hub, the spoke behind NAT must be a Cisco 6500 or Cisco 7600, respectively, or the router must be upgraded to Cisco IOS software Release 12.3(11)T02 or a later release.
Cisco 6500 or Cisco 7600 As a DMVPN Spoke

- If a Cisco 6500 or Cisco 7600 is functioning as a spoke, the hub cannot be behind NAT.
- If a Cisco 6500 or Cisco 7600 is functioning as a DMVPN spoke behind NAT, the hub must be a Cisco 6500 or Cisco 7600, respectively, or the router must be upgraded to Cisco IOS Release 12.3(11)T02 or a later release.

DMVPN Hub or Spoke Supervisor Engine

- Only a Supervisor Engine 720 can be used as a DMVPN hub or spoke. A Supervisor Engine 2 cannot be used.

Encrypted Multicast with GRE

- Encrypted Multicast with GRE is not supported on the Cisco 6500 nor on the Cisco 7600.

mGRE Interfaces

- If there are two mGRE interfaces on the same DMVPN node and they both do not have a tunnel key, the two mGRE interfaces must each have a unique tunnel source address (or interface) configured.
- On the Cisco 6500 and Cisco 7600, each GRE interface (multipoint or point-to-point) must have a unique tunnel source address (or interface).
- The following commands are not supported under mGRE with DMVPN: `ip tcp adjust-mss`, `qos pre-classify tunnel vrf`, `tunnel path-mtu-discovery`, and `tunnel vrf`.

Quality of Service (QoS)

- You cannot use QoS for DMVPN packets on a Cisco 6500 or Cisco 7600.

Tunnel Key

- The use of a tunnel key on a GRE (multipoint or point-to-point) interface is not supported in the hardware switching ASICs on the Cisco 6500 and Cisco 7600 platforms. If a tunnel key is configured, throughput performance is greatly reduced.
- In Cisco IOS Release 12.3(11)T3 and Release 12.3(14)T, the requirement that a mGRE interface must have a tunnel key was removed. Therefore, in a DMVPN network that includes a Cisco 6500 or Cisco 7600 as a DMVPN node, you should remove the tunnel key from all DMVPN nodes in the DMVPN network, thus preserving the throughput performance on the Cisco 6500 and Cisco 7600 platforms.
- If the tunnel key is not configured on any DMVPN node within a DMVPN network, it must not be configured on all DMVPN nodes with the DMVPN network.

VRF-Aware DMVPN Scenarios

- The `mls mpls tunnel-recir` command must be configured on the provider equipment (PE) DMVPN hub if customer equipment (CE) DMVPN spokes need to “talk” to other CEs across the MPLS cloud.
- The mGRE interface should be configured with a large enough IP maximum transmission unit (1400 packets to avoid having the route processor doing fragmentation.
Information About Dynamic Multipoint VPN (DMVPN)

Benefits of Dynamic Multipoint VPN (DMVPN)

Hub Router Configuration Reduction

• Currently, for each spoke router, there is a separate block of configuration lines on the hub router that define the crypto map characteristics, the crypto access list, and the GRE tunnel interface. This feature allows users to configure a single mGRE tunnel interface, a single IPsec profile, and no crypto access lists on the hub router to handle all spoke routers. Thus, the size of the configuration on the hub router remains constant even if spoke routers are added to the network.

• DMVPN architecture can group many spokes into a single multipoint GRE interface, removing the need for a distinct physical or logical interface for each spoke in a native IPsec installation.

Automatic IPsec Encryption Initiation

• GRE has the peer source and destination address configured or resolved with NHRP. Thus, this feature allows IPsec to be immediately triggered for the point-to-point GRE tunneling or when the GRE peer address is resolved via NHRP for the multipoint GRE tunnel.

Support for Dynamically Addressed Spoke Routers

• When using point-to-point GRE and IPsec hub-and-spoke VPN networks, the physical interface IP address of the spoke routers must be known when configuring the hub router because IP address must be configured as the GRE tunnel destination address. This feature allows spoke routers to have dynamic physical interface IP addresses (common for cable and DSL connections). When the spoke router comes online, it will send registration packets to the hub router: within these registration packets, is the current physical interface IP address of this spoke.

Dynamic Creation for Spoke-to-Spoke Tunnels

• This feature eliminates the need for spoke-to-spoke configuration for direct tunnels. When a spoke router wants to transmit a packet to another spoke router, it can now use NHRP to dynamically determine the required destination address of the target spoke router. (The hub router acts as the NHRP server, handling the request for the source spoke router.) The two spoke routers dynamically create an IPsec tunnel between them so data can be directly transferred.

VRF Integrated DMVPN

• DMVPN can be used to extend the Multiprotocol Label Switching (MPLS) networks that are deployed by service providers to take advantage of the ease of configuration of hub and spokes, to provide support for dynamically addressed customer premises equipment (CPEs), and to provide zero-touch provisioning for adding new spokes into a DMVPN.
Feature Design of Dynamic Multipoint VPN (DMVPN)

The Dynamic Multipoint VPN (DMVPN) feature combines GRE tunnels, IPsec encryption, and NHRP routing to provide users an ease of configuration via crypto profiles—which override the requirement for defining static crypto maps—and dynamic discovery of tunnel endpoints.

This feature relies on the following two Cisco enhanced standard technologies:

- **NHRP**—A client and server protocol where the hub is the server and the spokes are the clients. The hub maintains an NHRP database of the public interface addresses of each spoke. Each spoke registers its real address when it boots and queries the NHRP database for real addresses of the destination spokes to build direct tunnels.

- **mGRE Tunnel Interface**—Allows a single GRE interface to support multiple IPsec tunnels and simplifies the size and complexity of the configuration.

The topology shown in the diagram below and the corresponding bullets explain how this feature works.

*Figure 1: Sample mGRE and IPsec Integration Topology*

- Each spoke has a permanent IPsec tunnel to the hub, not to the other spokes within the network. Each spoke registers as clients of the NHRP server.

- When a spoke needs to send a packet to a destination (private) subnet on another spoke, it queries the NHRP server for the real (outside) address of the destination (target) spoke.

- After the originating spoke “learns” the peer address of the target spoke, it can initiate a dynamic IPsec tunnel to the target spoke.

- The spoke-to-spoke tunnel is built over the multipoint GRE interface.

- The spoke-to-spoke links are established on demand whenever there is traffic between the spokes. Thereafter, packets can bypass the hub and use the spoke-to-spoke tunnel.
After a preconfigured amount of inactivity on the spoke-to-spoke tunnels, the router will tear down those tunnels to save resources (IPsec security associations [SAs]).

IPsec Profiles

IPsec profiles abstract IPsec policy information into a single configuration entity, which can be referenced by name from other parts of the configuration. Therefore, users can configure functionality such as GRE tunnel protection with a single line of configuration. By referencing an IPsec profile, the user does not have to configure an entire crypto map configuration. An IPsec profile contains only IPsec information; that is, it does not contain any access list information or peering information.

VRF Integrated DMVPN

VPN Routing and Forwarding (VRF) Integrated DMVPN enables users to map DMVPN multipoint interfaces into MPLS VPNs. This mapping allows Internet service providers (ISPs) to extend their existing MPLS VPN services by mapping off-network sites (typically a branch office) to their respective MPLS VPNs. Customer equipment (CE) routers are terminated on the DMVPN PE router, and traffic is placed in the VRF instance of an MPLS VPN.

DMVPN can interact with MPLS VPNs in two ways:

1. The `ip vrf forwarding` command is used to inject the data IP packets (those packets inside the mGRE+IPsec tunnel) into the MPLS VPN. The `ip vrf forwarding` command is supported for DMVPN in Cisco IOS Release 12.3(6) and Release 12.3(7)T.

2. The `tunnel vrf` command is used to transport (route) the mGRE+IPsec tunnel packet itself within an MPLS VPN. The `tunnel vrf` command is supported in Cisco IOS Release 12.3(11)T but not in Cisco IOS Release 12.2(18)SXE.

Clear-text data IP packets are forwarded in a VRF using the `ip vrf forwarding` command, and encrypted tunnel IP packets are forwarded in a VRF using the `tunnel vrf` command.

The `ip vrf forwarding` and `tunnel vrf` commands may be used at the same time. If they are used at the same time, the VRF name of each command may be the same or different.

For information about configuring the forwarding of clear-text data IP packets into a VRF, see the section “Configuring the Forwarding of Clear-Text Data IP Packets into a VRF.” For information about configuring the forwarding of encrypted tunnel packets into a VRF, see the section “Configuring the Forwarding of Encrypted Tunnel Packets into a VRF.”

For more information about configuring VRF, see reference in the “Related Documents” section.

The diagram below illustrates a typical VRF Integrated DMVPN scenario.
DMVPN--Enabling Traffic Segmentation Within DMVPN

Cisco IOS Release 12.4(11)T provides an enhancement that allows you to segment VPN traffic within a DMVPN tunnel. VRF instances are labeled, using MPLS, to indicate their source and destination.

The diagram below and the corresponding bullets explain how traffic segmentation within DMVPN works.
Figure 3: Traffic Segmentation with DMVPN

- The hub shown in the diagram is a WAN-PE and a route reflector, and the spokes (PE routers) are clients.
- There are three VRFs, designated “red,” “green,” and “blue.”
- Each spoke has both a neighbor relationship with the hub (multiprotocol Border Gateway Protocol [MP-iBGP] peering) and a GRE tunnel to the hub.
- Each spoke advertises its routes and VPNv4 prefixes to the hub.
- The hub sets its own IP address as the next-hop route for all the VPNv4 addresses it learns from the spokes and assigns a local MPLS label for each VPN when it advertises routes back to the spokes. As a result, traffic from Spoke A to Spoke B is routed via the hub.

An example illustrates the process:

1. Spoke A advertises a VPNv4 route to the hub, and applies the label X to the VPN.
2. The hub changes the label to Y when the hub advertises the route to Spoke B.
3. When Spoke B has traffic to send to Spoke A, it applies the Y label, and the traffic goes to the hub.
4. The hub swaps the VPN label, by removing the Y label and applying an X label, and sends the traffic to Spoke A.
NAT-Transparency Aware DMVPN

DMVPN spokes are often situated behind a NAT router (which is often controlled by the ISP for the spoke site) with the outside interface address of the spoke router being dynamically assigned by the ISP using a private IP address (per Internet Engineering Task Force [IETF] RFC 1918).

Prior to Cisco IOS Release 12.3(6) and 12.3(7)T, these spoke routers had to use IPsec tunnel mode to participate in a DMVPN network. In addition, their assigned outside interface private IP address had to be unique across the DMVPN network. Even though ISAKMP and IPsec would negotiate NAT-T and “learn” the correct NAT public address for the private IP address of this spoke, NHRP could only “see” and use the private IP address of the spoke for its mapping entries. Effective with the NAT-Transparency Aware DMVPN enhancement, NHRP can now learn and use the NAT public address for its mappings as long as IPsec transport mode is used (which is the recommend IPsec mode for DMVPN networks). The restriction that the private interface IP address of the spoke must be unique across the DMVPN network has been removed. It is recommended that all DMVPN routers be upgraded to the new code before you try to use the new functionality even though spoke routers that are not behind NAT do not need to be upgraded. In addition, you cannot convert upgraded spoke routers that are behind NAT to the new configuration (IPsec transport mode) until the hub routers have been upgraded.

Also added in Cisco IOS Releases 12.3(9a) and 12.3(11)T is the capability to have the hub DMVPN router behind static NAT. This was a change in the ISAKMP NAT-T support. For this functionality to be used, all the DMVPN spoke routers and hub routers must be upgraded, and IPsec must use transport mode.

For these NAT-Transparency Aware enhancements to work, you must use IPsec transport mode on the transform set. Also, even though NAT-Transparency (IKE and IPsec) can support two peers (IKE and IPsec) being translated to the same IP address (using the UDP ports to differentiate them), this functionality is not supported for DMVPN. All DMVPN spokes must have a unique IP address after they have been NAT translated. They can have the same IP address before they are NAT translated.

The diagram below illustrates a NAT-Transparency Aware DMVPN scenario.

Note

In Cisco IOS Release 12.4(6)T or earlier, DMVPN spokes behind NAT will not participate in dynamic direct spoke-to-spoke tunnels. Any traffic to or from a spoke that is behind NAT will be forwarded using the DMVPN hub routers. DMVPN spokes that are not behind NAT in the same DMVPN network may create dynamic direct spoke-to-spoke tunnels between each other. In Cisco IOS Release 12.4(6)T or later releases, DMVPN spokes behind NAT will participate in dynamic direct spoke-to-spoke tunnels. The spokes must be behind NAT boxes that are performing NAT, not PAT. The NAT box must translate the spoke to the same outside NAT IP address for the spoke-spoke connections as the NAT box does for the spoke-hub connection. If there is more than one DMVPN spoke behind the same NAT box, then the NAT box must translate the DMVPN spokes to different outside NAT IP addresses. It is also likely that you may not be able to build a direct spoke-spoke tunnel between these spokes. If a spoke-spoke tunnel fails to form, then the spoke-spoke packets will continue to be forwarded via the spoke-hub-spoke path.
Call Admission Control with DMVPN

In a DMVPN network, it is easy for a DMVPN router to become “overwhelmed” with the number of tunnels it is trying to build. Call Admission Control can be used to limit the number of tunnels that can be built at any one time, thus protecting the memory of the router and CPU resources.

It is most likely that Call Admission Control will be used on a DMVPN spoke to limit the total number of ISAKMP sessions (DMVPN tunnels) that a spoke router will attempt to initiate or accept. This limiting is accomplished by configuring an IKE SA limit under Call Admission Control, which configures the router to drop new ISAKMP session requests (inbound and outbound) if the current number of ISAKMP SAs exceeds the limit.

It is most likely that Call Admission Control will be used on a DMVPN hub to rate limit the number of DMVPN tunnels that are attempting to be built at the same time. The rate limiting is accomplished by configuring a system resource limit under Call Admission Control, which configures the router to drop new ISAKMP session requests (new DMVPN tunnels) when the system utilization is above a specified percentage. The dropped session requests allow the DMVPN hub router to complete the current ISAKMP session requests, and when the system utilization drops, it can process the previously dropped sessions when they are reattempted.

No special configuration is required to use Call Admission Control with DMVPN. For information about configuring Call Admission Control, see the reference in the section “Related Documents.”

NHRP Rate-Limiting Mechanism

NHRP has a rate-limiting mechanism that restricts the total number of NHRP packets from any given interface. The default values, which are set using the `ip nhrp max-send` command, are 100 packets every 10 seconds per interface. If the limit is exceeded, you will get the following system message:

%NHRP-4-QUOTA: Max-send quota of [int]pkts/[int]Sec. exceeded on [chars]

For more information about this system message, see the document 12.4T System Message Guide.
How to Configure Dynamic Multipoint VPN (DMVPN)

To enable mGRE and IPsec tunneling for hub and spoke routers, you must configure an IPsec profile that uses a global IPsec policy template and configure your mGRE tunnel for IPsec encryption. This section contains the following procedures:

Configuring an IPsec Profile

The IPsec profile shares most of the same commands with the crypto map configuration, but only a subset of the commands are valid in an IPsec profile. Only commands that pertain to an IPsec policy can be issued under an IPsec profile; you cannot specify the IPsec peer address or the access control list (ACL) to match the packets that are to be encrypted.

Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Before you begin

Before configuring an IPsec profile, you must define a transform set by using the `crypto ipsec transform-set` command.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto ipsec profile` *name*
4. `set transform-set` *transform-set-name*
5. `set identity`
6. `set security association lifetime` `{seconds seconds | kilobytes kilobytes}`
7. `set pfs` `[group1 | group14 | group15 | group16 | group19 | group2 | group20 | group24 | group5]`

DETAILED STEPS

### Configuring an IPsec Profile

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 3** crypto ipsec profile *name* | Defines the IPsec parameters that are to be used for IPsec encryption between “spoke and hub” and “spoke and spoke” routers. This command enters crypto map configuration mode.  
  - The `name` argument specifies the name of the IPsec profile. |

**Example:**

```
Router(config)# crypto ipsec profile vpnprof
```

| **Step 4** set transform-set *transform-set-name* | Specifies which transform sets can be used with the IPsec profile.  
  - The `transform-set-name` argument specifies the name of the transform set. |

**Example:**

```
Router(config-crypto-map)# set transform-set trans2
```

| **Step 5** set identity | (Optional) Specifies identity restrictions to be used with the IPsec profile. |

**Example:**

```
Router(config-crypto-map)# set identity
```

| **Step 6** set security association lifetime {seconds seconds | kilobytes kilobytes} | (Optional) Overrides the global lifetime value for the IPsec profile.  
  - The `seconds` option specifies the number of seconds a security association will live before expiring; the `kilobytes` option specifies the volume of traffic (in kilobytes) that can pass between IPsec peers using a given security association before that security association expires.  
  - The default for the `seconds` argument is 3600 seconds. |

**Example:**

```
Router(config-crypto-map)# set security association lifetime seconds 1800
```

| **Step 7** set pfs [group1 | group14 | group15 | group16 | group19 | group2 | group20 | group24 | group5] | (Optional) Specifies that IPsec should ask for perfect forward secrecy (PFS) when requesting new security associations for this IPsec profile. If this command is not specified, the default Diffie-Hellman (DH) group, `group1` will be enabled.  
  - 1—768-bit DH (No longer recommended.)  
  - 2—1024-bit DH (No longer recommended)  
  - 5—1536-bit DH (No longer recommended)  
  - 14—Specifies the 2048-bit DH group.  
  - 15—Specifies the 3072-bit DH group.  
  - 16—Specifies the 4096-bit DH group.  
  - 19—Specifies the 256-bit elliptic curve DH (ECDH) group.  
  - 20—Specifies the 384-bit ECDH group. |

**Example:**

```
Router(config-crypto-map)# set pfs group14
```

Dynamic Multipoint VPN Configuration Guide, Cisco IOS Release 15M&T
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>Specifies the 2048-bit DH/DSA group.</td>
</tr>
</tbody>
</table>

### What to Do Next

Proceed to the following sections “Configuring the Hub for DMVPN” and “Configuring the Spoke for DMVPN.”

### Configuring the Hub for DMVPN

To configure the hub router for mGRE and IPsec integration (that is, associate the tunnel with the IPsec profile configured in the previous procedure), use the following commands:

#### Note

NHRP network IDs are locally significant and can be different. It makes sense from a deployment and maintenance perspective to use unique **network ID** numbers (using the `ip nhrp network-id` command) across all routers in a DMVPN network, but it is not necessary that they be the same.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `ip address ip-address mask secondary`
5. `ip mtu bytes`
6. `ip nhrp authentication string`
7. `ip nhrp map multicast dynamic`
8. `ip nhrp network-id number`
9. `tunnel source {ip-address | type number}`
10. `tunnel key key-number`
11. `tunnel mode gre multipoint`
12. `tunnel protection ipsec profile name`
13. `bandwidth kbps`
14. `ip tcp adjust-mss max-segment-size`
15. `ip nhrp holdtime seconds`
16. `delay number`

### DETAILED STEPS

<td>Purpose</td>
</tr>
<tr>
<td>-------</td>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>10</td>
<td><strong>tunnel key</strong> <em>key-number</em></td>
<td>(Optional) Enables an ID key for a tunnel interface.</td>
</tr>
<tr>
<td></td>
<td><em>Example:</em></td>
<td>- The <em>key-number</em> argument specifies a number from 0 to 4,294,967,295 that identifies the tunnel key.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>- The key number must be set to the same value on all hubs and spokes that are in the same DMVPN network.</td>
</tr>
<tr>
<td></td>
<td>Router (config-if)# tunnel key 100000</td>
<td>- This command should not be configured if you are using a Cisco 6500 or Cisco 7600 platform.</td>
</tr>
<tr>
<td>11</td>
<td><strong>tunnel mode gre multipoint</strong></td>
<td>Sets the encapsulation mode to mGRE for the tunnel interface.</td>
</tr>
<tr>
<td></td>
<td><em>Example:</em></td>
<td>- Sets the encapsulation mode to mGRE for the tunnel interface.</td>
</tr>
<tr>
<td></td>
<td>Router(config-if)# tunnel mode gre multipoint</td>
<td>- This command should not be configured if you are using a Cisco 6500 or Cisco 7600 platform.</td>
</tr>
<tr>
<td>12</td>
<td><strong>tunnel protection ipsec profile</strong> <em>name</em></td>
<td>Associates a tunnel interface with an IPsec profile.</td>
</tr>
<tr>
<td></td>
<td><em>Example:</em></td>
<td>- The <em>name</em> argument specifies the name of the IPsec profile; this value must match the <em>name</em> specified in the <strong>crypto ipsec profile</strong> command.</td>
</tr>
<tr>
<td></td>
<td>Router(config-if)# tunnel protection ipsec profile vpnprof</td>
<td>- The <em>name</em> argument specifies the name of the IPsec profile; this value must match the <em>name</em> specified in the <strong>crypto ipsec profile</strong> command.</td>
</tr>
<tr>
<td>13</td>
<td><strong>bandwidth</strong> <em>kbps</em></td>
<td>Sets the current bandwidth value for an interface to higher-level protocols.</td>
</tr>
<tr>
<td></td>
<td><em>Example:</em></td>
<td>- The <em>kbps</em> argument specifies the bandwidth in kilobits per second. The default value is 9. The recommend bandwidth value is 1000 or greater.</td>
</tr>
<tr>
<td></td>
<td>Router(config-if)# bandwidth 1000</td>
<td>- Setting the bandwidth value to at least 1000 is critical if EIGRP is used over the tunnel interface. Higher bandwidth values may be necessary depending on the number of spokes supported by a hub.</td>
</tr>
<tr>
<td>14</td>
<td><strong>ip tcp adjust-mss</strong> <em>max-segment-size</em></td>
<td>Adjusts the maximum segment size (MSS) value of TCP packets going through a router.</td>
</tr>
<tr>
<td></td>
<td><em>Example:</em></td>
<td>- The <em>max-segment-size</em> argument specifies the maximum segment size, in bytes. The range is from 500 to 1460.</td>
</tr>
<tr>
<td></td>
<td>Router(config-if)# ip tcp adjust-mss 1360</td>
<td>- The recommended value is 1360 when the number of IP MTU bytes is set to 1400. With these recommended settings, TCP sessions quickly scale back to 1400-byte IP packets so the packets will “fit” in the tunnel.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 15</strong></td>
<td><strong>ip nhrp holdtime</strong> <em>seconds</em>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Router(config-if)# ip nhrp holdtime 450</td>
<td></td>
</tr>
</tbody>
</table>
| | Changes the number of seconds that NHRP NBMA addresses are advertised as valid in authoritative NHRP responses.  
  - The *seconds* argument specifies the time in seconds that NBMA addresses are advertised as valid in positive authoritative NHRP responses. The recommended value ranges from 300 seconds to 600 seconds. |
| **Step 16** | **delay** *number*<br>**Example:**<br>Router(config-if)# delay 1000 |
| | (Optional) Used to change the EIGRP routing metric for routes learned over the tunnel interface.  
  - The *number* argument specifies the delay time in seconds. The recommend value is 1000. |

### Configuring the Spoke for DMVPN

To configure spoke routers for mGRE and IPsec integration, use the following commands.

**Note**

NHRP network IDs are locally significant and can be different. It makes sense from a deployment and maintenance perspective to use unique network ID numbers (using the **ip nhrp network-id** command) across all routers in a DMVPN network, but it is not necessary that they be the same.

### SUMMARY STEPS

1. **enable**  
2. **configure terminal**  
3. **interface tunnel** *number*  
4. **ip address** *ip-address* *mask* *secondary*  
5. **ip mtu** *bytes*  
6. **ip nhrp authentication** *string*  
7. **ip nhrp map** hub-tunnel-ip-address hub-physical-ip-address  
8. **ip nhrp map multicast** hub-physical-ip-address  
9. **ip nhrp nhs** hub-tunnel-ip-address  
10. **ip nhrp network-id** *number*  
11. **tunnel source** *{ip-address | type number}*  
12. **tunnel key** *key-number*  
13. Do one of the following:  
   - **tunnel mode gre multipoint**  
   - **tunnel destination** hub-physical-ip-address  
14. **tunnel protection ipsec profile** *name*  
15. **bandwidth** *kbps*
16. `ip tcp adjust-mss max-segment-size`
17. `ip nhrp holdtime seconds`
18. `delay number`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>interface tunnel number</code></td>
<td>Configures a tunnel interface and enters interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config)# interface tunnel 5</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
<td>The <code>number</code> argument specifies the number of the tunnel interface that you want to create or configure. There is no limit on the number of tunnel interfaces you can create.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>ip address ip-address mask secondary</code></td>
<td>Sets a primary or secondary IP address for the tunnel interface.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)# ip address 10.0.0.2 255.255.255.0</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
<td>All hubs and spokes that are in the same DMVPN network must be addressed in the same IP subnet.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>ip mtu bytes</code></td>
<td>Sets the MTU size, in bytes, of IP packets sent on an interface.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)# ip mtu 1400</code></td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>ip nhrp authentication string</code></td>
<td>Configures the authentication string for an interface using NHRP.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)# ip nhrp authentication donttell</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
<td>The NHRP authentication string be set to the same value on all hubs and spokes that are in the same DMVPN network.</td>
</tr>
<tr>
<td>Step 7</td>
<td><code>ip nhrp map hub-tunnel-ip-address hub-physical-ip-address</code></td>
<td>Statically configures the IP-to-NBMA address mapping of IP destinations connected to an MBMA network.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)# ip nhrp map 10.0.0.1 172.17.0.1</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
<td><code>hub-tunnel-ip-address</code> -- Defines the NHRP server at the hub, which is permanently mapped to the static public IP address of the hub.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Enables the use of a dynamic routing protocol between the spoke and hub, and sends multicast packets to the hub router.</td>
<td></td>
</tr>
<tr>
<td>ip nhrp map multicast <em>hub-physical-ip-address</em></td>
<td>Defines the static public IP address of the hub.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router(config-if)# ip nhrp map multicast 172.17.0.1</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Configures the hub router as the NHRP next-hop server.</td>
<td></td>
</tr>
<tr>
<td>ip nhrp nhs <em>hub-tunnel-ip-address</em></td>
<td>Enables NHRP on an interface.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router(config-if)# ip nhrp nhs 10.0.0.1</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Enables NHRP on an interface.</td>
<td></td>
</tr>
<tr>
<td>ip nhrp network-id <em>number</em></td>
<td>• The <em>number</em> argument specifies a globally unique 32-bit network identifier from a NBMA network. The range is from 1 to 4294967295.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router(config-if)# ip nhrp network-id 99</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Sets the source address for a tunnel interface.</td>
<td></td>
</tr>
<tr>
<td>tunnel source {*ip-address</td>
<td>type number*}</td>
<td>Enables NHRP on an interface.</td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router (config-if)# tunnel source Ethernet0</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>Enables NHRP on an interface.</td>
<td></td>
</tr>
<tr>
<td>tunnel key <em>key-number</em></td>
<td>• The <em>key-number</em> argument specifies a number from 0 to 4,294,967,295 that identifies the tunnel key.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router (config-if)# tunnel key 100000</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td>Sets the encapsulation mode to mGRE for the tunnel interface.</td>
<td></td>
</tr>
<tr>
<td>Do one of the following:</td>
<td>Use this command if data traffic can use dynamic spoke-to-spoke traffic.</td>
<td></td>
</tr>
<tr>
<td>• tunnel mode gre multipoint</td>
<td>Specifies the destination for a tunnel interface.</td>
<td></td>
</tr>
<tr>
<td>• tunnel destination <em>hub-physical-ip-address</em></td>
<td>Use this command if data traffic can use hub-and-spoke tunnels.</td>
<td></td>
</tr>
</tbody>
</table>
| Example: | **Router(config-if)#**
| &nbsp; &nbsp; &nbsp; &nbsp; tunnel mode gre multipoint | **Example:**
| &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; tunnel destination 172.17.0.1 | **Example:**
| &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &nbsp; &n... |
| Step 14 | **tunnel protection ipsec profile** *name*  
**Example:**  
Router(config-if)# tunnel protection ipsec profile vpnprof | **Purpose**  
Associates a tunnel interface with an IPsec profile.  
• The *name* argument specifies the name of the IPsec profile; this value must match the *name* specified in the **crypto ipsec profile** *name* command. |
| --- | --- |
| Step 15 | **bandwidth** *kbps*  
**Example:**  
Router(config-if)# bandwidth 1000 | Sets the current bandwidth value for an interface to higher-level protocols.  
• The *kbps* argument specifies the bandwidth in kilobits per second. The default value is 9. The recommend bandwidth value is 1000 or greater.  
The bandwidth setting for the spoke does not need to equal the bandwidth setting for the DMVPN hub. It is usually easier if all of the spokes use the same or similar value. |
| Step 16 | **ip tcp adjust-mss** *max-segment-size*  
**Example:**  
Router(config-if)# ip tcp adjust-mss 1360 | Adjusts the maximum segment size (MSS) value of TCP packets going through a router.  
• The *max-segment-size* argument specifies the maximum segment size, in bytes. The range is from 500 to 1460.  
The recommended number value is 1360 when the number of IP MTU bytes is set to 1400. With these recommended settings, TCP sessions quickly scale back to 1400-byte IP packets so the packets will “fit” in the tunnel. |
| Step 17 | **ip nhrp holdtime** *seconds*  
**Example:**  
Router(config-if)# ip nhrp holdtime 450 | Changes the number of seconds that NHRP NBMA addresses are advertised as valid in authoritative NHRP responses.  
• The *seconds* argument specifies the time in seconds that NBMA addresses are advertised as valid in positive authoritative NHRP responses. The recommended value ranges from 300 seconds to 600 seconds. |
| Step 18 | **delay** *number*  
**Example:**  
Router(config-if)# delay 1000 | (Optional) Used to change the EIGRP routing metric for routes learned over the tunnel interface.  
• The *number* argument specifies the delay time in seconds. The recommend value is 1000. |

**Configuring the Forwarding of Clear-Text Data IP Packets into a VRF**

To configure the forwarding of clear-text date IP packets into a VRF, perform the following steps. This configuration assumes that the VRF BLUE has already been configured.
### Configuring the Forwarding of Encrypted Tunnel Packets into a VRF

To configure the forwarding of encrypted tunnel packets into a VRF, perform the following steps. This configuration assumes that the VRF RED has already been configured.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **ip vrf forwarding vrf-name**

#### DETAILED STEPS

<table>

<tbody>
<tr>
<td>Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
</tbody>
</table>

**Step 2**

**Example:**

Router# configure terminal

**Step 3**

**Example:**

Router (config)# interface tunnel0

**Step 4**

**Example:**

Router (config-if)# tunnel vrf RED

---

## Configuring DMVPN--Traffic Segmentation Within DMVPN

There are no new commands to use for configuring traffic segmentation, but there are tasks you must complete in order to segment traffic within a DMVPN tunnel:

### Prerequisites

The tasks that follow assume that the DMVPN tunnel and the VRFs “red” and “blue” have already been configured.

For information on configuring a DMVPN tunnel, see the Configuring the Hub for DMVPN task and the Configuring the Spoke for DMVPN. For details about VRF configuration, see the Configuring the Forwarding of Clear-Text Data IP Packets into a VRF task and the Configuring the Forwarding of Encrypted Tunnel Packets into a VRF task.

### Enabling MPLS on the VPN Tunnel

Because traffic segmentation within a DMVPN tunnel depends upon MPLS, you must configure MPLS for each VRF instance in which traffic will be segmented. For detailed information about configuring MPLS, see *Cisco IOS Multiprotocol Label Switching Configuration Guide*, Release 12.4.

### SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. mpls ip
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface <em>type number</em></td>
<td>Configures an interface type and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# interface tunnel0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> mpls ip</td>
<td>Enables MPLS tagging of packets on the specified tunnel interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config-if)# mpls ip</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring Multiprotocol BGP on the Hub Router

You must configure multiprotocol iBGP (MP-iBGP) to enable advertisement of VPNv4 prefixes and labels to be applied to the VPN traffic. Use BGP to configure the hub as a route reflector. To force all traffic to be routed via the hub, configure the BGP route reflector to change the next hop to itself when it advertises VPNv4 prefixes to the route reflector clients (spokes).

### SUMMARY STEPS

1. enable
2. configure terminal
3. router bgp
4. neighbor *ipaddress* remote-as *as - number*
5. neighbor *ipaddress* update-source *interface*
6. address-family vpnv4
7. neighbor *ipaddress* activate
8. neighbor *ipaddress* send-community extended
9. neighbor *ipaddress* route-reflector-client
10. neighbor *ipaddress* route-map nexthop out
11. exit-address-family
12. address-family ipv4 vrf-name
13. redistribute connected
14. route-map
15. set ip next-hop *ipaddress*
### DETAILED STEPS

<tr>
<td><strong>Step 10</strong> neighbor ipaddress route-map nexthop out</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# neighbor 10.0.0.11 route-map nexthop out</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> exit-address-family</td>
<td>Exits the address family configuration mode for VPNv4.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# exit-address-family</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> address-family ipv4 vrf-name</td>
<td>Enters address family configuration mode to configure a routing session using standard IP Version 4 address prefixes.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# address-family ipv4 vrf red</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong> redistribute connected</td>
<td>Redistributes routes that are established automatically by virtue of having enabled IP on an interface from one routing domain into another routing domain.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# redistribute connected</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong> route-map</td>
<td>Enters route map configuration mode to configure the next-hop that will be advertised to the spokes.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# route-map nexthop permit 10</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 15</strong> set ip next-hop ipaddress</td>
<td>Sets the next hop to be the hub.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Router (config)# set ip next-hop 10.0.0.1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Configuring Multiprotocol BGP on the Spoke Routers**

Multiprotocol-iBGP (MP-iBGP) must be configured on the spoke routers and the hub. Follow the steps below for each spoke router in the DMVPN.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router bgp
4. neighbor ipaddress remote-as as - number
5. neighbor ipaddress update-source interface
6. address-family vpnv4

### Troubleshooting Dynamic Multipoint VPN (DMVPN)

After configuring DMVPN, to verify that DMVPN is operating correctly, to clear DMVPN statistics or sessions, or to debug DMVPN, you may perform the following optional steps:

#### Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

### SUMMARY STEPS

1. The **clear dmvpn session** command is used to clear DMVPN sessions.
2. The **clear dmvpn statistics** command is used to clear DMVPN related counters. The following example shows how to clear DMVPN related session counters for the specified tunnel interface:
3. The **debug dmvpn** command is used to debug DMVPN sessions. You can enable or disable DMVPN debugging based on a specific condition. There are three levels of DMVPN debugging, listed in the order of details from lowest to highest:
4. The **debug nhrp condition** command enables or disables debugging based on a specific condition. The following example shows how to enable conditional NHRP debugging:
5. The **debug nhrp error** command displays information about NHRP error activity. The following example shows how to enable debugging for NHRP error messages:
6. The `logging dmvpn` command is used to enable DMVPN system logging. The following command shows how to enable DMVPN system logging at the rate of 1 message every 20 seconds:

7. The `show crypto ipsec sa` command displays the settings used by the current SAs. The following example output shows the IPsec SA status of only the active device:

8. The `show crypto isakmp sa` command displays all current IKE SAs at a peer. For example, the following sample output is displayed after IKE negotiations have successfully completed between two peers.

9. The `show crypto map` command displays the crypto map configuration.

10. The `show dmvpn` command displays DMVPN specific session information. The following example shows example summary output:

11. The `show ip nhrp traffic` command displays NHRP statistics. The following example shows output for a specific tunnel, tunnel7:

**DETAILED STEPS**

**Step 1**
The `clear dmvpn session` command is used to clear DMVPN sessions.

The following example clears only dynamic DMVPN sessions:

```
Router# clear dmvpn session peer nbma
```

The following example clears all DMVPN sessions, both static and dynamic, for the specified tunnel:

```
Router# clear dmvpn session interface tunnel 100 static
```

**Step 2**
The `clear dmvpn statistics` command is used to clear DMVPN related counters. The following example shows how to clear DMVPN related session counters for the specified tunnel interface:

```
Router# clear dmvpn statistics peer tunnel 192.0.2.3
```

**Step 3**
The `debug dmvpn` command is used to debug DMVPN sessions. You can enable or disable DMVPN debugging based on a specific condition. There are three levels of DMVPN debugging, listed in the order of details from lowest to highest:

- Error level
- Detail level
- Packet level

The following example shows how to enable conditional DMVPN debugging that displays all error debugs for next hop routing protocol (NHRP), sockets, tunnel protection and crypto information:

```
Router# debug dmvpn error all
```

**Step 4**
The `debug nhrp condition` command enables or disables debugging based on a specific condition. The following example shows how to enable conditional NHRP debugging:

```
Router# debug nhrp condition
```

**Step 5**
The `debug nhrp error` command displays information about NHRP error activity. The following example shows how to enable debugging for NHRP error messages:

```
Router# debug nhrp error
```

**Step 6**
The `logging dmvpn` command is used to enable DMVPN system logging. The following command shows how to enable DMVPN system logging at the rate of 1 message every 20 seconds:

```
Router(config)# logging dmvpn rate-limit 20
```
The following example shows a sample system log with DMVPN messages:

**Example:**

```
%DMVPN-7-CRYPTO_SS: Tunnel101-192.0.2.1 socket is UP
%DMVPN-5-NHRP_NHS: Tunnel101 192.0.2.251 is UP
%DMVPN-5-NHRP_CACHE: Client 192.0.2.2 on Tunnel1 Registered.
%DMVPN-5-NHRP_CACHE: Client 192.0.2.2 on Tunnel101 came UP.
%DMVPN-3-NHRP_ERROR: Registration Request failed for 192.0.2.251 on Tunnel101
```

**Step 7**

The `show crypto ipsec sa` command displays the settings used by the current SAs. The following example output shows the IPsec SA status of only the active device:

**Example:**

```
Router# show crypto ipsec sa active
interface: Ethernet0/0
    Crypto map tag: to-peer-outside, local addr 209.165.201.3
    protected vrf: (none)
    local ident (addr/mask/prot/port): (192.168.0.1/255.255.255.255/0/0)
    remote ident (addr/mask/prot/port): (172.16.0.1/255.255.255.255/0/0)
    current_peer 209.165.200.225 port 500
        PERMIT, flags={origin_is_acl,}
        #pkts encaps: 3, #pkts encrypt: 3, #pkts digest: 3
        #pkts decaps: 4, #pkts decrypt: 4, #pkts verify: 4
        #pkts compressed: 0, #pkts decompressed: 0
        #pkts not compressed: 0, #pkts compr. failed: 0
        #pkts not decompressed: 0, #pkts decompress failed: 0
        #send errors 0, #recv errors 0
    local crypto endpt.: 209.165.201.3, remote crypto endpt.: 209.165.200.225
    path mtu 1500, media mtu 1500
    current outbound spi: 0xD42904F0(3559458032)
    inbound esp sas:
        spi: 0xD3E9ABD0(3555306448)
        transform: esp-aes
        in use settings = {Tunnel, }
        conn id: 2006, flow_id: 6, crypto map: to-peer-outside
        sa timing: remaining key lifetime (k/sec): (4586265/3542)
        HA last key lifetime sent(k): (4586267)
        ike_cookies: 9263635C CA4B4E99 C14E908E 8EE2D79C
        IV size: 16 bytes
        replay detection support: Y
        Status: ACTIVE
```

**Step 8**

The `show crypto isakmp sa` command displays all current IKE SAs at a peer. For example, the following sample output is displayed after IKE negotiations have successfully completed between two peers.

**Example:**

```
Router# show crypto isakmp sa
 dst      src      state   conn-id slot
172.17.63.19  172.16.175.76 QM_IDLE 2 0
172.17.63.19  172.17.63.20 QM_IDLE 1 0
172.16.175.75 172.17.63.19 QM_IDLE 3 0
```

**Step 9**

The `show crypto map` command displays the crypto map configuration.

The following sample output is displayed after a crypto map has been configured:

**Example:**
Router# show crypto map
 Crypto Map "Tunnel5-head-0" 10 ipsec-isakmp
 Profile name: vpnprof
 Security association lifetime: 4608000 kilobytes/3600 seconds
 PFS (Y/N): N
 Transform sets={trans2, }
 Crypto Map "Tunnel5-head-0" 20 ipsec-isakmp
 Map is a PROFILE INSTANCE.
 Peer = 172.16.175.75
 Extended IP access list
 access-list permit gre host 172.17.63.19 host 172.16.175.75
 Current peer: 172.16.175.75
 Security association lifetime: 4608000 kilobytes/3600 seconds
 PFS (Y/N): N
 Transform sets={trans2, }
 Crypto Map "Tunnel5-head-0" 30 ipsec-isakmp
 Map is a PROFILE INSTANCE.
 Peer = 172.17.63.20
 Extended IP access list
 access-list permit gre host 172.17.63.19 host 172.17.63.20
 Current peer: 172.17.63.20
 Security association lifetime: 4608000 kilobytes/3600 seconds
 PFS (Y/N): N
 Transform sets={trans2, }
 Crypto Map "Tunnel5-head-0" 40 ipsec-isakmp
 Map is a PROFILE INSTANCE.
 Peer = 172.16.175.76
 Extended IP access list
 access-list permit gre host 172.17.63.19 host 172.16.175.76
 Current peer: 172.16.175.76
 Security association lifetime: 4608000 kilobytes/3600 seconds
 PFS (Y/N): N
 Transform sets={trans2, }
 Interfaces using crypto map Tunnel5-head-0:
 Tunnel5

Step 10
The show dmvpn command displays DMVPN specific session information. The following example shows example summary output:

Example:

Router# show dmvpn
Legend: Attrb --> S - Static, D - Dynamic, I - Incomplete
 N - NATed, L - Local, X - No Socket
 # Ent --> Number of NHRP entries with same NBMA peer
 ! The line below indicates that the sessions are being displayed for Tunnel1.
 ! Tunnel1 is acting as a spoke and is a peer with three other NBMA peers.
 Tunnel1, Type: Spoke, NBMA Peers: 3,
 # Ent Peer NBMA Addr Peer Tunnel Add State UpDn Tm Attrb
 ----- --------------- --------------- ----- -------- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ----- ------

---

What to Do Next

If you have troubleshooted your DMVPN configuration and proceed to contact technical support, the `show tech-support` command includes information for DMVPN sessions. For more information, see the `show tech-support` command in the Cisco IOS Configuration Fundamentals Command Reference.

Configuration Examples for Dynamic Multipoint VPN (DMVPN) Feature

Example Hub Configuration for DMVPN

In the following example, which configures the hub router for multipoint GRE and IPsec integration, no explicit configuration lines are needed for each spoke; that is, the hub is configured with a global IPsec policy template that all spoke routers can talk to. In this example, EIGRP is configured to run over the private physical interface and the tunnel interface.

```
crypto isakmp policy 1
  encr aes
  authentication pre-share
  group 14
  crypto isakmp key cisco47 address 0.0.0.0

  crypto ipsec transform-set trans2 esp-aes esp-sha-hmac
  mode transport

  crypto ipsec profile vpnprof
    set transform-set trans2

  interface Tunnel0
    bandwidth 1000
    ip address 10.0.0.1 255.255.255.0
    ! Ensures longer packets are fragmented before they are encrypted; otherwise, the receiving router would have to do the reassembly.
    ip mtu 1400
    ! The following line must match on all nodes that “want to use” this mGRE tunnel:
    ip nhrp authentication donttell
    ! Note that the next line is required only on the hub.
    ip nhrp map multicast dynamic
    ! The following line must match on all nodes that want to use this mGRE tunnel:
    ip nhrp network-id 99
```
Example Spoke Configuration for DMVPN

In the following example, all spokes are configured the same except for tunnel and local interface address, thereby, reducing necessary configurations for the user:

crypto isakmp policy 1
  encr aes
  authentication pre-share
  group 14
  crypto isakmp key cisco47 address 0.0.0.0
  crypto ipsec transform-set trans2 esp-aes esp-sha-hmac
  mode transport
  crypto ipsec profile vpnprof
  set transform-set trans2
  !
  interface Tunnel0
  bandwidth 1000
  ip address 10.0.0.2 255.255.255.0
  ip mtu 1400
  ! The following line must match on all nodes that want to use this mGRE tunnel:
  ip nhrp authentication donttell
  ! Definition of NHRP server at the hub (10.0.0.1), which is permanently mapped to the static
  public address of the hub (172.17.0.1).
  ip nhrp map 10.0.0.1 172.17.0.1
  ! Sends multicast packets to the hub router, and enables the use of a dynamic routing
  protocol between the spoke and the hub.
  ip nhrp map multicast 172.17.0.1
  ! The following line must match on all nodes that want to use this mGRE tunnel:
  ip nhrp network-id 99
  ip nhrp holdtime 300
  ! Configures the hub router as the NHRP next-hop server.
ip nhdp nhs 10.0.0.1
ip tcp adjust-mss 1360
delay 1000
tunnel source Ethernet0

tunnel mode gre multipoint

! The following line must match on all nodes that want to use this mGRE tunnel:
tunnel key 100000

tunnel protection ipsec profile vpnprof

! This is a spoke, so the public address might be dynamically assigned via DHCP.
interface Ethernet0
ip address dhcp hostname Spoke1

interface Ethernet1
ip address 192.168.1.1 255.255.255.0

! EIGRP is configured to run over the inside physical interface and the tunnel.
router eigrp 1
network 10.0.0.0 0.0.0.255
network 192.168.1.0 0.0.0.255

Example VRF Aware DMVPN

When configuring VRF Aware DMVPN, you must create a separate DMVPN network for each VRF instance. In the following example, there are two DMVPN networks: BLUE and RED. In addition, a separate source interface has been used on the hub for each DMVPN tunnel—a must for Cisco IOS Release 12.2(18)SXE. For other Cisco IOS releases, you can configure the same tunnel source for both of the tunnel interfaces, but you must configure the tunnel key and tunnel protection (tunnel protection ipsec profile {name} shared) commands.

Note

If you use the shared keyword, then you should be running Cisco IOS Release 12.4(5) or Release 12.4(6)T, or a later release. Otherwise the IPsec/GRE tunnels under the two mGRE tunnel interfaces may not function correctly.

Hub Configuration

interface Tunnel0
! Note the next line.
ip vrf forwarding BLUE
bandwidth 1000
ip address 10.0.0.1 255.255.255.0
ip mtu 1436
! Note the next line.
ip nhdp authentication BLUE!KEY
ip nhdp map multicast dynamic
! Note the next line
ip nhdp network-id 100000

Feature Information for Dynamic Multipoint VPN (DMVPN)

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

| Mangeability Enhancements for DMVPN | 12.4(9)T | DMVPN session manageability was expanded with DMVPN specific commands for debugging, show output, session and counter control, and system log information. The following sections provide information about this feature:  
• Troubleshooting Dynamic Multipoint VPN (DMVPN)  
The following commands were introduced or modified by this feature: clear dmvpn session, clear dmvpn statistics, debug dmvpn, debug nhrp condition, debug nhrp error, logging dmvpn, show dmvpn, show ip nhrp traffic. |
| DMVPN Phase 2 | 12.2(18)SX, 12.3(9)a, 12.3(8)T | DMVPN Spoke-to-Spoke functionality was made more production ready. If you are using this functionality in a production network, the minimum release is Release 12.3(9a) or Release 12.3(8)T. In Release 12.2(18)SX, support was added for the Cisco Catalyst 6500 series switch and the Cisco 7600 series router. |
| -- | 12.3(6), 12.3(7)T | Virtual Route Forwarding Integrated DMVPN and Network Address Translation-Transparency (NAT-T) Aware DMVPN enhancements were added. In addition, DMVPN Hub-to-Spoke functionality was made more production ready. If you are using this functionality in a production network, the minimum release requirement is Cisco IOS Release 12.3(6) or 12.3(7)T. The enhancements added in Cisco IOS Release 12.3(6) were integrated into Cisco IOS Release 12.3(7)T. |
| Dynamic Multipoint VPN (DMVPN) Phase 1 | 12.2(13)T | The Dynamic Multipoint VPN (DMVPN) feature allows users to better scale large and small IPsec Virtual Private Networks (VPNs) by combining generic routing encapsulation (GRE) tunnels, IP security (IPsec) encryption, and Next Hop Resolution Protocol (NHRP). |

**Glossary**

**AM** --aggressive mode. A mode during IKE negotiation. Compared to MM, AM eliminates several steps, making it faster but less secure than MM. Cisco IOS software will respond in aggressive mode to an IKE peer that initiates aggressive mode.

**GRE** --generic routing encapsulation. Tunnels that provide a specific pathway across the shared WAN and encapsulate traffic with new packet headers to ensure delivery to specific destinations. The network is private because traffic can enter a tunnel only at an endpoint. Tunnels do not provide true confidentiality (encryption does) but can carry encrypted traffic.

GRE tunneling can also be used to encapsulate non-IP traffic into IP and send it over the Internet or IP network. The Internet Package Exchange (IPX) and AppleTalk protocols are examples of non-IP traffic.
IKE --Internet Key Exchange. A hybrid protocol that implements Oakley key exchange and Skeme key exchange inside the ISAKMP framework. Although IKE can be used with other protocols, its initial implementation is with IPsec. IKE provides authentication of the IPsec peers, negotiates IPsec keys, and negotiates IPsec security associations.

IPsec --IP security. A framework of open standards developed by the Internet Engineering Task Force (IETF). IPsec provides security for transmission of sensitive information over unprotected networks such as the Internet. IPsec acts at the network layer, protecting and authenticating IP packets between participating IPsec devices (“peers”), such as Cisco routers.

ISAKMP --Internet Security Association Key Management Protocol. A protocol framework that defines payload formats, the mechanics of implementing a key exchange protocol, and the negotiation of a security association.

MM --main mode. Mode that is slower than aggressive mode but more secure and more flexible than aggressive mode because it can offer an IKE peer more security proposals. The default action for IKE authentication (rsa-sig, rsa-encr, or preshared) is to initiate main mode.

NHRP --Next Hop Resolution Protocol. Routers, access servers, and hosts can use NHRP to discover the addresses of other routers and hosts connected to a NBMA network.

The Cisco implementation of NHRP supports the IETF draft version 11 of NBMA Next Hop Resolution Protocol (NHRP).

The Cisco implementation of NHRP supports IP Version 4, Internet Packet Exchange (IPX) network layers, and, at the link layer, ATM, Ethernet, SMDS, and multipoint tunnel networks. Although NHRP is available on Ethernet, NHRP need not be implemented over Ethernet media because Ethernet is capable of broadcasting. Ethernet support is unnecessary (and not provided) for IPX.

PFS --Perfect Forward Secrecy. A cryptographic characteristic associated with a derived shared secret value. With PFS, if one key is compromised, previous and subsequent keys are not compromised, because subsequent keys are not derived from previous keys.

SA --security association. Describes how two or more entities will utilize security services to communicate securely. For example, an IPsec SA defines the encryption algorithm (if used), the authentication algorithm, and the shared session key to be used during the IPsec connection.

Both IPsec and IKE require and use SAs to identify the parameters of their connections. IKE can negotiate and establish its own SA. The IPsec SA is established either by IKE or by manual user configuration.

transform --The list of operations done on a dataflow to provide data authentication, data confidentiality, and data compression. One example of a transform is ESP with the 256-bit AES encryption algorithm and the AH protocol with the HMAC-SHA authentication algorithm.

VPN --Virtual Private Network. A framework that consists of multiple peers transmitting private data securely to one another over an otherwise public infrastructure. In this framework, inbound and outbound network traffic is protected using protocols that tunnel and encrypt all data. This framework permits networks to extend beyond their local topology, while remote users are provided with the appearance and functionality of a direct network connection.
CHAPTER 2

IPv6 over DMVPN

This document describes how to implement the Dynamic Multipoint VPN for IPv6 feature, which allows users to better scale large and small IPsec Virtual Private Networks (VPNs) by combining generic routing encapsulation (GRE) tunnels, IP security (IPsec) encryption, and the Next Hop Resolution Protocol (NHRP). In Dynamic Multipoint Virtual Private Network (DMVPN) for IPv6, the public network (the Internet) is a pure IPv4 network, and the private network (the intranet) is IPv6 capable.

IPv6 support on DMVPN was extended to the public network (the Internet) facing the Internet service provider (ISP). The IPv6 transport for DMVPN feature builds IPv6 WAN-side capability into NHRP tunnels and the underlying IPsec encryption, and enables IPv6 to transport payloads on the Internet.

The IPv6 transport for DMVPN feature is enabled by default. You need not upgrade your private internal network to IPv6 for the IPv6 transport for DMVPN feature to function. You can have either IPv4 or IPv6 addresses on your local networks.

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for IPv6 over DMVPN

- One of the following protocols must be enabled for DMVPN for IPv6 to work: Border Gateway Protocol (BGP), Enhanced Interior Gateway Routing Protocol (EIGRP), On-Demand Routing (ODR), Open Shortest Path First (OSPF), and Routing Information Protocol (RIP).
- Every IPv6 NHRP interface is configured with one IPv6 unicast address. This address can be a globally reachable or unique local address.
- Every IPv6 NHRP interface is configured with one IPv6 link-local address that is unique across all DMVPN hosts in the DMVPN cloud (that is, the hubs and spokes).

Information About IPv6 over DMVPN

DMVPN for IPv6 Overview

The DMVPN feature combines NHRP routing, multipoint generic routing encapsulation (mGRE) tunnels, and IPsec encryption to provide users ease of configuration via crypto profiles--which override the requirement for defining static crypto maps--and dynamic discovery of tunnel endpoints.

This feature relies on the following Cisco enhanced standard technologies:

- NHRP--A client and server protocol where the hub is the server and the spokes are the clients. The hub maintains an NHRP database of the public interface addresses of each spoke. Each spoke registers its real address when it boots and queries the NHRP database for real addresses of the destination spokes to build direct tunnels.
- mGRE tunnel interface--An mGRE tunnel interface allows a single GRE interface to support multiple IPsec tunnels and simplifies the size and complexity of the configuration.
- IPsec encryption--An IPsec tunnel interface facilitates for the protection of site-to-site IPv6 traffic with native encapsulation.

In DMVPN for IPv6, the public network (the Internet) is a pure IPv4 network, and the private network (the intranet) is IPv6 capable. The intranets could be a mix of IPv4 or IPv6 clouds connected to each other using DMVPN technologies, with the underlying carrier being a traditional IPv4 network.

NHRP Routing

The NHRP protocol resolves a given intranet address (IPv4 or IPv6) to an Internet address (IPv4 nonbroadcast multiaccess [NBMA] address).

In the figure below, the intranets that are connected over the DMVPN network are IPv6 clouds, and the Internet is a pure IPv4 cloud. Spokes S1 and S2 are connected to Hub H over the Internet using a statically configured tunnel. The address of the tunnel itself is the IPv6 domain, because it is another node on the intranet. The source and destinations address of the tunnel (the mGRE endpoints), however, are always in IPv4, in the Internet domain. The mGRE tunnel is aware of the IPv6 network because the GRE passenger protocol is an IPv6 packet, and the GRE transport (or carrier) protocol is an IPv4 packet.
When an IPv6 host in LAN L1 sends a packet destined to an IPv6 host in LAN L2, the packet is first routed to the gateway (which is Spoke S1) in LAN L1. Spoke S1 is a dual-stack device, which means both IPv4 and IPv6 are configured on it. The IPv6 routing table in S1 points to a next hop, which is the IPv6 address of the tunnel on Spoke S2. This is a VPN address that must be mapped to an NBMA address, triggering NHRP.

**IPv6 NHRP Redirect and Shortcut Features**

When IPv6 NHRP redirect is enabled, NHRP examines every data packet in the output feature path. If the data packet enters and leaves on the same logical network, NHRP sends an NHRP traffic indication message to the source of the data packet. In NHRP, a logical network is identified by the NHRP network ID, which groups multiple physical interfaces into a single logical network.

When IPv6 NHRP shortcut is enabled, NHRP intercepts every data packet in the output feature path. It checks to see if there is an NHRP cache entry to the destination of the data packet and, if yes, it replaces the current output adjacency with the one present in the NHRP cache. The data packet is therefore switched out using the new adjacency provided by NHRP.

**IPv6 Routing**

NHRP is automatically invoked for mGRE tunnels carrying the IPv6 passenger protocol. When a packet is routed and sent to the switching path, NHRP looks up the given next hop and, if required, initiates an NHRP resolution query. If the resolution is successful, NHRP populates the tunnel endpoint database, which in turn populates the Cisco Express Forwarding adjacency table. The subsequent packets are Cisco Express Forwarding switched if Cisco Express Forwarding is enabled.
IPv6 Addressing and Restrictions

IPv6 allows multiple unicast addresses on a given IPv6 interface. IPv6 also allows special address types, such as anycast, multicast, link-local addresses, and unicast addresses.

DMVPN for IPv6 has the following addressing restrictions:

- Every IPv6 NHRP interface is configured with one IPv6 unicast address. This address can be a globally reachable or unique local address.
- Every IPv6 NHRP interface is configured with one IPv6 link-local address that is unique across all DMVPN hosts in the DMVPN cloud (that is, the hubs and spokes).
  - If no other tunnels on the device are using the same tunnel source, then the tunnel source address can be embedded into an IPv6 address.
  - If the device has only one DMVPN IPv6 tunnel, then manual configuration of the IPv6 link-local address is not required. Instead, use the `ipv6 enable` command to autogenerate a link-local address.
  - If the device has more than one DMVPN IPv6 tunnel, then the link-local address must be manually configured using the `ipv6 address fe80::2001 link-local` command.

How to Configure IPv6 over DMVPN

Configuring an IPsec Profile in DMVPN for IPv6

Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

The IPsec profile shares most commands with the crypto map configuration, but only a subset of the commands are valid in an IPsec profile. Only commands that pertain to an IPsec policy can be issued under an IPsec profile; you cannot specify the IPsec peer address or the access control list (ACL) to match the packets that are to be encrypted.

Before you begin

Before configuring an IPsec profile, you must do the following:

- Define a transform set by using the `crypto ipsec transform-set` command.
- Make sure that the Internet Security Association Key Management Protocol (ISAKMP) profile is configured with default ISAKMP settings.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto identity name`
4. `exit`
5. `crypto ipsec profile name`
6. `set transform-set transform-set-name`
7. `set identity`
8. `set security-association lifetime seconds seconds kilobytes kilobytes`
9. `set pfs [group1 | group14 | group15 | group16 | group19 | group2 | group20 | group24 | group5]`
10. `end`

## DETAILED STEPS

</tbody>
</table>

### Configuring the Hub for IPv6 over DMVPN

Perform this task to configure the hub device for IPv6 over DMVPN for mGRE and IPsec integration (that is, associate the tunnel with the IPsec profile configured in the previous procedure).

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `ipv6 address {ipv6-address / prefix-length | prefix-name sub-bits / prefix-length`
5. `ipv6 address ipv6-address / prefix-length link-local`
6. `ipv6 mtu bytes`
### Configuring the Hub for IPv6 over DMVPN

1. **ipv6 nhrp authentication string**
2. **ipv6 nhrp map multicast dynamic**
3. **ipv6 nhrp network-id network-id**
4. **tunnel source ip-address | ipv6-address | interface-type interface-number**
5. **tunnel mode {aurp | cayman | dvmrp | eon | gre | gre multipoint | ipv6 | ipip | ipip decapsulate-any | ipsec ipv4 | iptalk | ipv6 | ipsec ipv6 | mpls | nos | rbscp**
6. **Do one of the following:**
   - **tunnel protection ipsec profile name [shared]**
   - **tunnel protection psk key**
7. **bandwidth \{kbps | inherit [kbps] | receive [kbps]\}**
8. **ipv6 nhrp holdtime seconds**
9. **ipv6 nhrp max-send pkt-count every seconds**
10. **ip nhrp registration [timeout seconds | no-unique]**
11. **end**

### Configuring the NHRP Redirect and Shortcut Features on the Hub

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface tunnel number
4. ipv6 address {ipv6-address / prefix-length | prefix-name sub-bits / prefix-length}
5. Do one of the following:
   - ipv6 nhrp redirect [timeout seconds ]
   - ipv6 nhrp redirect [interest acl]
6. ipv6 nhrp shortcut
7. end
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable **Example:** Device> enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Step 2** configure terminal **Example:** Device# configure terminal | Enters global configuration mode. |
| **Step 3** interface tunnel number **Example:** Device(config)# interface tunnel 5 | Configures a tunnel interface and enters interface configuration mode.  
• The number argument specifies the number of the tunnel interfaces that you want to create or configure. There is no limit on the number of tunnel interfaces you can create. |
| **Step 4** ipv6 address \{ipv6-address / prefix-length \prefix-name\sub-bits / prefix-length | Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface. |
| **Step 5** Do one of the following:  
• ipv6 nhrp redirect \[ timeout seconds \]  
• ipv6 nhrp redirect \[interest acl\] **Example:** Device(config-if)# ipv6 nhrp redirect interest | Enables NHRP redirect.  
or  
Enables the user to specify an ACL.  
**Note** You must configure the `ipv6 nhrp redirect` command on a hub. |
| **Step 6** ipv6 nhrp shortcut **Example:** Device(config-if)# ipv6 nhrp shortcut | Enables NHRP shortcut switching.  
• You must configure the `ipv6 nhrp shortcut` command on a spoke.  
**Note** Effective with Cisco IOS XE Denali 16.3 `ipv6 nhrp shortcut` is enabled by default. |
| **Step 7** end **Example:** Device(config-if)# end | Exits interface configuration mode and returns to privileged EXEC mode. |
Configuring the Spoke for IPv6 over DMVPN

Perform this task to configure the spoke for IPv6 over DMVPN.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `ipv6 address {ipv6-address / prefix-length | prefix-name sub-bits / prefix-length}`
5. `ipv6 address ipv6-address / prefix-length link-local`
6. `ipv6 mtu bytes`
7. `ipv6 nhrp authentication string`
8. `ipv6 nhrp map ipv6-address nbma-address`
9. `ipv6 nhrp map multicast ipv4-nbma-address`
10. `ipv6 nhrp nh ns ipv6-nhs-address`
11. `ipv6 nhrp network-id network-id`
12. `tunnel source ip-address | ipv6-address | interface-type interface-number`
13. Do one of the following:
   • `tunnel mode {aurp | cayman | dvmrp | eon | gre | gre multipoint [ipv6] | gre ipv6 | ipip decapsulate-any} | ipsec ipv4 | iptalk | ipv6 | ipsec ipv6 | mpls | nos | rbscp`
   • `tunnel destination {host-name | ip-address | ipv6-address}`
14. Do one of the following:
   • `tunnel protection ipsec profile name [shared]`
   • `tunnel protection psk key`
15. `bandwidth {interzone | total | session} {default | zone zone-name} bandwidth-size`
16. `ipv6 nhrp holdtime seconds`
17. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>interface tunnel number</code></td>
<td>Configures a tunnel interface and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><code>Device(config)# interface tunnel 5</code></td>
<td>- The <em>number</em> argument specifies the number of the tunnel interfaces that you want to create or configure. There is no limit on the number of tunnel interfaces you can create.</td>
</tr>
<tr>
<td><strong>Step 4</strong> `ipv6 address {ipv6-address / prefix-length</td>
<td>prefix-name sub-bits / prefix-length`</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config-if) ipv6 address 2001:DB8:1:1::72/64</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>ipv6 address ipv6-address / prefix-length link-local</code></td>
<td>Configures an IPv6 link-local address for an interface and enables IPv6 processing on the interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config-if)# ipv6 address fe80::2001 link-local</code></td>
<td>- A unique IPv6 link-local address (across all DMVPN nodes in a DMVPN network) must be configured.</td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>ipv6 mtu bytes</code></td>
<td>Sets the MTU size of IPv6 packets sent on an interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config-if)# ipv6 mtu 1400</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> <code>ipv6 nhrp authentication string</code></td>
<td>Configures the authentication string for an interface using the NHRP.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config-if)# ipv6 nhrp authentication examplexx</code></td>
<td>- The NHRP authentication string must be set to the same value on all hubs and spokes that are in the same DMVPN network.</td>
</tr>
<tr>
<td><strong>Step 8</strong> <code>ipv6 nhrp map ipv6-address nbma-address</code></td>
<td>Statically configures the IPv6-to-NBMA address mapping of IPv6 destinations connected to an NBMA network.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config-if)# ipv6 nhrp map 2001:DB8:3333:4::5 10.1.1.1</code></td>
<td>- Only IPv4 NBMA addresses are supported, not ATM or Ethernet addresses.</td>
</tr>
<tr>
<td><strong>Step 9</strong> <code>ipv6 nhrp map multicast ipv4-nbma-address</code></td>
<td>Maps destination IPv6 addresses to IPv4 NBMA addresses.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config-if)# ipv6 nhrp map multicast 10.11.11.99</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> <code>ipv6 nhrp nhs ipv6- nhs-address</code></td>
<td>Specifies the address of one or more IPv6 NHRP servers.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config-if)# ipv6 nhrp nhs 2001:0DB8:3333:4::5 2001:0DB8::/64</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> <code>ipv6 nhrp network-id network-id</code></td>
<td>Enables the NHRP on an interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device(config-if)# ipv6 nhrp network-id 99</td>
<td><strong>Note</strong> Effective with Cisco IOS XE Denali 16.3 <strong>ipv6 nhrp network-id</strong> is enabled by default.</td>
</tr>
</tbody>
</table>

**Step 12**

set the source address for a tunnel interface.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>tunnel source *ip-address</td>
<td>ipv6-address</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# tunnel source ethernet 0</td>
<td>Sets the source address for a tunnel interface.</td>
</tr>
</tbody>
</table>

**Step 13**

Do one of the following:

- *tunnel mode {aurp | cayman | dvmrp | eon | gre | gre multipoint [ipv6] | gre ipv6 | ipip decapsulate-any] | ipsec ipv4 | iptalk | ipv6 | ipsec ipv6 | mpls | nos | rbscp | 
- *tunnel destination {host-name | ip-address | ipv6-address} |

**Example:**

Device(config-if)# tunnel mode gre multipoint

Device(config-if)# tunnel destination 10.1.1.1

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the encapsulation mode to mGRE for the tunnel interface.</td>
<td></td>
</tr>
<tr>
<td>• Use the <em>tunnel mode</em> command if data traffic can use dynamic spoke-to-spoke traffic.</td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Specifies the destination for a tunnel interface.</td>
<td></td>
</tr>
<tr>
<td>• Use the <em>tunnel destination</em> command if data traffic can use hub-and-spoke tunnels.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 14**

Do one of the following:

- *tunnel protection ipsec profile name [shared] | 
- *tunnel protection psk key |

**Example:**

Router(config-if)# tunnel protection ipsec profile vpnprof

Router(config-if)# tunnel protection psk test1

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associates a tunnel interface with an IPsec profile.</td>
<td></td>
</tr>
<tr>
<td>• The <em>name</em> argument specifies the name of the IPsec profile; this value must match the <em>name</em> specified in the <em>crypto ipsec profile name</em> command.</td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Simplifies the tunnel protection configuration for pre-shared key (PSK) by creating a default IPsec profile.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 15**

Sets the current bandwidth value for an interface to higher-level protocols.

- *bandwidth {interzone | total | session} {default | zone zone-name} bandwidth-size |

**Example:**

Device(config-if)# bandwidth total 1200

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the current bandwidth value for an interface to higher-level protocols.</td>
<td></td>
</tr>
<tr>
<td>• The <em>bandwidth-size</em> argument specifies the bandwidth in kilobits per second. The default value is 9. The recommended bandwidth value is 1000 or greater.</td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>The bandwidth setting for the spoke need not equal the bandwidth setting for the DMVPN hub. It is usually easier if all of the spokes use the same or similar value.</td>
<td></td>
</tr>
</tbody>
</table>
**Verifying DMVPN for IPv6 Configuration**

### SUMMARY STEPS

1. **enable**
2. **show dmvpn** *(ipv4 [vrf vrf-name] | ipv6 [vrf vrf-name]) [debug-condition] [interface tunnel number | peer {nbma ip-address | network network-mask | tunnel ip-address}] [static] [detail]*
3. **show ipv6 nhrp** *(dynamic [ipv6-address] | incomplete | static [address | interface] [brief | detail] [purge]*
4. **show ipv6 nhrp multicast** *(ipv4-address | interface | ipv6-address)*
5. **show ip nhrp multicast** *(nbma-address | interface)*
6. **show ipv6 nhrp summary*
7. **show ipv6 nhrp traffic** *(interface tunnel number)*
8. **show ip nhrp shortcut*
9. **show ip route*
10. **show ipv6 route*
11. **show nhrp debug-condition*

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

Enables privileged EXEC mode.
- Enter your password if prompted.

<p>| <strong>Step 2</strong> | show dmvpn *(ipv4 [vrf vrf-name] | ipv6 [vrf vrf-name]) [debug-condition] [interface tunnel number | peer {nbma ip-address | network network-mask | tunnel ip-address}] [static] [detail] | Displays DMVPN-specific session information. |
|------------|-------------------------------------------------|-------------------------------------------------|
| Example:   | Device# show dmvpn 2001:0db8:1:1::72/64         |                                                 |</p>

<td></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Device# debug nhrp ipv6 error</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

**Sample Output for the debug nhrp Command**

The following sample output is from the `debug nhrp` command with the `ipv6` keyword:

```
Device# debug nhrp ipv6
  - 2001:DB8:3c4d:0015:0000:0000:1a2f:3d2c/32
Aug 9 13:13:41.486: NHRP: Send Registration Request via Tunnel0 vrf 0, packet size: 105
  src: 2001:DB8:3c4d:0015:0000:0000:1a2f:3d2c/32,
  dst: 2001:DB8:3c4d:0015:0000:0000:1a2f:3d2c/32
```

**Configuration Examples for IPv6 over DMVPN**

**Example: Configuring an IPsec Profile**

```
Device(config)# crypto identity router1
Device(config)# crypto ipsec profile example1
Device(config-crypto-map)# set transform-set example-set
Device(config-crypto-map)# set identity router1
Device(config-crypto-map)# set security-association lifetime seconds 1800
Device(config-crypto-map)# set pfs group14
```

**Example: Configuring the Hub for DMVPN**

```
Device# configure terminal
Device(config)# interface tunnel 5
```
Example: Configuring the Hub for DMVPN

```
Device(config-if)# ipv6 address 2001:DB8:1:1::72/64
Device(config-if)# ipv6 address fe80::2001 link-local
Device(config-if)# ipv6 mtu 1400
Device(config-if)# ipv6 nhrp authentication examplexx
Device(config-if)# ipv6 nhrp map multicast dynamic
Device(config-if)# ipv6 nhrp network-id 99
Device(config-if)# tunnel source ethernet 0
Device(config-if)# tunnel mode gre multipoint
Device(config-if)# tunnel protection ipsec profile example_profile
Device(config-if)# bandwidth 1200
Device(config-if)# ipv6 nhrp holdtime 3600
```

The following sample output is from the `show dmvpn` command, with the `ipv6` and `detail` keywords, for the hub:

```
Device# show dmvpn ipv6 detail
Legend: Attrb --> S - Static, D - Dynamic, I - Incomplete

Dynamic Multipoint VPN Configuration Guide, Cisco IOS Release 15M&T
Interface Tunnel1 is up/up, Addr. is 10.0.0.1, VRF ""
Tunnel Src./Dest. addr: 192.169.2.10/MSRE, Tunnel VRF ""
Protocol/Transport: "multi-GRE/IP", Protect "test_profile"

IPv6 NHS: 2001::6 RE
Type:Spoke, Total NBMA Peers (v4/v6): 1
  1.Peer NBMA Address: 192.169.2.9
    Tunnel IPv6 Address: 2001::6
    IPv6 Target Network: 2001::/112
    # Ent: 2, Status: NHRP, UpDn Time: never, Cache Attrib: S

IPv6 NHS: 2001::6 RE
Type:Unknown, Total NBMA Peers (v4/v6): 1
  2.Peer NBMA Address: 192.169.2.9
    Tunnel IPv6 Address: FE80::1
    IPv6 Target Network: FE80::1/128
    # Ent: 0, Status: UP, UpDn Time: 00:00:24, Cache Attrib: D

Pending DMVPN Sessions:

Interface: Tunnel1
IKE SA: local 192.169.2.10/500 remote 192.169.2.9/500 Active
Crypto Session Status: UP-ACTIVE
fvrf: (none), Phase1_id: 192.169.2.9
IPSEC FLOW: permit 47 host 192.169.2.10 host 192.169.2.9
Active SAs: 2, origin: crypto map
Outbound SPI : 0x6F75C431, transform : esp-aes esp-sha-hmac
Socket State: Open

Example: Configuring the NHRP Redirect and Shortcut Features on the Hub

Device(config)# interface tunnel 5
Device(config-if)# ipv6 address 2001:DB8:1::72/64

Device(config-if)# ipv6 nhrp redirect

Device(config-if)# ipv6 nhrp shortcut

Example: Configuring NHRP on the Hub and Spoke

Hub

Device# show ipv6 nhrp
2001::4/128 via 2001::4
  Tunnel1 created 00:02:40, expire 00:00:47
  Type: dynamic, Flags: unique registered used
  NBMA address: 192.169.2.10
2001::5/128 via 2001::5
  Tunnel1 created 00:02:37, expire 00:00:47
  Type: dynamic, Flags: unique registered used
  NBMA address: 192.169.2.11
FE80::2/128 via 2001::4
  Tunnel1 created 00:02:40, expire 00:00:47
  Type: dynamic, Flags: unique registered used
  NBMA address: 192.169.2.10

Example: Configuring NHRP Redirect and Shortcut Features on the Hub

Device(config)# interface tunnel 5
Device(config-if)# ipv6 address 2001:DB8:1::72/64

Device(config-if)# ipv6 nhrp redirect

Device(config-if)# ipv6 nhrp shortcut

Example: Configuring NHRP on the Hub and Spoke

Hub

Device# show ipv6 nhrp
2001::4/128 via 2001::4
  Tunnel1 created 00:02:40, expire 00:00:47
  Type: dynamic, Flags: unique registered used
  NBMA address: 192.169.2.10
2001::5/128 via 2001::5
  Tunnel1 created 00:02:37, expire 00:00:47
  Type: dynamic, Flags: unique registered used
  NBMA address: 192.169.2.11
FE80::2/128 via 2001::4
  Tunnel1 created 00:02:40, expire 00:00:47
  Type: dynamic, Flags: unique registered used
  NBMA address: 192.169.2.10
FE80::3/128 via 2001::5
   Tunnel created 00:02:37, expire 00:00:47
   Type: dynamic, Flags: unique registered used
   NBMA address: 192.169.2.11

Spoke

Device# show ipv6 nh rp

2001::8/128
   Tunnel created 00:00:13, expire 00:02:51
   Type: incomplete, Flags: negative
   Cache hits: 2

2001::/112 via 2001::6
   Tunnel created 00:01:16, never expire
   Type: static, Flags: used
   NBMA address: 192.169.2.9

FE80::1/128 via FE80::1
   Tunnel created 00:01:15, expire 00:00:43
   Type: dynamic, Flags:
   NBMA address: 192.169.2.9

Feature Information for IPv6 over DMVPN

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 2: Feature Information for IPv6 over DMVPN

</thead>
<tbody>
<tr>
<td>IPv6 over DMVPN</td>
<td></td>
<td>The DMVPN feature allows users to better scale large and small IPsec Virtual Private Networks (VPNs) by combining generic routing encapsulation (GRE) tunnels, IP security (IPsec) encryption, and the Next Hop Resolution Protocol (NHRP). In Dynamic Multipoint Virtual Private Network (DMVPN) for IPv6, the public network (the Internet) is a pure IPv4 network, and the private network (the intranet) is IPv6 capable. The following commands were introduced or modified: <code>clear dmvpn session</code>, <code>clear ipv6 nhrp</code>, <code>crypto ipsec profile</code>, <code>debug dmvpn</code>, <code>debug dmvpn condition</code>, <code>debug nhrp condition</code>, <code>debug nhrp error</code>, <code>ipv6 nhrp authentication</code>, <code>ipv6 nhrp holdtime</code>, <code>ipv6 nhrp interest</code>, <code>ipv6 nhrp map</code>, <code>ipv6 nhrp map multicast</code>, <code>ipv6 nhrp map multicast dynamic</code>, <code>ipv6 nhrp max-send</code>, <code>ipv6 nhrp network-id</code>, <code>ipv6 nhrp nhs</code>, <code>ipv6 nhrp record</code>, <code>ipv6 nhrp redirect</code>, <code>ipv6 nhrp registration</code>, <code>ipv6 nhrp responder</code>, <code>ipv6 nhrp server-only</code>, <code>ipv6 nhrp shortcut</code>, <code>ipv6 nhrp trigger-svc</code>, <code>ipv6 nhrp use</code>, <code>set pfs</code>, <code>set security-association lifetime</code>, <code>set transform-set</code>, <code>show dmvpn</code>, <code>show ipv6 nhrp</code>, <code>show ipv6 nhrp multicast</code>, <code>show ipv6 nhrp nhs</code>, <code>show ipv6 nhrp summary</code>, <code>show ipv6 nhrp traffic</code>.</td>
</tr>
<tr>
<td>IPv6 Transport for DMVPN</td>
<td></td>
<td>The IPv6 transport for DMVPN feature builds IPv6 WAN-side capability into NHRP tunnels and the underlying IPsec encryption, and enables IPv6 to transport payloads on the Internet. The IPv6 transport for DMVPN feature is enabled by default.</td>
</tr>
</tbody>
</table>
CHAPTER 3

DMVPN Configuration Using FQDN

The DMVPN Configuration Using FQDN feature enables next hop clients (NHCs) to register with the next hop server (NHS).

This feature allows you to configure a fully qualified domain name (FQDN) for the nonbroadcast multiple access network (NBMA) address of the hub (NHS) on the spokes (NHCs). The spokes resolve the FQDN to IP address using the DNS service and get registered with the hub using the newly resolved address. This allows spokes to dynamically locate the IP address of the hub using FQDN.

With this feature, spokes need not configure the protocol address of the hub. Spokes learn the protocol address of the hub dynamically from the NHRP registration reply of the hub. According to RFC 2332, the hub to which the NHRP registration was sent responds with its own protocol address in the NHRP registration reply and hence the spokes learn the protocol address of the hub from the NHRP registration reply packet.

In Cisco IOS Release 15.1(2)T and earlier releases, in Dynamic Multipoint VPN (DMVPN), NHS NBMA addresses were configured with either IPv4 or IPv6 addresses. Because NHS was configured to receive a dynamic NBMA address, it was difficult for NHCs to get the updated NBMA address and register with the NHS. This limitation is addressed with the DMVPN Configuration Using FQDN feature. This feature allows NHC to use an FQDN instead of an IP address to configure NBMA and register with the NHS dynamically.

- Finding Feature Information, on page 75
- Prerequisites for DMVPN Configuration Using FQDN, on page 76
- Restrictions for DMVPN Configuration Using FQDN, on page 76
- Information About DMVPN Configuration Using FQDN, on page 76
- How to Configure DMVPN Configuration Using FQDN, on page 77

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for DMVPN Configuration Using FQDN

Cisco IOS Domain Name System (DNS) client must be available on the spoke.

Restrictions for DMVPN Configuration Using FQDN

If the NBMA IP address resolved from the FQDN is not mapped to an NHS configured with the protocol address, the spoke cannot register with the hub.

Information About DMVPN Configuration Using FQDN

DNS Functionality

A Domain Name System (DNS) client communicates with a DNS server to translate a hostname to an IP address.

The intermediate DNS server or the DNS client on the route enters the FQDN DNS reply from the DNS server into the cache for a lifetime. If the DNS client receives another query before the lifetime expires, the DNS client uses the entry information from the cache. If the cache expires, the DNS client queries the DNS server. If the NBMA address of the NHS changes frequently, the DNS entry lifetime must be short, otherwise the spokes may take some time before they start using the new NBMA address for the NHS.

DNS Server Deployment Scenarios

A DNS server can be located either in a hub network or outside a hub and spoke network.

Following are the four DNS server load balancing models:

- Round robin--Each DNS request is assigned an IP address sequentially from the list of IP addresses configured for an FQDN.

- Weighted round robin--This is similar to round-robin load balancing except that the IP addresses are assigned weights and nodes, where higher weights can take more load or traffic.

- Geography or network--Geography-based load balancing allows the requests to be directed to the optimal node that is geographically the nearest or the most efficient to the requester.

- Failover--Failover load balancing sends all requests to a single host until the load balancer determines a particular node to be no longer available. It then directs traffic to the next node available in the list.
How to Configure DMVPN Configuration Using FQDN

Configuring a DNS Server on a Spoke

Perform this task to configure a DNS server on a spoke. You must perform this task only if you want to resolve FQDN using an external DNS server.

SUMMARY STEPS

1. enable
2. configure terminal
3. ip name-server ip-address
4. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip name-server ip-address</td>
<td>Configures a DNS server on a spoke.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# ip name-server 192.0.2.1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>

Configuring a DNS Server

Perform this task to configure a DNS server. You must perform the configuration on a DNS server.

SUMMARY STEPS

1. enable
2. configure terminal
### DETAILED STEPS

<table>
<thead>
<tr>

<tr>
<td><strong>Step 4</strong> ip host hostname ip-address</td>
<td>Maps a FQDN (hostname) with the IP address in the DNS hostname cache for a DNS view.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# ip host host1.example.com 192.0.2.2</td>
<td><strong>Note</strong> Configure the <code>ip host</code> command on a DNS server if you have configured a DNS server on the spoke and configure the command on the spoke if you have not configured a DNS server on the spoke. See the Configuring a DNS Server on a Spoke task.</td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring an FQDN with a Protocol Address

Perform this task to configure an FQDN with a protocol address. You must know the protocol address of the NHS while you are configuring the FQDN. This configuration registers spoke to a hub using NBMA.

### SUMMARY STEPS

1. `enable`  
2. `configure terminal`  
3. `interface tunnel number`
### DMVPN Configuration Using FQDN

#### Configuring a FQDN Without an NHS Protocol Address

Perform this task to configure an FQDN without an NHS protocol address.

```
4. `ip nhrp nhs nhs-address nbma {nbma-address | FQDN-string}] [multicast] [priority value] [cluster number]

5. `end`
```

## DETAILED STEPS

</tbody>
</table>

### Configuring a FQDN Without an NHS Protocol Address

Perform this task to configure an FQDN without an NHS protocol address.
**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `ip nhrp nhs dynamic nbma {nbma-address | FQDN-string} [multicast] [priority value] [cluster value]`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>

</tr>
<tr>
<td>ip nhrp nhs dynamic nbma {nbma-address</td>
<td>FQDN-string} [multicast] [priority value] [cluster value]</td>
</tr>
<tr>
<td>Example:</td>
<td>• The NHS protocol address is dynamically fetched by the spoke. You can configure the command in the following two ways:</td>
</tr>
<tr>
<td></td>
<td>• <code>ip nhrp nhs dynamic nbma FQDN-string</code>--Use this command to register a spoke to a hub using the FQDN string.</td>
</tr>
<tr>
<td></td>
<td>• <code>ip nhrp nhs dynamic nbma nbma-address</code>--Use this command to register a spoke to a hub using the NHS NBMA IP address.</td>
</tr>
<tr>
<td>Note</td>
<td>You can use the `ipv6 nhrp nhs dynamic nbma {nbma-address</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Exits interface configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>
Verifying DMVPN FQDN Configuration

This task shows how to display information to verify DMVPN FQDN configuration. The following `show` commands can be entered in any order.

### SUMMARY STEPS

1. `enable`
2. `show dmvpn`
3. `show ip nhrp nhs`
4. `show running-config interface tunnel tunnel-number`
5. `show ip nhrp multicast`

### DETAILED STEPS

**Step 1**  
`enable`  
Enables privileged EXEC mode. Enter your password if prompted.  
**Example:**

```
Router# enable
```

**Step 2**  
`show dmvpn`  
Displays DMVPN-specific session information.  
**Example:**

```
Router# show dmvpn
Legend: Attrb --> S - Static, D - Dynamic, I - Incomplete
       N - NATed, L - Local, X - No Socket
# Ent --> Number of NHRP entries with same NBMA peer
NHS Status: E --> Expecting Replies, R --> Responding, W --> Waiting
UpDn Time --> Up or Down Time for a Tunnel
--------------------------------------------------------------------------
Interface: Tunnel1, IPv4 NHRP Details
Type:Spoke, NHRP Peers:1,
# Ent Peer NBMA Addr Peer Tunnel Add State UpDn Tm Attrb
----- --------------- --------------- ----- -------- ----- (h1.cisco.com)
1 192.0.2.1 192.0.2.2 UP 00:00:12 S
```

**Step 3**  
`show ip nhrp nhs`  
Displays the status of the NHS.  
**Example:**

```
Router# show ip nhrp nhs
IPv4 Registration Timer: 10 seconds
Legend: E=Expecting replies, R=Responding, W=Waiting
Tunnel1:
192.0.2.1 RE NBMA Address: 192.0.2.2 (h1.cisco.com) priority = 0 cluster = 0
```

**Step 4**  
`show running-config interface tunnel tunnel-number`
Displays the contents of the current running configuration file or the tunnel interface configuration.

**Example:**

```
Router# show running-config interface tunnel 1
Building configuration...
Current configuration : 462 bytes
!
interface Tunnel1
   ip address 192.0.2.1 255.255.255.0
   no ip redirects
   ip mtu 1440
   ip nhrp authentication testing
   ip nhrp group spoke_group2
   ip nhrp network-id 123
   ip nhrp holdtime 150
   ip nhrp nhs dynamic nbma h1.cisco.com multicast
   ip nhrp registration unique
   ip nhrp registration timeout 10
   ip nhrp shortcut
   no ip route-cache cef
   tunnel source Ethernet0/0
   tunnel mode gre multipoint
   tunnel key 1001
   tunnel protection ipsec profile DMVPN
end
```

**Step 5**

show ip nhrp multicast

Displays NHRP multicast mapping information.

**Example:**

```
Route# show ip nhrp multicast
I/F    NBMA address
Tunnel1  192.0.2.1  Flags: nhs
```

---

## Configuration Examples for DMVPN Configuration Using FQDN

### Example Configuring a Local DNS Server

The following example shows how to configure a local DNS server:

```
enable
configure terminal
ip host host1.example.com 192.0.2.2
```

### Example Configuring an External DNS Server

The following example shows how to configure an external DNS server:
On a spoke

```plaintext
enable
cconfigure terminal
ip name-server 192.0.2.1
```

On a DNS Server

```plaintext
enable
cconfigure terminal
ip dns server
ip host host1.example.com 192.0.2.2
```

**Example Configuring NHS with a Protocol Address and an NBMA Address**

The following example shows how to configure NHS with a protocol address and an NBMA address:

```plaintext
enable
cconfigure terminal
interface tunnel 1
ip nhrp nhs 192.0.2.1 nbma 209.165.200.225
```

**Example Configuring NHS with a Protocol Address and an FQDN**

The following example shows how to configure NHS with a protocol address and an FQDN:

```plaintext
enable
cconfigure terminal
interface tunnel 1
ip nhrp nhs 192.0.2.1 nbma examplehub.example1.com
```

**Example Configuring NHS Without a Protocol Address and with an NBMA Address**

The following example shows how to configure NHS without a protocol address and with an NBMA address:

```plaintext
enable
cconfigure terminal
interface tunnel 1
ip nhrp nhs dynamic nbma 192.0.2.1
```

**Example Configuring NHS Without a Protocol Address and with an FQDN**

The following example shows how to configure NHS without a protocol address and with an FQDN:

```plaintext
enable
cconfigure terminal
interface tunnel 1
ip nhrp nhs dynamic nbma examplehub.example1.com
```

CHAPTER 4

Per-Tunnel QoS for DMVPN

The Per-Tunnel QoS for DMVPN feature introduces per-tunnel QoS support for DMVPN and increases per-tunnel QoS performance for IPSec tunnel interfaces.

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Per-Tunnel QoS for DMVPN

• Before you configure the Per-Tunnel QoS for DMVPN feature, you must configure Cisco Express Forwarding switching.
Before you can configure an Next Hop Resolution Protocol (NHRP) group on a spoke and map the NHRP group to a QoS policy on a hub, the spoke and the hub must already be configured for DMVPN without the per-tunnel QoS.

Restrictions for Per-Tunnel QoS for DMVPN

Information About Per-Tunnel QoS for DMVPN

Per-Tunnel QoS for DMVPN Overview

The Per-Tunnel QoS for DMVPN feature lets you apply a quality of service (QoS) policy on a Dynamic Multipoint VPN (DMVPN) hub on a per-tunnel instance (per-spoke basis) in the egress direction for DMVPN hub-to-spoke tunnels. The QoS policy on a DMVPN hub on a per-tunnel instance lets you shape tunnel traffic to individual spokes (a parent policy) and differentiate individual data flows going through the tunnel for policing (a child policy). The QoS policy that the hub uses for a specific spoke is selected according to the specific Next Hop Resolution Protocol (NHRP) group into which that spoke is configured. Although you can configure many spokes into the same NHRP group, the tunnel traffic for each spoke is measured individually for shaping and policing.

You can use this feature with DMVPN with or without Internet Protocol Security (IPsec).

When the Per-Tunnel QoS for DMVPN feature is enabled, queuing and shaping are performed at the outbound physical interface for generic routing encapsulation (GRE)/IPsec tunnel packets. The Per-Tunnel QoS for DMVPN feature ensures that the GRE header, the IPsec header, and the Layer 2 (for the physical interface) header are included in the packet-size calculations for shaping and bandwidth queuing of packets under QoS.

Benefits of Per-Tunnel QoS for DMVPN

Before the introduction of Per-Tunnel QoS for DMVPN feature, quality of service (QoS) on a Dynamic Multipoint VPN (DMVPN) hub could be configured to measure only either the outbound traffic in the aggregate (overall spokes) or outbound traffic on a per-spoke basis (with extensive manual configuration).

The Per-Tunnel QoS for DMVPN feature provides the following benefits:

- The QoS policy is attached to the DMVPN hub, and the criteria for matching the tunnel traffic are set up automatically as each spoke registers with the hub (which means that extensive manual configuration is not needed).
- Traffic can be regulated from the hub to spokes on a per-spoke basis.
- The hub cannot send excessive traffic to (and overrun) a small spoke.
- The amount of outbound hub bandwidth that a “greedy” spoke can consume can be limited; therefore, the traffic cannot monopolize a hub’s resources and starve other spokes.
**NHRP QoS Provisioning for DMVPN**

Next Hop Resolution Protocol (NHRP) performs the provisioning for the Per-Tunnel QoS for DMVPN feature by using NHRP groups.

An NHRP group, a new functionality introduced by this feature, is the group identity information signaled by a Dynamic Multipoint VPN (DMVPN) node (a spoke) to the DMVPN hub. The hub uses this information to select a locally defined quality of service (QoS) policy instance for the remote node.

You can configure an NHRP group on the spoke router on the DMVPN generic routing encapsulation (GRE) tunnel interface. The NHRP group name is communicated to the hub in each of the periodic NHRP registration requests sent from the spoke to the hub.

NHRP group-to-QoS policy mappings are configured on the hub DMVPN GRE tunnel interface. The NHRP group string received from a spoke is mapped to a QoS policy, which is applied to that hub-to-spoke tunnel in the egress direction.

After an NHRP group is configured on a spoke, the group is not immediately sent to the hub, but is sent in the next periodic registration request. The spoke can belong to only one NHRP group per GRE tunnel interface. If a spoke is configured as part of two or more DMVPN networks (multiple GRE tunnel interfaces), then the spoke can have a different NHRP group name on each of the GRE tunnel interfaces.

If an NHRP group is not received from the spoke, then a QoS policy is not applied to the spoke, and any existing QoS policy applied to that spoke is removed. If an NHRP group is received from the spoke when previous NHRP registrations did not have an NHRP group, then the corresponding QoS policy is applied. If the same NHRP group is received from a spoke similar to the earlier NHRP registration request, then no action is taken because a QoS policy would have already been applied for that spoke. If a different NHRP group is received from the spoke than what was received in the previous NHRP registration request, any applied QoS policy is removed, and the QoS policy corresponding to the new NHRP group is applied.

**Per-Tunnel QoS for Spoke to Spoke Connections**

The QoS: Spoke to Spoke per tunnel QoS for DMVPN feature enables a DMVPN client to establish a direct crypto tunnel with another DMVPN client leveraging the per-tunnel QoS policy, using Next Hop Resolution Protocol (NHRP) to build spoke-to-spoke connections.

This feature enhances the Adaptive QoS over DMVPN feature, which ensures effective bandwidth management using dynamic shapers based on available bandwidth.

A spoke-to-spoke connection is established when a group identity information, configured on the spokes using the `nhrp attribute group` command, is exchanged between the spokes through the NHRP Vendor Private Extension (VPE). The NHRP Vendor Private Extensions, encapsulated in NHRP control packets—NHRP resolution request and reply packets.

Assume a network with two spokes—Spoke A and Spoke B, connected to hub. If Spoke A is configured with the `nhrp attribute group` command and traffic exists between the Spoke A and Spoke B, a resolution request from the Spoke A carries the group identity information as part of Vendor Private Extension (VPE). On receiving the resolution request, Spoke B extracts the VPE header and checks the extension types received as part of the resolution request packet. If the VPE extension has group type, the NHRP VPE parser extracts the group information and checka if a matching map is present. If a matching map is present, QoS applies the policy on the target interface.
How to Configure Per-Tunnel QoS for DMVPN

To configure the Per-Tunnel QoS for DMVPN feature, you define a Next Hop Resolution Protocol (NHRP) group on the spokes and then map the NHRP group to a quality of service (QoS) policy on the hub.

Configuring an NHRP Group on a Spoke

SUMMARY STEPS

1. enable
2. configure terminal
3. interface tunnel number
4. nhrp group group-name
5. end

  Device(config-if)# end |

### Enabling DMVPN Per-tunnel QoS Sourced from Port Channel

To enable the feature, you must configure the command **platform qos port-channel-aggregate <port-channel number>** before configuring port channel.

The **platform qos port-channel-aggregate <port-channel number>** is required for this feature. The order of the configuration steps is important to enable DMVPN Per-tunnel QoS Sourced from Port-Channel feature. The **platform qos port-channel-aggregate <port-channel number>** command must be configured first. Then, the port-channel interface must be created. Lastly, **channel-group x** command must be applied to member ports.

Both port-channel main-interface and sub-interface are supported in aggregate mode.

#### Note

Before configuring the command, you must remove the ‘port channel interface’ and ‘channel-group’ configuration from physical interface.

1. Enable the command **platform qos port-channel-aggregate <port-channel number>** before configuring port channel.
2. Configure per-tunnel QoS.
3. Reset the NHRP registration process to ensure the spokes register now that the new configuration is present on the hub BR. Use the command `show dmvpn detail` to display the NHRP group for each spoke.

## Verifying Per-Tunnel QoS for DMVPN

### SUMMARY STEPS

1. `enable`
2. `show dmvpn detail`
3. `show nhrp`
4. `show nhrp group [group-name]`
5. `show nhrp group-map [group-name]`
6. `show policy-map multipoint [tunnel tunnel-interface-number]`
7. `show tunnel endpoints`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>

</tr>
<tr>
<td>5.</td>
<td><code>show nhrp group-map [group-name]</code></td>
<td>Displays the group-to-policy maps configured on the hub and also displays the tunnels on which the QoS policy is applied.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device# show nhrp group-map group1-parent</code></td>
<td></td>
</tr>
</tbody>
</table>
### Step 6

**Command or Action:**

```
show policy-map multipoint [tunnel interface-number]
```

**Example:**

```
Device# show policy-map multipoint tunnel 1
```

**Purpose:**
Displays QoS policy details applied to multipoint tunnels.

### Step 7

**Command or Action:**

```
show tunnel endpoints
```

**Example:**

```
Device# show tunnel endpoints
```

**Purpose:**
Displays information about the source and destination endpoints for multipoint tunnels and the QoS policy applied on the spoke tunnel.

---

### Configuration Examples for Per-Tunnel QoS for DMVPN

#### Example: Configuring an NHRP Group on a Spoke

The following example shows how to configure two Next Hop Resolution Protocol (NHRP) groups on three spokes:

**Configuring the First Spoke**

```
interface tunnel 1
  ip address 209.165.200.225 255.255.255.224
  no ip redirects
  ip mtu 1400
  ip nhrp authentication testing
  nhrp group spoke_group1
  ip nhrp map 209.165.200.226 203.0.113.1
  ip nhrp map multicast 203.0.113.1
  ip nhrp network-id 172176366
  ip nhrp holdtime 300
  ip tcp adjust-mss 1360
  ip nhrp nhs 209.165.200.226
  tunnel source fastethernet 2/1/1
  tunnel mode gre multipoint
  tunnel protection ipsec profile DMVPN
interface fastethernet 2/1/1
  ip address 203.0.113.2 255.255.255.0
```

**Configuring the Second Spoke**

```
interface tunnel 1
  ip address 209.165.200.227 255.255.255.224
  no ip redirects
  ip mtu 1400
  ip nhrp authentication testing
  nhrp group spoke_group1
  ip nhrp map 209.165.200.226 203.0.113.1
  ip nhrp map multicast 203.0.113.1
  ip nhrp network-id 172176366
  ip nhrp holdtime 300
```

---

Dynamic Multipoint VPN Configuration Guide, Cisco IOS Release 15M&T
Example: Configuring an NHRP Group Attribute on a Spoke

The following example shows how to configure two Next Hop Resolution Protocol (NHRP) groups attributes on two spokes:

Configuring the First Spoke

class-map match-any class2
match ip precedence 5
end

tunnel mode gre multipoint
Example: Mapping an NHRP Group to a QoS Policy on the Hub

The following example shows how to map Next Hop Resolution Protocol (NHRP) groups to a quality of service (QoS) policy on the hub. The example shows a hierarchical QoS policy (parent: group1_parent/group2_parent; child: group1/group2) that will be used for configuring Per-tunnel QoS for Dynamic Multipoint VPN (DMVPN) feature. The example also shows how to map the NHRP group spoke_group1 to the QoS policy group1_parent and map the NHRP group spoke_group2 to the QoS policy group2_parent on the hub:

```plaintext
class-map match-all group1_Routing
  match ip precedence 6

class-map match-all group2_Routing
  match ip precedence 6

class-map match-all group2_voice
  match access-group 100

class-map match-all group1_voice
  match access-group 100
	policy-map group1
  class group1_voice
    priority 1000
  class group1_Routing
    bandwidth percent 20
	policy-map group1_parent
  class class-default
    shape average 3000000
    service-policy group1
```
policy-map group2
class group2_voice
  priority percent 20
class group2_Routing
  bandwidth percent 10
policy-map group2_parent
class class-default
  shape average 2000000
  service-policy group2
interface tunnel 1
  ip address 209.165.200.225 255.255.255.224
  no ip redirects
  ip mtu 1400
  ip nhrp authentication testing
  ip nhrp map multicast dynamic
  ip nhrp map group spoke_group1 service-policy output group1_parent
  ip nhrp map group spoke_group2 service-policy output group2_parent
  ip nhrp network-id 172176366
  ip nhrp holdtime 300
  ip nhrp registration unique
  tunnel source fastethernet 2/1/1
  tunnel mode gre multipoint
  tunnel protection ipsec profile DMVPN
interface fastethernet 2/1/1
  ip address 209.165.200.226 255.255.255.224

Example: Enabling DMVPN Per-tunnel QoS Sourced from Port Channel

The following example shows how to enable DMVPN Per-tunnel QoS Sourced from Port Channel.

Example: Configuring on hub

platform qos port-channel-aggregate 1
!
class-map match-any class2
match ip precedence 5
!
policy-map p1
class class2
  priority percent 60
!

The following examples show how to display information about the NHRP groups that are received from the spokes. You can enter this command on the hub.

Device# show ip nhrp
192.0.2.240/32 via 192.0.2.240
   Tunnel1 created 00:22:49, expire 00:01:40
   Type: dynamic, Flags: registered
   NBMA address: 209.165.200.227
   Group: spoke_group1
192.0.2.241/32 via 192.0.2.241
   Tunnel1 created 00:22:48, expire 00:01:41
   Type: dynamic, Flags: registered
   NBMA address: 209.165.200.228
   Group: spoke_group1
192.0.2.242/32 via 192.0.2.242
   Tunnel1 created 00:22:52, expire 00:03:27
   Type: dynamic, Flags: registered
   NBMA address: 209.165.200.229
   Group: spoke_group2

The following example shows how to display the details of NHRP group mappings on a hub and the list of tunnels using each of the NHRP groups defined in the mappings. You can enter this command on the hub.

Device# show nhrp group-map
Interface: tunnel1
   NHRP group: spoke_group1
   QoS policy: group1_parent
   Tunnels using the QoS policy:
   Tunnel destination overlay/transport address
   198.51.100.220/203.0.113.240
   198.51.100.221/203.0.113.241
   NHRP group: spoke_group2
   QoS policy: group2_parent
   Tunnels using the QoS policy:
   Tunnel destination overlay/transport address
   198.51.100.222/203.0.113.242

The following example shows how to display statistics about a specific QoS policy as it is applied to a tunnel endpoint. You can enter this command on the hub.
Device# show policy-map multipoint

Interface tunnel1 <--> 203.0.113.252
  Service-policy output: group1_parent
  Class-map: class-default (match-any)
    29 packets, 4988 bytes
    5 minute offered rate 0 bps, drop rate 0 bps
    Match: any
    Queueing
    queue limit 750 packets
    (queue depth/total drops/no-buffer drops) 0/0/0
    (pkts output/bytes output) 0/0
    shape (average) cir 3000000, bc 12000, be 12000
    target shape rate 3000000
  Service-policy : group1
    queue stats for all priority classes:
      queue limit 250 packets
      (queue depth/total drops/no-buffer drops) 0/0/0
      (pkts output/bytes output) 0/0
    Class-map: group1_voice (match-all)
      0 packets, 0 bytes

Feature Information for Per-Tunnel QoS for DMVPN

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 4: Feature Information for Per-Tunnel QoS for DMVPN

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Per-Tunnel QoS                                                     | 15.4(1)T / 3.11S | The Per-Tunnel QoS for DMVPN feature introduces per-tunnel QoS support for DMVPN and increases per-tunnel QoS performance for IPsec tunnel interfaces.  
In this feature was enhanced to provide support for IPv6 addresses.  
The following commands were introduced or modified: ip nhrp map, nhrp group, nhrp map group, show dmvpn, show ip nhrp, show ip nhrp group-map, show nhrp group-map, show policy-map multipoint tunnel.  
The commands ip nhrp group and ip nhrp map group were deprecated and hidden in the CLI. They are replaced with protocol agnostic nhrp group and nhrp map group. The configuration needs to be manually migrated to the new syntax. |
|                                                                    | 16.6.5, 16.8.1 | The commands ip nhrp group and ip nhrp map group are removed from CLI. Manual migration before or after upgrade is required. |
| QoS: Spoke to Spoke Per-tunnel QoS for DMVPN                       |              | The QoS: Spoke to Spoke per tunnel QoS for DMVPN feature enables a DMVPN client to establish a direct crypto tunnel with another DMVPN client leveraging the per-tunnel QoS policy, using Next Hop Resolution Protocol (NHRP) to build spoke-to-spoke connections.  
The following commands were introduced or modified: nhrp attribute group, show dmvpn, show ip nhrp.  
**Note** The command show ip nhrp group is deprecated and is not in use. |
| QoS: DMVPN Per-tunnel QoS over Aggregate GEC                      | Cisco IOS XE Everest 16.4.1 | The QoS: DMVPN Per-tunnel QoS over Aggregate GEC feature is supported. |
DMVPN Tunnel Health Monitoring and Recovery

The Dynamic Multipoint VPN Tunnel Health Monitoring and Recovery feature enhances the ability of the system to monitor and report Dynamic Multipoint VPN (DMVPN) events. It includes support for Simple Network Management Protocol (SNMP) Next Hop Resolution Protocol (NHRP) notifications for critical DMVPN events and support for DMVPN syslog messages. It also enables the system to control the state of the tunnel interface based on the health of the DMVPN tunnels.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for DMVPN Tunnel Health Monitoring and Recovery

SNMP NHRP notifications

- SNMP is enabled in the system.
- Generic SNMP configurations for Get and Set operations and for notifications are implemented in the system.
Restrictions for DMVPN Tunnel Health Monitoring and Recovery

**MIB SNMP**

- SNMP SET UNDO is not supported.
- The MIB Persistence feature that enables the MIB-SNMP data to persist across reloads is not supported. However, a virtual persistence for the MIB notification control object happens, because that information is also captured via the configuration command line interface (CLI).
- Notifications and syslogs are not virtual routing and forwarding (VRF)-aware.
- The Rate Limit Exceeded notification does not differentiate between the IPv4 or IPv6 protocol type.

**Interface State Control**

- Interface state control can be configured on leaf spoke nodes only.
- Interface state control supports IPv4 only.

Information About DMVPN Tunnel Health Monitoring and Recovery

**NHRP Extension MIB**

The NHRP Extension MIB module comprises objects that maintain redirect-related statistics for both clients and servers, and for the following SNMP notifications for critical DMVPN events:

- A spoke perceives that a hub has gone down. This can occur even if the spoke was not previously registered with the hub.
- A spoke successfully registers with a hub.
- A hub perceives that a spoke has gone down.
- A hub perceives that a spoke has come up.
- A spoke or hub perceives that another NHRP peer, not related by an NHRP registration, has gone down. For example, a spoke-spoke tunnel goes down.
- A spoke or hub perceives that another NHRP peer, not related by an NHRP registration, has come up. For example, a spoke-spoke tunnel comes up.
- The rate limit set for NHRP packets on the interface is exceeded.

The agent implementation of the MIB provides a means to enable and disable specific traps, from either the network management system or the CLI.
**DMVPN Syslog Messages**

The DMVPN syslog feature provides syslog messages for the following events:

- All next-hop state change events. For example, when the system declares that a Next Hop Server (NHS), Next Hop Client (NHC), or a Next Hop Peer (NHP) is up or down. The severity level for these messages is set to critical.

- NHRP resolution events. For example, when a spoke sends a resolution to a remote spoke, or when an NHRP resolution times out without receiving a response. The severity level for these messages is set to informational.

- DMVPN cryptography events. For example, when a DMVPN socket entry changes from open to closed, or from closed to open. The severity level for these messages is set to notification.

- NHRP error notifications. For example, when an NHRP registration or resolution event fails, when a system check event fails, or when an NHRP encapsulation error occurs, an NHRP error notification is displayed. The severity level for these messages is set to errors.

A sample NHRP error message is given below:

```
Received Error Indication from 209.165.200.226, code: administratively prohibited(4), (trigger src: 209.165.200.228 (nbma: 209.165.200.230) dst: 209.165.202.140), offset: 0, data: 00 01 08 00 00 00 00 00 00 00 68 F4 03 00 34
```

The error message includes the IP address of the node where the error originates, the source nonbroadcast multiaccess (NBMA), and the destination address.

- DMVPN error notifications. For example, when the NET_ID value is not configured, or when an NHRP multicast replication failure occurs. The severity level is set to notification for the unconfigured NET_ID value message, and set to errors if an NHRP multicast replication failure occurs.

- The rate limit set for NHRP packets on the interface is exceeded. This event occurs when the NHRP packets handled by the NHRP process exceeds the rate limit set on the interface. The severity level for this message is set to warning.

**Interface State Control**

The Interface State Control feature allows NHRP to control the state of the interface based on whether the tunnels on the interface are live. If NHRP detects that all NHSs configured on the interface are in the down state, NHRP can change the interface state to down. However, if NHRP detects that any one of the NHSs configured on the interface is up, then it can change the state of the interface to up.

When the NHRP changes the interface state, other Cisco services can react to the state change, for example:

- If the interface state changes, the generic routing and encapsulation (GRE) interface generates IF-MIB notifications (traps) that report a LinkUp or LinkDown message. The system uses these traps to monitor the connectivity to the DMVPN cloud.

- If the interface state changes to down, the Cisco IOS backup interface feature can be initiated to allow the system to use another interface to provide an alternative path to the failed primary path.

- If the interface state changes to down, the system generates an update that is sent to all dynamic routing protocols. The Interface State Control feature a failover mechanism for dynamic routing when the multipoint GRE (mGRE) interface is down.
• If the interface state changes to down, the system clears any static routes that use the mGRE interface as the next hop. The Interface State Control feature provides a failover mechanism for routing when the mGRE interface is down.

The interface state control feature works on both point-to-point and mGRE interfaces.

**Interface State Control Configuration Workflow**

The diagram below illustrates how the system behaves when the Interface State Control feature is initialized.

*Figure 6: Interface State Control Configuration Initialization Workflow*

```
1. NHRP Interface State Control
2. Line Up/Protocol Down
3. NHRP Registration
4. Initiate IPsec tunnel
5. IPsec and IKE session negotiation
6. IPsec Session Up
7. Line Up/Protocol Up
8. Interface State Event
9. Interface State Control
10. Cisco IOS Services Activation
11. Services

The Interface State Control initialization works as follows:

1. The Interface State Control feature is enabled on the GRE interface with NHRP configured.
2. The system reevaluates the protocol state and changes the state to line up and protocol down if none of the configured NHSSs is responding.
3. The line up state change initiates the NHRP registration process.
4. The NHRP registration process initiates the IPsec tunnel.
5. The IPsec tunnel initiation starts the IPsec and IKE tunnel negotiation process.
6. On successful completion of the tunnel negotiation process, the system sends an IPsec Session Up message.
7. The NHRP registration process receives the IPsec Session Up message.
8. The NHRP registration process reports the line up and protocol up state to the GRE interface.
9. The GRE interface state changes to line up and protocol up.
10. The system reports the GRE interface state change to Cisco software.
11. The state change triggers Cisco services, such as interface event notifications, syslog events, DHCP renew, IP route refresh, and SNMP traps.
```
How to Configure DMVPN Tunnel Health Monitoring and Recovery

The DMVPN Tunnel Health Monitoring and Recovery feature allows you to configure SNMP NHRP notifications and interface states.

Configuring Interfaces to Generate SNMP NHRP Notifications

You can configure an interface so that SNMP NHRP traps are generated for NHRP events. In addition, you can configure the system to send the traps to particular trap receivers. To configure SNMP NHRP notifications on an interface, perform the steps in this section.

SUMMARY STEPS

1. enable
2. configure terminal
3. snmp-server community string rw
4. snmp-server enable traps nhrp nhs
5. snmp-server enable traps nhrp nhc
6. snmp-server enable traps nhrp nhp
7. snmp-server enable traps nhrp quota-exceeded
8. snmp-server host ip-address version snmpversion community-string
9. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>

<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# end</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Troubleshooting Tips**

Use the `debug snmp mib nhrp` command to troubleshoot SNMP NHRP notifications.

**Configuring Interface State Control on an Interface**

The Interface State Control feature enables the system to control the state of an interface based on whether the DMVPN tunnels connected to the interface are live or not. To configure interface state control on an interface, perform the steps in this section.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `if-state nhrp`
5. `end`
**DETAILED STEPS**

</table>

**Configuration Examples for DMVPN Tunnel Health Monitoring and Recovery**

**Example: Configuring SNMP NHRP Notifications**

The following example shows how to configure SNMP NHRP notifications on a hub or spoke:

```plaintext
Device(config)# snmp-server community public rw
Device(config)# snmp-server enable traps nhrp nhs
Device(config)# snmp-server enable traps nhrp nhc
Device(config)# snmp-server enable traps nhrp nhp
Device(config)# snmp-server enable traps nhrp quota-exceeded
Device(config)# snmp-server host 209.165.200.226 version 2c public
```

**Example: Configuring Interface State Control**

The following example shows how to configure the Interface State Control feature for a spoke:
interface Tunnel 1
ip address 209.165.200.228 255.255.255.0
no ip redirects
ip nhrp authentication cisco
ip nhrp map 209.165.201.2 209.165.201.10
ip nhrp map 209.165.201.3 209.165.201.11
ip nhrp map multicast 209.165.201.10
ip nhrp map multicast 209.165.201.11
ip nhrp network-id 1
ip nhrp holdtime 90
ip nhrp nhs 209.165.201.3
ip nhrp nhs 209.165.201.2
ip nhrp shortcut
if-state nhrp
tunnel source Ethernet0/0
tunnel mode gre multipoint
!
end

DMVPN-Tunnel Health Monitoring and Recovery
Backup NHS

The DMVPN-Tunnel Health Monitoring and Recovery (Backup NHS) feature allows you to control the number of connections to the Dynamic Multipoint Virtual Private Network (DMVPN) hub and allows you to switch to alternate hubs in case of a connection failure to the primary hubs.

The recovery mechanism provided by the DMVPN-Tunnel Health Monitoring and Recovery (Backup NHS) feature allows spokes to recover from a failed spoke-to-hub tunnel path by replacing the tunnel by another active spoke-to-hub tunnel. Spokes can select the next hop server (NHS) [hub] from a list of NHSs configured on the spoke. You can configure priority values to the NHSs that control the order in which spokes select the NHS.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Information About DMVPN-Tunnel Health Monitoring and Recovery Backup NHS

NHS States

An NHS attains different states while associating with the hubs to from a spoke-to-hub tunnel. The table below describes different NHS states.

Table 6: NHS States

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOWN</td>
<td>NHS is waiting to get scheduled.</td>
</tr>
<tr>
<td>PROBE</td>
<td>NHS is declared as “DOWN” but it is still actively probed by the spoke to bring it “UP”.</td>
</tr>
<tr>
<td>UP</td>
<td>NHS is associated with a spoke to establish a tunnel.</td>
</tr>
</tbody>
</table>

NHS Priorities

NHS priority is a numerical value assigned to a hub that controls the order in which spokes select hubs to establish a spoke-to-hub tunnel. The priority value ranges from 0 to 255, where 0 is the highest and 255 is the lowest priority.

You can assign hub priorities in the following ways:

- Unique priorities to all NHS.
- Same priority level to a group of NHS.
- Unspecified priority (value 0) for an NHS, a group of NHSs, or all NHSs.

NHS Clusterless Model

NHS clusterless model is a model where you assign the priority values to the NHSs and do not place the NHSs into any group. NHS clusterless model groups all NHSs to a default group and maintains redundant connections based on the maximum NHS connections configured. Maximum NHS connections is the number of NHS connections in a cluster that must be active at any point in time. The valid range for maximum NHS connections is from 0 to 255.

Priority values are assigned to the hubs to control the order in which the spokes select hubs to establish the spoke-to-hub tunnel. However, assigning these priorities in a clusterless model has certain limitations.

The table below provides an example of limitations for assigning priorities in a clusterless model.

Table 7: Limitations of Clusterless Mode

<table>
<thead>
<tr>
<th>Maximum Number of Connections</th>
<th>3</th>
</tr>
</thead>
</table>
Consider a scenario with three data centers A, B, and C. Each data center consists of two NHSs: NHSs A1 and A2 comprise one data center, NHS B1 and B2 another, and C1 and C3 another.

Although two NHSs are available for each data center, the spoke is connected to only one NHS of each data center at any point in time. Hence, the maximum connection value is set to 3. That is, three spoke-to-hub tunnels are established. If any one NHS, for example, NHS B1, becomes inactive, the spoke-to-hub tunnel associated with NHS B1 goes down. Based on the priority model, NHS A2 has the next priority value and the next available NHS in the queue, so it forms the spoke-to-hub tunnel and goes up. However, this does not meet the requirement that a hub from data center B be associated with the spoke to form a tunnel. Hence, no connection is made to data center B.

This problem can be addressed by placing NHSs into different groups. Each group can be configured with a group specific maximum connection value. NHSs that are not assigned to any groups belong to the default group.

### NHS Clusters

The table below presents an example of cluster functionality. NHSs corresponding to different data centers are grouped to form clusters. NHS A1 and NHS A2 with priority 1 and 2, respectively, are grouped as cluster1, NHS B1 and NHS B2 with priority 1 and 2, respectively, are grouped as cluster2, and NHS C1 and NHS C2 with priority 1 and 2, respectively, are grouped as cluster3. NHS 7, NHS 8, and NHS 9 are part of the default cluster. The maximum cluster value is set to 1 for each cluster so that at least one spoke-to-hub tunnel is continuously established with all the four clusters.

In scenario 1, NHS A1, NHS B1, and NHS C1 with the highest priority in each cluster are in the UP state. In scenario 2, the connection between the spoke and NHS A1 breaks, and a connection is established between the spoke and NHS A2 (hub from the same cluster). NHS A1 with the highest priority attains the PROBE state. In this way, at any point in time a connection is established to all the three data centers.

<table>
<thead>
<tr>
<th>NHS</th>
<th>NHS Priority</th>
<th>Cluster</th>
<th>Maximum Number of Connections</th>
<th>Scenario 1</th>
<th>Scenario 2</th>

</tr>
</tbody>
</table>

*Table 8: Cluster Functionality*
### NHS Fallback Time

Fallback time is the time that the spoke waits for the NHS to become active before detaching itself from an NHS with a lower priority and connecting to the NHS with the highest priority to form a spoke-to-hub tunnel. Fallback time helps in avoiding excessive flaps.

The table below shows how the spoke flaps from one NHS to another excessively when the fallback time is not configured on the spoke. Five NHSs having different priorities are available to connect to the spoke to form a spoke-to-hub tunnel. All these NHSs belong to the default cluster. The maximum number of connections is one.

#### Table 9: NHS Behavior when Fallback Time is not Configured

<table>
<thead>
<tr>
<th>NHS</th>
<th>NHS Priority</th>
<th>Cluster</th>
<th>Scenario 1</th>
<th>Scenario 2</th>
<th>Scenario 3</th>
<th>Scenario 4</th>
<th>Scenario 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>NHS 1</td>
<td>1</td>
<td>Default</td>
<td>PROBE</td>
<td>PROBE</td>
<td>PROBE</td>
<td>PROBE</td>
<td>UP</td>
</tr>
<tr>
<td>NHS 2</td>
<td>2</td>
<td>Default</td>
<td>PROBE</td>
<td>PROBE</td>
<td>PROBE</td>
<td>UP</td>
<td>DOWN</td>
</tr>
<tr>
<td>NHS 3</td>
<td>3</td>
<td>Default</td>
<td>PROBE</td>
<td>PROBE</td>
<td>UP</td>
<td>DOWN</td>
<td>DOWN</td>
</tr>
<tr>
<td>NHS 4</td>
<td>4</td>
<td>Default</td>
<td>PROBE</td>
<td>UP</td>
<td>DOWN</td>
<td>DOWN</td>
<td>DOWN</td>
</tr>
<tr>
<td>NHS 5</td>
<td>5</td>
<td>Default</td>
<td>UP</td>
<td>DOWN</td>
<td>DOWN</td>
<td>DOWN</td>
<td>DOWN</td>
</tr>
</tbody>
</table>

In scenario 1, NHS 5 with the lowest priority value is connected to the spoke to form a tunnel. All the other NHSs having higher priorities than NHS 5 are in the PROBE state.

In scenario 2, when NHS 4 becomes active, the spoke breaks connection with the existing tunnel and establishes a new connection with NHS 4. In scenario 3 and scenario 4, the spoke breaks the existing connections as soon as an NHS with a higher priority becomes active and establishes a new tunnel. In scenario 5, as the NHS with the highest priority (NHS 1) becomes active, the spoke connects to it to form a tunnel and continues with it until the NHS becomes inactive. Because NHS 1 is having the highest priority, no other NHS is in the PROBE state.
The table below shows how to avoid the excessive flapping by configuring the fallback time. The maximum number of connection is one. A fallback time period of 30 seconds is configured on the spoke. In scenario 2, when an NHS with a higher priority than the NHS associated with the spoke becomes active, the spoke does not break the existing tunnel connection until the fallback time. Hence, although NHS 4 becomes active, it does not form a tunnel and attain the UP state. NHS 4 remains active but does not form a tunnel until the fallback time elapses. Once the fallback time elapses, the spoke connects to the NHS having the highest priority among the active NHSs.

This way, the flaps that occur as soon as an NHS of higher priority becomes active are avoided.

**NHS Recovery Process**

NHS recovery is a process of establishing an alternative spoke-to-hub tunnel when the existing tunnel becomes inactive, and connecting to the preferred hub upon recovery.

The following sections explain NHS recovery:

**Alternative Spoke to Hub NHS Tunnel**

When a spoke-to-hub tunnel fails it must be backed up with a new spoke-to-hub tunnel. The new NHS is picked from the same cluster to which the failed hub belonged. This ensures that the required number of spoke-to-hub tunnels are always present although one or more tunnel paths are unavailable.

The table below presents an example of NHS backup functionality.

**Table 11: NHS Backup Functionality**

</tr>
</tbody>
</table>

Four NHSs belonging to cluster 1 and cluster 3 and two NHSs belonging to the default cluster are available for setting up spoke-to-hub tunnels. All NHSs have different priorities. The maximum number of connections is set to 1 for all the three clusters. That is, at any point in time, at least one NHS from each cluster must be connected to the spoke to form a tunnel.

In scenario 1, NHS A1 from cluster 1, NHS B1 from cluster 3, and NHS 9 from the default cluster are UP. They establish a contact with the spoke to form different spoke-to-hub tunnels. In scenario 2, NHS A1 and NHS B1 with the highest priority in their respective clusters become inactive. Hence a tunnel is established from the spoke to NHS A2 and NHS B2, which have the next highest priority values. However, the spoke continues to probe NHS A1 and NHS B1 because they have the highest priority. Hence, NHS A1 and NHS B1 remain in the PROBE state.

In scenario 3, NHS A2, NHS B2, and NHS 9 become inactive. The spoke checks if the NHSs in PROBE state have turned active. If yes, then the spoke establishes a connection to the NHS that has turned active. However, as shown in scenario 3, because none of the NHSs in the PROBE state is active, the spoke connects to NHS A3 of cluster 1 and NHS B3 of cluster 2. NHS A1 and NHS B1 continue to be in the PROBE state until they associate themselves with the spoke to form a tunnel and attain the UP state.

**Returning to Preferred NHS Tunnel upon Recovery**

When a spoke-to-hub tunnel fails, a backup tunnel is established using an NHS having the next higher priority value. Even though the tunnel is established with an NHS of lower priority, the spoke continuously probes the NHS having the highest priority value. Once the NHS having the highest priority value becomes active, the spoke establishes a tunnel with the NHS and hence the NHS attains the UP state.

The table below presents NHS recovery functionality. Four NHSs belonging to cluster 1 and cluster 3 and two NHSs belonging to the default cluster are available for setting up spoke-to-hub tunnels. All NHSes have different priorities. The maximum connection value is set to 1. In scenario 1, NHS A4, NHS B4, and NHS 10 with the least priority in their respective clusters associate with the spoke in establishing a tunnel. The spoke continues to probe NHSs of higher priority to establish a connection with the NHS having the highest priority value. Hence, in scenario 1, NHSs having the highest priority value in their respective clusters are in the PROBE state. In scenario 2, NHS A1 is ACTIVE, forms a tunnel with the spoke, and attains the UP state. Because NHS A1 has the highest priority, the spoke does not probe any other NHS in the cluster. Hence, all the other NHSs in cluster 1 are in the DOWN state.

When the connection with NHS B4 breaks, the spoke connects to NHS B3, which has the next higher priority value, because NHS B1 of cluster 3 is not active. In scenario 3, NHS A1 continues to be in the UP state and NHS B1 with the highest priority in cluster 2 becomes active, forms a tunnel, and attains the UP state. Hence,
no other NHSs in cluster 2 are in the PROBE state. However, because NHS 10 having the lowest priority value in the default cluster is in the UP state, the spoke continues to probe NHS 9 having the highest priority in the cluster.

In scenario 4, NHS A1 and NHS B1 continue to be in the UP state and NHS 9 having the highest priority in the default cluster attains the UP state. Hence, because the spoke is associated with the NHSs having the highest priority in all the clusters, none of the NHSs are in the PROBE state.

### How to Configure DMVPN-Tunnel Health Monitoring and Recovery Backup NHS

#### Configuring the Maximum Number of Connections for an NHS Cluster

Perform this task to configure the desired maximum number of connections for an NHS cluster.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `ip nhrp nhs cluster cluster-number max-connections value`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>interface tunnel <em>number</em></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# interface tunnel 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Configures the desired maximum number of connections.</td>
</tr>
<tr>
<td>ip nhrp nhs cluster <em>cluster-number max-connections value</em></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip nhrp nhs cluster 5 max-connections 100</td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>Use the <em>ipv6 nhrp nhs cluster cluster-number max-connections value</em> command for IPv6 configuration.</td>
</tr>
</tbody>
</table>

Configuring NHS Fallback Time

Perform this task to configure NHS fallback time.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface tunnel *number*
4. ip nhrp nhs fallback *fallback-time*

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>

<tr>
<td><strong>Step 3</strong> interface tunnel  <code>number</code></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# interface tunnel 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip nhrp nhs fallback  <code>fallback-time</code></td>
<td>Configures NHS fallback time.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-if)# ip nhrp nhs fallback 25</td>
<td>Note: Use the <code>ipv6 nhrp nhs fallback fallback-time</code> command for IPv6 configuration.</td>
</tr>
</tbody>
</table>

### Configuring NHS Priority and Group Values

Perform this task to configure NHS priority and group values.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface tunnel  `number`
4. `ip nhrp nhs nhs-address priority nhs-priority cluster cluster-number`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>* Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>interface tunnel number</code></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# interface tunnel 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>ip nhrp nhs nhs-address priority nhs-priority cluster cluster-number</code></td>
<td>Configures the desired priority and cluster values.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Note: Use the <code>ipv6 nhrp nhs nhs-address priority nhs-priority cluster cluster-number</code> command for IPv6 configuration.</td>
</tr>
</tbody>
</table>
Verifying the DMVPN-Tunnel Health Monitoring and Recovery Backup NHS Feature

Perform this task to display information and verify DMVPN-Tunnel Health Monitoring and Recovery (Backup NHS) feature configuration. You can enter these `show` commands in any order.

**SUMMARY STEPS**

1. `enable`
2. `show ip nhrp nhs`
3. `show ip nhrp nhs redundancy`
4. `show ipv6 nhrp nhs`
5. `show ipv6 nhrp nhs redundancy`

**DETAILED STEPS**

**Step 1**  `enable`

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

Router# enable

**Step 2**  `show ip nhrp nhs`

Displays NHRP NHS information.

**Example:**

Router# show ip nhrp nhs

Legend: E=Expecting replies, R=Responding, W=Waiting
Tunnel0:
10.0.0.1 RE priority = 0 cluster = 0

**Step 3**  `show ip nhrp nhs redundancy`

Displays NHRP NHS recovery information.

**Example:**

Router# show ip nhrp nhs redundancy

Legend: E=Expecting replies, R=Responding, W=Waiting

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Tunnel0</td>
<td>0</td>
<td>10.0.0.253</td>
<td>3</td>
<td>RE</td>
<td>Running</td>
<td>E</td>

</tr>
<tr>
<td>2</td>
<td>Tunnel0</td>
<td>0</td>
<td>10.0.0.252</td>
<td>2</td>
<td>RE</td>
<td>Running</td>
<td>E</td>
<td>Running</td>
</tr>
<tr>
<td>3</td>
<td>Tunnel0</td>
<td>0</td>
<td>10.0.0.251</td>
<td>1</td>
<td>RE</td>
<td>Running</td>
<td>E</td>
<td>Running</td>
</tr>
</tbody>
</table>
Step 4 show ipv6 nhrp nhs
Displays IPv6, specific NHRP NHS information.

Example:

Router# show ipv6 nhrp nhs
Legend: E=Expecting replies, R=Responding, W=Waiting
Tunnel0: 2001::101 RE priority = 1 cluster = 5

Step 5 show ipv6 nhrp nhs redundancy
Displays IPv6, specific NHRP NHS recovery information.

Example:

Router# show ipv6 nhrp nhs redundancy
Legend: E=Expecting replies, R=Responding, W=Waiting

Configuration Examples for DMVPN-Tunnel Health Monitoring and Recovery Backup NHS

Example Configuring Maximum Connections for an NHS Cluster

The following example shows how to configure a “max-connections” value of 3 for three NHSs that belong to cluster 0:

interface tunnel 0
  bandwidth 1000
  ip address 10.0.0.1 255.0.0.0
  no ip redirects
  ip mtu 1400
  ip nhrp authentication test
  ip nhrp map multicast 172.0.2.1
  ip nhrp map 10.0.0.253 172.0.2.1
  ip nhrp map multicast 172.0.2.2
  ip nhrp map 10.0.0.251 172.0.2.2
  ip nhrp map multicast 172.0.2.3
  ip nhrp map 10.0.0.252 172.0.2.3
  ip nhrp network-id 100000
  ip nhrp holdtime 300
  ip nhrp nhs 10.0.0.252 priority 2
  ip nhrp nhs 10.0.0.251 priority 1
  ip nhrp nhs 10.0.0.253 priority 3
  ip nhrp nhs cluster 0 max-connections 3
Example Configuring NHS Fallback Time

The following example shows how to configure NHS fallback time to 25 seconds:

```text
configure terminal
  interface tunnel 1
    ip nhrp nhs fallback 25
```

Example Configuring NHS Priority and Group Values

The following example shows how to group NHSs under different clusters and then assign different maximum connection values to the clusters:

```text
Configure terminal
  interface tunnel 0
    ip nhrp nhs 10.0.0.251 priority 1 cluster 1
    ip nhrp map 10.0.0.251 192.0.2.4
    ip nhrp map multicast 192.0.2.4
  end
configure terminal
  interface tunnel 0
    ip nhrp nhs 10.0.0.252 priority 2 cluster 2
    ip nhrp map 10.0.0.252 192.0.2.5
    ip nhrp map multicast 192.0.2.5
  end
configure terminal
  interface tunnel 0
    ip nhrp nhs 10.0.0.253 priority 3 cluster 3
    ip nhrp map 10.0.0.253 192.0.2.6
    ip nhrp map multicast 192.0.2.6
  end
configure terminal
  interface tunnel 0
    ip nhrp nhs cluster 1 max 1
    ip nhrp nhs cluster 2 max 1
    ip nhrp nhs cluster 3 max 1
  end
```

CHAPTER 7

DMVPN Event Tracing

The DMVPN Event Tracing feature provides a trace facility for troubleshooting Cisco IOS Dynamic Multipoint VPN (DMVPN). This feature enables you to monitor DMVPN events, errors, and exceptions. During runtime, the event trace mechanism logs trace information in a buffer space. A display mechanism extracts and decodes the debug data.

You can use the DMVPN Event Tracing feature to analyze the cause of a device failure. When you configure the DMVPN Event Tracing feature, the router logs messages from specific DMVPN subsystem components into the device memory. You can view trace messages stored in the memory or save them to a file.

• Finding Feature Information, on page 129
• Information About DMVPN Event Tracing, on page 129
• How to Configure DMVPN Event Tracing, on page 130
• Configuration Examples for DMVPN Event Tracing, on page 132
• Additional References, on page 132
• Feature Information for DMVPN Event Tracing, on page 133

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About DMVPN Event Tracing

Benefits of DMVPN Event Tracing

• Displays debug information on the console during runtime.
• Avoids multiple debug calls, and hence improves device performance.
• Saves memory space.
DMVPN Event Tracing Options

The DMVPN Event Tracing feature defines the event data type, provides functionalities to capture the event, and prints the events and the CLI extensions required to access and modify the log. The table below lists different options that can be monitored using the DMVPN Event Tracing feature.

Table 14: DMVPN Event Trace Options

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>

</tr>
</tbody>
</table>

How to Configure DMVPN Event Tracing

You can configure the DMVPN Event Tracing feature in privileged EXEC mode or global configuration mode based on the desired parameters. See the Cisco IOS Security Command Reference for information on different parameters available in privileged EXEC mode or global configuration mode.

Perform one of the following tasks to configure the DMVPN Event Tracing feature:

Configuring DMVPN Event Tracing in Privileged EXEC Mode

Perform this task to configure DMVPN event tracing in privileged EXEC mode.

SUMMARY STEPS

1. enable
2. monitor event-trace dmvpn {nhrp {error | event | exception} | tunnel} {clear | continuous [cancel] | disable | enable | one-shot} | tunnel

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 monitor event-trace dmvpn {nhrp {error</td>
<td>event</td>
</tr>
</tbody>
</table>
Configuring DMVPN Event Tracing in Global Configuration Mode

Perform this task to configure DMVPN event tracing in global configuration mode.

SUMMARY STEPS

1. enable
2. configure terminal
3. monitor event-trace dmvpn {dump-file url | {nhrp {error | event | exception} | tunnel} {disable | dump-file url | enable | size | stacktrace value}}
4. exit

DETAILED STEPS

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>
Configuration Examples for DMVPN Event Tracing

Example Configuring DMVPN Event Tracing in Privileged EXEC Mode

The following example shows how to monitor NHRP error traces in privileged EXEC mode:

```
Router> enable
Router# monitor event-trace dmvpn nhrp error enable
```

Example Configuring DMVPN Event Tracing in Global Configuration Mode

The following example shows how to monitor NHRP error traces in global configuration mode:

```
Router> enable
Router# configure terminal
Router(config)# monitor event-trace dmvpn nhrp error enable
```

Feature Information for DMVPN Event Tracing
CHAPTER 8

NHRP MIB

The Cisco NHRP MIB feature introduces support for the NHRP MIB, which helps to manage and monitor the Next Hop Resolution Protocol (NHRP) via Simple Network Management Protocol (SNMP). Statistics can be collected and monitored via standards-based SNMP techniques (get operations) to query objects defined in the NHRP MIB. The NHRP MIB is VRF aware and supports VRF aware queries.

Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for NHRP MIB

- You should be familiar with configuring SNMP.
Restrictions for NHRP MIB

- Cisco does not support all the MIB variables defined in RFC-2677, Definitions of Managed Objects for the NBMA Next Hop Resolution Protocol (NHRP). For a list of variables supported and other caveats of this feature, see the Agent Capabilities file. Cisco does not support the set operations defined in RFC-2677.

Information About NHRP MIB

CISCO-NHRP-MIB

CISCO-NHRP-MIB provides NHRP MIB information on managed objects relating to clients only, servers only, and clients and servers.

The NHRP MIB module contains ten tables of objects as follows:

- NHRP Cache Table
- NHRP Purge Request Table
- NHRP Client Table
- NHRP Client Registration Table
- NHRP Client NHS Table
- NHRP Client Statistics Table
- NHRP Server Table
- NHRP Server Cache Table
- NHRP Server NHCTable
- NHRP Server Statistics Table

The Cisco implementation supports all of the tables except the NHRP Purge Request Table.

RFC-2677

RFC-2677 - Definitions of Managed Objects for the NBMA Next Hop Resolution Protocol (NHRP), describes managed objects that can be used to remotely monitor NHRP using SNMP and provide management information on the performance of NHRP.

How to Use NHRP MIB

No special configuration is needed for this feature. The SNMP framework can be used to manage NHRP MIB. See the section “Configuration Examples for NHRP MIB” for an example of how to manage a VRF aware NHRP MIB.
Verifying NHRP MIB Status

Use this task to verify the NHRP MIB status.

SUMMARY STEPS

1. `enable`
2. `show snmp mib nhrp status`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>show snmp mib nhrp status</code></td>
<td>Displays the status of the NHRP MIB.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router# show snmp mib nhrp status</code></td>
<td></td>
</tr>
</tbody>
</table>

Configuration Examples for NHRP MIB

Example Verifying NHRP MIB Status

The following output is from the `show snmp mib nhrp status` command:

```
Spoke_103# show snmp mib nhrp status
NHRP-SNMP Agent Feature: Enabled
NHRP-SNMP Tree State: Good
ListEnqueue Count = 0 Node Malloc Counts = 1
Spoke_103#
```

The “Enabled” status of “NHRP-SNMP Agent Feature:” indicates that the NHRP MIB is enabled. If the NHRP MIB was disabled, it would display “Disabled”. “ListEnqueue Count” and “Node Malloc Counts” counts are internal counts. “ListEnqueue Count” indicates how many nodes are queued for freeing. “Node Malloc Counts” displays how many nodes are allocated.

Example VRF-Aware NHRP MIB Configuration

The following is an example of how to configure a VRF Table with the name V3red, for monitoring by SNMP:

```

CHAPTER 9

DMVPN Dynamic Tunnels Between Spokes Behind a NAT Device

The DMVPN: Dynamic Tunnels Between Spokes Behind a NAT Device feature allows Next Hop Resolution Protocol (NHRP) spoke-to-spoke tunnels to be built in Dynamic Multipoint Virtual Private Networks (DMVPNs), even if one or more spokes is behind a Network Address Translation (NAT) device.

• Finding Feature Information, on page 141
• Restrictions for DMVPN Dynamic Tunnels Between Spokes Behind a NAT Device, on page 141
• Information About DMVPN Dynamic Tunnels Between Spokes Behind a NAT Device, on page 142
• Additional References, on page 146
• Feature Information for DMVPN Dynamic Tunnels Between Spokes Behind a NAT Device, on page 147

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for DMVPN Dynamic Tunnels Between Spokes Behind a NAT Device

In order for spokes to build tunnels between them, they need to know the post-NAT address of the other spoke. Consider the following restrictions when using spoke-to-spoke tunneling in NAT environments:

• **Multiple NAT translations** --A packet can go across multiple NAT devices in a nonbroadcast multiaccess (NBMA) DMVPN cloud and make several (unimportant) translations before it reaches its destination. The last translation is the important translation because it is used to create the NAT translation for all devices that reach a spoke through the last NAT device.
• **Hub or spoke can be reached through pre-NAT addresses** -- It is possible for two or more spokes to be behind the same NAT device, which can be reached through a pre-NAT IP address. Only the post-NAT IP address is relied on even if it means that a tunnel may take a less desirable path. If both spokes use NAT through the same device, then a packet may not travel inside-out or outside-in as expected by the NAT device and translations may not occur correctly.

• **Interoperability between NAT and non-NAT capable devices** -- In networks that are deployed with DMVPN, it is important that a device with NHRP NAT functionality operate together with non-NAT supported devices. A capability bit in the NHRP packet header indicates to any receiver whether a sending device understands a NAT extension.

• **Same NAT translation** -- A spoke’s post-NAT IP address must be the same when the spoke is communicating with its hubs and when it is communicating with other spokes. For example, a spoke must have the same post-NAT IP address no matter where it is sending tunnel packets within the DMVPN network.

• If one spoke is behind one NAT device and another different spoke is behind another NAT device, and Peer Address Translation (PAT) is the type of NAT used on both NAT devices, then a session initiated between the two spokes cannot be established.

One example of a PAT configuration on a NAT interface is:

```bash
ip nat inside source list nat_acl interface FastEthernet0/1 overload
```

**Information About DMVPN Dynamic Tunnels Between Spokes Behind a NAT Device**

The following sections describe how DMVPN: Dynamic Tunnels Between Spokes Behind a NAT Device allows spoke-to-spoke tunnels to be built even if one or both spoke devices are behind a NAT device:

**DMVPN Spoke-to-spoke Tunneling Limited to Spokes not Behind a NAT Device**

NAT allows a single device, such as a router, to act as agent between the Internet (or “public network”) and a local (or “private”) network, and is often used because of the scarcity of available IP addresses. A single unique IP address is required to represent an entire group of devices to anything outside the NAT device. NAT is also deployed for security and administration purposes.

In DMVPN networks, spoke-to-spoke tunneling is limited to spokes that are not behind the NAT device. If one or both spokes are behind a NAT device, a spoke-to-spoke tunnel cannot be built to or from the NAT device because it is possible for the spoke-to-spoke tunnel traffic to fail or be lost “black-holed” for an extended period of time.

The diagram below and the following sections describe how DMVPN works when spoke-to-spoke tunneling is limited to spokes that are not behind a NAT device.
NHRP Registration

When an NHRP registration is received, the hub checks the source IP address on the encapsulating GRE/IP header of the NHRP packet with the source NBMA IP address, which is contained in the NHRP registration packet. If these IP addresses are different, then NHRP knows that NAT is changing the outer IP header source address. The hub preserves both the pre- and post-NAT address of the registered spoke.

Note

If encryption is used, then IPsec transport mode must be used to enable NHRP.

The following `show ip nhrp` command output example shows the source IP address of the NHRP packet and tunnel information for Spoke B in the figure above:

```
Router# show ip nhrp
10.0.0.11/32 via 10.0.0.11, Tunnel0 created 00:00:21, expire 00:05:38
  Type: dynamic, Flags: authoritative unique registered used
  NBMA address: 172.18.2.1
    (Claimed NBMA address: 172.16.2.1)
```

NHRP Resolution

The following describes the NHRP resolution process between Spoke A and Spoke B shown in the figure above, where Spoke B is behind a NAT device with pre-NAT address of 172.16.2.1 and a post-NAT address of 172.18.2.1:

- The NHRP table entry for Spoke B on the hub contains both the post-NAT and pre-NAT addresses. When the hub receives an NHRP resolution request for the VPN address (tunnel address) of Spoke B, it answers with its own NBMA address instead of Spoke B’s NBMA address.
- When the hub receives an NHRP resolution request sourced from Spoke B for any other spoke, the hub also answers with its own NBMA address. This ensures that any attempt to build a spoke-to-spoke tunnel with Spoke B results in the data packets being sent through the hub rather than through a spoke-to-spoke tunnel.

For example:

- Data traffic from source IP address 192.168.1.1 (behind Spoke A) to destination IP address 192.168.2.1 (behind Spoke B) triggers Spoke A to send a resolution request for Spoke B (10.0.0.12) to the next hop router (hub).
- The hub receives the resolution request and finds a mapping entry for Spoke B (10.0.0.12). Because Spoke B is behind a NAT device, it acts as a proxy and replies with its own NBMA address (172.17.0.1).
- The hub also receives a resolution request from Spoke B for Spoke A (10.0.0.11). Because Spoke B is behind a NAT device, it acts as a proxy and replies with its own NBMA address (172.17.0.1). This restricts any spoke-to-spoke traffic to or from Spoke B to travel through the hub router, which is done rather than having a tunnel between the spokes.

NHRP Spoke-to-Spoke Tunnel with a NAT Device

The NHRP Spoke-to-Spoke Tunnel with NAT introduces NAT extension in the NHRP protocol and is enabled automatically. The NHRP NAT extension is a Client Information Entry (CIE) entry with information about the protocol and post-NAT NBMA address. This additional information allows the support of spoke-to-spoke tunnels between spokes where one or both are behind a NAT device without the problem of losing (black-holing) traffic for an extended period of time.

Note

The spoke-to-spoke tunnel may fail to come up, but it is detected and the data traffic flows through the hub, rather than being lost (black-holed).

the diagram below shows how the NHRP spoke-to-spoke tunnel works with NAT.
Figure 8: NHRP Between Spoke-to-Spoke Tunnels

**NHRP Registration Process**

The following steps describe the NHRP registration process:

1. A spoke sends a registration request with the NAT-Capability=1 parameter and a NAT NHRP extension of the NBMA address of the hub as configured on the spoke.

2. The hub compares the NHRP (NAT) extension with its configured NBMA address and determines whether it itself is or is not behind a NAT device. The hub also makes a note of whether the spoke is behind a NAT device by comparing the incoming GRE/IP source address with the spoke’s NBMA address in the NHRP packet.

3. The registration reply from the hub to the spoke includes a NAT NHRP extension with the post-NAT address of the spoke, if the hub detects if it is behind a NAT device.

4. If the spokes get a NAT NHRP extension in the NHRP registration reply, it then records its post-NAT IP address for possible use later.

**NHRP Resolution and Purge Process**

The following steps describe the NHRP resolution and purge process:

1. When a spoke is behind a NAT device, it includes a NAT NHRP extension when it sends NHRP resolution requests.

2. The hub receives the resolution request. If the spoke is behind a NAT device and there is no NAT extension, then the hub adds a NAT extension before forwarding this extension to the next node (spoke or next hop).
server) along the path. However, if the hub is forwarding the request to a non-NAT extension capable node, it rewrites the source-NBMA inside the packet to be the post-NAT IP address for the requesting spoke rather than its pre-NAT IP address.

3. The receiver (spoke) uses a NAT NHRP extension record (NAT capable) or the source NBMA address (non-NAT capable information) to build the tunnel. This spoke’s reply includes its own NAT extension if it is behind a NAT device.

Note
Hubs do not answer NHRP resolution requests on behalf of spokes. Hubs always forward NHRP resolution requests to the end spoke that has the requested tunnel IP address or services the requested data from the host IP address.

The following describes the NHRP resolution process between Spoke A and Spoke B shown in the figure above, where Spoke B is behind a NAT device with pre-NAT address 172.16.2.1 and post-NAT address of 172.18.2.1:

- Data traffic to the 192.168.2.0/24 network from hosts behind Spoke A triggers an NHRP resolution request for Spoke B’s tunnel IP address (10.0.0.12) to be sent through the hub. The hub receives a resolution request and forwards it to Spoke B. Spoke B creates a dynamic spoke-to-spoke tunnel using the source NBMA IP address for Spoke A from the NHRP resolution request and sends an NHRP resolution reply directly to Spoke A. It includes its post-NAT address in the NAT NHRP-extension header.

- Alternatively, traffic to the 192.168.1.0/24 network from hosts behind the NAT device on Spoke B triggers an NHRP resolution request for Spoke A’s tunnel IP address (10.0.0.11). Spoke B adds its own post-NAT IP address in the NHRP NAT-extension in the resolution request. The hub receives a resolution request and forwards it to Spoke A. Spoke A parses the NHRP NAT-extension and builds a tunnel using Spoke B’s post-NAT address and replies directly to Spoke B.

CHAPTER 10

DHCP Tunnels Support

The DHCP Tunnels Support feature provides the capability to configure the node (or spoke) of the generic routing encapsulation (GRE) tunnel interfaces dynamically using DHCP.

In a Dynamic Multipoint VPN (DMVPN) network, each participating spoke must have a unique IP address belonging to the same IP subnet. It is difficult for a network administrator to configure the spoke addresses manually on a large DMVPN network. Hence, DHCP is used to configure the spoke address dynamically on a DMVPN network.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for DHCP Tunnels Support

- The DHCP functionality of address validation is not supported on DMVPN.
- The DHCP IP address is not assigned to the spoke when configured in DMVPN phase 1.
- When you register the spoke to the hub using the `ip nhrp nhs {dynamic nbma nbma-address | FQDN-string} [multicast]` command, the unicast adjacency is only created after the session comes up.
• When using the Dual-hub single-DMVPN topology, Cisco DHCP server automatically changes the unicast flag to broadcast mode. To prevent this automatic change, run the following command on the Cisco DHCP server:

   no ip dhcp auto-broadcast

• When DHCP is configured on an interface, the interface may take more time than usual to shutdown.

## Information About DHCP Tunnels Support

### DHCP Overview

DHCP is based on the Bootstrap Protocol (BOOTP), which provides the framework for passing configuration information to hosts on a TCP/IP network. DHCP adds the capability to automatically allocate reusable network addresses and configuration options to Internet hosts. DHCP consists of two components: a protocol for delivering host-specific configuration parameters from a DHCP server to a host and a mechanism for allocating network addresses to hosts. DHCP is built on a client/server model, where designated DHCP server hosts allocate network addresses and deliver configuration parameters to dynamically configured hosts. See the “DHCP” section of the *Cisco IOS IP Addressing Configuration Guide* for more information.

### DHCP Behavior on a Tunnel Network

DMVPN spoke nodes establish a tunnel with a preconfigured DMVPN next hop server (NHS) (hub node) and exchange IP packets with the NHS before an IP address is configured on the tunnel interface. This allows the DHCP client on the spoke and the DHCP relay agent or the DHCP server on the NHS to send and receive the DHCP messages. A DHCP relay agent is any host that forwards DHCP packets between clients and servers.

When the tunnel on a spoke is in the UP state or becomes active, the spoke establishes a tunnel with the preconfigured hub node. The tunnel formation may include setting up IP Security (IPsec) encryption for the tunnel between the spoke and the hub. DHCP receives the GRE tunnel interface UP notification only after the spoke establishes a tunnel with the hub. The DHCP client configured on the spoke must exchange the DHCP IP packets with the hub (DHCP relay agent or server) to obtain an IP address for the GRE tunnel interface. Therefore, the spoke-to-hub tunnel must be in active state before the GRE tunnel interface UP notification is sent to the DHCP server or the relay agent.

IP packets that are broadcast on the DMVPN spoke reach the DMVPN hub. The spoke broadcasts a DHCPDISCOVER message to the DHCP relay agent on the DMVPN hub, before the spoke has an IP address on the GRE tunnel interface. By using the DHCPDISCOVER message, DHCP unicasts the offer back to the client. The hub cannot send IP packets to the spoke before the hub receives a Next Hop Resolution Protocol (NHRP) registration from the spoke. The DHCP relay agent configured on the DMVPN hub adds mapping information to the DHCP client packets (DHCPDISCOVER and DHCPREQUEST).

Depending on whether the hub is a DHCP server or a DHCP relay agent, the mapping is handled differently.

- If the hub is a DHCP server, the Non-Broadcast Multiple Access (NBMA) address is known and a temporary mapping is created on the hub. The hub then unicasts a reply to the spoke.

- If the hub is a DHCP relay agent, the server behind the relay assigns the address. To preserve the NBMA address of the spoke, the address is attached to the DHCP message. When the reply is received, the NBMA address is fetched from the message. The address is sent to the spoke to create the mapping.
DMVPN Hub as a DHCP Relay Agent

Relay agents are not required for DHCP to work. Relay agents are used only when the DHCP client and server are in different subnets. The relay agent acts as a communication channel between the DHCP client and server. The DHCP--Tunnels Support feature requires the DMVPN hub to act as a relay agent to relay the DHCP messages to the DHCP server.

The DHCP server is located outside the DMVPN network and is accessible from the DMVPN hub nodes through a physical path. The spoke nodes reach the DHCP servers through the hub-to-spoke tunnel (GRE tunnel). The DHCP server is not directly reachable from the DMVPN spoke. The DHCP relay agent on the DMVPN hub helps the DHCP protocol message exchange between the DHCP client on the spoke and the DHCP server.

DMVPN Topologies

Dual-Hub Single-DMVPN Topology

In a dual-hub single-DMVPN topology, both the hubs must be connected to the same DHCP server that has the high availability (HA) support to maintain DMVPN redundancy. If the hubs are connected to different DHCP servers, they must be configured with mutually exclusive IP address pools for address allocation.

Dual-Hub Dual-DMVPN Topology

In the dual-hub dual-DMVPN topology, each hub is connected to a separate DHCP server. The DMVPN hubs (DHCP relay agents) include a client-facing tunnel IP address in the relayed DHCP requests. DHCP requests are used by the DHCP server to allocate an IP address from the correct pool.

Hierarchical DMVPN Topology

In a DMVPN hierarchical topology, there are multiple levels of DMVPN hubs. However, all the tunnel interface IP addresses are allocated from the same IP subnet address. The DHCP client broadcast packets are broadcast to the directly connected hubs. Hence, the DMVPN hubs at all levels must either be DHCP servers or DHCP relay agents. If DHCP servers are used then the servers must synchronize their databases. The DMVPN hubs must be configured as DHCP relay agents to forward the DHCP client packets to the central DHCP servers. If the DHCP server is located at the central hub, all DHCP broadcasts are relayed through the relay agents until they reach the DHCP server.

How to Configure DHCP Tunnels Support

Configuring the DHCP Relay Agent to Unicast DHCP Replies

Perform this task to configure the DHCP relay agent (hub) to unicast DHCP replies.
By default, the DHCP replies are broadcast from the DMVPN hub to the spoke. Therefore a bandwidth burst occurs. The DHCP Tunnels Support feature does not function if the DHCP messages are broadcast. Hence, you must configure the DHCP relay agent to unicast the DHCP messages for the DHCP to be functional in a DMVPN environment.

SUMMARY STEPS

1. enable
2. configure terminal
3. ip dhcp support tunnel unicast
4. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enable privileged EXEC mode.</td>
</tr>
<tr>

<td>Configures a spoke-to-hub tunnel to unicast DHCP replies over the DMVPN network.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# ip dhcp support tunnel unicast</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>

Configuring a DMVPN Spoke to Clear the Broadcast Flag

Perform this task to configure a DMVPN spoke to clear the broadcast flag.

By default, DMVPN spokes set the broadcast flag in the DHCP DISCOVER and REQUEST messages. Therefore the DHCP relay agent is forced to broadcast the DHCP replies back to the spokes, even though the relay agent has sufficient information to unicast DHCP replies. Hence, you must clear the broadcast flag from the DMVPN spoke.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface tunnel *number*
4. `ip dhcp client broadcast-flag clear`
5. `exit`

Dynamic Multipoint VPN Configuration Guide, Cisco IOS Release 15M&T
CHAPTER 11

Sharing IPsec with Tunnel Protection

The Sharing IPsec with Tunnel Protection feature allows sharing an IPsec security association database (SADB) between two or more generic routing encapsulation (GRE) tunnel interfaces when tunnel protection is used. Shared tunnel interfaces have a single underlying cryptographic SADB, cryptographic map, and IPsec profile in the Dynamic Multipoint Virtual Private Network (DMVPN) configuration.

The Sharing IPsec with Tunnel Protection feature is required in some DMVPN configurations. If IPsec SA sessions are not shared within the same IPsec SADB, an IPsec SA may be associated with the wrong IPsec SADB and therefore with the wrong tunnel interface, thereby causing duplicate IPsec security associations (SAs) and tunnel interfaces to flap, which in turn results in network connectivity problems.

Security threats and the cryptographic technologies to help protect against such threats are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Restrictions for Sharing IPsec with Tunnel Protection

• If two or more generic route encapsulation (GRE) tunnel interfaces share the same tunnel source interface and one of the GRE tunnel interface is a multipoint generic route encapsulation (mGRE) tunnel interface, all tunnels with the same tunnel source must use different tunnel keys, the same IPsec profile name, and the shared keyword with the tunnel protection command.

• If there are multiple point-to-point GRE tunnel interfaces that share the same tunnel source interface with the same tunnel destination address, the GRE tunnels must use different tunnel keys, the same IPsec profile name, and the shared keyword in the tunnel protection command.

• Shared tunnel protection is not required and should not be used when several point-to-point GRE tunnels share the same tunnel source but have unique tunnel destination IP addresses.

• The tunnel source command on all tunnel interfaces that use shared tunnel protection must be configured using the interface type and number and not the IP address.

Note

It is recommended that the tunnel source command be configured with an interface than an IP address on all GRE tunnels.

• Different IPsec profile names must be used for shared and unshared tunnels. For example, if “tunnel 1” is configured with the tunnel source loopback1 command, and “tunnel 2” and “tunnel 3” are shared using the tunnel source loopback2 command, use separate IPsec profiles, for example, define IPsec_profile_1 for tunnel 1 and IPsec_profile_2 for tunnels 2 and 3.

• Different IPsec profile must be used for each set of shared tunnels. For example, if tunnels 1 through 5 use tunnel source loopback1 and tunnels 6 through 10 use tunnel source loopback2, use IPsec_profile_1 for tunnels 1 through 5 and ipsec_profile_2 for tunnels 6 through 10.

• There are few exceptions to the above rules:

  • Several mGRE tunnels sharing the same tunnel source interface can be configured without the shared keyword in the tunnel protection command if they use different IPsec profiles with different IPsec transform sets. Different IPsec transform sets disambiguate tunnel setup in this case. Each mGRE tunnel interface must still be configured with a different tunnel key. This applies to several mGRE tunnels and point-to-point GRE tunnels sharing the same tunnel source. This method cannot be used if several point-to-point GRE tunnels share the same tunnel source interface and the same tunnel destination address.

  • Sometimes, it may be desirable not to share an IPsec session between two or more tunnel interfaces using the same tunnel source. For example, in a service provider environment, each DMVPN cloud can represent a different customer. It is desirable to lock the connections from a customer to a tunnel interface and not share or allow IPsec sessions from other customers. In such scenarios, Internet Security Association and Key Management Protocol (ISAKMP) profiles can be used to identify and bind customer connections to an ISAKMP profile and through that to an IPsec profile. This ISAKMP profile limits the IPsec profile to accept only those connections that match the corresponding ISAKMP profile. Separate ISAKMP and IPsec profiles can be obtained for each DMVPN cloud (tunnel interface) without sharing the same IPsec Security Association Database (SADB).
An exception is multiple ISAKMP sessions between same peers, which will not work. For example, in a dual hub dual DMVPN setup, the security associations (SAs) for the second tunnel interface between the hubs will not come up without sharing the SADB. Hence, the hubs cannot register to themselves on both mGRE tunnel interfaces without using the shared keyword in the IPsec profile.

- Shared tunnel protection is not supported for a IPsec virtual tunnel interface (VTI). If there are VTI tunnels sharing the same tunnel source with other GRE or mGRE tunnels that have shared tunnel protection, these VTI tunnels should be configured with different IPsec profiles without using the shared keyword.

Information About Sharing IPsec with Tunnel Protection

Single IPsec SA

In a dual-hub, dual-DMVPN topology, it is possible to have two or more generic route encapsulation (GRE) tunnel sessions (same tunnel source and destination, but different tunnel keys) between the same two endpoints. In this case, it is desirable to use a single IPsec SA to secure both GRE tunnel sessions. It is also not possible to decide under which tunnel interface an IPsec Quick Mode (QM) request must be processed and bound when two tunnel interfaces use the same tunnel source.

The tunnel protection IPsec profile shared command is used to create a single IPsec SADB for all the tunnel interfaces that use the same profile and tunnel source interface. This allows a single IPsec SA to be used for all GRE tunnels (same tunnel source and destination, but different tunnel keys) between the same two endpoints. It also makes IPsec QM processing unambiguous because there is one SADB to process the incoming IPsec QM request for all shared tunnel interfaces as opposed to multiple SADBs, one for each tunnel interface when the tunnel interface is not shared.

The SA of a QM proposal to a tunnel interface is processed by using the shared SADB and crypto map parameters. On the crypto-data plane, the decrypted and GRE decapsulated packets are demultiplexed to the appropriate tunnel interface by the GRE module using a local address, remote address, and optional tunnel key information.

The tunnel source, tunnel destination, and tunnel key (triplet) must be unique for all tunnel interfaces on a device. For a multipoint GRE interfaces where the tunnel destination is not configured, the pair (tunnel source and tunnel key) must be unique. Incoming GRE packets are also matched to point-to-point GRE tunnels first; if there is no match, they are matched to mGRE tunnels.
# How to Share an IPsec Session Between Multiple Tunnels

## Sharing an IPsec SADB Between Multiple Tunnel Interfaces in a DMVPN

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `tunnel source {ip-address | interface-type number}`
5. `tunnel protection IPsec profile name shared`
6. `end`
7. Repeat this task to configure additional spokes.

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

- Enter your password if prompted.

| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** Device# configure terminal |

| **Step 3** interface tunnel *number* | Configures a tunnel interface and enters interface configuration mode. |
| **Example:** Device(config)# interface tunnel 5 |

- The *number* argument specifies the number of the tunnel interface that you want to create or configure. There is no limit on the number of tunnel interfaces that you can create.

| **Step 4** tunnel source {ip-address | interface-type number} | Sets the source IP address or source interface type and number for a tunnel interface. |
| **Example:** Device(config-if)# tunnel source Ethernet 0 |

- When using the `tunnel protection IPsec profile shared` command, the tunnel source must specify an interface, not an IP address.

| **Step 5** tunnel protection IPsec profile *name* shared | Associates a tunnel interface with an IPsec profile. |
| **Example:** |

- The *name* argument specifies the name of the IPsec profile; this value must match the *name* specified in the `crypto IPsec profile *name*` command.
Shared keyword allows IPsec sessions to be shared between multiple tunnel interfaces that are configured with the same tunnel source IP.

Step 6

Example:

```
Device(config-if)# end
```

Returns to privileged EXEC mode.

Step 7

Repeat this task to configure additional spokes.

---

Configuration Examples for Sharing IPsec with Tunnel Protection

Example: Sharing IPsec Sessions Between Multiple Tunnels

The following example shows how to share IPsec sessions between multiple tunnels. This example uses the dual-hub router, dual-DMVPN topology as shown in the figure below and has the following attributes:

- Each hub device is configured with a single multipoint generic routing encapsulation (mGRE) tunnel interface.
- Each hub device is connected to one DMVPN subnet (blue cloud), and the spokes are connected to both DMVPN 1 and DMVPN 2.
- Each spoke device is configured with two mGRE tunnel interfaces.
- One mGRE tunnel interface belongs to DMVPN 1, and the other mGRE tunnel interface belongs to DMVPN 2.
- Each mGRE tunnel interface is configured with the same tunnel source IP address and uses shared tunnel protection between them.
Figure 9: Dual-Hub Router and Dual-DMVPN Topology

Hub 1 Configuration

The Hub 1 and Hub 2 configurations are similar, except that each hub belongs to a different DMVPN.

Hub 1 has the following DMVPN configuration:

- IP subnet: 10.0.0.0/24
- Next Hop Resolution Protocol (NHRP) network ID: 100000
- Tunnel key: 100000
- Dynamic routing protocol: Enhanced Interior Gateway Routing Protocol (EIGRP)

```
hostname Hub1

Interfaces using crypto map vpnprof-head-1:
  Tunnel1
  Tunnel0
All three crypto sessions are shown under each tunnel interface (three entries, twice) in the `show crypto IPsec sa` command output, because both interfaces are mapped to the same IPsec SADB, which has three entries. This duplication of output is expected in this case.

Sharing IPsec with Tunnel Protection

Feature Information for Sharing IPsec with Tunnel Protection

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 19: Feature Information for Sharing IPsec with Tunnel Protection

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sharing IPsec with Tunnel Protection</td>
<td>12.4(15)T</td>
<td>The Sharing IPsec with Tunnel Protection feature allows sharing an IPsec security association database (SADB) between two or more generic routing encapsulation (GRE) tunnel interfaces when tunnel protection is used. Shared tunnel interfaces have a single underlying cryptographic SADB, cryptographic map, and IPsec profile in the Dynamic Multipoint Virtual Private Network (DMVPN) configuration. The Sharing IPsec with Tunnel Protection feature is required in some DMVPN configurations. If IPsec SA sessions are not shared within the same IPsec SADB, an IPsec SA may be associated with the wrong IPsec SADB and therefore with the wrong tunnel interface, thereby causing duplicate IPsec security associations (SAs) and tunnel interfaces to flap, which in turn results in network connectivity problems. The following command was introduced or modified: <code>tunnel protection IPsec profile</code>.</td>
</tr>
</tbody>
</table>

Glossary

**GRE**—generic routing encapsulation. Tunnels that provide a specific pathway across the shared WAN and encapsulate traffic with new packet headers to ensure delivery to specific destinations. The network is private because traffic can enter a tunnel only at an endpoint. Tunnels do not provide true confidentiality (encryption does) but can carry encrypted traffic.

GRE tunneling can also be used to encapsulate non-IP traffic into IP and send it over the Internet or IP network. The Internet Package Exchange (IPX) and AppleTalk protocols are examples of non-IP traffic.

**IKE**—Internet Key Exchange. A hybrid protocol that implements Oakley key exchange and Skeme key exchange inside the ISAKMP framework. Although IKE can be used with other protocols, its initial implementation is with IPsec. IKE provides authentication of the IPsec peers, negotiates IPsec keys, and negotiates IPsec security associations.

**IPsec**—IP security. A framework of open standards developed by the Internet Engineering Task Force (IETF). IPsec provides security for transmission of sensitive information over unprotected networks such as the Internet. IPsec acts at the network layer, protecting and authenticating IP packets between participating IPsec peers, such as Cisco routers.

**ISAKMP**—Internet Security Association Key Management Protocol. A protocol framework that defines payload formats, the mechanics of implementing a key exchange protocol, and the negotiation of a security association.

**NHRP**—Next Hop Resolution Protocol. A protocol that routers, access servers, and hosts can use to discover the addresses of other routers and hosts connected to an NBMA network. The Cisco implementation of NHRP supports the IETF draft version 11 of NBMA NHRP.

The Cisco implementation of NHRP supports IP Version 4, Internet Packet Exchange (IPX) network layers, and, at the link layer, ATM, Ethernet, SMDS, and multipoint tunnel networks. Although NHRP is available on Ethernet, NHRP need not be implemented over Ethernet media because Ethernet is capable of broadcasting. Ethernet support is unnecessary (and not provided) for IPX.
SA—security association. Describes how two or more entities use security services to communicate securely. For example, an IPsec SA defines the encryption algorithm (if used), the authentication algorithm, and the shared session key to be used during the IPsec connection.

Both IPsec and IKE require and use SAs to identify the parameters of their connections. IKE can negotiate and establish its own SA. The IPsec SA is established either by IKE or by manual user configuration.

transform—List of operations performed on a data flow to provide data authentication, data confidentiality, and data compression. An example of a transform is the ESP with the 256-bit AES encryption algorithm and the AH protocol with the HMAC-SHA authentication algorithm.

tunnel—In the context of this module, a secure communication path between two peers, such as two routers. It does not refer to using IPsec in tunnel mode.

VPN—Virtual Private Network. A framework that consists of multiple peers transmitting private data securely to one another over an otherwise public infrastructure. In this framework, inbound and outbound network traffic is protected using protocols that tunnel and encrypt all data. This framework permits networks to extend beyond their local topology, while remote users are provided with the appearance and functionality of a direct network connection.
CHAPTER 12

DMVPN NHRP Event Publisher

The DMVPN: NHRP Event Publisher feature allows you to publish Next Hop Resolution Protocol (NHRP) specific events to the Event Detector (ED). NHRP publishes NHRP events with data to the NHRP-ED handler. The DMVPN: NHRP Event Publisher feature enhances Dynamic Multipoint VPN (DMVPN) with the capability to control the building of dynamic spoke-to-spoke tunnels. This feature also optimizes the conditions under which spokes build dynamic tunnels with each other. It also integrates Embedded Event Manager (EEM) with NHRP and leverages EEM scripts to influence the behavior of NHRP. In this feature, the only event that is supported is the capability to build dynamic spoke-to-spoke tunnels.

- Finding Feature Information, on page 175
- Prerequisites for DMVPN NHRP Event Publisher, on page 175
- Restrictions for DMVPN NHRP Event Publisher, on page 176
- Information About DMVPN NHRP Event Publisher, on page 176
- How to Configure DMVPN NHRP Event Publisher, on page 178
- Configuration Examples for DMVPN NHRP Event Publisher, on page 180
- Additional References, on page 180
- Feature Information for DMVPN NHRP Event Publisher, on page 181

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for DMVPN NHRP Event Publisher

You need to use the `nhrpevent-publishermax-event-timeout` command to turn on the DMVPN: NHRP Event Publisher feature. For information on DMVPN configuration, see Configuring Dynamic Multipoint VPN. For information on NHRP configuration, see Configuring NHRP.
Restrictions for DMVPN NHRP Event Publisher

You cannot manually configure spoke-to-spoke tunneling with this feature. You can only build dynamic spoke-to-spoke tunnels.

Information About DMVPN NHRP Event Publisher

Dynamic Spoke-to-Spoke Tunnels

Spoke-to-spoke tunnels are designed to be dynamic, in that they are created only when there is data traffic that uses the tunnel; and they are removed when there is no data traffic using the tunnel.

In addition to NHRP registration of next hop clients (NHCs) with next hop servers (NHSs), NHRP provides the capability for NHCs (spokes) to find a shortcut path over the infrastructure of the network (IP network, Switched Multimegabit Data Service [SMDS]) or to build a shortcut switched virtual circuit (SVC) over a switched infrastructure network (Frame Relay and ATM) directly to another NHC (spoke), bypassing hops through the NHSs (hubs). This capability allows the building of very large NHRP-NBMA networks. In this way, the bandwidth and CPU limitations of the hub do not limit the overall bandwidth of the NHRP-NBMA network. This capability effectively creates a full-mesh-capable network without having to discover all possible connections beforehand. This type of network is called a dynamic-mesh network, where there is a base hub-and-spoke network of NHCs and NHSs. The network of NHCs and NHSs is used for transporting NHRP, dynamic routing protocol information, data traffic, and dynamic direct spoke-to-spoke links. The spoke-to-spoke links are built when there is data traffic to use the link, and the spoke-to-spoke links are torn down when the data traffic stops.

The dynamic-mesh network allows individual spoke routers to directly connect to anywhere in the NBMA network, even though they are capable of connecting only to a limited number at the same time. This functionality allows each spoke in the network to participate in the whole network up to its capabilities without limiting another spoke from participating up to its capability. If a full-mesh network were to be built, all spokes would have to be sized to handle all possible tunnels at the same time.

For example, in a network of 1000 nodes, a full-mesh spoke would need to be large and powerful because it must always support 999 tunnels (one to every other node). In a dynamic-mesh network, a spoke needs to support only a limited number of tunnels to its NHSs (hubs) plus any currently active tunnels to other spokes. Also, if a spoke cannot build more spoke-to-spoke tunnels, it will send its data traffic by way of the spoke-hub-spoke path. This design ensures that connectivity is always preserved, even when the preferred single hop path is not available.

DMVPN NHRP Event Publisher

Currently DMVPN establishes a direct spoke-to-spoke tunnel with shortcut switching enabled on the spoke and NHRP redirect on the hub, without performing any additional checks before establishing traffic on the tunnel. This direct spoke-to-spoke tunnel may not be the best path as there could be other alternative best paths available for this traffic.

The DMVPN NHRP Event Publisher feature performs additional checks before establishing the spoke-to-spoke tunnel and sending traffic on the tunnel. This feature helps the administrator to decide about the local policies and attributes while building the tunnel. This prevents known bad network connections based on local history.
or centralized information. It also reduces the administrative overhead by monitoring available resources and selecting the best options.

**Embedded Event Manager**

Embedded Event Manager (EEM) is a powerful and flexible subsystem in Cisco IOS software that provides real-time network event detection and onboard automation. Using EEM, you can adapt the behavior of your network devices to align with your business needs. EEM is available on a wide range of Cisco platforms, and customers can benefit from the capabilities of EEM without upgrading to a new version of IOS.

EEM supports over 20 event detectors that are integrated with different Cisco IOS components to trigger actions in response to network events. Business logic can be injected into various networking operations using EEM policies. These policies are programmed using either a simple CLI-based interface or a scripting language called Tool Command Language (TCL). EEM harnesses the significant intelligence within Cisco devices to enable creative solutions including automated troubleshooting, automatic fault detection and troubleshooting, and device configuration automation.

EEM is implemented through the creation of policies. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs. There are two types of EEM policies: an applet and a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in TCL. When an EEM policy is registered with the EEM, the software examines the policy and registers it to be run when the specified event occurs. Policies can be unregistered or suspended.

The following tasks are required to create an EEM policy:

- Selecting the event for which the policy is run.
- Defining the Event Detector (ED) options associated with logging and responding to the event.
- Defining the environment variables, if required.
- Choosing the actions to be performed when the event occurs.

**NHRP Event Publishing Flow**

When a local spoke sends a resolution request to a remote spoke, the remote spoke triggers the EEM. The EEM decides whether to connect to or reject the request. If the EEM agrees to connect, the remote spoke builds the tunnel and sends the resolution reply through the tunnel.

Making NHRP be the ED helps define your own events, and the application can create and publish these events. On the remote spoke, the TCL scripts can subscribe to these events. The published events are sent to the subscribed TCL scripts. NHRP events are published to the NHRP-ED handler. The event information is copied to the XML buffer, and the NHRP-ED publishes this buffer to the EEM server. The event subscriber (TCL scripts from the remote spoke) receives and registers the event request so that the remote spoke is notified when the event is published. The TCL script replies to NHRP with the `ipnhrpconnectreqid` or `ipnhrprejectreqid` command. The `ipnhrpconnectreqid` command enables the spoke to initiate a resolution reply for the received request to build a shortcut tunnel. The `ipnhrprejectreqid` command prevents the spoke from initiating the resolution reply for the received request.

The `ipnhrpconnectreqid` command invokes connect registry callback as an action to trigger the resolution reply. The remote spoke either builds the spoke-to-spoke tunnel and sends the resolution reply within the tunnel or sends the resolution reply with the policy attributes through the hub. If the resolution reply is sent through the hub, the spoke receiving the resolution reply builds the spoke-to-spoke tunnel.
When the TCL script responds with the `ipnhrprejectreqid` command, the remote spoke does not build the spoke-to-spoke tunnel. It sends the NHRP resolution NAK message with a reject time value and subnet mask to the local spoke through the hub.

The following sequence lists the NHRP event flow:
1. An NHRP event registers with the NHRP-ED.
2. The application creates an event definition.
3. A TCL script subscribes for NHRP event receipt asking that the script’s callback routine be invoked when the event is published.
4. The NHRP ED detects an event and contacts the EEM at the remote spoke.
5. The EEM schedules the event processing calling the application’s callback handler routine.
6. The TCL script returns the callback routine.

## How to Configure DMVPN NHRP Event Publisher

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `tunnel mode gre multipoint`
5. `tunnel key key-number`
6. `ip nhrp network-id number`
7. `ip nhrp attribute set isp-name value`
8. `nhrp event timer`
9. `end`
10. `show ipv6 nhrp attribute`
11. `show ip nhrp attribute`
12. `show dmvpn detail`
13. `debug nhrp attribute`
14. `exit`

### DETAILED STEPS

<table>

| **Step 3** interface type number  
Example:  
Router(config)# interface tunnel 100 | Enables a GRE tunnel to be used in multipoint NBMA mode. |
| **Step 4** tunnel mode gre multipoint  
Example:  
Router(config-if)# tunnel mode gre multipoint | (Optional) Sets the tunnel ID key. |
| **Step 5** tunnel key key-number  
Example:  
Router(config-if)# tunnel key 3 | Enables NHRP on the interface. |
| **Step 6** ip nhrp network-id number  
Example:  
Router(config-if)# ip nhrp network-id 1 | Sets the local policy attributes that are carried in NHRP resolution requests. |
| **Step 7** ip nhrp attribute set isp-name value  
Example:  
Router(config-if)# ip nhrp attribute set isp-name 200 | Publishes an NHRP event with the attributes to EEM. |
| **Step 8** nhrp event timer  
Example:  
Router(config-if)# nhrp event timer | Exits interface configuration mode and returns to privileged EXEC mode. |
| **Step 9** end  
Example:  
Router(config-if)# end | Displays the IPv6 NHRP attributes configured on the spoke. |
| **Step 10** show ipv6 nhrp attribute  
Example:  
Router# show ipv6 nhrp attribute | Displays the IP NHRP attributes configured on the spoke. |

### What to do next

### Configuration Examples for DMVPN NHRP Event Publisher

#### Example Configuring DMVPN NHRP Event Publisher

The following is a sample configuration of the DMVPN: NHRP Event Publisher feature:

```plaintext
interface tunnel 100
tunnel mode gre multipoint
tunnel key 3
ip nhrp network-id 1
ip nhrp attribute set isp-name 200
nhrp event timer
end
show ip nhrp attribute
show dmvpn detail
dump nhrp attribute
```

---

Feature Information for DMVPN NHRP Event Publisher

The following table lists the release history for this feature.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note

The following table lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 20: Feature Information for DMVPN: NHRP Event Publisher

<table>

CHAPTER 13

Configuring TrustSec DMVPN Inline Tagging Support

The TrustSec DMVPN Inline Tagging Support feature enables IPsec to carry the Cisco TrustSec (CTS) Security Group Tag (SGT) between IPsec peers.

• Finding Feature Information, on page 183
• Prerequisites for Configuring TrustSec DMVPN Inline Tagging Support, on page 183
• Restrictions for Configuring TrustSec DMVPN Inline Tagging Support, on page 184
• Information About Configuring TrustSec DMVPN Inline Tagging Support, on page 184
• How to Configure TrustSec DMVPN Inline Tagging Support, on page 187

• Feature Information for TrustSec DMVPN Inline Tagging Support, on page 195

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring TrustSec DMVPN Inline Tagging Support

Internet Key Exchange Version 2 (IKEv2) and IPsec must be configured on the router. For more information, see the “Configuring Internet Key Exchange Version 2 and FlexVPN Site-to-Site” and “Configuring Security for VPNs with IPsec” modules.
Restrictions for Configuring TrustSec DMVPN Inline Tagging Support

The TrustSec DMVPN Inline Tagging Support feature via IKEv2 supports the following:

- Dynamic Virtual Tunnel Interface (dVTI)
- GRE with Tunnel Protection
- Site-to-site VPNs
- Static crypto maps
- Static Virtual Tunnel Interface (sVTI)

The TrustSec DMVPN Inline Tagging Support feature does not support the following:

- Cisco AnyConnect
- Cisco VPNClient
- DMVPN with IKEv1
- EasyVPN
- FlexVPN
- GetVPN
- IKEv1 IPsec methods
- SSLVPN

`crypto ikev2 cts sgt` and `cts sgt inline` commands on tunnel are two different features. Do not configure these two features together as it causes the packets getting tagged twice.

`cts sgt inline` command does not rely on crypto or IKEv2. It can be configured statically or by NHRP. `cts sgt inline` command works with DMVPN IPSEC tunnel and also in transport mode.

The TrustSec DMVPN Inline Tagging Support feature via the `cts sgt inline` command is supported on all combinations of DMVPN (IKEv1, IKEv2, non-crypto, crypto accelerators such as ISM-VPN, point-to-point, multipoint) except when running MPLS (as an MPLS cloud extension or as MPLS L3VPN) over DMVPN.

Information About Configuring TrustSec DMVPN Inline Tagging Support

Cisco TrustSec

The Cisco TrustSec (CTS) architecture helps to build secure networks by establishing a domain of trusted network devices by combining identity, trust, and policy to protect user transactions and enforce role-based policies. CTS uses the user and the device identification information acquired during the authentication phase.
to classify packets as they enter the network. CTS maintains a classification of each packet by tagging packets on ingress to the CTS network so that they can be properly identified for applying security and other policy criteria along the data path. The packets or frames are tagged using the Security Group Tag (SGT), which allows network intermediaries such as switches and firewalls, to enforce an access control policy based on the classification.

The IPsec Inline Tagging for TrustSec feature is used to propagate the SGT to other network devices.

---

### SGT and IPsec

IPsec uses the IKE protocol for negotiating algorithms, keys, and capabilities. IKEv2 is used to negotiate and inform IPsec about the SGT capability. Once the peers acknowledge the SGT tagging capability, an SGT tag number (a 16-bit) is added as the SGT Cisco Meta Data (CMD) payload into IPsec and sent to the receiving peer.

The access layer device authenticates the incoming packets. The access layer device receives an SGT from the authentication server and assigns the SGT along with an IP address to the incoming packets. In other words, an IP address is bound to an SGT. This IP address/SGT binding is propagated to upstream devices to enforce SGT-based policy and inline tagging.

If IKEv2 is configured to negotiate the SGT capability in the initiator, the initiator proposes the SGT capability information in the SA_INIT request. If IKEv2 is configured to negotiate the SGT capability in the responder, the responder acknowledges the SGT capability in the responder, and the initiator and the responder inform IPsec to use inline tagging for all packets to the peer.

During egress, IPsec adds the SGT capability and prefixes to the IPsec payload if the peer supports inline tagging; otherwise the packet is not tagged.

During ingress, IPsec inspects the packet for the SGT capability. If a tag is available, IPsec extracts the tag information and passes the information to the device only if inline tagging is negotiated. If there is no tag, IPsec processes the packet as a normal packet.

The tables below describe how IPsec behaves during egress and ingress.

#### Table 21: IPsec Behavior on the Egress Path

<table>
<thead>
<tr>
<th>Inline Tagging Negotiated</th>

<th>Inline Tagging Negotiated</th>
<th>IPsec Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>The SGT CMD in the packet is processed.</td>
</tr>
</tbody>
</table>
### SGT on the IKEv2 Initiator and Responder

To enable SGT on an IKEv2 session, the SGT capability support must be sent to the peers using the `crypto ikev2 cts` command. SGT is a Cisco proprietary capability; hence, it is sent as a Vendor ID (VID) payload in the SA_INIT exchange.

The table below explains the scenarios when SGT capability is configured on the initiator and the responder:

**Table 23: SGT Capability on IKEv2 Initiator and Responder**

<table>
<thead>
<tr>
<th>SGT Enabled on Initiator</th>
<th>SGT Enabled on Responder</th>
<th>What Happens . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>The VID is exchanged between the initiator and the responder, and IPsec SA is enabled with the SGT inline tagging capability.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>The initiator proposes the VID, but the responder ignores the VID. IPsec SA is not enabled with the SGT inline tagging capability.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>The initiator does not propose the VID, and the responder does not send the VID payload. IPsec SA is not enabled with the SGT inline tagging capability.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>The initiator does not propose the VID, and responder also does not send the VID payload. IPsec SA is not enabled with the SGT inline tagging capability.</td>
</tr>
</tbody>
</table>

### Handling Fragmentation

Fragmentation is handled in the following two ways:

- **Fragmentation before IPsec**—If IPsec receives fragmented packets, each fragment is tagged.
- **Fragmentation after IPsec**—If IPsec packets are fragmented after encryption, the first fragment will be tagged.
How to Configure TrustSec DMVPN Inline Tagging Support

Enabling IPsec Inline Tagging

SUMMARY STEPS

1. enable
2. configure terminal
3. interface tunnel tunnel id
4. cts sgt inline
5. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Enters configured EXEC mode.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong> interface tunnel tunnel id</td>
<td>Specifies a tunnel interface number, and enters interface configuration mode.</td>

</tr>
<tr>
<td><strong>Step 4</strong> cts sgt inline</td>
<td>Enables TrustSec on DMVPN. This command is valid for generic routing encapsulation (GRE) and to tunnel interfaces modes only.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)# cts sgt inline</td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# exit</td>
</tr>
</tbody>
</table>

Monitoring and Verifying TrustSec DMVPN Inline Tagging Support

To monitor and verify the TrustSec DMVPN Inline Tagging Support configuration, perform the following steps.

SUMMARY STEPS

1. enable
2. show dmvpn
3. `show ip nhrp nhs detail`
4. `show tunnel endpoints`
5. `show adjacency interface-type interface-number detail`

**DETAILED STEPS**

**Step 1** enable

**Example:**

```
Device> enable
```

Enables privileged EXEC mode.

**Step 2** `show dmvpn`

**Example:**

```
Device# show dmvpn
```

Legend: Attrb --> S - Static, D - Dynamic, I - Incomplete
       N - NATed, L - Local, X - No Socket
       T1 - Route Installed, T2 - Nexthop-override
       C - CTS Capable
# Ent --> Number of NHRP entries with same NBMA peer
NHS Status: E --> Expecting Replies, R --> Responding, W --> Waiting
UpDn Time --> Up or Down Time for a Tunnel

Interface: Tunnel0, IPv4 NHRP Details
Type:Spoke, NHRP Peers:1,

<table>
<thead>
<tr>
<th># Ent</th>
<th>Peer NBMA Addr</th>
<th>Peer Tunnel Add</th>
<th>State</th>

<td>1</td>
<td>1.1.1.99</td>
<td>10.1.1.99</td>
<td>UP</td>
<td>00:00:01</td>
<td>SC</td>
</tr>
</tbody>
</table>

Use this command to display Dynamic Multipoint VPN (DMVPN)-specific session information.

**Step 3** `show ip nhrp nhs detail`

**Example:**

```
Device# show ip nhrp nhs detail
```

Legend: E=Expecting replies, R=Responding, W=Waiting
Tunnel0:
10.1.1.99  RE NBMA Address: 1.1.1.99 priority = 0 cluster = 0 req-sent 44 req-failed 0 repl-recv 43 (00:01:37 ago)
TrustSec Enabled

Use this command to display Next Hop Resolution Protocol (NHRP) next hop server (NHS) information.

**Step 4** `show tunnel endpoints`

**Example:**

```
Device# show tunnel endpoints
```

Tunnel0 running in multi-GRE/IP mode

Endpoint transport 1.1.1.99 Refcount 3 Base 0xF3FB79B4 Create Time 00:03:15
overlay 10.1.1.99 Refcount 2 Parent 0xF3FB79B4 Create Time 00:03:15
Tunnel Subblocks:
Use this command to display the contents of the tunnel endpoint database that is used for tunnel endpoint address resolution, when running a tunnel in multipoint generic routing encapsulation (mGRE) mode.

**Step 5**

*show adjacency interface-type interface-number detail*

**Example:**

```
Device# show adjacency tunnel0 detail
```

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Interface</th>
<th>Address</th>

</tr>
<tr>
<td></td>
<td></td>
<td>Tun endpt</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Next chain element:</td>
</tr>
</tbody>
</table>

Use this command to display information about the protocol.

---

**Enabling IPsec Inline Tagging on IKEv2 Networks**

Configuring the `cts sgt inline` and `crypto ikev2 cts sgt` commands results in the packets getting tagged twice - once each by each command.

**Before you begin**

IKEv2 and IPsec must be configured.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto ikev2 cts sgt
4. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>· Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>crypto ikev2 cts sgt</td>
<td>Device(config)# crypto ikev2 cts sgt</td>
</tr>
<tr>
<td>4</td>
<td>exit</td>
<td>Device(config)# exit</td>
</tr>
</tbody>
</table>

**Purpose**

- Enables TrustSec on DMVPN on IKEv2 networks. This command is valid for generic routing encapsulation (GRE) and to tunnel interfaces modes only.
- Exits global configuration mode.

---

### Configuration Examples for TrustSec DMVPN Inline Tagging Support

**Example: Enabling IPsec Inline Tagging on IKEv2 Networks**

**Static VTI Initiator Configuration**

The following example shows how to enable IPsec inline tagging on a static VTI initiator. You can use this configuration for configuring crypto maps and VTIs.

Feature Information for TrustSec DMVPN Inline Tagging Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Spoke-to-Spoke NHRP Summary Maps

Spoke-to-Spoke NHRP Summary Maps

In DMVPN phase 3, route summarization is performed at a hub. The hub is the next-hop for any spoke to reach any network behind a spoke. On receiving a packet, the hub sends a redirect message to a local spoke and indicates the local spoke to send Next Hop Resolution Protocol (NHRP) resolution request for the destination network. The resolution request is forwarded by the hub to a remote spoke with the destination LAN network. The remote spoke responds to the resolution request and initiates a tunnel with the local spoke.

When a spoke answers an NHRP resolution request for a local host, it uses the explicit IP address network and subnet mask from the Routing Information Base (RIB) in response. Multiple networks behind a local spoke require similar NHRP messages for a host behind remote spoke to exchange packets with the hosts in these networks. It is difficult to handle NHRP messages for a huge number of spokes and large networks behind each spoke.
The number of NHRP messages between spokes can be limited when the first NHRP resolution reply provides information about the network behind a local spoke instead of a specific network. The spoke-to-spoke NHRP summary map uses the configured IP address network and subnet mask in the NHRP resolution response instead of the IP address network and subnet mask from RIB. If RIB has more number of IP address networks (lesser subnet mask length) than the configured IP address network and subnet mask, the spoke still uses the configured IP address network and subnet mask for NHRP resolution response thereby summarizing and reducing the NHRP resolution traffic on the network. Use the `ip nhrp summary-map` command to configure NHRP summary map on a spoke.

**Note**
In DMVPN, it is recommended to configure a Rendezvous Point (RP) at or behind the hub. If there is an IP multicast source behind a spoke, the `ip pim spt-threshold infinity` command must be configured on spokes to avoid multicast traffic going through spoke-to-spoke tunnels.

**How Spoke-to-Spoke NHRP Summary Maps Works**

On receiving the resolution request, the spoke

1. Looks into the RIB for the IP address and subnet mask and returns.
2. Checks the IP address and subnet mask against the configured NHRP summary map and verifies if the destination IP address is covered.
3. Sends the summary map in the NHRP resolution reply to the remote spoke and NHRP on the remote spoke adds the IP address and subnet mask with the next-hop of the local spoke to the RIB.

The entire network behind the local spoke is identified to the remote spoke with one NHRP resolution request.

The following figure shows the working of spoke-to-spoke NHRP summary maps.

**Figure 10: Spoke-to-Spoke NHRP Summary Maps**

A local spoke with the address space 192.0.0.0/19 on its local LAN has all 32-24 RIB entries – 192.0.0.0/24, …, 192.0.31.0/24. When a routing protocol like EIGRP is used to advertise this local address space, the routing protocol is configured to summarize the networks to 192.0.0.0/19 and advertise that to the hub. The hub summarizes this further, to 192.0.0.0/16, when it advertises it to the other spokes. The other spokes starts with only a 192.0.0.0/16 routing table entry with the next-hop of the hub in the RIB.
If a remote host communicates with 192.0.12.1, the local spoke receives the NHRP resolution request for 192.0.12.1/32. It looks into the RIB and returns 192.0.12.0/24 in NHRP resolution reply.

If the local spoke is configured with NHRP summary map for eg. "ip nhrp summary-map 192.0.0.0/19", the local spoke upon receiving the resolution request for 192.0.12.1 checks the RIB which return 192.0.12.0/24. The local spoke then checks for summary map configuration 192.0.0.0/19 and verifies if the destination 192.0.12.1/32 is covered and returns 192.0.0.0/19 in NHRP resolution reply.

NHRP Summary Map Support for IPv6 Overlay

Spoke-to-spoke NHRP summary maps feature is supported on IPv6 and is configured using `ipv6 nhrp summary-map` command.

How to Configure Spoke-to-Spoke NHRP Summary Maps

Configuring Spoke-to-Spoke NHRP Summary Maps on Spoke

Note
The following task can be performed to configure the spoke device.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `ip address ip-address mask  secondary ip-address mask`
5. `ip nhrp authentication string`
6. `ip nhrp summary-map {ip-address | mask}`
7. `ip nhrp network-id number`
9. `ip nhrp shortcut`
10. `tunnel source {ip-address | type number}`
11. `tunnel mode gre multipoint`
12. `tunnel key key-number`
13. `end`

DETAILED STEPS

<table>

<td>------------------</td>
</tr>
</tbody>
</table>
| 2    | `configure terminal`  
Example:  
Device# configure terminal | Enters global configuration mode. |
| 3    | `interface tunnel number`  
Example:  
Device(config)# interface tunnel 5 | Configures a tunnel interface and enters interface configuration mode.  
- `number`—Specifies the number of the tunnel interface that you want to create or configure. There is no limit on the number of tunnel interfaces you can create. |
| 4    | `ip address ip-address mask  secondary ip-address mask`  
Example:  
Device(config-if)# ip address 10.0.0.2 255.255.255.0 | Sets a primary or secondary IP address for the tunnel interface.  
**Note**  
All hubs and spokes that are in the same DMVPN network must be addressed in the same IP subnet. |
| 5    | `ip nhrp authentication string`  
Example:  
Device(config-if)# ip nhrp authentication donttell | Configures an authentication string for an interface using NHRP. |
| 6    | `ip nhrp summary-map {ip-address | mask}`  
Example:  
Device(config-if)# ip nhrp summary-map 10.0.0.0/24 | Summarizes and reduces the NHRP resolution traffic on the network. |
| 7    | `ip nhrp network-id number`  
Example:  
Device(config-if)# ip nhrp network-id 99 | Enables NHRP on an interface.  
- `number`—Specifies a globally unique 32-bit network identifier from a nonbroadcast multiaccess (NBMA) network. |
| 8    | `ip nhrp nhs [hub-tunnel-ip-address] nbma [hub-wan--ip] nbma multicast`  
Example:  
Device(config-if)# ip nhrp nhs 10.0.0.1 nbma 172.17.0.1 multicast | Configures the hub router as the NHRP next-hop server. |
| 9    | `ip nhrp shortcut`  
Example:  
Device(config-if)# ip nhrp shortcut | Enables NHRP shortcut switching. |
### Dynamic Multipoint VPN Configuration Guide, Cisco IOS Release 15M&T

<tr>
<td>Device(config-if)# tunnel source Gigabitethernet 0/0/0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> tunnel mode gre multipoint</td>
<td>Sets the encapsulation mode to Multiple Generic Routing Encapsulation (mGRE) for the tunnel interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# tunnel mode gre multipoint</td>
<td>• Use this command if data traffic can use dynamic spoke-to-spoke traffic.</td>
</tr>
<tr>
<td><strong>Step 12</strong> tunnel key key-number</td>
<td>(Optional) Enables an ID key for a tunnel interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# tunnel key 100000</td>
<td>• key-number—Specifies a number to identify a tunnel key. This must be set to the same value on all hubs and spokes that are in the same DMVPN network.</td>
</tr>
<tr>
<td><strong>Step 13</strong> end</td>
<td>Exits interface configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Verifying Spoke-to-Spoke NHRP Summary Maps

**SUMMARY STEPS**

1. enable
2. show ip nhrp

**DETAILED STEPS**

**Step 1** enable

Example:

Device> enable

Enables privileged EXEC mode.

• Enter your password if prompted.

**Step 2** show ip nhrp

Example:

The following is an example of show command output on spoke.

Device# show ip nhrp
Troubleshooting Spoke-to-Spoke NHRP Summary Maps

SUMMARY STEPS

1. debug dmvpn all nhrp

DETAILED STEPS

ddebug dmvpn all nhrp

Checks the IP address and subnet mask received by the spoke for a resolution request.

Example:

Device# debug dmvpn all nhrp

NHRP-RT: Attempting to create instance PDB for vrf global(0x0) (0x0)
NHRP-CACHE: Tunnel0: Cache add for target 67.0.0.1/32 vrf global(0x0) label none next-hop 67.0.0.1
NHRP-CACHE: Tunnel0: Cache add for target 67.0.0.0/24 vrf global(0x0) label none next-hop 15.0.0.30 80.0.0.1
NHRP-CACHE: Inserted subblock node(2 now) for cache: Target 67.0.0.0/24 nhop 15.0.0.30
NHRP-CACHE: Converted internal dynamic cache entry for 67.0.0.0/24 interface Tunnel0 vrf global(0x0) to external
NHRP-RT: Adding route entry for 67.0.0.0/24 (Tunnel0 vrf:global(0x0)) to RIB
NHRP-RT: Route addition to RIB Successful
NHRP-RT: Route watch started for 67.0.0.0/23
NHRP-CACHE: Updating label on Tunnel0 for 15.0.0.30 vrf global(0x0), old none new none nhop 15.0.0.30
NHRP-CACHE: Tunnel0: Cache update for target 15.0.0.30/32 vrf global(0x0) label none next-hop 15.0.0.30 80.0.0.1
NHRP-CACHE: Deleting incomplete entry for 67.0.0.1/32 interface Tunnel0 vrf global(0x0)
NHRP-CACHE: Still other cache entries with same overlay nhop 67.0.0.1
NHRP-RT: Received route watch notification for 67.0.0.0/24
NHRP-RT: Received route watch notification for 67.0.0.0/24
NHRP-RT: (0x0):NHRP RIB entry for 67.0.0.0/24 is unreachable

## Configuration Examples for Spoke-to-Spoke NHRP Summary Maps

### Example: Spoke-to-Spoke NHRP Summary Maps

The following is an example of configuring DMVPN phase 3 on hub for summary map.

```plaintext
interface Tunnel0
  ip address 15.0.0.1 255.255.255.0
  no ip redirects
  no ip split-horizon eigrp 2
  ip nhrp authentication cisco123
  ip nhrp network-id 23
  ip nhrp redirect
  ip summary-address eigrp 2 190.0.0.0 255.255.252.0
  ip summary-address eigrp 2 201.0.0.0 255.255.252.0
  tunnel source GigabitEthernet1/0/0
  tunnel mode gre multipoint
  tunnel key 6
end
```

The following example shows how to configure spoke-to-spoke NHRP summary maps on spoke 1.

```plaintext
interface Tunnel0
  vrf forwarding vrf1
  ip address 15.0.0.10 255.255.255.0
  ip nhrp authentication cisco123
  ip nhrp summary-map 190.0.0.0/22
  ip nhrp network-id 5
  ip nhrp nh 15.0.0.1 nbma 123.0.0.1 multicast
  ip nhrp shortcut
  tunnel source GigabitEthernet0/1/0
  tunnel mode gre multipoint
  tunnel key 6
end
```

The following example shows how to configure spoke-to-spoke NHRP summary maps on spoke 2.

```plaintext
interface Tunnel0
  ip address 15.0.0.20 255.255.255.0
  ip nhrp authentication cisco123
  ip nhrp summary-map 201.0.0.0/22
```
ip nhrp network-id 5
ip nhrp nhs 15.0.0.1 nbma 123.0.0.1 multicast
ip nhrp shortcut
tunnel source GigabitEthernet0/0/0
tunnel mode gre multipoint
tunnel key 6
end

The following is a sample output of the `show ip nhrp` command on the hub.

Device# show ip nhrp
15.0.0.10/32 via 15.0.0.10
  Tunnel0 created 00:22:26, expire 00:07:35
  Type: dynamic, Flags: registered used nhop
  NBMA address: 41.0.0.1
15.0.0.20/32 via 15.0.0.20
  Tunnel0 created 00:13:43, expire 00:09:36
  Type: dynamic, Flags: registered used nhop
  NBMA address: 42.0.0.1

The following is a sample output of the `show ip nhrp` command on spoke 1.

Device# show ip nhrp
15.0.0.1/32 (vrf1) via 15.0.0.1
  Tunnel3 created 09:09:00, never expire
  Type: static, Flags: used
  NBMA address: 123.0.0.1
15.0.0.20/32 (vrf1) via 15.0.0.20
  Tunnel3 created 00:00:54, expire 00:04:05
  Type: dynamic, Flags: router nhop rib
  NBMA address: 42.0.0.1
190.0.0.0/22 (vrf1) via 15.0.0.10
  Tunnel0 created 00:00:04, never expire
  Type: static, Flags: local
  NBMA address: 121.0.0.1
  (no-socket)
201.0.0.0/22 (vrf1) via 15.0.0.20
  Tunnel3 created 00:00:54, expire 00:04:05
  Type: dynamic, Flags: router rib nho
  NBMA address: 42.0.0.1

The following is a sample output of the `show ip nhrp` command on spoke 2.

Device# show ip nhrp
15.0.0.1/32 via 15.0.0.1
  Tunnel0 created 09:08:16, never expire
  Type: static, Flags: used
  NBMA address: 123.0.0.1
15.0.0.10/32 via 15.0.0.10
  Tunnel0 created 00:00:04, expire 01:59:55
  Type: dynamic, Flags: router nhop rib
  NBMA address: 121.0.0.1
190.0.0.0/22 via 15.0.0.10
  Tunnel0 created 00:00:04, expire 01:59:55
  Type: dynamic, Flags: router rib nho
  NBMA address: 121.0.0.1
