Dynamic Multipoint VPN

The Dynamic Multipoint VPN (DMVPN) feature allows users to better scale large and small IP Security (IPsec) Virtual Private Networks (VPNs) by combining generic routing encapsulation (GRE) tunnels, IPsec encryption, and Next Hop Resolution Protocol (NHRP).

Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for Dynamic Multipoint VPN (DMVPN)

- Before a multipoint GRE (mGRE) and IPsec tunnel can be established, you must define an Internet Key Exchange (IKE) policy by using the `crypto isakmp policy` command.

- For the NAT-Transparency Aware enhancement to work, you must use IPsec transport mode on the transform set. Also, even though NAT-Transparency can support two peers (IKE and IPsec) being translated to the same IP address (using the User Datagram Protocol [UDP] ports to differentiate them [that is, Peer Address Translation (PAT)]), this functionality is not supported for DMVPN. All DMVPN spokes must have a unique IP address after they have been NAT translated. They can have the same IP address before they are NAT translated.

- To enable 2547oDMPVN--Traffic Segmentation Within DMVPN you must configure multiprotocol label switching (MPLS) by using the `mpls ip` command.

Restrictions for Dynamic Multipoint VPN (DMVPN)

- If you use the Dynamic Creation for Spoke-to-Spoke Tunnels benefit of this feature, you must use IKE certificates or wildcard preshared keys for Internet Security Association Key Management Protocol (ISAKMP) authentication.

  It is highly recommended that you do not use wildcard preshared keys because the attacker will have access to the VPN if one spoke router is compromised.

- GRE tunnel keepalives (that is, the `keepalive` command under a GRE interface) are not supported on point-to-point or multipoint GRE tunnels in a DMVPN Network.

- For best DMVPN functionality, it is recommended that you run the latest Cisco IOS software Release 12.4 mainline, 12.4T, or 12.2(18)SXF.

- If one spoke is behind one NAT device and another different spoke is behind another NAT device, and Peer Address Translation (PAT) is the type of NAT used on both NAT devices, then a session initiated between the two spokes cannot be established.

One example of a PAT configuration on a NAT interface is:

`ip nat inside source list nat_acl interface FastEthernet0/1 overload`

DMVPN Support on the Cisco 6500 and Cisco 7600

Blade-to-Blade Switchover on the Cisco 6500 and Cisco 7600

- DMVPN does not support blade-to-blade switchover on the Cisco 6500 and Cisco 7600.
Cisco 6500 or Cisco 7600 As a DMVPN Hub

- A Cisco 6500 or Cisco 7600 that is functioning as a DMVPN hub cannot be located behind a NAT router.
- If a Cisco 6500 or Cisco 7600 is functioning as a DMVPN hub, the spoke behind NAT must be a Cisco 6500 or Cisco 7600, respectively, or the router must be upgraded to Cisco IOS software Release 12.3(11)T02 or a later release.

Cisco 6500 or Cisco 7600 As a DMVPN Spoke

- If a Cisco 6500 or Cisco 7600 is functioning as a spoke, the hub cannot be behind NAT.
- If a Cisco 6500 or Cisco 7600 is functioning as a DMVPN spoke behind NAT, the hub must be a Cisco 6500 or Cisco 7600, respectively, or the router must be upgraded to Cisco IOS Release 12.3(11)T02 or a later release.

DMVPN Hub or Spoke Supervisor Engine

- Only a Supervisor Engine 720 can be used as a DMVPN hub or spoke. A Supervisor Engine 2 cannot be used.

Encrypted Multicast with GRE

- Encrypted Multicast with GRE is not supported on the Cisco 6500 nor on the Cisco 7600.

mGRE Interfaces

- If there are two mGRE interfaces on the same DMVPN node and they both do not have a tunnel key, the two mGRE interfaces must each have a unique tunnel source address (or interface) configured.
- On the Cisco 6500 and Cisco 7600, each GRE interface (multipoint or point-to-point) must have a unique tunnel source address (or interface).
- The following commands are not supported under mGRE with DMVPN: ip tcp adjust-mss, qos pre-classify tunnel vrf, tunnel path-mtu-discovery, and tunnel vrf.

Quality of Service (QoS)

- You cannot use QoS for DMVPN packets on a Cisco 6500 or Cisco 7600.

Tunnel Key

- The use of a tunnel key on a GRE (multipoint or point-to-point) interface is not supported in the hardware switching ASICs on the Cisco 6500 and Cisco 7600 platforms. If a tunnel key is configured, throughput performance is greatly reduced.
- In Cisco IOS Release 12.3(11)T3 and Release 12.3(14)T, the requirement that a mGRE interface must have a tunnel key was removed. Therefore, in a DMVPN network that includes a Cisco 6500 or Cisco 7600 as a DMVPN node, you should remove the tunnel key from all DMVPN nodes in the DMVPN network, thus preserving the throughput performance on the Cisco 6500 and Cisco 7600 platforms.
If the tunnel key is not configured on any DMVPN node within a DMVPN network, it must not be configured on all DMVPN nodes with the DMVPN network.

VRF-Aware DMVPN Scenarios

- The `mls mpls tunnel-recirc` command must be configured on the provider equipment (PE) DMVPN hub if customer equipment (CE) DMVPN spokes need to "talk" to other CEs across the MPLS cloud.
- The mGRE interface should be configured with a large enough IP maximum transmission unit (1400 packets to avoid having the route processor doing fragmentation.
- Enhanced Interior Gateway Routing Protocol (EIGRP) should be avoided.

Information About Dynamic Multipoint VPN (DMVPN)

Benefits of Dynamic Multipoint VPN (DMVPN)

Hub Router Configuration Reduction

- Currently, for each spoke router, there is a separate block of configuration lines on the hub router that define the crypto map characteristics, the crypto access list, and the GRE tunnel interface. This feature allows users to configure a single mGRE tunnel interface, a single IPsec profile, and no crypto access lists on the hub router to handle all spoke routers. Thus, the size of the configuration on the hub router remains constant even if spoke routers are added to the network.
- DMVPN architecture can group many spokes into a single multipoint GRE interface, removing the need for a distinct physical or logical interface for each spoke in a native IPsec installation.

Automatic IPsec Encryption Initiation

- GRE has the peer source and destination address configured or resolved with NHRP. Thus, this feature allows IPsec to be immediately triggered for the point-to-point GRE tunneling or when the GRE peer address is resolved via NHRP for the multipoint GRE tunnel.

Support for Dynamically Addressed Spoke Routers

- When using point-to-point GRE and IPsec hub-and-spoke VPN networks, the physical interface IP address of the spoke routers must be known when configuring the hub router because IP address must be configured as the GRE tunnel destination address. This feature allows spoke routers to have dynamic physical interface IP addresses (common for cable and DSL connections). When the spoke router comes online, it will send registration packets to the hub router: within these registration packets, is the current physical interface IP address of this spoke.

Dynamic Creation for Spoke-to-Spoke Tunnels

- This feature eliminates the need for spoke-to-spoke configuration for direct tunnels. When a spoke router wants to transmit a packet to another spoke router, it can now use NHRP to dynamically determine the required destination address of the target spoke router. (The hub router acts as the NHRP server, handling
the request for the source spoke router.) The two spoke routers dynamically create an IPsec tunnel between them so data can be directly transferred.

**VRF Integrated DMVPN**

- DMVPNs can be used to extend the Multiprotocol Label Switching (MPLS) networks that are deployed by service providers to take advantage of the ease of configuration of hub and spokes, to provide support for dynamically addressed customer premises equipment (CPEs), and to provide zero-touch provisioning for adding new spokes into a DMVPN.

**Feature Design of Dynamic Multipoint VPN (DMVPN)**

The Dynamic Multipoint VPN (DMVPN) feature combines GRE tunnels, IPsec encryption, and NHRP routing to provide users an ease of configuration via crypto profiles--which override the requirement for defining static crypto maps--and dynamic discovery of tunnel endpoints.

This feature relies on the following two Cisco enhanced standard technologies:

- **NHRP**--A client and server protocol where the hub is the server and the spokes are the clients. The hub maintains an NHRP database of the public interface addresses of the each spoke. Each spoke registers its real address when it boots and queries the NHRP database for real addresses of the destination spokes to build direct tunnels.

- **mGRE Tunnel Interface**--Allows a single GRE interface to support multiple IPsec tunnels and simplifies the size and complexity of the configuration.

The topology shown in the diagram below and the corresponding bullets explain how this feature works.

**Figure 1: Sample mGRE and IPsec Integration Topology**

- Each spoke has a permanent IPsec tunnel to the hub, not to the other spokes within the network. Each spoke registers as clients of the NHRP server.
When a spoke needs to send a packet to a destination (private) subnet on another spoke, it queries the NHRP server for the real (outside) address of the destination (target) spoke.

After the originating spoke “learns” the peer address of the target spoke, it can initiate a dynamic IPsec tunnel to the target spoke.

The spoke-to-spoke tunnel is built over the multipoint GRE interface.

The spoke-to-spoke links are established on demand whenever there is traffic between the spokes. Thereafter, packets can bypass the hub and use the spoke-to-spoke tunnel.

After a preconfigured amount of inactivity on the spoke-to-spoke tunnels, the router will tear down those tunnels to save resources (IPsec security associations [SAs]).

**IPsec Profiles**

IPsec profiles abstract IPsec policy information into a single configuration entity, which can be referenced by name from other parts of the configuration. Therefore, users can configure functionality such as GRE tunnel protection with a single line of configuration. By referencing an IPsec profile, the user does not have to configure an entire crypto map configuration. An IPsec profile contains only IPsec information; that is, it does not contain any access list information or peering information.

**VRF Integrated DMVPN**

VPN Routing and Forwarding (VRF) Integrated DMVPN enables users to map DMVPN multipoint interfaces into MPLS VPNs. This mapping allows Internet service providers (ISPs) to extend their existing MPLS VPN services by mapping off-network sites (typically a branch office) to their respective MPLS VPNs. Customer equipment (CE) routers are terminated on the DMVPN PE router, and traffic is placed in the VRF instance of an MPLS VPN.

DMVPN can interact with MPLS VPNs in two ways:

1. The `ip vrf forwarding` command is used to inject the data IP packets (those packets inside the mGRE+IPsec tunnel) into the MPLS VPN. The `ip vrf forwarding` command is supported for DMVPN in Cisco IOS Release 12.3(6) and Release 12.3(7)T.

2. The `tunnel vrf` command is used to transport (route) the mGRE+IPsec tunnel packet itself within an MPLS VPN. The `tunnel vrf` command is supported in Cisco IOS Release 12.3(11)T but not in Cisco IOS Release 12.2(18)SXE.

**Note**

Clear-text data IP packets are forwarded in a VRF using the `ip vrf forwarding` command, and encrypted tunnel IP packets are forwarded in a VRF using the `tunnel vrf` command.

The `ip vrf forwarding` and `tunnel vrf` commands may be used at the same time. If they are used at the same time, the VRF name of each command may be the same or different.

For information about configuring the forwarding of clear-text data IP packets into a VRF, see the section "Configuring the Forwarding of Clear-Text Data IP Packets into a VRF." For information about configuring...
the forwarding of encrypted tunnel packets into a VRF, see the section "Configuring the Forwarding of Encrypted Tunnel Packets into a VRF."

For more information about configuring VRF, see reference in the "Related Documents" section.

The diagram below illustrates a typical VRF Integrated DMVPN scenario.

**Figure 2: VRF Integrated DMVPN**

---

**DMVPN--Enabling Traffic Segmentation Within DMVPN**

Cisco IOS Release 12.4(11)T provides an enhancement that allows you to segment VPN traffic within a DMVPN tunnel. VRF instances are labeled, using MPLS, to indicate their source and destination.
The diagram below and the corresponding bullets explain how traffic segmentation within DMVPN works.

**Figure 3: Traffic Segmentation with DMVPN**

- The hub shown in the diagram is a WAN-PE and a route reflector, and the spokes (PE routers) are clients.
- There are three VRFs, designated "red," "green," and "blue."
- Each spoke has both a neighbor relationship with the hub (multiprotocol Border Gateway Protocol [MP-iBGP] peering) and a GRE tunnel to the hub.
- Each spoke advertises its routes and VPNv4 prefixes to the hub.
- The hub sets its own IP address as the next-hop route for all the VPNv4 addresses it learns from the spokes and assigns a local MPLS label for each VPN when it advertises routes back to the spokes. As a result, traffic from Spoke A to Spoke B is routed via the hub.

An example illustrates the process:

1. Spoke A advertises a VPNv4 route to the hub, and applies the label $X$ to the VPN.
2. The hub changes the label to $Y$ when the hub advertises the route to Spoke B.
3. When Spoke B has traffic to send to Spoke A, it applies the $Y$ label, and the traffic goes to the hub.
The hub swaps the VPN label, by removing the $Y$ label and applying an $X$ label, and sends the traffic to Spoke A.

**NAT-Transparency Aware DMVPN**

DMVPN spokes are often situated behind a NAT router (which is often controlled by the ISP for the spoke site) with the outside interface address of the spoke router being dynamically assigned by the ISP using a private IP address (per Internet Engineering Task Force [IETF] RFC 1918).

Prior to Cisco IOS Release 12.3(6) and 12.3(7)T, these spoke routers had to use IPsec tunnel mode to participate in a DMVPN network. In addition, their assigned outside interface private IP address had to be unique across the DMVPN network. Even though ISAKMP and IPsec would negotiate NAT-T and “learn” the correct NAT public address for the private IP address of this spoke, NHRP could only “see” and use the private IP address of the spoke for its mapping entries. Effective with the NAT-Transparency Aware DMVPN enhancement, NHRP can now learn and use the NAT public address for its mappings as long as IPsec transport mode is used (which is the recommend IPsec mode for DMVPN networks). The restriction that the private interface IP address of the spoke must be unique across the DMVPN network has been removed. It is recommended that all DMVPN routers be upgraded to the new code before you try to use the new functionality even though spoke routers that are not behind NAT do not need to be upgraded. In addition, you cannot convert upgraded spoke routers that are behind NAT to the new configuration (IPsec transport mode) until the hub routers have been upgraded.

Also added in Cisco IOS Releases 12.3(9a) and 12.3(11)T is the capability to have the hub DMVPN router behind static NAT. This was a change in the ISAKMP NAT-T support. For this functionality to be used, all the DMVPN spoke routers and hub routers must be upgraded, and IPsec must use transport mode.

For these NAT-Transparency Aware enhancements to work, you must use IPsec transport mode on the transform set. Also, even though NAT-Transparency (IKE and IPsec) can support two peers (IKE and IPsec) being translated to the same IP address (using the UDP ports to differentiate them), this functionality is not supported for DMVPN. All DMVPN spokes must have a unique IP address after they have been NAT translated. They can have the same IP address before they are NAT translated.

The diagram below illustrates a NAT-Transparency Aware DMVPN scenario.
In Cisco IOS Release 12.4(6)T or earlier, DMVPN spokes behind NAT will not participate in dynamic direct spoke-to-spoke tunnels. Any traffic to or from a spoke that is behind NAT will be forwarded using the DMVPN hub routers. DMVPN spokes that are not behind NAT in the same DMVPN network may create dynamic direct spoke-to-spoke tunnels between each other. In Cisco IOS Release 12.4(6)T or later releases, DMVPN spokes behind NAT will participate in dynamic direct spoke-to-spoke tunnels. The spokes must be behind NAT boxes that are performing NAT, not PAT. The NAT box must translate the spoke to the same outside NAT IP address for the spoke-spoke connections as the NAT box does for the spoke-hub connection. If there is more than one DMVPN spoke behind the same NAT box, then the NAT box must translate the DMVPN spokes to different outside NAT IP addresses. It is also likely that you may not be able to build a direct spoke-spoke tunnel between these spokes. If a spoke-spoke tunnel fails to form, then the spoke-spoke packets will continue to be forwarded via the spoke-hub-spoke path.

Figure 4: NAT-Transparency Aware DMVPN

Call Admission Control with DMVPN

In a DMVPN network, it is easy for a DMVPN router to become "overwhelmed" with the number of tunnels it is trying to build. Call Admission Control can be used to limit the number of tunnels that can be built at any one time, thus protecting the memory of the router and CPU resources.

It is most likely that Call Admission Control will be used on a DMVPN spoke to limit the total number of ISAKMP sessions (DMVPN tunnels) that a spoke router will attempt to initiate or accept. This limiting is accomplished by configuring an IKE SA limit under Call Admission Control, which configures the router to drop new ISAKMP session requests (inbound and outbound) if the current number of ISAKMP SAs exceeds the limit.

It is most likely that Call Admission Control will be used on a DMVPN hub to rate limit the number of DMVPN tunnels that are attempting to be built at the same time. The rate limiting is accomplished by configuring a system resource limit under Call Admission Control, which configures the router to drop new ISAKMP session requests (new DMVPN tunnels) when the system utilization is above a specified percentage. The dropped session requests allow the DMVPN hub router to complete the current ISAKMP session requests, and when the system utilization drops, it can process the previously dropped sessions when they are reattempted.
No special configuration is required to use Call Admission Control with DMVPN. For information about configuring Call Admission Control, see the reference in the section "Related Documents."

**NHRP Rate-Limiting Mechanism**

NHRP has a rate-limiting mechanism that restricts the total number of NHRP packets from any given interface. The default values, which are set using the `ip nhrp max-send` command, are 100 packets every 10 seconds per interface. If the limit is exceeded, you will get the following system message:

```
%NHRP-4-QUOTA: Max-send quota of [int]pkts/[int]Sec. exceeded on [chars]
```

For more information about this system message, see the document 12.4T System Message Guide.

**How to Configure Dynamic Multipoint VPN (DMVPN)**

To enable mGRE and IPsec tunneling for hub and spoke routers, you must configure an IPsec profile that uses a global IPsec policy template and configure your mGRE tunnel for IPsec encryption. This section contains the following procedures:

**Configuring an IPsec Profile**

The IPsec profile shares most of the same commands with the crypto map configuration, but only a subset of the commands are valid in an IPsec profile. Only commands that pertain to an IPsec policy can be issued under an IPsec profile; you cannot specify the IPsec peer address or the access control list (ACL) to match the packets that are to be encrypted.

---

**Note**

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

---

**Before You Begin**

Before configuring an IPsec profile, you must define a transform set by using the `crypto ipsec transform-set` command.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto ipsec profile name
4. set transform-set transform-set-name
5. set identity
6. set security association lifetime {seconds seconds | kilobytes kilobytes}
7. set pfs [group1 | group14 | group15 | group16 | group19 | group2 | group20 | group24 | group5]
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto ipsec profile <em>name</em></td>
<td>Defines the IPsec parameters that are to be used for IPsec encryption between &quot;spoke and hub&quot; and &quot;spoke and spoke&quot; routers. This command enters crypto map configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto ipsec profile vpnprof</td>
<td>• The <em>name</em> argument specifies the name of the IPsec profile.</td>
</tr>
<tr>
<td><strong>Step 4</strong> set transform-set <em>transform-set-name</em></td>
<td>Specifies which transform sets can be used with the IPsec profile.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-crypto-map)# set transform-set trans2</td>
<td>• The <em>transform-set-name</em> argument specifies the name of the transform set.</td>
</tr>
<tr>
<td><strong>Step 5</strong> set identity</td>
<td>(Optional) Specifies identity restrictions to be used with the IPsec profile.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-crypto-map)# set identity</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> set security association lifetime {seconds</td>
<td>(Optional)Overridesthe global lifetime value for the IPsec profile.</td>
</tr>
<tr>
<td><strong>Example:</strong> seconds} kilobytes kilobytes}</td>
<td>• The <em>seconds</em> option specifies the number of seconds a security association will live before expiring; the <em>kilobytes</em> option specifies the volume of traffic (in kilobytes) that can pass between IPsec peers using a given security association before that security association expires.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-crypto-map)# set security association lifetime seconds 1800</td>
<td>• The default for the <em>seconds</em> argument is 3600 seconds.</td>
</tr>
<tr>
<td><strong>Step 7</strong> set pfs [group1</td>
<td>(Optional) Specifies that IPsec should ask for perfect forward secrecy (PFS) when requesting new security associations for this IPsec profile. If this command is not specified, the default Diffie-Hellman (DH) group, <em>group1</em> will be enabled.</td>
</tr>
<tr>
<td><strong>Example:</strong> group14</td>
<td>• 1—768-bit DH (No longer recommended.)</td>
</tr>
<tr>
<td>group15</td>
<td>• 2—1024-bit DH (No longer recommended)</td>
</tr>
</tbody>
</table>
### Configuring the Hub for DMVPN

To configure the hub router for mGRE and IPsec integration (that is, associate the tunnel with the IPsec profile configured in the previous procedure), use the following commands:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• 5</td>
<td>1536-bit DH (No longer recommended)</td>
</tr>
<tr>
<td>• 14</td>
<td>Specifies the 2048-bit DH group.</td>
</tr>
<tr>
<td>• 15</td>
<td>Specifies the 3072-bit DH group.</td>
</tr>
<tr>
<td>• 16</td>
<td>Specifies the 4096-bit DH group.</td>
</tr>
<tr>
<td>• 19</td>
<td>Specifies the 256-bit elliptic curve DH (ECDH) group.</td>
</tr>
<tr>
<td>• 20</td>
<td>Specifies the 384-bit ECDH group.</td>
</tr>
<tr>
<td>• 24</td>
<td>Specifies the 2048-bit DH/DSA group.</td>
</tr>
</tbody>
</table>

### What to Do Next

Proceed to the following sections “Configuring the Hub for DMVPN” and “Configuring the Spoke for DMVPN.”

**Note**

NHRP network IDs are locally significant and can be different. It makes sense from a deployment and maintenance perspective to use unique network ID numbers (using the `ip nhrp network-id` command) across all routers in a DMVPN network, but it is not necessary that they be the same.
SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel number**
4. **ip address ip-address mask secondary**
5. **ip mtu bytes**
6. **ip nhrp authentication string**
7. **ip nhrp map multicast dynamic**
8. **ip nhrp network-id number**
9. **tunnel source {ip-address | type number}**
10. **tunnel key key-number**
11. **tunnel mode gre multipoint**
12. **tunnel protection ipsec profile name**
13. **bandwidth kbps**
14. **ip tcp adjust-mss max-segment-size**
15. **ip nhrp holdtime seconds**
16. **delay number**

DETAILED STEPS

<table>

<td>Configures a tunnel interface and enters interface configuration mode</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# interface tunnel 5</td>
<td>The <strong>number</strong> argument specifies the number of the tunnel interface that you want to create or configure. There is no limit on the number of tunnel interfaces you can create.</td>
</tr>
<tr>
<td><strong>Step 4</strong> ip address ip-address mask secondary</td>
<td>Sets a primary or secondary IP address for the tunnel interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-if)# ip address 10.0.0.1 255.255.255.0</td>
<td><strong>Note</strong> All hubs and spokes that are in the same DMVPN network must be addressed in the same IP subnet.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>ip mtu</strong> bytes</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-if)# ip mtu 1400</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Sets the maximum transmission unit (MTU) size, in bytes, of IP packets sent on an interface.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>ip nhrp authentication</strong> string</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-if)# ip nhrp authentication donttell</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Configures the authentication string for an interface using NHRP. <strong>Note</strong> The NHRP authentication string must be set to the same value on all hubs and spokes that are in the same DMVPN network.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>ip nhrp map multicast dynamic</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-if)# ip nhrp map multicast dynamic</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Allows NHRP to automatically add spoke routers to the multicast NHRP mappings.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>ip nhrp network-id</strong> number</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-if)# ip nhrp network-id 99</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Enables NHRP on an interface. <strong>Note</strong> The <em>number</em> argument specifies a globally unique 32-bit network identifier from a nonbroadcast multiaccess (NBMA) network. The range is from 1 to 4294967295.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>tunnel source</strong> {ip-address</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-if)# tunnel source Ethernet0</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Sets source address for a tunnel interface.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td><strong>tunnel key</strong> key-number</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-if)# tunnel key 100000</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>(Optional) Enables an ID key for a tunnel interface. <strong>Note</strong> The <em>key-number</em> argument specifies a number from 0 to 4,294,967,295 that identifies the tunnel key. <strong>Note</strong> The key number must be set to the same value on all hubs and spokes that are in the same DMVPN network. <strong>Note</strong> This command should not be configured if you are using a Cisco 6500 or Cisco 7600 platform.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td><strong>tunnel mode gre multipoint</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-if)# tunnel mode gre multipoint</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Sets the encapsulation mode to mGRE for the tunnel interface.</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td><strong>tunnel protection ipsec profile</strong> name</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Associates a tunnel interface with an IPsec profile.</td>
</tr>
</tbody>
</table>
**Command or Action** | **Purpose**
---|---
Example: Router(config-if)# tunnel protection ipsec profile vpnprof | • The `name` argument specifies the name of the IPsec profile; this value must match the `name` specified in the `crypto ipsec profile` `name` command.

**Step 13** bandwidth **kbps** | Sets the current bandwidth value for an interface to higher-level protocols.

Example: Router(config-if)# bandwidth 1000 | • The `kbps` argument specifies the bandwidth in kilobits per second. The default value is 9. The recommend bandwidth value is 1000 or greater.

Setting the bandwidth value to at least 1000 is critical if EIGRP is used over the tunnel interface. Higher bandwidth values may be necessary depending on the number of spokes supported by a hub.

**Step 14** ip tcp adjust-mss **max-segment-size** | Adjusts the maximum segment size (MSS) value of TCP packets going through a router.

Example: Router(config-if)# ip tcp adjust-mss 1360 | • The `max-segment-size` argument specifies the maximum segment size, in bytes. The range is from 500 to 1460.

The recommended value is 1360 when the number of IP MTU bytes is set to 1400. With these recommended settings, TCP sessions quickly scale back to 1400-byte IP packets so the packets will "fit" in the tunnel.

**Step 15** ip nhrp holdtime **seconds** | Changes the number of seconds that NHRP NBMA addresses are advertised as valid in authoritative NHRP responses.

Example: Router(config-if)# ip nhrp holdtime 450 | • The `seconds` argument specifies the time in seconds that NBMA addresses are advertised as valid in positive authoritative NHRP responses. The recommended value ranges from 300 seconds to 600 seconds.

**Step 16** delay **number** | (Optional) Used to change the EIGRP routing metric for routes learned over the tunnel interface.

Example: Router(config-if)# delay 1000 | • The `number` argument specifies the delay time in seconds. The recommend value is 1000.

---

**Configuring the Spoke for DMVPN**

To configure spoke routers for mGRE and IPsec integration, use the following commands.
NHRP network IDs are locally significant and can be different. It makes sense from a deployment and maintenance perspective to use unique network IDs (using the `ip nhrp network-id` command) across all routers in a DMVPN network, but it is not necessary that they be the same.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `ip address ip-address mask secondary`
5. `ip mtu bytes`
6. `ip nhrp authentication string`
7. `ip nhrp map hub-tunnel-ip-address hub-physical-ip-address`
8. `ip nhrp map multicast hub-physical-ip-address`
9. `ip nhrp nhs hub-tunnel-ip-address`
10. `ip nhrp network-id number`
11. `tunnel source {ip-address | type number}`
12. `tunnel key key-number`
13. Do one of the following:
   - `tunnel mode gre multipoint`
   - `tunnel destination hub-physical-ip-address`
14. `tunnel protection ipsec profile name`
15. `bandwidth kbps`
16. `ip tcp adjust-mss max-segment-size`
17. `ip nhrp holdtime seconds`
18. `delay number`

**DETAILED STEPS**

### Dynamic Multipoint VPN

**Configuring the Spoke for DMVPN**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong> interface tunnel number</td>
<td>Configures a tunnel interface and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# interface tunnel 5</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The <em>number</em> argument specifies the number of the tunnel interface that you want to create or configure. There is no limit on the number of tunnel interfaces you can create.</td>
</tr>
<tr>
<td><strong>Step 4</strong> ip address ip-address mask secondary</td>
<td>Sets a primary or secondary IP address for the tunnel interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip address 10.0.0.2 255.255.255.0</td>
<td>Note: All hubs and spokes that are in the same DMVPN network must be addressed in the same IP subnet.</td>
</tr>
<tr>
<td><strong>Step 5</strong> ip mtu bytes</td>
<td>Sets the MTU size, in bytes, of IP packets sent on an interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip mtu 1400</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> ip nhrp authentication string</td>
<td>Configures the authentication string for an interface using NHRP.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip nhrp authentication donttell</td>
<td>Note: The NHRP authentication string be set to the same value on all hubs and spokes that are in the same DMVPN network.</td>
</tr>
<tr>
<td><strong>Step 7</strong> ip nhrp map hub-tunnel-ip-address hub-physical-ip-address</td>
<td>Statically configures the IP-to-NBMA address mapping of IP destinations connected to an MBMA network.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip nhrp map 10.0.0.1 172.17.0.1</td>
<td>• <em>hub-tunnel-ip-address</em> --Defines the NHRP server at the hub, which is permanently mapped to the static public IP address of the hub.</td>
</tr>
<tr>
<td></td>
<td>• <em>hub-physical-ip-address</em> --Defines the static public IP address of the hub.</td>
</tr>
<tr>
<td><strong>Step 8</strong> ip nhrp map multicast hub-physical-ip-address</td>
<td>Enables the use of a dynamic routing protocol between the spoke and hub, and sends multicast packets to the hub router.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip nhrp map multicast 172.17.0.1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> ip nhrp nhs hub-tunnel-ip-address</td>
<td>Configures the hub router as the NHRP next-hop server.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip nhrp nhs 10.0.0.1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> ip nhrp network-id number</td>
<td>Enables NHRP on an interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router(config-if)# ip nhrp network-id 99</code></td>
<td>• The <em>number</em> argument specifies a globally unique 32-bit network identifier from a NBMA network. The range is from 1 to 4294967295.</td>
</tr>
<tr>
<td>Step 11</td>
<td><strong>tunnel source</strong> `{ip-address</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router(config-if)# tunnel source Ethernet0</code></td>
<td></td>
</tr>
<tr>
<td>Step 12</td>
<td><strong>tunnel key</strong> <code>key-number</code></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router(config-if)# tunnel key 100000</code></td>
<td>• The <em>key-number</em> argument specifies a number from 0 to 4,294,967,295 that identifies the tunnel key.</td>
</tr>
<tr>
<td></td>
<td>• The key number must be set to the same value on all hubs and spokes that are in the same DMVPN network.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>This command should not be configured if you are using a Cisco 6500 or Cisco 7600 platform.</td>
</tr>
<tr>
<td>Step 13</td>
<td>Do one of the following:</td>
</tr>
<tr>
<td>• <strong>tunnel mode gre multipoint</strong></td>
<td>Use this command if data traffic can use dynamic spoke-to-spoke traffic.</td>
</tr>
<tr>
<td>• <strong>tunnel destination</strong> <code>hub-physical-ip-address</code></td>
<td>Specifies the destination for a tunnel interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router(config-if)# tunnel mode gre multipoint</code></td>
<td>Use this command if data traffic can use hub-and-spoke tunnels.</td>
</tr>
<tr>
<td><code>Router(config-if)# tunnel destination 172.17.0.1</code></td>
<td></td>
</tr>
<tr>
<td>Step 14</td>
<td><strong>tunnel protection ipsec profile</strong> <code>name</code></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router(config-if)# tunnel protection ipsec profile vpnprof</code></td>
<td>• The <em>name</em> argument specifies the name of the IPsec profile; this value must match the <em>name</em> specified in the <code>crypto ipsec profile name</code> command.</td>
</tr>
<tr>
<td>Step 15</td>
<td><strong>bandwidth</strong> <code>kbps</code></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-if)# bandwidth 1000</code></td>
<td>- The <em>kbps</em> argument specifies the bandwidth in kilobits per second. The default value is 9. The recommend bandwidth value is 1000 or greater. The bandwidth setting for the spoke does not need to equal the bandwidth setting for the DMVPN hub. It is usually easier if all of the spokes use the same or similar value.</td>
</tr>
<tr>
<td><strong>Step 16</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip tcp adjust-mss max-segment-size</code></td>
<td>Adjusts the maximum segment size (MSS) value of TCP packets going through a router. - The <em>max-segment-size</em> argument specifies the maximum segment size, in bytes. The range is from 500 to 1460. The recommended number value is 1360 when the number of IP MTU bytes is set to 1400. With these recommended settings, TCP sessions quickly scale back to 1400-byte IP packets so the packets will “fit” in the tunnel.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-if)# ip tcp adjust-mss 1360</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 17</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip nhrp holdtime seconds</code></td>
<td>Changes the number of seconds that NHRP NBMA addresses are advertised as valid in authoritative NHRP responses. - The <em>seconds</em> argument specifies the time in seconds that NBMA addresses are advertised as valid in positive authoritative NHRP responses. The recommended value ranges from 300 seconds to 600 seconds.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-if)# ip nhrp holdtime 450</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 18</strong></td>
<td></td>
</tr>
<tr>
<td><code>delay number</code></td>
<td>(Optional) Used to change the EIGRP routing metric for routes learned over the tunnel interface. - The <em>number</em> argument specifies the delay time in seconds. The recommend value is 1000.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-if)# delay 1000</code></td>
<td></td>

</tbody>
</table>

### Configuring the Forwarding of Clear-Text Data IP Packets into a VRF

To configure the forwarding of clear-text date IP packets into a VRF, perform the following steps. This configuration assumes that the VRF BLUE has already been configured.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **ip vrf forwarding vrf-name**
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables higher privilege levels, such as privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: configure terminal</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface type number</td>
<td>Configures an interface type and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example: interface type number</td>
<td></td>
</tr>
<tr>
<td>Router (config)# interface tunnel0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip vrf forwarding vrf-name</td>
<td>Associates a VPN VRF with an interface or subinterface.</td>
</tr>
<tr>
<td>Example: ip vrf forwarding vrf-name</td>
<td></td>
</tr>
<tr>
<td>Router (config-if)# ip vrf forwarding BLUE</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring the Forwarding of Encrypted Tunnel Packets into a VRF**

To configure the forwarding of encrypted tunnel packets into a VRF, perform the following steps. This configuration assumes that the VRF RED has already been configured.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface type number
4. tunnel vrf vrf-name
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>enable</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures an interface type and enters interface configuration mode.</td>
</tr>
<tr>
<td>interface type number</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router (config)# interface tunnel0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Associates a VPN VRF instance with a specific tunnel destination, interface, or subinterface.</td>
</tr>
<tr>
<td>tunnel vrf vrf-name</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router (config-if)# tunnel vrf RED</td>
<td></td>
</tr>
</tbody>
</table>

Configuring DMVPN--Traffic Segmentation Within DMVPN

There are no new commands to use for configuring traffic segmentation, but there are tasks you must complete in order to segment traffic within a DMVPN tunnel:

**Prerequisites**

The tasks that follow assume that the DMVPN tunnel and the VRFs “red” and “blue” have already been configured.

For information on configuring a DMVPN tunnel, see the Configuring the Hub for DMVPN task and the Configuring the Spoke for DMVPN. For details about VRF configuration, see the Configuring the Forwarding of Clear-Text Data IP Packets into a VRF task and the Configuring the Forwarding of Encrypted Tunnel Packets into a VRF task.

**Enabling MPLS on the VPN Tunnel**

Because traffic segmentation within a DMVPN tunnel depends upon MPLS, you must configure MPLS for each VRF instance in which traffic will be segmented. For detailed information about configuring MPLS, see Cisco IOS Multiprotocol Label Switching Configuration Guide, Release 12.4.
SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. mpls ip

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables higher privilege levels, such as privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| Step 2 | configure terminal | Enters global configuration mode. |
| **Example:** Router# configure terminal | |

| Step 3 | interface type number | Configures an interface type and enters interface configuration mode. |
| **Example:** Router (config)# interface tunnel0 | |

| Step 4 | mpls ip | Enables MPLS tagging of packets on the specified tunnel interface. |
| **Example:** Router (config-if)# mpls ip | |

**Configuring Multiprotocol BGP on the Hub Router**

You must configure multiprotocol iBGP (MP-iBGP) to enable advertisement of VPNv4 prefixes and labels to be applied to the VPN traffic. Use BGP to configure the hub as a route reflector. To force all traffic to be routed via the hub, configure the BGP route reflector to change the next hop to itself when it advertises VPNv4 prefixes to the route reflector clients (spokes).
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp`
4. `neighbor ipaddress remote-as as - number`
5. `neighbor ipaddress update-source interface`
6. `address-family vpnv4`
7. `neighbor ipaddress activate`
8. `neighbor ipaddress send-community extended`
9. `neighbor ipaddress route-reflector-client`
10. `neighbor ipaddress route-map nexthop out`
11. `exit-address-family`
12. `address-family ipv4 vrf-name`
13. `redistribute connected`
14. `route-map`
15. `set ip next-hop ipaddress`

### DETAILED STEPS

<table>
<thead>

<td>Router (config)# set ip next-hop 10.0.0.1</td>
</tr>
</tbody>
</table>

**Configuring Multiprotocol BGP on the Spoke Routers**

Multiprotocol-iBGP (MP-iBGP) must be configured on the spoke routers and the hub. Follow the steps below for each spoke router in the DMVPN.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router bgp
4. neighbor ipaddress remote-as as-number
5. neighbor ipaddress update-source interface
6. address-family vpnv4
7. neighbor ipaddress activate
8. neighbor ipaddress send-community extended
9. exit-address-family
10. address-family ipv4 vrf-name
11. redistribute connected
12. exit-address-family
## Detailed Steps

<table>
<thead>

### Troubleshooting Dynamic Multipoint VPN (DMVPN)

After configuring DMVPN, to verify that DMVPN is operating correctly, to clear DMVPN statistics or sessions, or to debug DMVPN, you may perform the following optional steps:

**Note**  
Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.
SUMMARY STEPS

1. The **clear dmvpn session** command is used to clear DMVPN sessions.
2. The **clear dmvpn statistics** command is used to clear DMVPN related counters. The following example shows how to clear DMVPN related session counters for the specified tunnel interface:
3. The **debug dmvpn** command is used to debug DMVPN sessions. You can enable or disable DMVPN debugging based on a specific condition. There are three levels of DMVPN debugging, listed in the order of details from lowest to highest:
4. The **debug nhrp condition** command enables or disables debugging based on a specific condition. The following example shows how to enable conditional NHRP debugging:
5. The **debug nhrp error** command displays information about NHRP error activity. The following example shows how to enable debugging for NHRP error messages:
6. The **logging dmvpn** command is used to enable DMVPN system logging. The following command shows how to enable DMVPN system logging at the rate of 1 message every 20 seconds:
7. The **show crypto ipsec sa** command displays the settings used by the current SAs. The following example output shows the IPsec SA status of only the active device:
8. The **show crypto isakmp sa** command displays all current IKE SAs at a peer. For example, the following sample output is displayed after IKE negotiations have successfully completed between two peers.
9. The **show crypto map** command displays the crypto map configuration.
10. The **show dmvpn** command displays DMVPN specific session information. The following example shows example summary output:
11. The **show ip nhrp traffic** command displays NHRP statistics. The following example shows output for a specific tunnel, tunnel7:

DETAILED STEPS

Step 1

The **clear dmvpn session** command is used to clear DMVPN sessions.
The following example clears only dynamic DMVPN sessions:

```
Router# clear dmvpn session peer nbma
```

The following example clears all DMVPN sessions, both static and dynamic, for the specified tunnel:

```
Router# clear dmvpn session interface tunnel 100 static
```

Step 2

The **clear dmvpn statistics** command is used to clear DMVPN related counters. The following example shows how to clear DMVPN related session counters for the specified tunnel interface:

```
Router# clear dmvpn statistics peer tunnel 192.0.2.3
```

Step 3

The **debug dmvpn** command is used to debug DMVPN sessions. You can enable or disable DMVPN debugging based on a specific condition. There are three levels of DMVPN debugging, listed in the order of details from lowest to highest:

- **Error level**
- **Detail level**
- **Packet level**

The following example shows how to enable conditional DMVPN debugging that displays all error debugs for next hop routing protocol (NHRP), sockets, tunnel protection and crypto information:

```
Router# debug dmvpn error all
```
Step 4  The **debug nhrp condition** command enables or disables debugging based on a specific condition. The following example shows how to enable conditional NHRP debugging:

Router# debug nhrp condition

Step 5  The **debug nhrp error** command displays information about NHRP error activity. The following example shows how to enable debugging for NHRP error messages:

Router# debug nhrp error

Step 6  The **logging dmvpn** command is used to enable DMVPN system logging. The following command shows how to enable DMVPN system logging at the rate of 1 message every 20 seconds:

Router(config)# logging dmvpn rate-limit 20

The following example shows a sample system log with DMVPN messages:

**Example:**

```
%DMVPN-7-CRYPTO_SS: Tunnel101-192.0.2.1 socket is UP
%DMVPN-5-NHRP_NHS: Tunnel101 192.0.2.251 is UP
%DMVPN-5-NHRP_CACHE: Client 192.0.2.2 on Tunnel1 Registered.
%DMVPN-5-NHRP_CACHE: Client 192.0.2.2 on Tunnel101 came UP.
%DMVPN-3-NHRP_ERROR: Registration Request failed for 192.0.2.251 on Tunnel101
```

Step 7  The **show crypto ipsec sa** command displays the settings used by the current SAs. The following example output shows the IPsec SA status of only the active device:

**Example:**

```
Router# show crypto ipsec sa active
interface: Ethernet0/0
    Crypto map tag: to-peer-outside, local addr 209.165.201.3
    protected vrf: (none)
    local ident (addr/mask/prot/port): (192.168.0.1/255.255.255.255/0/0)
    remote ident (addr/mask/prot/port): (172.16.0.1/255.255.255.255/0/0)
    current_peer 209.165.200.225 port 500
    PERMIT, flags=origin_is_acl,
    #pkts encaps: 2, #pkts encrypt: 3, #pkts digest: 3
    #pkts decaps: 4, #pkts decrypt: 4, #pkts verify: 4
    #pkts compressed: 0, #pkts decompressed: 0
    #pkts not compressed: 0, #pkts compr. failed: 0
    #pkts not decompressed: 0, #pkts decompress failed: 0
    local crypto endpt.: 209.165.201.3, remote crypto endpt.: 209.165.200.225
    path mtu 1500, media mtu 1500
    current outbound spi: 0xD42904F0(3559458032)
    inbound esp sas:
        spi: 0xD39ABDD0(3555306448)  transform: esp-aes ,
        in use settings ={Tunnel, }
    conn id: 2006, flow id: 6, crypto map: to-peer-outside
    sa timing: remaining key lifetime (k/sec): (4586265/3542)
    HA last key lifetime sent(k): (4586267)
    ike cookies: 9263635C CA4B4E99 C14E908E 8EE2D79C
    IV Size: 16 bytes
    replay detection support: Y
    Status: ACTIVE
```

Step 8  The **show crypto isakmp sa** command displays all current IKE SAs at a peer. For example, the following sample output is displayed after IKE negotiations have successfully completed between two peers.
Step 9

The `show crypto map` command displays the crypto map configuration. The following sample output is displayed after a crypto map has been configured:

```
Router# show crypto map
Crypto Map "Tunnel5-head-0" 10 ipsec-isakmp
  Profile name: vpnprof
  Security association lifetime: 4608000 kilobytes/3600 seconds
  PFS (Y/N): N
  Transform sets={trans2, }
Crypto Map "Tunnel5-head-0" 20 ipsec-isakmp
  Map is a PROFILE INSTANCE.
  Peer = 172.16.175.75
  Extended IP access list
    access-list permit gre host 172.17.63.19 host 172.16.175.75
  Current peer: 172.16.175.75
  Security association lifetime: 4608000 kilobytes/3600 seconds
  PFS (Y/N): N
  Transform sets={trans2, }
Crypto Map "Tunnel5-head-0" 30 ipsec-isakmp
  Map is a PROFILE INSTANCE.
  Peer = 172.17.63.20
  Extended IP access list
    access-list permit gre host 172.17.63.19 host 172.17.63.20
  Current peer: 172.17.63.20
  Security association lifetime: 4608000 kilobytes/3600 seconds
  PFS (Y/N): N
  Transform sets={trans2, }
Crypto Map "Tunnel5-head-0" 40 ipsec-isakmp
  Map is a PROFILE INSTANCE.
  Peer = 172.16.175.76
  Extended IP access list
    access-list permit gre host 172.17.63.19 host 172.16.175.76
  Current peer: 172.16.175.76
  Security association lifetime: 4608000 kilobytes/3600 seconds
  PFS (Y/N): N
  Transform sets={trans2, }
Interfaces using crypto map Tunnel5-head-0:
  Tunnel5
```

Step 10

The `show dmvpn` command displays DMVPN specific session information. The following example shows example summary output:

```
Router# show dmvpn
Legend: Attrb --> S - Static, D - Dynamic, I - Incomplete
        N - NATed, L - Local, X - No Socket
# Ent --> Number of NHFP entries with same NBMA peer
! The line below indicates that the sessions are being displayed for Tunnel1.
! Tunnel is acting as a spoke and is a peer with three other NBMA peers.
Tunnel1, Type: Spoke, NBMA Peers: 3,
  # Ent Peer NBMA Addr Peer Tunnel Add State UpDn Tm Attrb
   ---- -------------- -------------- -------- ----- --------- ------
    2  192.0.2.21 192.0.2.116 IKE  3w0d D
```
Step 11  
The `show ip nhrp traffic` command displays NHRP statistics. The following example shows output for a specific tunnel, tunnel7:

```plaintext
Router# show ip nhrp traffic interface tunnel7
```

Example:

```plaintext
Tunnel7: Max-send limit:100Pkts/10Sec, Usage:0%
  Sent: Total 79
    18 Resolution Request 10 Resolution Reply 42 Registration Request
    0 Registration Reply  3 Purge Request   6 Purge Reply
    0 Error Indication    0 Traffic Indication
  Rcvd: Total 69
    10 Resolution Request 15 Resolution Reply 0 Registration Request
    36 Registration Reply  6 Purge Request   2 Purge Reply
    0 Error Indication    0 Traffic Indication
```

**What to Do Next**

If you have troubleshooting your DMVPN configuration and proceed to contact technical support, the `show tech-support` command includes information for DMVPN sessions. For more information, see the `show tech-support` command in the Cisco IOS Configuration Fundamentals Command Reference.

**Configuration Examples for Dynamic Multipoint VPN (DMVPN) Feature**

**Example Hub Configuration for DMVPN**

In the following example, which configures the hub router for multipoint GRE and IPsec integration, no explicit configuration lines are needed for each spoke; that is, the hub is configured with a global IPsec policy template that all spoke routers can talk to. In this example, EIGRP is configured to run over the private physical interface and the tunnel interface.

```plaintext
crypto isakmp policy 1
  encr aes
  authentication pre-share
group 14
crypto isakmp key cisco47 address 0.0.0.0
!crypto ipsec transform-set trans2 esp-aes esp-sha-hmac
mode transport
!crypto ipsec profile vpnprof
  set transform-set trans2
```

interface Tunnel0
  bandwidth 1000
  ip address 10.0.0.1 255.255.255.0
! Ensures longer packets are fragmented before they are encrypted; otherwise, the receiving
router would have to do the reassembly.
  ip mtu 1400
! The following line must match on all nodes that "want to use" this mGRE tunnel:
  ip nhrp authentication donttell
! Note that the next line is required only on the hub.
  ip nhrp network-id 99
  ip nhrp holdtime 300
! Turns off split horizon on the mGRE tunnel interface; otherwise, EIGRP will not advertise
routes that are learned via the mGRE interface back out that interface.
  no ip split-horizon eigrp 1
! Enables dynamic, direct spoke-to-spoke tunnels when using EIGRP.
  no ip next-hop-self eigrp 1
  ip tcp adjust-mss 1360
  delay 1000
! Sets IPsec peer address to Ethernet interface’s public address.
  tunnel source Ethernet0
  tunnel mode gre multipoint
! The following line must match on all nodes that want to use this mGRE tunnel.
  tunnel key 100000
  tunnel protection ipsec profile vpnprof
! interface Ethernet0
  ip address 172.17.0.1 255.255.255.0
!
interface Ethernet1
  ip address 192.168.0.1 255.255.255.0
!
router eigrp 1
  network 10.0.0.0 0.0.0.255
  network 192.168.0.0 0.0.0.255
!
For information about defining and configuring ISAKMP profiles, see the references in the “Related Documents” section.

Example Spoke Configuration for DMVPN

In the following example, all spokes are configured the same except for tunnel and local interface address,
thereby, reducing necessary configurations for the user:

crypto isakmp policy 1
  encc aes
  authentication pre-share
  group 14
  crypto isakmp key cisco497 address 0.0.0.0
!
  crypto ipsec transform-set trans2 esp-aes esp-sha-hmac
  mode transport
!
  crypto ipsec profile vpnprof
  set transform-set trans2
!
interface Tunnel0
  bandwidth 1000
  ip address 10.0.0.2 255.255.255.0
  ip mtu 1400
! The following line must match on all nodes that want to use this mGRE tunnel:
  ip nhrp authentication donttell
! Definition of NHRP server at the hub (10.0.0.1), which is permanently mapped to the static
public address of the hub (172.17.0.1).
  ip nhrp map 10.0.0.1 172.17.0.1
! Sends multicast packets to the hub router, and enables the use of a dynamic routing
protocol between the spoke and the hub.

ip nhrp map multicast 172.17.0.1
! The following line must match on all nodes that want to use this mGRE tunnel:
  ip nhrp network-id 99
  ip nhrp holdtime 300
! Configures the hub router as the NHRP next-hop server.
  ip nhrp nh 10.0.0.1
  ip tcp adjust-mss 1360
delay 1000
tunnel source Ethernet0
tunnel mode gre multipoint
! The following line must match on all nodes that want to use this mGRE tunnel:
tunnel key 100000
tunnel protection ipsec profile vpnprof
!
! This is a spoke, so the public address might be dynamically assigned via DHCP.
interface Ethernet0
  ip address dhcp hostname Spoke1

interface Ethernet1
  ip address 192.168.1.1 255.255.255.0
!
! EIGRP is configured to run over the inside physical interface and the tunnel.
router eigrp 1
  network 10.0.0.0 0.0.0.255
  network 192.168.1.0 0.0.0.255

Example VRF Aware DMVPN

When configuring VRF Aware DMVPN, you must create a separate DMVPN network for each VRF instance. In the following example, there are two DMVPN networks: BLUE and RED. In addition, a separate source interface has been used on the hub for each DMVPN tunnel—a must for Cisco IOS Release 12.2(18)SXE. For other Cisco IOS releases, you can configure the same tunnel source for both of the tunnel interfaces, but you must configure the `tunnel key` and `tunnel protection ipsec profile` commands.

If you use the `shared` keyword, then you should be running Cisco IOS Release 12.4(5) or Release 12.4(6)T, or a later release. Otherwise the IPsec/GRE tunnels under the two mGRE tunnel interfaces may not function correctly.

Hub Configuration

interface Tunnel0
  ! Note the next line.
  ip vrf forwarding BLUE
  bandwidth 1000
  ip address 10.0.0.1 255.255.255.0
  ip mtu 1436
  ! Note the next line.
  ip nhrp authentication BLUE!KEY
  ip nhrp map multicast dynamic
  ! Note the next line
  ip nhrp network-id 100000
  ip nhrp holdtime 600
  no ip split-horizon eigrp 1
  no ip next-hop-self eigrp 1
  ip tcp adjust-mss 1360
delay 1000
  ! Note the next line.
  tunnel source Ethernet0
tunnel mode gre multipoint
tunnel protection ipsec profile vpnprof!
interface Tunnel1
! Note the next line.
ip vrf forwarding RED
bandwidth 1000
ip address 10.0.0.1 255.255.255.0
ip mtu 1436
! Note the next line.
ip nhrp authentication RED!KEY
ip nhrp map multicast dynamic
! Note the next line.
ip nhrp network-id 20000
ip nhrp holdtime 600
no ip split-horizon eigrp 1
no ip next-hop-self eigrp 1
ip tcp adjust-mss 1360
delay 1000
! Note the next line.
tunnel source Ethernet1
tunnel mode gre multipoint
tunnel protection ipsec profile vpnprof!
interface Ethernet0
ip address 172.17.0.1 255.255.255.0
interface Ethernet1
ip address 192.0.2.171 255.255.255.0

For the hub configuration shown above, a separate DMVPN network is configured for each VPN. The NHRP network ID and authentication keys must be unique on the two mGRE interfaces.

**EIGRP Configuration on the Hub**

```
router eigrp 1
auto-summary
!
address-family ipv4 vrf BLUE
network 10.0.0.0 0.0.0.255
no auto-summary
autonomous-system 1
exit-address-family
!
address-family ipv4 vrf RED
network 10.0.0.0 0.0.0.255
no auto-summary
autonomous-system 1
exit-address-family
```

**Spoke Configurations**

**Spoke 1:**

```
interface Tunnel0
bandwidth 1000
ip address 10.0.0.2 255.255.255.0
ip mtu 1436
! Note the next line.
ip nhrp authentication BLUE!KEY
ip nhrp map 10.0.0.1 172.17.0.1
ip nhrp network-id 100000
ip nhrp holdtime 300
ip nhrp nhs 10.0.0.1
ip tcp adjust-mss 1360
delay 1000
tunnel mode gre multipoint
tunnel source Ethernet0
```
Example 2547oDMVPN with Traffic Segmentation (with BGP only)

The following example shows a traffic segmentation configuration in which traffic is segmented between two spokes that serve as provider edge (PE) devices.

Hub Configuration

cisco hostname hub-pe1
cisco boot-start-marker
cisco boot-end-marker
cisco no aaa new-model
cisco resource policy
cisco clock timezone EST 0
cisco ip cef
cisco no ip domain lookup

Feature Information for Dynamic Multipoint VPN (DMVPN)

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

| Manageability Enhancements for DMVPN | 12.4(9)T | DMVPN session manageability was expanded with DMVPN specific commands for debugging, show output, session and counter control, and system log information. The following sections provide information about this feature:  
  - Troubleshooting Dynamic Multipoint VPN (DMVPN)  
  
  The following commands were introduced or modified by this feature: **clear dmvpn session, clear dmvpn statistics, debug dmvpn, debug nhrp condition, debug nhrp error, logging dmvpn, show dmvpn, show ip nhrp traffic.** |
| DMVPN Phase 2 | 12.2(18)SXE 12.3(9)a 12.3(8)T1 | DMVPN Spoke-to-Spoke functionality was made more production ready. If you are using this functionality in a production network, the minimum release is Release 12.3(9a) or Release 12.3(8)T1.  
  
  In Release 12.2(18)SXE, support was added for the Cisco Catalyst 6500 series switch and the Cisco 7600 series router. |
| -- | 12.3(6) 12.3(7)T | Virtual Route Forwarding Integrated DMVPN and Network Address Translation-Transparency (NAT-T) Aware DMVPN enhancements were added. In addition, DMVPN Hub-to-Spoke functionality was made more production ready. If you are using this functionality in a production network, the minimum release requirement is Cisco IOS Release 12.3(6) or 12.3(7)T.  
  
  The enhancements added in Cisco IOS Release 12.3(6) were integrated into Cisco IOS Release 12.3(7)T. |

</table>

---

**Glossary**

**AM** --aggressive mode. A mode during IKE negotiation. Compared to MM, AM eliminates several steps, making it faster but less secure than MM. Cisco IOS software will respond in aggressive mode to an IKE peer that initiates aggressive mode.

**GRE** --generic routing encapsulation. Tunnels that provide a specific pathway across the shared WAN and encapsulate traffic with new packet headers to ensure delivery to specific destinations. The network is private because traffic can enter a tunnel only at an endpoint. Tunnels do not provide true confidentiality (encryption does) but can carry encrypted traffic.

GRE tunneling can also be used to encapsulate non-IP traffic into IP and send it over the Internet or IP network. The Internet Package Exchange (IPX) and AppleTalk protocols are examples of non-IP traffic.

**IKE** --Internet Key Exchange. A hybrid protocol that implements Oakley key exchange and Skeme key exchange inside the ISAKMP framework. Although IKE can be used with other protocols, its initial implementation is with IPsec. IKE provides authentication of the IPsec peers, negotiates IPsec keys, and negotiates IPsec security associations.

**IPsec** --IP security. A framework of open standards developed by the Internet Engineering Task Force (IETF). IPsec provides security for transmission of sensitive information over unprotected networks such as the Internet. IPsec acts at the network layer, protecting and authenticating IP packets between participating IPsec devices (“peers”), such as Cisco routers.

**ISAKMP** --Internet Security Association Key Management Protocol. A protocol framework that defines payload formats, the mechanics of implementing a key exchange protocol, and the negotiation of a security association.

**MM** --main mode. Mode that is slower than aggressive mode but more secure and more flexible than aggressive mode because it can offer an IKE peer more security proposals. The default action for IKE authentication (rsa-sig, rsa-encr, or preshared) is to initiate main mode.

**NHRP** --Next Hop Resolution Protocol. Routers, access servers, and hosts can use NHRP to discover the addresses of other routers and hosts connected to a NBMA network.

The Cisco implementation of NHRP supports the IETF draft version 11 of NBMA Next Hop Resolution Protocol (NHRP).

The Cisco implementation of NHRP supports IP Version 4, Internet Packet Exchange (IPX) network layers, and, at the link layer, ATM, Ethernet, SMDS, and multipoint tunnel networks. Although NHRP is available...
on Ethernet, NHRP need not be implemented over Ethernet media because Ethernet is capable of broadcasting. Ethernet support is unnecessary (and not provided) for IPX.

**PFS** --Perfect Forward Secrecy. A cryptographic characteristic associated with a derived shared secret value. With PFS, if one key is compromised, previous and subsequent keys are not compromised, because subsequent keys are not derived from previous keys.

**SA** --security association. Describes how two or more entities will utilize security services to communicate securely. For example, an IPsec SA defines the encryption algorithm (if used), the authentication algorithm, and the shared session key to be used during the IPsec connection.

Both IPsec and IKE require and use SAs to identify the parameters of their connections. IKE can negotiate and establish its own SA. The IPsec SA is established either by IKE or by manual user configuration.

**transform** --The list of operations done on a dataflow to provide data authentication, data confidentiality, and data compression. One example of a transform is ESP with the 256-bit AES encryption algorithm and the AH protocol with the HMAC-SHA authentication algorithm.

**VPN** --Virtual Private Network. A framework that consists of multiple peers transmitting private data securely to one another over an otherwise public infrastructure. In this framework, inbound and outbound network traffic is protected using protocols that tunnel and encrypt all data. This framework permits networks to extend beyond their local topology, while remote users are provided with the appearance and functionality of a direct network connection.
