Important Information about Cisco IOS XE 16

Effective Cisco IOS XE Release 3.7.0E for Catalyst Switching and Cisco IOS XE Release 3.17S (for Access and Edge Routing) the two releases evolve (merge) into a single version of converged release—the Cisco IOS XE 16—providing one release covering the extensive range of access and edge products in the Switching and Routing portfolio.

Feature Information

Use Cisco Feature Navigator to find information about feature support, platform support, and Cisco software image support. An account on Cisco.com is not required.

Introduction to FlexVPN

Internet Key Exchange Version 2 (IKEv2), a next-generation key management protocol based on RFC 4306, is an enhancement of the IKE Protocol. IKEv2 is used for performing mutual authentication and establishing and maintaining security associations (SAs).

FlexVPN is Cisco's implementation of the IKEv2 standard featuring a unified paradigm and CLI that combines site to site, remote access, hub and spoke topologies and partial meshes (spoke to spoke direct). FlexVPN offers a simple but modular framework that extensively uses the tunnel interface paradigm while remaining compatible with legacy VPN implementations using crypto maps.

This guide contains the following modules:

- Configuring Internet Key Exchange Version 2 (IKEv2) and FlexVPN Remote Access, on page 3
- Configuring FlexVPN Server, on page 4
- Configuring FlexVPN Client, on page 4
- Configuring IKEv2 Load Balancer, on page 4
- Configuring IKEv2 Fragmentation, on page 4
- Configuring IKEv2 Reconnect, on page 4
- Configuring IKEv2 Packet of Disconnect, on page 4
- Configuring IKEv2 Change of Authorization Support, on page 4
- Configuring Aggregate Authentication, on page 4
- Appendix: FlexVPN RADIUS Attributes, on page 5
- Appendix: IKEv2 and Legacy VPNs, on page 5

Configuring Internet Key Exchange Version 2 (IKEv2) and FlexVPN Remote Access

This module describes IKEv2 CLI and is divided into basic and advanced sections.

The basic section introduces basic IKEv2 commands and describes IKEv2 smart defaults and the mandatory IKEv2 commands required for FlexVPN remote access. This module is a prerequisite for understanding subsequent chapters.

The advanced section describes global IKEv2 commands and how to override the default IKEv2 commands.
Configuring FlexVPN Server

This module describes FlexVPN server features, IKEv2 commands required to configure FlexVPN server, remote access clients and the supported RADIUS attributes.

Configuring FlexVPN Client

This module describes FlexVPN client features and the IKEv2 commands required for FlexVPN client.

Configuring IKEv2 Load Balancer

This module describes the IKEv2 Load Balancer Support feature and the IKEv2 commands required to configure the IKEv2 Load Balancer.

Configuring IKEv2 Fragmentation

The IKE Fragmentation adhering to RFC feature implements fragmentation of Internet Key Exchange Version 2 (IKEv2) packets as proposed in the IETF draft-ietf-ipsecme-ikev2-fragmentation-10 document.

Configuring IKEv2 Reconnect

The IOS IKEv2 support for AutoReconnect feature of AnyConnect feature helps in reestablishing IKEv2 negotiation without user interaction with the Cisco AnyConnect client.

Configuring IKEv2 Packet of Disconnect

The IKEv2 Remote Access Change of Authorization (CoA)—Packet of Disconnect feature terminates an active crypto IKEv2 session on Cisco supported devices.

Configuring IKEv2 Change of Authorization Support

The FlexVPN - IKEv2 CoA for QoS and ACL feature supports RADIUS Change of Authorization (CoA) on an active IKEv2 crypto session.

Configuring Aggregate Authentication

The FlexVPN RA - Aggregate Auth Support for AnyConnect feature implements aggregate authentication method by extending support for Cisco AnyConnect client that uses the proprietary AnyConnect EAP
authentication method to establish a secure tunnel over the Internet between Cisco AnyConnect client and FlexVPN server.

**Appendix: FlexVPN RADIUS Attributes**

This module describes the RADIUS attributes supported by FlexVPN server.

**Appendix: IKEv2 and Legacy VPNs**

This module contains configuration examples on how to configure legacy VPNs such as crypto maps and DMVPN with Internet Key Exchange Version 2 (IKEv2).
Determining Internet Key Exchange Version 2

This module contains information about and instructions for configuring basic and advanced Internet Key Exchange Version 2 (IKEv2). The tasks and configuration examples for IKEv2 in this module are divided as follows:

- Basic IKEv2—Provides information about basic IKEv2 commands, IKEv2 smart defaults, basic IKEv2 profile, and IKEv2 key ring.
- Advanced IKEv2—Provides information about global IKEv2 commands and how to override IKEv2 smart defaults.

Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for Configuring Internet Key Exchange Version 2

You should be familiar with the concepts and tasks described in the “Configuring Security for VPNs with IPsec” module.

Restrictions for Configuring Internet Key Exchange Version 2

You cannot configure an option that is not supported on a specific platform. For example, in a security protocol, the capability of the hardware-crypto engine is important, and you cannot specify the Triple Data Encryption Standard (3DES) or the Advanced Encryption Standard (AES) type of encryption transform in a nonexportable image, or specify an encryption algorithm that a crypto engine does not support.

Note

IKEv2 is not supported on Integrated Service Routers (ISR) G1.

Information About Internet Key Exchange Version 2

IKEv2 Supported Standards

Note

Cisco no longer recommends using DES or MD5 (including HMAC variant); instead, you should use AES and SHA-256. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

The component technologies implemented in IKEv2 are as follows:

- AES-CBC—Advanced Encryption Standard—Cipher Block Chaining
- SHA (HMAC variant)—Secure Hash Algorithm
- Diffie-Hellman—A public-key cryptography protocol
- DES—Data Encryption Standard (No longer recommended)
- MD5 (HMAC [Hash-based Message Authentication Code] variant)—Message digest algorithm 5 (No longer recommended)

For more information about supported standards and component technologies, see the “Supported Standards for Use with IKE” section in the “Configuring Internet Key Exchange for IPsec VPNs” module in the Internet Key Exchange for IPsec VPNs Configuration Guide.
Benefits of IKEv2

Dead Peer Detection and Network Address Translation-Traversals
Internet Key Exchange Version 2 (IKEv2) provides built-in support for Dead Peer Detection (DPD) and Network Address Translation-Traversals (NAT-T).

Certificate URLs
Certificates can be referenced through a URL and hash, instead of being sent within IKEv2 packets, to avoid fragmentation.

Denial of Service Attack Resilience
IKEv2 does not process a request until it determines the requester, which addresses to some extent the Denial of Service (DoS) problems in IKEv1, which can be spoofed into performing substantial cryptographic (expensive) processing from false locations.

EAP Support
IKEv2 allows the use of Extensible Authentication Protocol (EAP) for authentication.

Multiple Crypto Engines
If your network has both IPv4 and IPv6 traffic and you have multiple crypto engines, choose one of the following configuration options:

- One engine handles IPv4 traffic and the other engine handles IPv6 traffic.
- One engine handles both IPv4 and IPv6 traffic.

Reliability and State Management (Windowing)
IKEv2 uses sequence numbers and acknowledgments to provide reliability, and mandates some error-processing logistics and shared state management.

Internet Key Exchange Version 2 CLI Constructs

IKEv2 Proposal
An Internet Key Exchange Version 2 (IKEv2) proposal is a collection of transforms used in the negotiation of Internet Key Exchange (IKE) security associations (SAs) as part of the IKE_SA_INIT exchange. The transform types used in the negotiation are as follows:

- Encryption algorithm
- Integrity algorithm
- Pseudo-Random Function (PRF) algorithm
- Diffie-Hellman (DH) group
See the “IKEv2 Smart Defaults” section for information about the default IKEv2 proposal. See the “Configuring Advanced IKEv2 CLI Constructs” section for information about how to override the default IKEv2 proposal and to define new proposals.

**IKEv2 Policy**

An IKEv2 policy contains proposals that are used to negotiate the encryption, integrity, PRF algorithms, and DH group in the IKE_SA_INIT exchange. It can have match statements, which are used as selection criteria to select a policy during negotiation.

See the “IKEv2 Smart Defaults” section for information about the default IKEv2 policy. See the “Configuring Advanced IKEv2 CLI Constructs” section for information about how to override the default IKEv2 policy and to define new policies.

**IKEv2 Profile**

An IKEv2 profile is a repository of nonnegotiable parameters of the IKE SA, such as local or remote identities and authentication methods and services that are available to authenticated peers that match the profile. An IKEv2 profile must be attached to either a crypto map or an IPsec profile on the initiator. An IKEv2 profile is not mandatory on the responder.

**IKEv2 Key Ring**

An IKEv2 key ring is a repository of symmetric and asymmetric preshared keys and is independent of the IKEv1 key ring. The IKEv2 key ring is associated with an IKEv2 profile and hence supports a set of peers that match the IKEv2 profile. The IKEv2 key ring gets its VPN routing and forwarding (VRF) context from the associated IKEv2 profile.

**IKEv2 Smart Defaults**

The IKEv2 Smart Defaults feature minimizes the FlexVPN configuration by covering most of the use cases. IKEv2 smart defaults can be customized for specific use cases, though this is not recommended.

See the “Configuring Advanced IKEv2 CLI Constructs” section for information about how to modify the default IKEv2 constructs.

The following rules apply to the IKEv2 Smart Defaults feature:

1. A default configuration is displayed in the corresponding show command with default as a keyword and with no argument. For example, the `show crypto ikev2 proposal default` command displays the default IKEv2 proposal and the `show crypto ikev2 proposal` command displays the default IKEv2 proposal, along with any user-configured proposals.

2. A default configuration is displayed in the `show running-config all` command; it is not displayed in the `show running-config` command.

3. You can modify the default configuration, which is displayed in the `show running-config all` command.

4. A default configuration can be disabled using the no form of the command; for example, `no crypto ikev2 proposal default`. A disabled default configuration is not used in negotiation but the configuration is displayed in the `show running-config` command. A disabled default configuration loses any user modification and restores system-configured values.

5. A default configuration can be reenabled using the default form of the command, which restores system-configured values; for example, `default crypto ikev2 proposal`. 
6. The default mode for the default transform set is transport; the default mode for all other transform sets is tunnel.

Cisco no longer recommends using MD5 (including HMAC variant) and Diffie-Hellman (DH) groups 1, 2 and 5; instead, you should use SHA-256 and DH Groups 14 or higher. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

The following table lists the commands that are enabled with the IKEv2 Smart Defaults feature, along with the default values.

</tbody>
</table>
Before you can use the default IPsec profile, explicitly specify the `crypto ipsec profile` command on a tunnel interface using the `tunnel protection ipsec profile default` command.

---

**IKEv2 Suite-B Support**

Suite-B is a set of cryptographic algorithms promulgated by the National Security Agency as part of its Cryptographic Modernization Program. Suite-B for Internet Key Exchange (IKE) and IPsec is defined in RFC 4869. The Suite-B components are as follows:

- Advanced Encryption Standard (AES) 128- and 256-bit keys configured in the IKEv2 proposal. For data traffic, AES should be used in Galois Counter Mode (GCM) that is configured in the IPsec transform set.
- Elliptic Curve Digital Signature Algorithm (ECDSA) configured in the IKEv2 profile.
- Secure Hashing Algorithm 2 (SHA-256 and SHA-384) configured in the IKEv2 proposal and IPsec transform set.

Suite-B requirements comprise four user-interface suites of cryptographic algorithms for use with IKE and IPsec. Each suite consists of an encryption algorithm, a digital-signature algorithm, a key-agreement algorithm, and a hash- or message-digest algorithm. See the “Configuring Security for VPNs with IPsec” feature module for detailed information about Cisco Suite-B support.

---

**AES-GCM Support**

An authenticated encryption algorithm provides a combined functionality of encryption and integrity. Such algorithms are called combined mode algorithms. The Support of AES-GCM as an IKEv2 Cipher on IOS feature provides the use of authenticated encryption algorithms for encrypted messages in IKEv2 protocol by adding the Advanced Encryption Standard in Galois/Counter Mode (AES-GCM). AES-GCM supports the key size of 128- and 256-bits—AES-GCM-128 and AES-GCM-256.

---

**Auto Tunnel Mode Support in IKEv2**

When configuring a VPN headend in a multiple vendor scenario, you must be aware of the technical details of the peer or responder. For example, some devices may use IPsec tunnels while others may use generic routing encapsulation (GRE) or IPsec tunnel, and sometimes, a tunnel may be IPv4 or IPv6. In the last case, you must configure an Internet Key Exchange (IKE) profile and a virtual template.

The Tunnel Mode Auto Selection feature eases the configuration and spares you about knowing the responder’s details. This feature automatically applies the tunneling protocol (GRE or IPsec) and transport protocol (IPv4 or IPv6) on the virtual template as soon as the IKE profile creates the virtual access interface. This feature is useful on dual stack hubs aggregating multivendor remote access, such as Cisco AnyConnect VPN Client, Microsoft Windows7 Client, and so on.
The Tunnel Mode Auto Selection feature eases the configuration for a responder only. The tunnel must be statically configured for an initiator.

The Tunnel Mode Auto Selection feature can be activated using the `auto mode` keywords in the `virtual-template` command in the IKEv2 profile configuration.

### How to Configure Internet Key Exchange Version 2

#### Configuring Basic Internet Key Exchange Version 2 CLI Constructs

To enable IKEv2 on a crypto interface, attach an Internet Key Exchange Version 2 (IKEv2) profile to the crypto map or IPsec profile applied to the interface. This step is optional on the IKEv2 responder.

The difference between IKEv1 and IKEv2 is that you need not enable IKEv1 on individual interfaces because IKEv1 is enabled globally on all interfaces on a device.

Perform the following tasks to manually configure basic IKEv2 constructs:

#### Configuring the IKEv2 Keyring

Perform this task to configure the IKEv2 key ring if the local or remote authentication method is a preshared key.

IKEv2 key ring keys must be configured in the peer configuration submode that defines a peer subblock. An IKEv2 key ring can have multiple peer subblocks. A peer subblock contains a single symmetric or asymmetric key pair for a peer or peer group identified by any combination of the hostname, identity, and IP address.

IKEv2 key rings are independent of IKEv1 key rings. The key differences are as follows:

- IKEv2 key rings support symmetric and asymmetric preshared keys.
- IKEv2 key rings do not support Rivest, Shamir, and Adleman (RSA) public keys.
- IKEv2 key rings are specified in the IKEv2 profile and are not looked up, unlike IKEv1, where keys are looked up on receipt of MM1 to negotiate the preshared key authentication method. The authentication method is not negotiated in IKEv2.
- IKEv2 key rings are not associated with VPN routing and forwarding (VRF) during configuration. The VRF of an IKEv2 key ring is the VRF of the IKEv2 profile that refers to the key ring.
- A single key ring can be specified in an IKEv2 profile, unlike an IKEv1 profile, which can specify multiple key rings.
- A single key ring can be specified in more than one IKEv2 profile, if the same keys are shared across peers matching different profiles.
- An IKEv2 key ring is structured as one or more peer subblocks.
On an IKEv2 initiator, the IKEv2 key ring key lookup is performed using the peer’s hostname or the address, in that order. On an IKEv2 responder, the key lookup is performed using the peer’s IKEv2 identity or the address, in that order.

**Note**
You cannot configure the same identity in more than one peer.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **crypto ikev2 keyring** `keyring-name`
4. **peer** `name`
5. **description** `line-of-description`
6. **hostname** `name`
7. **address** `{ipv4-address [mask] | ipv6-address prefix}`
8. **identity** `{address | fqdn domain | email domain}`
9. **pre-shared-key** `{local | remote} [0 | 6] line hex hexadecimal-string`
10. **end**

**DETAILED STEPS**

<td>end</td>
<td>Exits IKEv2 key ring peer configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-ikev2-keyring-peer)# end</td>
<td></td>
</tr>
</tbody>
</table>

### What to Do Next

After configuring the IKEv2 key ring, configure the IKEv2 profile. For more information, see the “Configuring IKEv2 Profile (Basic)” section.

### Configuring an IKEv2 Profile (Basic)

Perform this task to configure the mandatory commands for an IKEv2 profile.

An IKEv2 profile is a repository of nonnegotiable parameters of the IKE security association (SA) (such as local or remote identities and authentication methods) and services available to authenticated peers that match the profile. An IKEv2 profile must be configured and associated with either a crypto map or an IPsec profile on the IKEv2 initiator. Use the `set ikev2-profile profile-name` command to associate a profile with a crypto map or an IPsec profile. To disassociate the profile, use the `no` form of the command.

The following rules apply to match statements:
• An IKEv2 profile must contain a match identity or a match certificate statement; otherwise, the profile is considered incomplete and is not used. An IKEv2 profile can have more than one match identity or match certificate statements.

• An IKEv2 profile must have a single match Front Door VPN routing and forwarding (FVRF) statement.

• When a profile is selected, multiple match statements of the same type are logically ORed, and multiple match statements of different types are logically ANDed.

• The match identity and match certificate statements are considered to be the same type of statements and are ORed.

• Configuration of overlapping profiles is considered a misconfiguration. In the case of multiple profile matches, no profile is selected.

Use the `show crypto ikev2 profile profile-name` command to display the IKEv2 profile.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto ikev2 profile profile-name`
4. `description line-of-description`
5. `aaa accounting {psk | cert | eap} list-name`
6. `authentication {local {rsa-sig | pre-share [key {0 | 6} password] | ecdsa-sig | eap [gtc | md5 | ms-chapv2] [username username] [password {0 | 6} password]} | remote {eap [query-identity | timeout seconds] | rsa-sig | pre-share [key {0 | 6} password] | ecdsa-sig}}`
7. `dpd interval retry-interval {on-demand | periodic}`
8. `identity local {address {ipv4-address | ipv6-address} | dn | email email-string | fqdn fqdn-string | key-id opaque-string}`
9. `initial-contact force`
10. `ivrf name`
11. `keyring {local keyring-name | aaa list-name [name-mangler mangler-name | password password]}
12. `lifetime seconds`
13. `match {address local {ipv4-address | ipv6-address | interface name} | certificate certificate-map | fvrf {fvrf-name | any} | identity remote address {ipv4-address [mask] | ipv6-address prefix} | {email [domain string] | fqdn [domain string]} string | key-id opaque-string}`
14. `nat keepalive seconds`
15. `pki trustpoint trustpoint-label [sign | verify]`
16. `virtual-template number mode auto`
17. `shutdown`
18. `end`

|---|---|
| Example: | Device(config-ikev2-profile)# aaa accounting eap list1 |

| Step 6 | authentication {local | rsa-sig | pre-share [key {0 | 6} password] | ecdsa-sig | eap [gtc | md5 | ms-chapv2] [username username] [password {0 | 6} password1] | remote [eap | query-identity | timeout seconds] | rsa-sig | pre-share [key {0 | 6} password] | ecdsa-sig] |
|---|---|
| Example: | Device(config-ikev2-profile)# authentication local ecdsa-sig |

| Step 7 | dpd interval retry-interval {on-demand | periodic} |
|---|---|
| Example: | Device(config-ikev2-profile)# dpd 30 6 on-demand |

### Purpose

- **Device> enable**
  
  Enters global configuration mode.

- **Device# configure terminal**
  
  Defines an IKEv2 profile and enters IKEv2 profile configuration mode.

- **Device(config)# crypto ikev2 profile profile1**
  
  (Optional) Describes the profile.

- **Device(config-ikev2-profile)# description This is an IKEv2 profile**
  
  (Optional) Enables authentication, authorization, and accounting (AAA) accounting method lists for IPsec sessions.

- **Device(config-ikev2-profile)# aaa accounting eap list1**
  
  Note: If the `psk`, `cert`, or `eap` keyword is not specified, the AAA accounting method list is used irrespective of the peer authentication method.

- **Device(config-ikev2-profile)# authentication local ecdsa-sig**
  
  Specifies the local or remote authentication method.

  - **rsa-sig**—Specifies RSA-sig as the authentication method.
  
  - **pre-share**—Specifies the preshared key as the authentication method.
  
  - **ecdsa-sig**—Specifies ECDSA-sig as the authentication method.
  
  - **eap**—Specifies EAP as the remote authentication method.

  - **query-identity**—Queries the EAP identity from the peer.
  
  - **timeout seconds**—Specifies the duration, in seconds, to wait for the next IKE_AUTH request after sending the first IKE_AUTH response.

  Note: You can specify only one local authentication method but multiple remote authentication methods.

- **Device(config-ikev2-profile)# dpd 30 6 on-demand**
  
  (Optional) Configures Dead Peer Detection (DPD) globally for peers matching the profile.

  - Dead Peer Detection (DPD) is disabled by default.
### Purpose
In the example in this step, the first DPD is sent after 30 seconds when there is no incoming ESP traffic. After waiting for 6 seconds (which is the specified retry interval), DPD retries are sent aggressively 5 times in intervals of 6 seconds each. So, a total of 66 seconds \((30 + 6 + 6 \times 5 = 66)\) elapses before a crypto session is torn down because of DPD.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong> identity local {address {ipv4-address</td>
<td>ipv6-address}}</td>
</tr>
<tr>
<td>\dn {email email-string</td>
<td>fqdn fqdn-string</td>

<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# identity local email <a href="mailto:abc@example.com">abc@example.com</a></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> initial-contact force</td>
<td>Enforces initial contact processing if the initial contact notification is not received in the IKE_AUTH exchange.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# initial-contact force</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> ivrf name</td>
<td>(Optional) Specifies a user-defined VPN routing and forwarding (VRF) or global VRF if the IKEv2 profile is attached to a crypto map.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# ivrf vrf1</td>
<td>• If the IKEv2 profile is used for tunnel protection, the Inside VRF (IVRF) for the tunnel interface should be configured on the tunnel interface.</td>
</tr>
<tr>
<td><strong>Step 11</strong> keyring {local keyring-name</td>
<td>aaa list-name [name-mangler mangler-name</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# keyring aaa keyring1 name-mangler mangler1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> lifetime seconds</td>
<td>Specifies the lifetime, in seconds, for the IKEv2 SA.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# lifetime 1000</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td><strong>match</strong> {address local {ipv4-address</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-profile)# match address local interface Ethernet 2/0</td>
</tr>
<tr>
<td><strong>Step 14</strong></td>
<td><strong>nat keepalive</strong> seconds</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-profile)# nat keepalive 500</td>
</tr>
<tr>
<td><strong>Step 15</strong></td>
<td><strong>pki trustpoint</strong> trustpoint-label [sign</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-profile)# pki trustpoint tsp1 sign</td>
</tr>
<tr>
<td><strong>Step 16</strong></td>
<td><strong>virtual-template</strong> number mode auto</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-profile)# virtual-template 1 mode auto</td>
</tr>
<tr>
<td><strong>Step 17</strong></td>
<td><strong>shutdown</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-profile)# shutdown</td>
</tr>
<tr>
<td><strong>Step 18</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-profile)# end</td>
</tr>
</tbody>
</table>

(Optional) Enables NAT keepalive and specifies the duration in seconds.
- NAT is disabled by default.

Specifies Public Key Infrastructure (PKI) trustpoints for use with the RSA signature authentication method.

**Note**
- If the `sign` or `verify` keyword is not specified, the trustpoint is used for signing and verification.
- In contrast to IKEv1, a trustpoint must be configured in an IKEv2 profile for certificate-based authentication to succeed. There is no fallback for globally configured trustpoints if this command is not present in the configuration. The trustpoint configuration applies to the IKEv2 initiator and responder.

(Optional) Specifies the virtual template for cloning a virtual access interface (VAI).
- **mode auto**—Enables the tunnel mode auto selection feature.

For the IPsec Dynamic Virtual Tunnel Interface (DVTI), a virtual template must be specified in an IKEv2 profile, without which an IKEv2 session is not initiated.

(Optional) Shuts down the IKEv2 profile.

Exits IKEv2 profile configuration mode and returns to privileged EXEC mode.
Configuring Advanced Internet Key Exchange Version 2 CLI Constructs

This section describes the global IKEv2 CLI constructs and how to override the IKEv2 default CLI constructs. IKEv2 smart defaults support most use cases and hence, we recommend that you override the defaults only if they are required for specific use cases not covered by the defaults.

Perform the following tasks to configure advanced IKEv2 CLI constructs:

Configuring Global IKEv2 Options

Perform this task to configure global IKEv2 options that are independent of peers.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto ikev2 certificate-cache number-of-certificates`
4. `crypto ikev2 cookie-challenge number`
5. `crypto ikev2 diagnose error number`
6. `crypto ikev2 dpd interval retry-interval {on-demand | periodic}`
7. `crypto ikev2 http-url cert`
8. `crypto ikev2 limit {max-in-negotiation-sa limit | max-sa limit}`
9. `crypto ikev2 nat keepalive interval`
10. `crypto ikev2 window size`
11. `crypto logging ikev2`
12. `end`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>

<td>• Cookie challenge is disabled by default.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 5    | crypto ikev2 diagnose error number | Enables IKEv2 error diagnostics and defines the number of entries in the exit path database.  
- IKEv2 error diagnostics is disabled by default. |
| 6    | crypto ikev2 dpd interval retry-interval {on-demand | periodic} | Allows live checks for peers as follows:  
- Dead Peer Detection (DPD) is disabled by default.  
**Note** In the example in this step, the first DPD is sent after 30 seconds when there is no incoming ESP traffic. After waiting for 6 seconds (which is the specified retry interval), DPD retries are sent aggressively 5 times in intervals of 6 seconds each. So, a total of 66 seconds \((30 + 6 + 6 \times 5 = 66)\) elapses before a crypto session is torn down because of DPD. |
| 7    | crypto ikev2 http-url cert | Enables the HTTP CERT support.  
- HTTP CERT is disabled by default. |
| 8    | crypto ikev2 limit {max-in-negotiation-sa limit | max-sa limit} | Enables connection admission control (CAC).  
- Connection admission control is enabled by default. |
| 9    | crypto ikev2 nat keepalive interval | Enables the Network Address Translation (NAT) keepalive that prevents the deletion of NAT entries in the absence of any traffic when there is NAT between Internet Key Exchange (IKE) peers.  
- NAT keepalive is disabled by default. |
| 10   | crypto ikev2 window size | Allows multiple IKEv2 request-response pairs in transit.  
- The default window size is 5. |
| 11   | crypto logging ikev2 | Enables IKEv2 syslog messages.  
- IKEv2 syslog messages are disabled by default. |
| 12   | end | Exits global configuration mode and returns to privileged EXEC mode. |

### Configuring IKEv2 Proposal

Refer to the “IKEv2 Smart Defaults” section for information on the default IKEv2 proposal.
Perform this task to override the default IKEv2 proposal or to manually configure the proposals if you do not want to use the default proposal.

An IKEv2 proposal is a set of transforms used in the negotiation of IKEv2 SA as part of the IKE_SA_INIT exchange. An IKEv2 proposal is regarded as complete only when it has at least an encryption algorithm, an integrity algorithm, and a Diffie-Hellman (DH) group configured. If no proposal is configured and attached to an IKEv2 policy, the default proposal in the default IKEv2 policy is used in negotiation.

Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Although the IKEv2 proposal is similar to the `crypto isakmp policy` command, the IKEv2 proposal differs as follows:

- An IKEv2 proposal allows configuring one or more transforms for each transform type.
- An IKEv2 proposal does not have any associated priority.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto ikev2 proposal name`
4. `encryption encryption-type...`
5. `integrity integrity-type...`
6. `group group-type...`
7. `prf prf-algorithm`
8. `end`
9. `show crypto ikev2 proposal [name | default]`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>crypto ikev2 proposal name</code></td>
<td>Overrides the default IKEv2 proposal, defines an IKEv2 proposal name, and enters IKEv2 proposal configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# crypto ikev2 proposal proposal1</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 4</strong> encryption <em>encryption-type</em>...</td>
<td>Specifies one or more transforms of the encryption type, which are as follows:</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-proposal)# encryption aes-cbc-128 aes-cbc-192</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> integrity <em>integrity-type</em>...</td>
<td>Specifies one or more transforms of the integrity algorithm type, which are as follows:</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-proposal)# integrity sha1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> group <em>group-type</em>...</td>
<td>Specifies the Diffie-Hellman (DH) group identifier.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-proposal)# group 14</td>
<td></td>
</tr>
</tbody>
</table>

**Note** An integrity algorithm type cannot be specified if you specify Advanced Encryption Standard (AES) in Galois/Counter Mode (AES GCM) as the encryption type.

- The **md5** keyword specifies MD5 (HMAC variant) as the hash algorithm. (No longer recommended)
- The **sha1** keyword specifies SHA-1 (HMAC variant) as the hash algorithm.
- The **sha256** keyword specifies SHA-2 family 256-bit (HMAC variant) as the hash algorithm.
- The **sha384** keyword specifies SHA-2 family 384-bit (HMAC variant) as the hash algorithm.
- The **sha512** keyword specifies SHA-2 family 512-bit (HMAC variant) as the hash algorithm.

- 3des (No longer recommended)
- aes-cbc-128
- aes-cbc-192
- aes-cbc-256
- aes-gcm-128
- aes-gcm-256

- 1 — 768-bit DH (No longer recommended).
- 2 — 1024-bit DH (No longer recommended).
- 5 — 1536-bit DH (No longer recommended).
- 14 — Specifies the 2048-bit DH group.
- 15 — Specifies the 3072-bit DH group.
- 16 — Specifies the 4096-bit DH group.
- 19 — Specifies the 256-bit elliptic curve DH (ECDH) group.
- 20 — Specifies the 384-bit ECDH group.
- 24 — Specifies the 2048-bit DH group.
### Purpose

The group chosen must be strong enough (have enough bits) to protect the IPsec keys during negotiation. A generally accepted guideline recommends the use of a 2048-bit group after 2013 (until 2030). Either group 14 or group 24 can be selected to meet this guideline. Even if a longer-lived security method is needed, the use of Elliptic Curve Cryptography is recommended, but group 15 and group 16 can also be considered.

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>prf prf-algorithm</td>
<td>Specifies one or more of the Pseudo-Random Function (PRF) algorithm, which are as follows:</td>
</tr>
<tr>
<td>Example:</td>
<td>• md5</td>
</tr>
<tr>
<td></td>
<td>• sha1</td>
</tr>
<tr>
<td></td>
<td>• sha256</td>
</tr>
<tr>
<td></td>
<td>• sha384</td>
</tr>
<tr>
<td></td>
<td>• sha512</td>
</tr>
<tr>
<td>Note</td>
<td>This step is mandatory if the encryption type is AES-GCM—<code>aes-gmc-128</code> or <code>aes-gmc-256</code>. If the encryption algorithm is not AES-GCM, the PRF algorithm is the same as the specified integrity algorithm. However, you can specify a PRF algorithm, if required.</td>
</tr>
</tbody>
</table>

### Step 7

<table>
<thead>
<tr>
<th>Step 7</th>
<th>prf prf-algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-ikev2-proposal)# prf sha256 sha512</td>
</tr>
</tbody>
</table>

### Step 8

<table>
<thead>
<tr>
<th>Step 8</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-ikev2-proposal)# end</td>
</tr>
</tbody>
</table>

### Step 9

| Step 9 | show crypto ikev2 proposal [name | default] |
|--------|----------------------------------|
| Example: | Device# show crypto ikev2 proposal default |

### What to Do Next

After you create the IKEv2 proposal, attach it to a policy so that the proposal is picked for negotiation. For information about completing this task, see the “Configuring IKEv2 Policy” section.

### Configuring IKEv2 Policies

See the “IKEv2 Smart Defaults” section for information about the default IKEv2 policy. Perform this task to override the default IKEv2 policy or to manually configure the policies if you do not want to use the default policy.

An IKEv2 policy must contain at least one proposal to be considered as complete and can have match statements, which are used as selection criteria to select a policy for negotiation. During the initial exchange, the local address (IPv4 or IPv6) and the Front Door VRF (FVRF) of the negotiating SA are matched with the policy and the proposal is selected.

The following rules apply to the match statements:
- An IKEv2 policy without any match statements will match all peers in the global FVRF.
- An IKEv2 policy can have only one match FVRF statement.
- An IKEv2 policy can have one or more match address local statements.
- When a policy is selected, multiple match statements of the same type are logically ORed and match statements of different types are logically ANDed.
- There is no precedence between match statements of different types.
- Configuration of overlapping policies is considered a misconfiguration. In the case of multiple, possible policy matches, the first policy is selected.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto ikev2 policy name`
4. `proposal name`
5. `match fvrf {fvrf-name | any}`
6. `match address local {ipv4-address | ipv6-address}`
7. `end`
8. `show crypto ikev2 policy [policy-name | default]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>crypto ikev2 policy name</code></td>
<td>Overrides the default IKEv2 policy, defines an IKEv2 policy name, and enters IKEv2 policy configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device(config)# crypto ikev2 policy policy1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>proposal name</code></td>
<td>Specifies the proposals that must be used with the policy.</td>
</tr>
<tr>
<td>Example: <code>Device(config-ikev2-policy)# proposal proposal1</code></td>
<td>• The proposals are prioritized in the order of listing.</td>
</tr>
<tr>
<td>Note</td>
<td>You must specify at least one proposal. You can specify additional proposals with each proposal in a separate statement.</td>
</tr>
<tr>
<td><strong>Step 5</strong> `match fvrf {fvrf-name</td>
<td>any}`</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

- **Device(config-ikev2-policy)# match fvrf any**

  **Purpose**
  - The default is global FVRF.

  **Note**
  - The `match fvrf any` command must be explicitly configured in order to match any VRF. The FVRF specifies the VRF in which the IKEv2 packets are negotiated.

### Step 6

- **match address local [ipv4-address | ipv6-address]**

  **Example:**
  - `Device(config-ikev2-policy)# match address local 10.0.0.1`

  **Purpose**
  - (Optional) Matches the policy based on the local IPv4 or IPv6 address.

  - The default matches all the addresses in the configured FVRF.

### Step 7

- **end**

  **Example:**
  - `Device(config-ikev2-policy)# end`

  **Purpose**
  - Exits IKEv2 policy configuration mode and returns to privileged EXEC mode.

### Step 8

- **show crypto ikev2 policy [policy-name | default]**

  **Example:**
  - `Device# show crypto ikev2 policy policy1`

  **Purpose**
  - (Optional) Displays the IKEv2 policy.

---

### Configuration Examples for Internet Key Exchange Version 2

### Configuration Examples for Basic Internet Key Exchange Version 2 CLI Constructs

**Example: Configuring the IKEv2 Key Ring**

**Example: IKEv2 Key Ring with Multiple Peer Subblocks**

The following example shows how to configure an Internet Key Exchange Version 2 (IKEv2) key ring with multiple peer subblocks:

```bash
crypto ikev2 keyring keyring-1
peer peer1
description peer1
address 209.165.200.225 255.255.255.224
pre-shared-key key-1
definition peer2
description peer2
hostname peer1.example.com
pre-shared-key key-2
peer peer3
description peer3
hostname peer3.example.com
identity key-id abc
```
Example: IKEv2 Key Ring with Symmetric Preshared Keys Based on an IP Address

The following example shows how to configure an IKEv2 key ring with symmetric preshared keys based on an IP address. The following is the initiator’s key ring:

```
crypto ikev2 keyring keyring-1
peer peer1
  description peer1
  address 209.165.200.225 255.255.255.224
  pre-shared-key key1
```

The following is the responder’s key ring:

```
crypto ikev2 keyring keyring-1
peer peer2
  description peer2
  address 209.165.200.228 255.255.255.224
  pre-shared-key key1
```

Example: IKEv2 Key Ring with Asymmetric Preshared Keys Based on a Hostname

The following example shows how to configure an IKEv2 key ring with asymmetric preshared keys based on the hostname. The following is the initiator’s key ring:

```
crypto ikev2 keyring keyring-1
peer host1
  description host1 in example domain
  hostname host1.example.com
  pre-shared-key local key1
  pre-shared-key remote key2
```

The following is the responder’s key ring:

```
crypto ikev2 keyring keyring-1
peer host2
  description host2 in example domain
  hostname host2.example.com
  pre-shared-key local key1
  pre-shared-key remote key2
```
Example: IKEv2 Key Ring with Symmetric Preshared Keys Based on an Identity

The following example shows how to configure an IKEv2 key ring with symmetric preshared keys based on an identity:

crypto ikev2 keyring keyring-4
  peer abc
  description example domain
  identity fqdn example.com
  pre-shared-key abc-key-1
  peer user1
  description user1 in example domain
  identity email user1@example.com
  pre-shared-key abc-key-2
  peer user1-remote
  description user1 example remote users
  identity key-id example
  pre-shared-key example-key-3

Example: IKEv2 Key Ring with a Wildcard Key

The following example shows how to configure an IKEv2 key ring with a wildcard key:

crypto ikev2 keyring keyring-1
  peer cisco
  description example domain
  address 0.0.0.0 0.0.0.0
  pre-shared-key example-key

Example: Matching a Key Ring

The following example shows how a key ring is matched:

crypto ikev2 keyring keyring-1
  peer cisco
  description example.com
  address 0.0.0.0 0.0.0.0
  pre-shared-key xyz-key
  peer peer1
  description abc.example.com
  address 10.0.0.0 255.255.0.0
  pre-shared-key abc-key
  peer host1
  description host1@abc.example.com
  address 10.0.0.1
  pre-shared-key host1-example-key

In the example shown, the key lookup for peer 10.0.0.1 first matches the wildcard key example-key, then the prefix key example-key, and finally the host key host1-example-key. The best match host1-example-key is used.

crypto ikev2 keyring keyring-2
  peer host1
  description host1 in abc.example.com sub-domain
address 10.0.0.1
pre-shared-key host1-example-key
peer host2
description example domain
address 0.0.0.0 0.0.0.0
pre-shared-key example-key

In the example shown, the key lookup for peer 10.0.0.1 would first match the host key host1-abc-key. Because this is a specific match, no further lookup is performed.

Example: Configuring the Profile

Example: IKEv2 Profile Matched on Remote Identity

The following profile supports peers that identify themselves using fully qualified domain name (FQDN) example.com and authenticate with the RSA signature using trustpoint-remote. The local node authenticates itself with a preshared key using keyring-1.

crypto ikev2 profile profile2
match identity remote fqdn example.com
identity local email router2@example.com
authentication local pre-share
authentication remote rsa-sig
keyring keyring-1
pki trustpoint trustpoint-remote verify
lifetime 300
dpd 10 5 on-demand
virtual-template 1

Example: IKEv2 Profile Supporting Two Peers

The following example shows how to configure an IKEv2 profile supporting two peers that use different authentication methods:

crypto ikev2 profile profile2
match identity remote email user1@example.com
match identity remote email user2@example.com
identity local email router2@cisco.com
authentication local rsa-sig
authentication remote pre-share
authentication remote rsa-sig
keyring keyring-1
pki trustpoint trustpoint-local sign
pki trustpoint trustpoint-remote verify
lifetime 300
dpd 10 5 on-demand
virtual-template 1

Example: Configuring FlexVPN with Dynamic Routing Using Certificates and IKEv2 Smart Defaults

The following examples show a connection between a branch device (initiator, using a static virtual tunnel interface [sVTI]) and a central device (responder, using a dynamic virtual tunnel interface [dVTI]) with dynamic routing over the tunnel. The example uses IKEv2 smart defaults, and the authentication is performed using certificates (RSA signatures).
A RSA modulus size of 2048 is recommended.

The peers use the FQDN as their IKEv2 identity, and the IKEv2 profile on the responder matches the domain in the identity FQDN.

The configuration on the initiator (branch device) is as follows:

```
hostname branch
ip domain name cisco.com
!
crypto ikev2 profile branch-to-central
match identity remote fqdn central.cisco.com
identity local fqdn branch.cisco.com
authentication local rsa-sig
authentication remote rsa-sig
pki trustpoint CA
!
crypto ipsec profile svti
set ikev2-profile branch-to-central
!
interface Tunnel0
ip address 172.16.0.101 255.255.255.0
tunnel source Ethernet0/0
tunnel mode ipsec ipv4
tunnel destination 10.0.0.100
tunnel protection ipsec profile svti
!
interface Ethernet0/0
ip address 10.0.0.101 255.255.255.0
!
interface Ethernet1/0
ip address 192.168.101.1 255.255.255.0
!
router rip
version 2
passive-interface Ethernet1/0
network 172.16.0.0
network 192.168.101.0
no auto-summary
```

The configuration on the responder (central router) is as follows:

```
hostname central
ip domain name cisco.com
!
crypto ikev2 profile central-to-branch
match identity remote fqdn domain cisco.com
identity local fqdn central.cisco.com
authentication local rsa-sig
authentication remote rsa-sig
pki trustpoint CA
virtual-template 1
!
interface Loopback0
ip address 172.16.0.100 255.255.255.0
!
interface Ethernet0/0
ip address 10.0.0.100 255.255.255.0
!
interface Ethernet1/0
ip address 192.168.100.1 255.255.255.0
```
! interface Virtual-Template1 type tunnel
  ip unnumbered Loopback0
  tunnel source Ethernet0/0
  tunnel mode ipsec ipv4
  tunnel protection ipsec profile default
!
router rip
version 2
passive-interface Ethernet1/0
network 172.16.0.0
network 192.168.100.0
no auto-summary

Configuration Examples for Advanced Internet Key Exchange Version 2 CLI Constructs

Example: Configuring the Proposal

Example: IKEv2 Proposal with One Transform for Each Transform Type
This example shows how to configure an IKEv2 proposal with one transform for each transform type:

crypto ikev2 proposal proposal-1
  encryption aes-cbc-128
  integrity sha1
  group 14

Example: IKEv2 Proposal with Multiple Transforms for Each Transform Type
This example shows how to configure an IKEv2 proposal with multiple transforms for each transform type:

crypto ikev2 proposal proposal-2
  encryption aes-cbc-128 aes-cbc-192
  integrity sha1
  group 14

Note
Cisco no longer recommends using 3DES, MD5 (including HMAC variant), and Diffie-Hellman(DH) groups 1, 2 and 5; instead, you should use AES, SHA-256 and DH Groups 14 or higher. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

The IKEv2 proposal proposal-2 shown translates to the following prioritized list of transform combinations:

- aes-cbc-128, sha1, 14
- aes-cbc-192, sha1, 14

Example: IKEv2 Proposals on the Initiator and Responder

The following example shows how to configure IKEv2 proposals on the initiator and the responder. The proposal on the initiator is as follows:
The proposal on the responder is as follows:

```
crypto ikev2 proposal proposal-2
  encryption aes-cbc-128 aes-cbc-192
  peer
  integrity sha1 sha-256
  group 24 14
```

The selected proposal will be as follows:

```
encryption aes-cbc-128
integrity sha1
group 14
```

In the proposals shown for the initiator and responder, the initiator and responder have conflicting preferences. In this case, the initiator is preferred over the responder.

### Example: Configuring the Policy

#### Example: IKEv2 Policy Matched on a VRF and Local Address

The following example shows how an IKEv2 policy is matched based on a VRF and local address:

```
crypto ikev2 policy policy2
  match vrf vrf1
  match local address 10.0.0.1
  proposal proposal-1
```

#### Example: IKEv2 Policy with Multiple Proposals That Match All Peers in a Global VRF

The following example shows how an IKEv2 policy with multiple proposals matches the peers in a global VRF:

```
crypto ikev2 policy policy2
  proposal proposal-A
  proposal proposal-B
  proposal proposal-B
```

#### Example: IKEv2 Policy That Matches All Peers in Any VRF

The following example shows how an IKEv2 policy matches the peers in any VRF:

```
crypto ikev2 policy policy2
  match vrf any
  proposal proposal-1
```

#### Example: Matching a Policy

Do not configure overlapping policies. If there are multiple possible policy matches, the best match is used, as shown in the following example:
crypto ikev2 policy policy1
match fvrf fvrf1
crypto ikev2 policy policy2
match fvrf fvrf1
match local address 10.0.0.1

The proposal with FVRF as fvrf1 and the local peer as 10.0.0.1 matches policy1 and policy2, but policy2 is selected because it is the best match.

Where to Go Next

After configuring IKEv2, proceed to configure IPsec VPNs. For more information, see the “Configuring Security for VPNs with IPsec” module.

Feature Information for Configuring Internet Key Exchange Version 2 (IKEv2)

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<tr>
<td>Suite-B Support in IOS SW Crypto</td>
<td></td>
<td>Suite-B adds support for the SHA-2 family (HMAC variant) hash algorithm used to authenticate packet data and verify the integrity verification mechanisms for the IKEv2 proposal configuration. HMAC is a variant that provides an additional level of hashing. Suite-B also allows the Elliptic Curve Digital Signature Algorithm (ECDSA) signature (ECDSA-sig), as defined in RFC 4754, to be the authentication method for IKEv2. Suite-B requirements comprise of four user interface suites of cryptographic algorithms for use with IKE and IPsec that are described in RFC 4869. Each suite is consists of an encryption algorithm, a digital signature algorithm, a key agreement algorithm, and a hash or message digest algorithm. See the Configuring Security for VPNs with IPsec module for more information about Cisco IOS Suite-B support. The following commands were introduced or modified: <code>authentication</code>, <code>group</code>, <code>identity (IKEv2 profile)</code>, <code>integrity</code>, <code>match (IKEv2 profile)</code>.</td>
</tr>
<tr>
<td>Support of AES-GCM as an IKEv2 Cipher on IOS</td>
<td></td>
<td>The AES-GCM Support on IKEv2 feature describes the use of authenticated encryption algorithms with the Encrypted Payload of the Internet Key Exchange version 2 (IKEv2) protocol by adding the Advanced Encryption Standard (AES) in Galois/Counter Mode (AES-GCM). The following commands were introduced or modified: <code>encryption (IKEv2 proposal)</code>, <code>prf</code>, <code>show crypto ikev2 proposal</code>.</td>
</tr>
<tr>
<td>Tunnel Mode Auto Selection</td>
<td></td>
<td>The Tunnel Mode Auto Selection feature eases the configuration and spares you about knowing the responder’s details. This feature automatically applies the tunneling protocol (GRE or IPsec) and transport protocol (IPv4 or IPv6) on the virtual template as soon as the IKE profile creates the virtual access interface. The following commands were introduced or modified: <code>virtual-template (IKEv2 profile)</code>, <code>show crypto ikev2 profile</code>.</td>
</tr>

---

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for the FlexVPN Server

Dual-Stack Tunnel Interface and VRF-Aware IPsec

When configuring a dual-stack tunnel interface in a VPN routing and forwarding (VRF)-aware IPsec scenario, you cannot use the `ip vrf forwarding` command to configure an Inside VPN routing and forwarding (IVRF) instance because this is not a valid configuration. Use the `vrf forwarding vrf-name` command to define the
IVRF of the tunnel interface, where the vrf-name argument is defined using the vrf definition command with IPv4 and IPv6 address families inside the definition.

SSO Restrictions

- The Cisco ASR 1000 Series Routers support stateful IPSec sessions on Embedded Services Processor (ESP) switchover. During ESP switchover, all IPSec sessions will stay up and no user intervention is needed to maintain IPSec sessions.

- For an ESP reload (no standby ESP), the SA sequence number restarts from 0. The peer router drops packets that do not have the expected sequence number. You may need to explicitly reestablish IPSec sessions to work around this issue for systems that have a single ESP after an ESP reload. Traffic disruption might happen over the IPSec sessions in such cases for the duration of the reload.

- The Cisco ASR 1000 Series Router currently does not support Stateful Switchover (SSO) IPSec sessions on Route Processors (RPs). The IPSec sessions will go down on initiation of the switchover, but will come back up when the new RP becomes active. No user intervention is needed. Traffic disruption might happen over the IPSec sessions for the duration of the switchover, until the sessions are back up.

- The Cisco ASR 1000 Series Router does not support stateful ISSU for IPSec sessions. Before performing an ISSU, you must explicitly terminate all existing IPSec sessions or tunnels prior to the operation and reestablish them post ISSU. Specifically, ensure that there are no half-open or half-established IPSec tunnels present before performing ISSU. To do this, we recommend an interface shutdown in the case of interfaces that may initiate a tunnel setup, such as a routing protocol initiating a tunnel setup, or interfaces that have keepalive enabled, or where there is an auto trigger for an IPSec session. Traffic disruption over the IPSec sessions during ISSU is obvious in this case.

Restrictions for AnyConnect Profile Download

- The FlexVPN AnyConnect Profile Download feature supports Cisco IOS XE devices as headend and Cisco AnyConnect Secure Mobility client.

- The Cisco AnyConnect profile information can be stored on bootflash only. You cannot load the profile from a remote location, for example, on a TFTP boot server.

- This feature works only with Anyconnect EAP option as a remote authentication method.

Information About the FlexVPN Server

Peer Authentication Using EAP

The FlexVPN server supports peer authentication using the Extensible Authentication protocol (EAP) and acts as a pass-through authenticator relaying EAP messages between the client and the backend EAP server. The backend EAP server is typically a RADIUS server that supports EAP authentication.

Note

While a FlexVPN client authenticates the FlexVPN client using EAP, the FlexVPN server must authenticated by using certificates.
The FlexVPN server is configured to authenticate FlexVPN clients that use EAP by configuring the **authentication remote eap** command in IKEv2 profile configuration mode. FlexVPN clients authenticate using EAP by skipping the AUTH payload in the IKE_AUTH request.

If the **query-identity** keyword is configured, the FlexVPN server queries the EAP identity from the client; otherwise, the FlexVPN client’s IKEv2 identity is used as the EAP identity. However, if the **query-identity** keyword is not configured and the FlexVPN client’s IKEv2 identity is an IPv4 or IPv6 address, the session is terminated because IP addresses cannot be used as the EAP identity.

The FlexVPN server starts the EAP authentication by passing the FlexVPN client’s EAP identity to the EAP server; the FlexVPN server then relays EAP messages between the remote access (RA) client and the EAP server until the authentication is complete. If the authentication succeeds, the EAP server is expected to return the authenticated EAP identity to the FlexVPN server in the EAP success message.

After EAP authentication, the EAP identity used for the IKEv2 configuration is obtained from the following sources in the given order:

- The EAP identity provided by the EAP server with the EAP success message.
- The EAP identity queried from the client when the **query-identity** keyword is configured.
- The FlexVPN client IKEv2 identity used as the EAP identity.

The figure below shows IKEv2 exchange for EAP authentication without the **query-identity** keyword.
The figure below shows the IKEv2 exchange for EAP authentication with the *query-identity* keyword.
### IKEv2 Configuration Mode

IKEv2 configuration mode allows IKE peers to exchange configuration information such as IP addresses and routes. The configuration information is obtained from IKEv2 authorization. Both pull and push models are supported. The pull model involves the exchange of configuration requests and replies; the push model involves the exchange of configuration sets and acknowledgements.

The following table describes the conditions when the initiator and the responder send different configuration payload types:

<table>
<thead>
<tr>
<th>IKEv2 RA client</th>
<th>IKEv2 RA server</th>
<th>RADIUS-EAP server</th>
</tr>
</thead>
<tbody>
<tr>
<td>HDR, SAI1, KE1, Ni $\rightarrow$</td>
<td>HDR, SAr1, KEr, Nr, [CERTREQ]</td>
<td></td>
</tr>
<tr>
<td>HDR, SK {IDr, [CERTREQ], [IDr, SAI2, Ts1, Ts2]}</td>
<td>HDR, SK {IDr, [CERT, AUTH, EAP (EAP-request (Identity))}</td>
<td></td>
</tr>
<tr>
<td>HDR, SK {EAP (EAP-Response (Identity))}</td>
<td>RADIUS Access-Request/EAP-Message/EAP-Response (EAP-ID) $\rightarrow$</td>

FlexVPN and Internet Key Exchange Version 2 Configuration Guide, Cisco IOS XE Gibraltar 16.11.x
Table 3: Configuration Payload Types

<table>
<thead>
<tr>
<th>Configuration Payload Type</th>
<th>Sent By...</th>
<th>When...</th>
</tr>
</thead>
<tbody>
<tr>
<td>CFG_REQUEST</td>
<td>Initiator</td>
<td>The initiator is the FlexVPN client or if the config-exchange request command is enabled in the IKEv2 profile.</td>
</tr>
<tr>
<td>CFG_REPLY</td>
<td>Responder</td>
<td>The responder receives the CFG_REQUEST.</td>
</tr>
</tbody>
</table>
| CFG_SET                   | Initiator and responder | Initiator—The config-exchange set send command is enabled in the IKEv2 profile.  
                         |             | Responder—The CFG_REQUEST is not received, the configuration data is available, and the config-exchange set send command is enabled in the IKEv2 profile. |
| CFG_ACK                   | Initiator and responder | Initiator—The config-exchange set accept command is enabled in the IKEv2 profile.  
                         |             | Responder—The config-exchange set accept command is enabled in the IKEv2 profile. |

Note

The commands to send configuration requests and configuration set payloads are enabled by default.

Depending on your release, the IKEv2 initiator can trigger a configuration mode when the initiator is a FlexVPN client, or any static tunnel interface initiating IKEv2 can trigger configuration mode by enabling the config-mode command in the IKEv2 profile.

The IKEv2 FlexVPN server supports the following standard IPv4 configuration attributes:

- INTERNAL_IP4_ADDRESS
- INTERNAL_IP4_NETMASK
- INTERNAL_IP4_DNS
- INTERNAL_IP4_NBNS
- INTERNAL_IP4_SUBNET

The IKEv2 FlexVPN server supports the following standard IPv6 configuration attributes:

- INTERNAL_IP6_ADDRESS
- INTERNAL_IP6_DNS
- INTERNAL_IP6_SUBNET

Note

IPv6 configuration attributes are only supported by the Microsoft Windows IKEv2 client.
The INTERNAL_IP4_SUBNET and INTERNAL_IP6_SUBNET configuration attributes, controlled by the `route set` and `aaa attribute list` commands in the IKEv2 authorization policy, are not supported when you configure a static virtual tunnel interface (SVTI)-to-SVTI tunnel. In such cases, static routing or dynamic routing must be used instead of the IKEv2-based route exchange.

The IKEv2 FlexVPN server supports the following standard common configuration attribute:

- **APPLICATION_VERSION**

  **Note** This attribute is only sent for Cisco Anyconnect and FlexVPN clients.

The IKEv2 FlexVPN server supports the following Cisco Unity configuration attributes:

- **MODECFG_BANNER**
- **MODECFG_DEFDOMAIN**
- **MODECFG_SPLITDNS_NAME**
- **MODECFG_BACKUPSERVERS**
- **MODECFG_PFS**
- **MODECFG_SMARTCARD_REMOVAL_DISCONNECT**

  **Note** The Cisco Unity attributes are sent only for Cisco Anyconnect and FlexVPN clients.

The IKEv2 FlexVPN server supports the following Cisco FlexVPN configuration attributes:

- **MODECFG_CONFIG_URL**
- **MODECFG_CONFIG_VERSION**

  **Note** The Cisco FlexVPN attributes are sent only for Cisco FlexVPN clients.

The INTERNAL_IP4_ADDRESS attribute value is derived from the following sources in the given order:

- The Framed-IP-Address attribute received in AAA user authorization.
- The local IP address pool.
- The DHCP server.

The DHCP server, if configured, allocates addresses only if the local IP address pool is not configured. However, if an error occurs when allocating IP addresses from the local pool, the next address source DHCP server is not used for allocating the addresses.

The value for INTERNAL_IP4_NETMASK attribute is derived as follows:

- If the IP address is obtained from the DHCP server, the netmask is also obtained from the DHCP server.
If the IP address is obtained from either the Framed-IP-Address attribute in AAA user authorization or the local IP address pool, the netmask is derived from the IPv4 netmask attribute received in the user or group authorization. If the netmask is not available, the INTERNAL_IP4_NETMASK attribute is not included in the configuration reply. If the netmask is available, the INTERNAL_IP4_NETMASK attribute is included only if the INTERNAL_IP4_ADDRESS attribute is included in the configuration reply.

An IPv4 address is allocated and included in the reply only if the client requests an address. If the client requests multiple IPv4 addresses, only one IPv4 address is sent in the reply. If available, the remaining attributes are included in the reply even though the client does not request them. If the client requests an IPv4 address and the FlexVPN server is unable to assign an address, an INTERNAL_ADDRESS_FAILURE message is returned to the client.

It is always recommended that the prefix length should be used as 128 on ipv6 local pool configuration.

For example, if clients are 4, `ipv6 local pool pool1 afe0::/126 128` needed to be configured for the prefix length. If clients are 16, `ipv6 local pool pool1 afe0::/124 128` needed to be configured for the prefix length.

## IKEv2 Authorization

IKEv2 authorization provides a policy for an authenticated session by using the AAA. The policy can be defined locally or on the RADIUS server, and contains local and/or remote attributes. The username for authorization can either be derived from the peer identity using the name-mangler keyword or be directly specified in the command. IKEv2 authorization is mandatory only if the peer requests an IP address via configuration mode.

IKEv2 authorization types are as follows:

- **User authorization**—Use the `aaa authorization user` command in the IKEv2 profile to enable user authorization. User authorization is based on the user-specific portion of the peer IKE identity such as fqdn-hostname. The attributes from user authorization are called user attributes.

- **Group authorization**—Use the `aaa authorization group` command in the IKEv2 profile to enable group authorization. Group authorization is based on the generic portion of the peer IKE identity such as fqdn-domain. The attributes from group authorization are called group attributes.

- **Implicit user authorization**—Use the `aaa authorization user cached` command in the IKEv2 profile to enable implicit user authorization. Implicit authorization is performed as part of EAP authentication or when obtaining the AAA preshared key. The attributes from implicit user authorization are called cached attributes.

### Note

Depending on your release, the `aaa authorization user cached` command may or may not be available. Explicit user authorization is performed only when implicit user authorization does not return any attributes or does not have the Framed-IP-Address attribute.

### Merging and Overriding Attributes

Attributes from different sources are merged before they are used. The precedence of merging attributes is as follows:

- When merging duplicate attributes, the source of the attribute has a higher precedence.
- When merging user and cached attributes, user attributes have higher precedence.
• When merging merged-user-attributes and group attributes, merged-user attributes have a higher precedence, by default. However, this precedence can be reversed using the `aaa author group override` command.

**IKEv2 Authorization Policy**

An IKEv2 authorization policy defines the local authorization policy and contains local and/or remote attributes. Local attributes, such as VPN routing and forwarding (VRF) and the QOS policy, are applied locally. Remote attributes, such as routes, are pushed to the peer via the configuration mode. Use the `crypto ikev2 authorization policy` command to define the local policy. The IKEv2 authorization policy is referred from the IKEv2 profile via the `aaa authorization` command.

**IKEv2 Name Mangler**

The IKEv2 name mangler is used to derive the username for IKEv2 authorization and obtain the AAA preshared key from the peer IKE identity.

**IKEv2 Multi-SA**

The IKEv2 Multi-SA feature allows an IKEv2 Dynamic Virtual Tunnel Interface (DVTI) session on the IKEv2 responder to support multiple IPsec Security Associations (SA). The maximum number of IPsec SAs per DVTI session is either obtained from AAA authorization or configured on the IPsec profile. The value from AAA has a higher priority. Any change to the `max-flow-limit` argument in the IPsec profile is not applied to the current session but is applied to subsequent sessions. The IKEv2 Multi-SA feature makes the configuration of the IKEv2 profile in the IPsec profile optional. This optional configuration allows IPsec DVTI sessions using the same virtual template to have different IKEv2 profiles, thus saving the number of virtual template configurations.

---

**Note**

The IKEv2 Multi-SA feature allows multiple IPsec SAs that have non-any-any proxies. However, when the IPsec SA proxies are any-any, a single IPsec SA is allowed.

For more information, see the “Multi-SA Support for Dynamic Virtual Tunnel Interfaces for IKEv2” module in the *Security for VPNs with IPsec Configuration Guide*.

**IKEv2 Dynamic Routing**

With IKEv2 static routing, route information is exchanged during initial session bring up. The IKEv2 Dynamic Routing Support feature enables exchange of route information even after a session is established. Changes in routing information such as new routes, addition or deletion of routes can be propagated from FlexVPN client to FlexVPN server. The route information is included in the IKEv2 information exchange messages.

The IKEv2 Dynamic Routing Support feature is supported with SVTI, FlexVPN Client and FlexVPN Spoke. For more information, refer to the “IKEv2 Dynamic Routing” section in the *Configuring the FlexVPN Client* module of *FlexVPN and Internet Key Exchange Version 2 Configuration Guide, Cisco IOS Release 15M&T*. The software release on FlexVPN server must be Cisco IOS XE Everest 16.5.1 and later for this feature to work with FlexVPN client.
AnyConnect Profile Download

The FlexVPN AnyConnect Profile Download feature enables a device running Cisco IOS XE software to connect and push the profile information in IKEv2 protocol to Cisco AnyConnect Secure Mobility client. Cisco AnyConnect Secure Mobility client contains profiles used for configuring the settings for VPN. These profiles can be manually configured or can be downloaded from a headend. The headend can be configured to deploy profiles globally for all Cisco AnyConnect Secure Mobility client users.

Use the `anyconnect profile` command to match a VPN profile against an IKEv2 profile.

Note

Crypto SSL profile is not mandatory to configure AnyConnect Profile Download feature.

Supported RADIUS Attributes

The following tables list the RADIUS attributes supported by the IKEv2 FlexVPN server:

- The Scope field defines the direction of the attribute and the usage on the FlexVPN server or client.
  - Inbound—FlexVPN server to RADIUS
  - Outbound—RADIUS to the FlexVPN server
  - Local—Used locally by the FlexVPN server
  - Remote—Pushed to the client by the FlexVPN server

- The “Local configuration” field specifies the IKEv2 authorization policy command that is used to configure the attribute locally on the FlexVPN server.

- Cisco AV Pair is a Cisco Vendor Specific Attribute (VSA) with vendor-id 9 and vendor-type 1. The VSAs are encapsulated in the Radius IETF attribute 26 Vendor-Specific. The Cisco AV pair is specified as a string of format “protocol:attribute=value”.

Example:

```cisco-avpair = "ipsec:ipv6-addr-pool=v6-pool"
```

The following example shows the Cisco AV pair for a standard access-list.

```cisco-avpair = "ipsec:route-set=access-list 99"
```

### Supported Remote Access Clients

The FlexVPN server interoperates with the Microsoft Windows 7 IKEv2 client, Cisco IKEv2 AnyConnect client, and Cisco FlexVPN client.

**Microsoft Windows 7 IKEv2 Client**

The Microsoft Windows 7 IKEv2 client sends an IP address as the Internet Key Exchange (IKE) identity that prevents the Cisco IKEv2 FlexVPN server from segregating remote users based on the IKE identity. To allow the Windows 7 IKEv2 client to send the email address (user@domain) as the IKE identity, apply the hotfix documented in KB975488 ([http://support.microsoft.com/kb/975488](http://support.microsoft.com/kb/975488)) on Microsoft Windows 7 and specify the email address string in either the Username field when prompted or the CommonName field in the certificate depending on the authentication method.

For certificate-based authentication, the FlexVPN server and Microsoft Windows 7 client certificates must have an Extended Key Usage (EKU) field as follows:

- For the client certificate, EKU field = client authentication certificate.
- For the server certificate, EKU field = server authentication certificate.

### Attribute Values for the FlexVPN Server

<table>
<thead>
<tr>

<td>Remote</td>
<td>configuration url</td>
</tr>
<tr>
<td>ipsec:configuration-version</td>
<td>Cisco AV Pair</td>
<td>Remote</td>
<td>configuration version</td>
</tr>
</tbody>
</table>

**Note**

1. The RADIUS attribute to set an access list on IKEv2 FlexVPN server only supports a standard access list. An extended access list is not supported.
• The certificates can be obtained from the Microsoft Certificate Server or the IOS CA server.

For EAP authentication, the Microsoft Windows 7 IKEv2 client expects an EAP identity request before any other EAP requests. Ensure that you configure the `query-identity` keyword in the IKEv2 profile on the IKEv2 FlexVPN server to send an EAP identity request to the client.

**Cisco IKEv2 AnyConnect Client**

For certificate-based authentication, the FlexVPN server and the AnyConnect client certificates must have an Extended Key Usage (EKU) field as follows:

- For the client certificate, EKU field = client authentication certificate
- For the server certificate, EKU field = server authentication certificate

If the FlexVPN server authenticates to AnyConnect client using certificates, a SubjectAltName extension is required in the FlexVPN server certificate that contains the server’s IP address or fully qualified domain name (FQDN). Additionally, HTTP certified URLs must be disabled on the FlexVPN server using the `no crypto ikev2 http-url cert` command.

The following example displays the XML tags specific to EAP-MD5 authentication of IKEv2 sessions in the AnyConnect client profile:

```xml
<PrimaryProtocol>IPsec
  <StandardAuthenticationOnly>true
    <AuthMethodDuringIKENegotiation>
        EAP-MD5
    </AuthMethodDuringIKENegotiation>
    <IKEIdentity>DEPT24</IKEIdentity>
  </StandardAuthenticationOnly>
</PrimaryProtocol>
```

For more information, refer to AnyConnect client 3.0 documentation at this link: http://www.cisco.com/en/US/docs/security/vpn_client/anyconnect/anyconnect30/release/notes/anyconnect30rn.html#wp1268255.

**How to Configure the FlexVPN Server**

**Configuring the IKEv2 Profile for the FlexVPN Server**

This task describes the IKEv2 profile commands required for configuring the FlexVPN server in addition to the basic IKEv2 profile commands. Refer to the “Configuring IKEv2 Profile (Basic)” task in the Configuring Internet Key Exchange Version 2 (IKEv2) feature module for information about configuring the basic IKEv2 profile.

Perform this task to configure the IKEv2 profile for the FlexVPN Server:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto ikev2 profile `profile-name`
4. aaa authentication eap `list-name`
5. authentication {local {rsa-sig | pre-share [key {0 | 6} password]} | ecdsa-sig | eap [gtc | md5 | ms-chapv2] [username username] [password {0 | 6} password]] | remote {eap [query-identity | timeout seconds] | rsa-sig | pre-share [key {0 | 6} password]} | ecdsa-sig}}

6. Execute both or one of the following:
   • aaa authorization user {eap | psk} {cached | list aaa-listname [aaa-username | name-mangler mangler-name]}
   • aaa authorization user cert list aaa-listname {aaa-username | name-mangler mangler-name}

7. Execute both or one of the following:
   • aaa authorization group [override] {eap | psk} list aaa-listname {aaa-username | name-mangler mangler-name}
   • aaa authorization group [override] cert list aaa-listname {aaa-username | name-mangler mangler-name}

8. crypto vpn anyconnect profile profile-name flash:file-name
9. anyconnect profile profile-name
10. config-exchange {request | set {accept | send}}
11. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>

<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>crypto ikev2 profile profile-name</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# crypto ikev2 profile profile1</td>
</tr>
<tr>
<td></td>
<td>Defines an IKEv2 profile name and enters IKEv2 profile configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>aaa authentication eap list-name</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-ikev2-profile)# aaa authentication eap list1</td>
</tr>
<tr>
<td></td>
<td>(Optional) Specifies AAA authentication list for EAP authentication when implementing the IKEv2 remote access server.</td>
</tr>
<tr>
<td></td>
<td>• eap—Specifies the external EAP server.</td>
</tr>
<tr>
<td></td>
<td>• list-name—The AAA authentication list name.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>authentication {local {rsa-sig</td>
</tr>
<tr>
<td>Example:</td>
<td>Specifies the local or remote authentication method.</td>
</tr>
<tr>
<td></td>
<td>• rsa-sig—Specifies RSA-sig as the authentication method.</td>
</tr>
<tr>
<td></td>
<td>• pre-share—Specifies the preshared key as the authentication method.</td>
</tr>
</tbody>
</table>
Purpose

**Command or Action**

Device(config-ikev2-profile)# authentication local
ecdsa-sig

- **ecdsa-sig**—Specifies ECDSA-sig as the authentication method.
- **eap**—Specifies EAP as the remote authentication method.
- **query-identity**—Queries the EAP identity from the peer.
- **timeout seconds**—Specifies the duration, in seconds, to wait for the next IKE_AUTH request after sending the first IKE_AUTH response.

**Note**

You can specify only one local authentication method but multiple remote authentication methods.

**Step 6**

Execute both or one of the following:

- **aaa authorization user {eap | psk} {cached | list aaa-listname [aaa-username | name-mangler mangler-name]}
- **aaa authorization user cert list aaa-listname {aaa-username | name-mangler mangler-name}

**Example:**

Device(config-ikev2-profile)# aaa authorization user eap cached

**Example:**

Device(config-ikev2-profile)# aaa authorization user cert list list1 name-mangler mangler1

**Purpose**

Specifies the AAA method list and username for user authorization.

- **user**—Specifies user authorization.
- **cert**—Specifies that the peers must be authenticated using certificates.
- **eap**—Specifies that the peers must be authenticated using EAP.
- **psk**—Specifies that the peers must be authenticated using preshared keys.
- **cached**—Specifies that the attributes received during EAP authentication or obtained from the AAA preshared key must be cached.
- **aaa-listname**—AAA method list name.
- **aaa-username**—Specifies the username that must be used in the AAA authorization request.
- **name-mangler**—Specifies the name mangler that derives the AAA authorization username from the peer identity.
- **mangler-name**—Name mangler to be used.
### Step 7

Execute both or one of the following:

- **aaa authorization group [override] {eap | psk} list**
  - `aaa-listname` [`aaa-username` | `name-mangler` `mangler-name`]
- **aaa authorization group [override] cert list**
  - `aaa-listname` {`aaa-username` | `name-mangler` `mangler-name`}

**Example:**
```
Device(config-ikev2-profile)# aaa authorization group override psk list list1
```

**Example:**
```
Device(config-ikev2-profile)# aaa authorization group cert list list1 name-mangler mangler1
```

### Purpose

Specifies the AAA method list and username for group authorization.

- **group**—Specifies group authorization.
- **override**—(Optional) Specifies that attributes from group authorization should take precedence while merging attributes. By default, user attributes take precedence.
- **cert**—Specifies that peers must be authenticated using certificates.
- **eap**—Specifies that peers must be authenticated using EAP.
- **psk**—Specifies that peers must be authenticated using preshared keys.
- **aaa-listname**—AAA method list name.
- **aaa-username**—Username that must be used in the AAA authorization request.
- **name-mangler**—Specifies the name mangler that derives the AAA authorization username from the peer identity.
- **mangler-name**—Name mangler to be used.

### Note

- For **psk** and **eap** authentication methods, specifying the **aaa-username** argument or the **name-mangler** keyword is optional and if not specified, the peer identity is used as the username.
- For **psk** and **eap** authentication methods, you can simultaneously configure two variants for user authorization with the **cached** and **list** keyword respectively.
- Specifying the **aaa-username** argument or the **name-mangler** keyword is mandatory for **cert** authentication, as the peer identity of type distinguished name (DN) cannot be used.
### Command or Action

<table>
<thead>
<tr>
<th>Step 8</th>
<th>crypto vpn anyconnect profile profile-name flash:file-name</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-profile)# crypto vpn anyconnect profile vpn-profile flash:test1.xml</td>
<td></td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td></td>
</tr>
<tr>
<td>Defines an AnyConnect profile.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 9

<table>
<thead>
<tr>
<th>anyconnect profile profile-name</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Device(config-ikev2-profile)# anyconnect profile vpn-profile</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
</tr>
<tr>
<td>Enables downloading Cisco AnyConnect profile.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td>The profile name mentioned in this step must reference to Cisco AnyConnect profile in the <code>crypto vpn anyconnect profile profile-name flash:file-name</code> command.</td>
</tr>
</tbody>
</table>

### Step 10

| config-exchange {request | set {accept | send}} |
|-----------------------------------------------|
| **Example:** |
| Device(config-ikev2-profile)# config-exchange set accept |
| **Purpose:** |
| (Optional) Enables configuration exchange options. |
| **Note:** |
| The request and set options are enabled by default. |

### Step 11

<table>
<thead>
<tr>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Device(config-ikev2-profile)# end</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
</tr>
<tr>
<td>Exits IKEv2 profile configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

---

**Note**

- For **psk** and **eap** authentication methods, specifying the `aaa-username` argument or the `name-mangler` keyword is optional and if not specified, the peer identity is used as the username.

- For **psk** and **eap** authentication methods, you can simultaneously configure two variants for user authorization with the `cached` and `list` keyword respectively.

- Specifying the `aaa-username` argument or the `name-mangler` keyword is mandatory for **cert** authentication, as the peer identity of type distinguished name (DN) cannot be used.
Configuring the IKEv2 Name Mangler

Perform this task to specify the IKEv2 name mangler, which is used to derive a name for authorization requests and obtain AAA preshared keys. The name is derived from specified portions of different forms of remote IKE identities or the EAP identity. The name mangler specified here is referred to in the IKEv2 profile.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto ikev2 name-mangler mangler-name`
4. `dn {common-name | country | domain | locality | organization | organization-unit | state}`
5. `eap {all | dn {common-name | country | domain | locality | organization | organization-unit | state} | prefix | suffix {delimiter {. | @ | \}}}`
6. `email {all | domain | username}`
7. `fqdn {all | domain | hostname}`
8. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>crypto ikev2 name-mangler mangler-name</code></td>
<td>Defines a name mangler and enters IKEv2 name mangler configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config)# crypto ikev2 name-mangler mangler1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> `dn {common-name</td>
<td>country</td>
</tr>
</tbody>
</table>
| **Example:** `Device(config-ikev2-name-mangler)# dn state` | *common-name*
|  | *country*
|  | *domain*
|  | *locality*
|  | *organization*
|  | *organization-unit*
|  | *state*
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong> eap {all | dn { common-name | country | domain | locality | organization | organization-unit | state } | prefix | suffix {delimiter { , | @ | } } }</td>
<td>Derives the name from the remote identity of type EAP (Extensible Authentication Protocol).</td>
</tr>
<tr>
<td>Example: Device(config-ikev2-name-mangler)# eap prefix delimiter @</td>
<td></td>
</tr>
</tbody>
</table>

- **all**—Derives the name from the entire EAP identity.
- **dn**—Derives the name from any of the following fields in the remote EAP identity of type DN:
  - common-name
  - country
  - domain
  - locality
  - organization
  - organization-unit
  - state
- **prefix**—Derives the name from the prefix in the EAP identity.
- **suffix**—Derives the name from the suffix in the EAP identity.
- **delimiter** \{ , \| @ \| \}—Specifies the delimiter in the EAP identity that separates the prefix and the suffix.

| **Step 6** email \{all \| domain \| username\} | Derives the name from the remote identity of type e-mail. |
| Example: Device(config-ikev2-name-mangler)# email username | |

- **all**—Derives the name from the entire remote IKE identity of type e-mail.
- **domain**—Derives the name from the domain part of the remote IKE identity.
- **username**—Derives the name from the username part of the remote IKE identity.

| **Step 7** fqdn \{all \| domain \| hostname\} | Derives the name from the remote identity of type FQDN (Fully Qualified Domain Name). |
| Example: Device(config-ikev2-name-mangler)# fqdn domain | |

- **all**—Derives the name from the entire remote IKE identity of type FQDN.
- **domain**—Derives the name from the domain part of the remote IKE identity.
- **hostname**—Derives the name from the hostname part of the remote IKE identity.

| **Step 8** end | Exits IKEv2 name mangler configuration mode and returns to privileged EXEC mode. |
| Example: Device(config-ikev2-name-mangler)# end | |
Configuring the IKEv2 Authorization Policy

Perform this task to configure the IKEv2 authorization policy.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto ikev2 authorization policy policy-name
4. aaa attribute list list-name
5. backup-gateway string
6. banner banner-text
7. configuration url url
8. configuration version version
9. def-domain domain-name
10. dhcp {giaddr ip-address | server {ip-address | hostname} | timeout seconds}
11. [ipv6] dns primary-server [secondary-server]
12. include-local-lan
13. ipsec flow-limit number
14. netmask mask
15. pfs
16. [ipv6] pool name
17. route set {interface interface | access-list {access-list-name | access-list-number | ipv6 access-list-name} }
18. route accept any [tag value] [distance value]
19. route redistribute protocol [route-map map-name]
20. route set remote {ipv4 ip-address mask | ipv6 ip-address/mask}
21. smartcard-removal-disconnect
22. split-dns string
23. session-lifetime seconds
24. route set access-list {acl-number | [ipv6] acl-name}
25. wins primary-server [secondary-server]
26. end

<tr>
<td><strong>Purpose:</strong></td>
<td>Allows you to specify up to ten backup server names. This parameter is pushed to the client via the nonstandard Cisco Unity configuration attribute. This parameter specifies the backup servers that the client can use.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>banner <em>banner-text</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-author-policy)# banner This is IKEv2</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Specifies the banner. This parameter is sent to the client via the nonstandard Cisco Unity configuration attribute.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>configuration url <em>url</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-author-policy)# configuration url <a href="http://www.cisco.com">http://www.cisco.com</a></td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Specifies the configuration URL. This parameter is sent to the client via the nonstandard Cisco FlexVPN configuration attribute. The client can use this URL to download the configuration.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>configuration version <em>version</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-author-policy)# configuration version 2.4</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Specifies the configuration version. This parameter is sent to the client via the nonstandard Cisco FlexVPN configuration attribute. This parameter is sent with the configuration URL to specify the version that the client can download.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>def-domain <em>domain-name</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-author-policy)# def-domain cisco</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Specifies the default domain. This parameter is sent to the client via the nonstandard Cisco Unity configuration attribute. This parameter specifies the default domain that the client can use.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>dhcp {giaddr <em>ip-address</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-author-policy)# dhcp giaddr 192.0.2.1</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Specifies the DHCP server to lease an IP address that is assigned to the remote access client.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>• <strong>giaddr ip-address</strong>—Specifies the gateway IP address (giaddr).</td>
</tr>
<tr>
<td></td>
<td>• **server {ip-address</td>
</tr>
<tr>
<td></td>
<td>• <strong>timeout seconds</strong>—Specifies the wait time in seconds for the response from the DHCP server.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Purpose</td>
<td>You can specify only one DHCP server. It is assumed that the DHCP server can be reached via the global routing table, and therefore, the DHCP packets are forwarded to the global routing table.</td>
</tr>
<tr>
<td><strong>Step 11</strong> [ipv6] dns primary-server [secondary-server]</td>
<td>Specifies the IP addresses of primary and secondary Domain Name Service (DNS) servers that are sent to the client in the configuration reply.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# dns 198.51.100.1 198.51.100.100</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• ipv6—(Optional) Specifies an IPv6 address for the DNS server. To specify an IPv4 address, execute the command without this keyword.</td>
</tr>
<tr>
<td></td>
<td>• primary-server—IP address of the primary DNS server.</td>
</tr>
<tr>
<td></td>
<td>• secondary-server—(Optional) IP address of the secondary DNS server.</td>
</tr>
<tr>
<td><strong>Step 12</strong> include-local-lan</td>
<td>Includes local LAN. This parameter is sent to the client via the nonstandard Cisco Unity configuration attribute.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# include-local-lan</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong> ipsec flow-limit number</td>
<td>Specifies the maximum number of IPsec SAs that an IKEv2 dVTI session on the IKEv2 responder can have. The range is from 0 to 50000.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# ipsec flow-limit 12500</td>
<td>By default, the command is disabled, and there is no limit on the number of IPsec flows per dVTI session. A value of 0 will not allow any IPsec SAs.</td>
</tr>
<tr>
<td><strong>Step 14</strong> netmask mask</td>
<td>Specifies the netmask of the subnet from which the IP address is assigned to the client.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# netmask 255.255.255.0</td>
<td>• mask—Subnet mask address.</td>
</tr>
<tr>
<td><strong>Step 15</strong> pfs</td>
<td>Enables Password Forward Secrecy (PFS). This parameter is sent to the client via the nonstandard Cisco Unity configuration attribute. This parameter specifies whether the client should use PFS.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# pfs</td>
<td></td>
</tr>
<tr>
<td><strong>Step 16</strong> [ipv6] pool name</td>
<td>Defines a local IP address pool for assigning IP addresses to the remote access client.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# pool abc</td>
<td>• ipv6—(Optional) Specifies an IPv6 address pool. To specify an IPv4 address, execute the command without this keyword.</td>
</tr>
<tr>
<td></td>
<td>• name—Name of the local IP address pool.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 17</strong> route set {interface interface</td>
<td>access-list</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# route set interface</td>
<td></td>
</tr>
<tr>
<td><strong>Step 18</strong> route accept any [tag value] [distance value]</td>
<td>Filters the routes received from the peer and specify the tag and metric values to install these routes.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# route accept any tag 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 19</strong> route redistribute protocol [route-map map-name]</td>
<td>Filters the routes received from the peer and specify the tag and metric values to install these routes.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# route redistribute connected</td>
<td></td>
</tr>
<tr>
<td><strong>Step 20</strong> route set remote {ipv4 ip-address mask</td>
<td>ipv6 ip-address/mask}</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# route set remote ipv6 2001:DB8::1/32</td>
<td></td>
</tr>
<tr>
<td><strong>Step 21</strong> smartcard-removal-disconnect</td>
<td>Enables smartcard removal disconnect. This parameter is sent to the client via the nonstandard Cisco Unity configuration attribute. This parameter specifies that the client should terminate the session when the smart card is removed.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ikev2-author-policy)# smartcard-removal-disconnect</td>
<td></td>
</tr>
</tbody>

```

Example: Configuring the FlexVPN Server for User Authorization
Example: Configuring the FlexVPN Server for IPv6 Session with IPv6 Configuration Attributes

The following example shows how to configure the FlexVPN server for an IPv6 dynamic Virtual Tunnel Interfaces (dVTI) session. The example uses local AAA group authorization using the IKEv2 authorization policy. The IPv6 configuration attributes are configured under the IKEv2 authorization policy.

```conf
aaa new-model

aaa authorization network local-group-author-list local

crypto pki trustpoint trustpoint1
    enrollment url http://192.168.3.1:80
    revocation-check crl

crypto pki certificate map certmap1 1
    subject-name co cisco

crypto ikev2 authorization policy author-policy1
    ipv6 pool v6-pool
    ipv6 dns 2001:DB8:1::11 2001:DB8:1::12
    ipv6 subnet-acl v6-acl

crypto ikev2 profile ikev2-profile1
    match certificate certmap1
    authentication local rsa-sig
    authentication remote rsa-sig
    pki trustpoint trustpoint1
    aaa authorization group cert list local-group-author-list author-policy1
    virtual-template 1

crypto ipsec transform-set transform1 esp-aes esp-sha-hmac

crypto ipsec profile ipsec-profile1
    set transform-set trans transform1
    set ikev2-profile ikev2-profile1

interface Ethernet0/0
    ipv6 address 2001:DB8:1::1/32

interface Virtual-Template1 type tunnel
    ip unnumbered Ethernet0/0
    tunnel mode ipsec ipv6
    tunnel protection ipsec profile ipsec-profile1
```

Example: Configuring the FlexVPN Server for IPv6 Session with IPv6 Configuration Attributes
Example: Configuring AnyConnect Profile Download

The following example shows how to configure the FlexVPN AnyConnect Profile Download feature:

```
! ipv6 local pool v6-pool 2001:DB8:1::10/32 48
! ipv6 access-list v6-acl
  permit ipv6 host 2001:DB8:1::20 any
  permit ipv6 host 2001:DB8:1::30 any
!
```

Note

You do not modify the Local Policy files on the Anyconnect Client machine. After the configuration of Anyconnect Profile Download feature on IKEv2, the required XML profiles get automatically downloaded on the client device.

```
no ip http secure-server
crypto ssl policy ssl-policy
  pki trustpoint CA1 sign
  ip address local 10.0.0.1 port 443
  no shutdown
crypto ssl profile ssl_prof
  match policy ssl-policy
crypto vpn anyconnect profile ANY-PROF bootflash:profile.xml
crypto ikev2 profile ikev2_profile
  anyconnect profile ANY-PROF
```

CHAPTER 5

Configuring the FlexVPN Client

This module describes the FlexVPN client features and the Internet Key Exchange Version 2 (IKEv2) commands required to configure the FlexVPN client.

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

- Finding Feature Information, on page 67
- Restrictions for the FlexVPN Client, on page 67
- Information About the FlexVPN Client, on page 68
- How to Configure the FlexVPN Client, on page 75
- Configuration Examples for the FlexVPN Client, on page 82
- Additional References for Configuring the FlexVPN Client, on page 85

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for the FlexVPN Client

EAP as the Local Authentication Method

- Extensible Authentication Protocol (EAP) as the local authentication method, is supported only on the IKEv2 initiator, and as the remote authentication, is supported only on the IKEv2 responder.
• If EAP is specified as the local authentication method, the remote authentication method must be certificate based.

• If the authentication remote eap query-identity command is not configured on the FlexVPN server, the client cannot have an IPv4 or IPv6 address as the local identity because these IP addresses cannot be used as the username for the EAP authentication method.

Dual-Stack Tunnel Interface and VRF-Aware IPsec

When configuring a dual-stack tunnel interface in a VPN routing and forwarding (VRF)-aware IPsec scenario, you cannot use the ip vrf forwarding command to configure an Inside VPN routing and forwarding (IVRF) instance because this is not a valid configuration. Use the vrf forwarding vrf-name command to define the IVRF of the tunnel interface, where the vrf-name argument is defined using the vrf definition command with IPv4 and IPv6 address families inside the definition.

SSO Restrictions

• The Cisco ASR 1000 Series Routers support stateful IPsec sessions on Embedded Services Processor (ESP) switchover. During ESP switchover, all IPsec sessions will stay up and no user intervention is needed to maintain IPsec sessions.

• For an ESP reload (no standby ESP), the SA sequence number restarts from 0. The peer router drops packets that do not have the expected sequence number. You may need to explicitly reestablish IPsec sessions to work around this issue for systems that have a single ESP after an ESP reload. Traffic disruption might happen over the IPsec sessions in such cases for the duration of the reload.

• The Cisco ASR 1000 Series Router currently does not support Stateful Switchover (SSO) IPsec sessions on Route Processors (RPs). The IPsec sessions will go down on initiation of the switchover, but will come back up when the new RP becomes active. No user intervention is needed. Traffic disruption might happen over the IPsec sessions for the duration of the switchover, until the sessions are back up.

• The Cisco ASR 1000 Series Router does not support stateful ISSU for IPsec sessions. Before performing an ISSU, you must explicitly terminate all existing IPsec sessions or tunnels prior to the operation and reestablish them post ISSU. Specifically, ensure that there are no half-open or half-established IPsec tunnels present before performing ISSU. To do this, we recommend a interface shutdown in the case of interfaces that may initiate a tunnel setup, such as a routing protocol initiating a tunnel setup, or interfaces that have keepalive enabled, or where there is an auto trigger for an IPsec session. Traffic disruption over the IPsec sessions during ISSU is obvious in this case.

Information About the FlexVPN Client

IKEv2 FlexVPN Client

The IKEv2 FlexVPN Client feature establishes a secure IPsec VPN tunnel between a FlexVPN client and a FlexVPN server. The IKEv2 FlexVPN Client feature provides the following benefits:

• Unified tunnel infrastructure

• IPv4/IPv6 proxy support over IPv4/IPv6 transport

• Backward compatibility with some features supported by EasyVPN
• Flexibility for running dynamic routing protocols

Each FlexVPN client is associated with a unique tunnel interface, which implies that the IPsec security association (SA) retrieved by the specific FlexVPN client is bound to the tunnel interface. The figure below shows the association between the FlexVPN client and the tunnel interface.

*Figure 3: Association of the FlexVPN Client and the Tunnel Interface*

The sequence of operation is as follows:

- **Routing**—The FlexVPN server pushes the network list as part of the mode configuration response. The client adds routes on the tunnel interface to these networks. As part of the configuration mode set, the client sends the routes to its network. The IP address is configured on the tunnel interface so that the server can add routes to the client-side network.

- **NAT**—Network Address Translation (NAT) rules must be configured explicitly using route maps. If the rules match, the hosts behind the FlexVPN client are translated to the tunnel IP address. This IP address can be obtained as one of the attributes pushed during mode configuration by the FlexVPN server.

- **Encapsulation and encryption**—Generic routing encapsulation (GRE) and IPsec encapsulation modes are supported. GRE supports both IPv4 and IPv6 traffic. The traffic that reaches the tunnel interface is
encapsulated by the GRE header, followed by IPsec protection. The encrypted traffic is then routed to the outgoing interface.

The features supported by the FlexVPN client are described in the following sections:

**Tunnel Activation**

The FlexVPN client can be connected automatically or manually through user intervention. The FlexVPN client connects automatically to the tunnel when the FlexVPN configuration is complete. If the tunnel times out or fails, the tunnel automatically reconnects and retries the connection indefinitely. To configure an automatic tunnel connection, use the `connect` command with the `auto` keyword in the IKEv2 FlexVPN profile.

In a manual connection, the FlexVPN client waits for user intervention to execute a command before establishing a connection. When the client times out or fails to connect, subsequent connections require user intervention. To configure a manual connection, use the `crypto ikev2 client flexvpn connect` command with the `flexvpn-name` argument in privileged EXEC mode. To terminate the connection, use the `clear crypto ikev2 client flexvpn connect` command with the `flexvpn-name` argument.

**Tracking-Based Tunnel Activation**

The Tracking-Based Tunnel Activation feature is mainly used in backup scenarios. The FlexVPN client registers with the tracking system to obtain notifications for change in the state of an object. This notification prompts the client to perform an appropriate action for tunnel activation. The `track` keyword in the `connect` command informs the tracking process that the client is interested in tracking an object, which is identified by an object number. The tracking process, in turn, informs the client when the state of the objects changes.

If the `track` keyword in the `connect` command is set to activate the tunnel when the object goes up, the client triggers the connection upon receiving the notification that the object is in the UP state. If the `track` keyword in the `connect` command is set to activate the tunnel when the object goes down, the client triggers the connection upon receiving the notification that the object is in the DOWN state.

**Backup Features**

A FlexVPN client can connect to various peers or servers in a predetermined order. The list of peers is called the gateway list or backup gateway list and is built using the following lists:

- Static backup gateway list or static list
- Downloaded backup gateway list or downloaded list

The static backup gateway list is configured in the FlexVPN profile by providing a list of peers with a sequence number. The downloaded backup gateway list is downloaded dynamically and is obtained during the mode configuration response. The downloaded list complements the static gateway list to build the backup gateway list. The downloaded list is inserted after the peer from which the list is downloaded.

If an existing connection with a peer from the gateway list goes down, the client tries to establish a connection with the next peer in the gateway list. If a downloaded list is available and connection with a static peer fails, the client tries to connect, in sequence, with the peers from the downloaded list. If the client fails to establish a connection with all the peers in the downloaded list, the client tries to connect to the next peer in the static list, and the downloaded list is deleted.

**Backup Gateways**

Use the `peer` command to add a peer to the backup gateway list. To remove the backup gateway list, use the `no peer` command.
Peers are ordered by preference; the lower the sequence number, the higher the preference.

If a connection is established with a new peer and the peer is not a part of the downloaded list, the peer adds the downloaded list to the backup gateway list, and the existing backup gateway list is replaced with the new list.

You can configure a static peer and attach it to a track object. A peer is a “possible peer” if the track object of the peer is in the UP state.

---

**Note**

Peers that are not attached to a track object, including peers in the downloaded list, are classified as “possible peers” because these peers are always in the UP state.

---

The peer selection process works as follows: when a connection is established, the gateway list is looked up and the first possible peer is selected. A peer is selected according to the following rule: a static peer can be associated with the track object with a desired status (UP or DOWN). If the status of the track object matches the configured status, the peer is said to be a “possible peer.”

---

**Note**

If the peer is identified by either a Domain Name Service (DNS) name or a fully qualified domain name (FQDN), the name is resolved dynamically.

---

The peer selection process is followed by the selection of a new peer or when the existing criteria fail, which happens in the following scenarios:

- The active peer stops responding to liveness checks.
- The DNS resolution of the peer name fails.
- The IKE negotiation with the peer fails.
- The peer is no longer a “possible peer” (its corresponding track object goes DOWN).

---

**Note**

When you configure multiple FlexVPN peers on a FlexVPN client and when you clear the IKEv2 SA on the primary peer, the clearance will trigger a new peer selection on the client.

---

**Reactivate Primary Peer**

The Reactivate Primary Peer feature ensures that the highest-priority peer is always connected. If the track object of the highest-priority peer matches the object status, the existing connection with the lower-priority peer is disconnected, and the connection to the higher-priority peer is established. Use the `peer reactivate` command to enable this feature.

---

**Note**

A track object must be associated with statically configured peers.
Dial Backup (Primary or Backup Tunnels)

The FlexVPN client registers with the tracking system to get notifications about the change in the state of the object. The `connect track` command is used to inform the tracking process that the client is interested in tracking an object, which is identified by the object number. The tracking process, in turn, informs the client when the state of this objects changes. This notification prompts the client to take further action to bring up or bring down the primary or backup connections when the state of the tracked object is UP or DOWN.

The Dial Backup feature can be configured as follows:

- When both primary and backup tunnels are FlexVPN tunnels,
  - Any one tunnel is active at a time.
  - Both client profiles are configured using the `connect track` command, referencing the same track object.
  - If the primary tunnel tracks the status when the object is UP, the secondary tunnel tracks the status of the object when the object is DOWN.

- When one tunnel is the FlexVPN tunnel,
  - The remaining tunnels can be on any secured connection.
  - The primary connection is not FlexVPN, and the backup connection is FlexVPN.
  - The client profile is configured using the `connect track` command with an object, which traces the ability to reach the primary peer through the primary outgoing interface.

Backup Group

The Backup Group feature allows the FlexVPN client to omit a peer when a FlexVPN client that belongs to a group has established a session with the same peer. When a FlexVPN client belonging to a group initiates a connection with a peer, the FlexVPN client validates if another FlexVPN client in the same group has established a session with the same peer. If a connection exists, the FlexVPN client omits this peer and validates the next peer in the sequence. Use the `backup group` command with the `group-number` argument to configure the backup group.

Dual FlexVPN Support

The Dual FlexVPN Support feature provides the ability to configure two FlexVPN tunnels that share the same inside and outside interfaces. The two FlexVPN tunnels use route injections to direct appropriate traffic through the corresponding tunnel interface. When the tunnel is up, the tunnel “learns” the network list from the server. If the server forwards a network list, FlexVPN installs specific routes to the destination networks in its routing table, directing the traffic to these networks out of the tunnel interface.

Only one FlexVPN connection can be established with a default route through the tunnel interface.

Split DNS Support

The Split DNS functionality enables the FlexVPN client to act as a Domain Name System (DNS) proxy. During FlexVPN negotiations, the DNS list is downloaded during mode configuration. This list is configured as a DNS view list on the inside interfaces associated with the FlexVPN profile. The view list is used to match requests based on the domain names with the DNS query and then forward the match requests to the DNS server. Other DNS queries are used to match the default view (global DNS configuration) and are forwarded to the ISP DNS.
If no inside interfaces are mentioned in the FlexVPN client profile, the DNS view is applied to all interfaces except the tunnel interface and the tunnel source interfaces of all configured profiles. When the DNS query request reaches the inside interface, the matching DNS view is obtained, and the request is forwarded to the DNS IP address.

**NAT**

The Network Address Translation (NAT) feature in FlexVPN enables traffic to be translated to an IP address based on the interface to which the traffic is routed. If a packet is received on one interface that is configured with the `ip nat inside` command and is being sent out another interface that is configured with the `ip nat outside` command, the packet is translated to the IP address configured on the second interface.

**Network List from the Server**

Routes for enterprise traffic are dynamically installed by a client through the tunnel interface. The traffic takes the default route via the outgoing physical interface. The enterprise traffic is translated to the tunnel IP address, and the Internet traffic is translated to the external outgoing interface IP address.

**Default Route List from the Server**

A default route must be configured on the device with the higher sequence number via the tunnel interface. The tunnel interface is configured with the `ip nat outside` command, and the IP address of the tunnel interface is assigned by the IP address sent by the client. The enterprise traffic from inside interfaces is translated to the sent address. NAT is achieved by configuring NAT rules with the help of route maps. The route maps define rules based on the outgoing interface, by which the globally configured NAT rules are applied based on routing.

IPv4 traffic going out the tunnel interface is translated to the sent IPv4 address.

---

**Note**

If NAT is not required, NAT rules associated with the tunnel interface must not be configured.

**How the FlexVPN Client learns about the Network List**

The FlexVPN client learns about the list of networks behind a peer in one of the following ways:

- **Mode configuration push**—The FlexVPN server sends the list of network attributes as a configuration mode parameter to the client. The FlexVPN client installs the routes to these networks through the tunnel interface that has the highest metric. The client also communicates its networks to the server in the mode configuration set or acknowledgment (SET/ACK) exchange so that the server can add those routes via the virtual access interface.

- **Running routing protocols**—The FlexVPN client and server run routing protocols over the tunnel interface to establish network routes, which allows the client and the server the flexibility to add or remove networks without disconnecting the existing session. The tunnel addresses are communicated during mode configuration to establish routes with peers.

**WINS NBNS and DOMAIN Name**

The FlexVPN server pushes the domain name, Windows Internet Naming Service (WINS), or NetBios Name Server (NBNS) attributes during mode configuration. These attributes are dynamically updated to the DHCP server that runs on the FlexVPN client.
**Event Tracing**

The Event Tracing feature is used for debugging purposes. Events posted to the FlexVPN client are logged, and the information is used for debugging. Event tracing is a combination of a fast mechanism that logs a few bytes of trace information in a buffer area and a display mechanism that extracts and decodes the debug data. The FlexVPN client maintains its buffer and can be enabled during normal operation.

**Extensible Authentication Protocol as a Local Authentication Method**

The FlexVPN client supports EAP as a local authentication method. Supported EAP authentication methods are Microsoft Challenge Handshake Authentication Protocol Version 2 (MSCHAPv2), message digest algorithm 5 (MD5), and Generic Token Card (GTC). The EAP authentication process is as follows:

- Use the `authentication local eap` command in IKEv2 profile configuration mode to authenticate the FlexVPN client by using EAP.
- After the FlexVPN client receives the IKE_AUTH response from the peer, enter the `crypto eap credentials` command.
- If the EAP-Identity Request is received in the IKE_AUTH response, the EAP username and password must be specified.
- If an EAP-Identity Request is not received in the IKE_AUTH response, only the password is specified because the local IKEv2 identity is used as the username.

**Note**

EAP as the local authentication method must be used with the FlexVPN client, but EAP can also be used on the IKEv2 initiator. If the EAP server initially proposes an unsupported authentication method, the FlexVPN EAP initiator responds with an EAP Negative Acknowledgment (NAK) packet, requesting EAP-MSCHAPv2, EAP-MD5, or EAP-GTC as the desired authentication method. The FlexVPN EAP responder selects one of the authentication methods.

**IKEv2 Dynamic Route Tagging**

The IKEv2 Dynamic Route Tagging feature enables you to specify a tag value for automatically learned (connected) routes and apply this tag value during the installation on the hub. The feature is supported on SVTI, FlexVPN Client and FlexVPN Spoke. The IKEv2 Dynamic Route Tagging feature supports only the IPv6 connected routes. You can configure the IKEv2 Dynamic Route Tagging feature on both FlexVPN server and FlexVPN client.

This feature requires Cisco IOS Release 15.6(3)M2 or later for SVTI, FlexVPN Client and FlexVPN Spoke. FlexVPN server must be Cisco IOS XE Everest 16.5.1 or later.

The IKEv2 Dynamic Route Tagging feature supports the following route map scenarios:

- Route matching is performed through the `match ipv6-address` command only.
- Route map support with local and external AAA attributes.
- Modifying route-map configurations during the active crypto sessions can cause route leaks for redistributed routes.
• The redistribute protocol can be pushed through AAA also. The AAA string would be as follows: `ipsec:route-redistribute=protocol-name [route-map route-map-name]`. The `route-map` command must be configured on the device already.

• Route dampening can be configured or set to the default value.

• Route injection in the same VRF to which the virtual access interface belongs.

• Upto 100 routes can be configured per session using the `crypto ikev2 route redistribute update-per-msg` command. If the number of routes exceeds 100, multiple information exchange messages are sent, with each message having 100 or less routes.

**Restrictions for IKEv2 Dynamic Route Tagging**

• Route properties distance is not supported with the routes.

• IKE2 Dynamic Route Tagging supports IPv6 connected routes only. The LAN side must be IPv6 address. However, the WAN side can be IPv4 or IPv6.

• VRF for IKEv2 Dynamic Route Tagging from FlexVPN client is not supported.

## How to Configure the FlexVPN Client

### Configuring the IKEv2 VPN Client Profile

This task describes the IKEv2 commands required for configuring the FlexVPN client and the basic IKEv2 commands. Refer to the “Configuring Basic Internet Key Exchange Version 2 CLI Constructs” task in the *Configuring Internet Key Exchange Version 2 (IKEv2)* module for information about configuring the basic IKEv2 profile.

**Note**

When you enter a typo in authorization list under ikev2 profile, it automatically goes back to the default list.

Refer to the “How to Configure the FlexVPN Client” section for information about configuring an IKEv2 profile for the FlexVPN server.

### Configuring the Tunnel Interface

Perform this task to configure the tunnel interface that is referred to by the FlexVPN client.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `ip address {ipv4-address | negotiated}`
5. `tunnel mode gre ip`
6. `tunnel mode ipsec ipv4`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  
  Example:  
  Device> enable  
  • Enter your password if prompted. |
| 2    | configure terminal | Enters global configuration mode.  
  Example:  
  Device# configure terminal |
| 3    | interface tunnel number | Creates a tunnel interface and enters interface configuration mode.  
  Example:  
  Device(config)# interface tunnel 1 |
| 4    | ip address {ipv4-address | negotiated} | (Optional) Assigns an IPv4 address to the tunnel interface.  
  Example:  
  Device(config-if)# ip address negotiated |
| 5    | tunnel mode gre ip | (Optional) Enables generic route encapsulation (GRE) mode for the tunnel interface.  
  Example:  
  Device(config-if)# tunnel mode gre ip |
| 6    | tunnel mode ipsec ipv4 | (Optional) Enables IPsec encapsulation.  
  Example:  
  Device(config-if)# tunnel mode ipsec ipv4 |
| 7    | tunnel source {ip-address | interface | dynamic} | Specifies the source for the tunnel interface.  
  Example:  
  Device(config-if)# tunnel source 10.0.0.1 |
| 8    | tunnel destination dynamic | Specifies the destination for the tunnel interface.  
  Example:  
  Device(config-if)# tunnel destination dynamic |
| 9    | tunnel protection ipsec-profile profile-name | Associates a tunnel interface with an IPsec profile.  
  Example:  
  Device(config-if)# tunnel protection ipsec-profile ipsecprofile1 |
### Purpose
- **Command or Action**
- **End**
- **Example:**

<table>
<thead>
<tr>
<th>Example</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-if)# end</td>
<td>Exits interface configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

### Configuring the FlexVPN Client

Use the `monitor event-trace flexvpn` command to enable event tracing.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ikev2 client flexvpn client-name**
4. **peer sequence {ipv4-address | ipv6-address | fqdn fqdn-name [dynamic | ipv6]} [track track-number [up | down]]**
5. **connect {manual | auto | track track-number [up | down]}**
6. **client inside interface-type interface-number**
7. **client connect tunnel interface-type interface-number**
8. **source sequence-number interface-type interface-number track track-number**
9. **peer reactivate**
10. **backup group {group-number | default}**
11. **end**

Configuring IKEv2 Dynamic Route Tagging for Hub

Perform this task to configure IKEv2 dynamic route tagging on FlexVPN hub.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto ikev2 route redistribute {update-interval seconds | update-per-msg number}
4. `crypto ikev2 authorization policy policy-name`
5. `route accept route-map route map-name`
6. `aaa attribute list list-name`
7. `route redistribute connected [route-map map-name]`
8. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  * Enter your password if prompted. |
| Example: Device> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example: Device# configure terminal | |
| **Step 3** crypto ikev2 route redistribute {update-interval seconds} | Configures the update interval and update per message (IKEv2 Information Exchange message) for IKEv2 dynamic route tagging.  
  * update-interval seconds — Duration between the route redistribution, in seconds. The default is two seconds.  
    Range: 1 to 60.  
  * update-per-msg number — Number of routes permitted in a message. Range: 1 to 100. |
| Example: Device(config)# crypto ikev2 route redistribute update-interval 5 | |
| **Step 4** crypto ikev2 authorization policy policy-name | Specifies the IKEv2 authorization policy and enters IKEv2 authorization policy configuration mode. |
| Example: Device(config)# crypto ikev2 authorization policy policy1 | |
| **Step 5** route accept route-map route map-name | Specifies the configured route map to simulate in the IKEv2 session. |
| Example: Device(config)# crypto ikev2 authorization policy | |
| **Step 6** aaa attribute list list-name | Specifies an AAA attribute list.  
  **Note** The AAA attribute list referred to in this command should be defined in global configuration mode. |
| Example: Device(config-ikev2-author-policy)# aaa attribute list list1 | |
| **Step 7** route redistribute connected [route-map map-name] | Enables route redistribution for the connected route map.  
  * route-map map-name — (Optional) Route map that should be filtered to import routes from one source routing protocol to another routing protocol. If a map name is not specified, all routes are redistributed.  
  **Note** The map name should be defined in global configuration mode |
| Example: Device(config-ikev2-author-policy)# route redistribute connected | |
### Purpose

Command or Action | Purpose |
--- | --- |
**Step 8** | **end** |
**Example:** | Device(config-ikev2-author-policy)# end |
| | Exits IKEv2 authorization policy configuration mode and returns to privileged EXEC mode. |

### Configuring IKEv2 Dynamic Route Tagging for Spoke

Perform this task to configure IKEv2 dynamic route tagging on FlexVPN client.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ikev2 route redistribute** `{update-interval seconds | update-per-msg number}`
4. **crypto ikev2 authorization policy** `policy-name`
5. **aaa attribute list** `list-name`
6. **route redistribute connected** `[route-map map-name]`
7. **end**

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong></td>

<td><strong>crypto ikev2 authorization policy</strong> <code>policy-name</code></td>
<td>Specifies the IKEv2 authorization policy and enters IKEv2 authorization policy configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# crypto ikev2 authorization policy policy1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>aaa attribute list</strong> <code>list-name</code></td>
<td>Specifies an AAA attribute list.</td>
</tr>
</tbody>
</table>
## Purpose

Command or Action | Purpose
---|---
**Example:**
Device(config-ikev2-author-policy)# aaa attribute list list1 | **Note** The AAA attribute list referred to in this command should be defined in global configuration mode.

### Step 6

**route redistribute connected [route-map map-name]**

**Example:**
Device(config-ikev2-author-policy)# route redistribute connected

<table>
<thead>
<tr>
<th>Step 6 route redistribute connected [route-map map-name]</th>
<th>Enables route redistribution for the connected route map.</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <strong>route-map map-name</strong>—(Optional) Route map that should be filtered to import routes from one source routing protocol to another routing protocol. If a map name is not specified, all the connected routes are redistributed.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 7

**end**

**Example:**
Device(config-ikev2-author-policy)# end

| Step 7 end | Exits IKEv2 authorization policy configuration mode and returns to privileged EXEC mode. |

---

## Configuration Examples for the FlexVPN Client

### Example: Configuring the IKEv2 FlexVPN Client Profile

The following example shows how to configure the IKEv2 FlexVPN client profile:

```plaintext
crypto ikev2 client flexvpn flex
cryptov2 peer 1 10.0.0.1
cryptov2 connect manual
cryptov2 client connect Tunnel0

cryptov2 authorization policy flex
subnet-acl 199
route set interface
route accept any

cryptov2 keyring key

cryptov2 peer dvti

cryptov2 address 0.0.0.0 0.0.0.0

cryptov2 pre-shared-key cisco

cryptov2 ikev2 profile prof

cryptov2 match identity remote address 10.0.0.1 255.0.0.0

cryptov2 authentication local pre-share

cryptov2 authentication remote pre-share

cryptov2 keyring key

cryptov2 aaa authorization group psk list local-group-author-list flex

cryptov2 config-mode set

cryptov2 ipsec transform-set trans esp-aes

cryptov2 ipsec profile ipsecprof

cryptov2 set transform-set trans

cryptov2 set pfs group2

cryptov2 set ikev2-profile prof
```

---

**FlexVPN and Internet Key Exchange Version 2 Configuration Guide, Cisco IOS XE Gibraltar 16.11.x**

Example: Configuring EAP as a Local Authentication Method

The following example shows how to configure EAP as a local authentication method:
crypto ikev2 profile profile1
 authentication remote rsa-sig
 authentication local eap

When the session is brought up, a prompt appears to enter the EAP credentials, as follows:

Enter the command "crypto eap credentials profile1"
Device# crypto eap credentials profile1
Enter the Username for profile profile1: cisco
Enter the password for username cisco

Example: Configuring the IKEv2 Dynamic Route Tagging for Hub

The following example shows how to configure the IKEv2 Dynamic Router Tagging for hub:

Feature Information for Configuring the FlexVPN Client

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Configuring IKEv2 Load Balancer

The IKEv2 Load Balancer feature provides support for enabling clusters of FlexVPN gateways and distributes incoming Internet Key Exchange Version 2 (IKEv2) connection requests among FlexVPN gateways. This feature redirects the incoming FlexVPN or AnyConnect client requests to the least loaded FlexVPN gateway based on the system and crypto load factors.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for IKEv2 Load Balancer

- For the server-side configuration, the Hot Standby Router Protocol (HSRP) and FlexVPN server (IKEv2 profile) must be configured.

- For the client-side configuration, the FlexVPN client must be configured.
Information About IKEv2 Load Balancer

Overview of IKEv2 Load Balancer

The IKEv2 Load Balancer Support feature provides a Cluster Load Balancing (CLB) solution by redirecting requests from remote access clients to the Least Loaded Gateway (LLG) in the Hot Standby Router Protocol (HSRP) group or cluster. An HSRP cluster is a group of gateways or FlexVPN servers in a LAN or in an enterprise network. The CLB solution works with the Internet Key Exchange Version 2 (IKEv2) redirect mechanism defined in RFC 5685 by redirecting requests to the LLG in the HSRP cluster.

The figure below shows the working of the IKEv2 cluster load balancing solution.

Figure 4: IKEv2 Cluster Load Balancing Solution

1. An active HSRP gateway is elected as a “master” in the HSRP group and takes ownership of the Virtual IP address (VIP) for the group. The master maintains a list of gateways in the cluster, keeps track of the load on each gateway, and redirects the FlexVPN client requests to the LLG.

2. The remaining gateways, termed as “slaves,” send load updates to the master at periodic intervals.

3. When an IKEv2 client connects to the HSRP VIP, the request first reaches the master, which in turn, redirects the request to the LLG in the cluster.

The components of the CLB solution are as follows:

- HSRP
- CLB master
- CLB slave
- CLB communication
- IKEv2 redirects mechanism
Hot Standby Router Protocol

Hot Standby Router Protocol (HSRP) is used to elect the HSRP master or Active Router (AR). For HSRP to elect a designated device, you must configure the VIP for one device in the group. This address is learned by other devices in the group. The IP address that is assigned to the master is used as the VIP for the group. The HSRP active router (also called CLB master) receives the IKEv2 requests and redirects these requests to the LLG in the cluster. The redirection is performed at the IKEv2 protocol level thereby achieving the following:

- All requests from the FlexVPN client reach the HSRP master as the VIP is configured on the FlexVPN clients. The configuration of FlexVPN clients is minimized because the FlexVPN clients must only know the VIP of the HSRP cluster.
- The CLB master is run on the same gateway as the HSRP master, thereby maintaining the load information of all CLB slaves. The CLB master enables effective redirection of requests and avoids multiple redirects and loops.

CLB Master

A CLB master runs on the HSRP master or Active Router (AR). The master receives updates from CLB slaves and sorts them based on their load condition to calculate the least loaded gateway (LLG). The master sends the IP address of the LLG to IKEv2 (on the FlexVPN server). The IP address is sent to the initiator (FlexVPN client), which initiates an IKEv2 session with the LLG. The master redirects incoming IKEv2 client connections towards the LLG. For more information, see section “IKEv2 Redirect Mechanism, on page 90.”

Note

“CLB nodes” are used where both a CLB master and CLB slave must be specified.

CLB Slave

A CLB slave runs on all devices in an HSRP group except on the Active Router (AR). The slaves are responsible for sending periodic load updates to the server. A CLB slave is a fully functional IKEv2 gateway which supplies information to the CLB master. Apart from updates, CLB slaves send messages for aliveness assurance to the CLB master.

CLB Load Management Mechanism

The CLB Load Management Mechanism is a TCP-based protocol that runs between the CLB master and the CLB slaves. The CLB load management mechanism informs the CLB master about the load on the CLB slaves. Based on this information, the CLB master selects the LLG to handle the session on each new incoming IKEv2 connection.

Benefits of IKEv2 Load Balancer

- The IKEv2 Load Balancer Support feature is easy to configure and cost-effective.
- A FlexVPN client need not know the IP addresses of all gateways in the cluster. The client need only know the virtual IP address of the cluster.
- The entire crypto session is redirected to a node in the cluster.
IKEv2 Redirect Mechanism

The IKEv2 redirect mechanism enables a VPN gateway to redirect a FlexVPN client request to another VPN gateway based on load conditions and maintenance requirements.

The IKEv2 redirect mechanism is performed on security association (SA) initialization (IKE_SA_INIT) and on SA authentication (IKE_AUTH).

Redirect During IKEv2 Initial Exchange (SA Initialization)

A FlexVPN client, or an AnyConnect client indicates support for Internet Key Exchange Version 2 (IKEv2) redirect mechanism by including a REDIRECT_SUPPORTED notification message in the initial IKE_SA_INIT request. Use the `crypto ikev2 redirect client` command to enable the redirect mechanism on a client. Use the `crypto ikev2 redirect gateway init` command to enable redirect at IKE_SA_INIT on the gateway.

To redirect an IKEv2 request to another new gateway, the gateway that receives the IKE_SA_INIT request selects the IP address or the fully qualified domain name (FQDN) of the new gateway (in this case, the LLG) with help of the crypto load balancer (CLB) module. The gateway replies with an IKE_SA_INIT response that contains a REDIRECT notification message. The notification includes information such as the new gateway and the nonce value from the payload in the IKE_SA_INIT request. When a client receives the IKE_SA_INIT response, it verifies the nonce value sent in the IKE_SA_INIT request and the gateway information provided in the redirect notification, and confirms whether the redirect notification is as per the configuration.

- **Note**
  If the nonce value does not match, the client discards the response and waits for another response, thereby preventing denial of service (DoS) attacks on the initiator. DoS attacks could be caused by an attacker injecting incorrect redirect payloads in IKE_SA_INIT responses.

  In the IKE_SA_INIT exchange with the new gateway, the client message contains the REDIRECTED_FROM notification payload. The REDIRECTED_FROM notification payload consists of the IP address of the original VPN gateway that redirected the client. The IKEv2 exchange then proceeds as it would have proceeded with the original gateway.

- **Note**
  The client may be redirected again by the new gateway if the new gateway also cannot serve the client. The client does not include the REDIRECT_SUPPORTED payload again in the IKE_SA_INIT exchange with the new gateway after the redirect. The presence of the REDIRECTED_FROM notification payload in the IKE_SA_INIT exchange with the new gateway indicates to the new gateway that the client supports the IKEv2 redirects mechanism.

Redirect During IKE_AUTH Exchange (SA Authentication)

A thorough security analysis shows that redirect during IKE_AUTH is neither more nor less secure than redirect during IKE_INIT. However, for performance and scalability reasons, we recommend redirect during IKE_INIT. Use the `crypto ikev2 redirect gateway auth` command to enable the redirect mechanism on the gateway. Use the `redirect gateway auth` command to enable redirect on authentication for selected IKEv2 profiles.

In this method, the client authorization payload is verified before sending the redirect notification payload. A client also verifies the gateway authorization payload before acting on the redirect notification. As the
authorization payload is exchanged and successfully verified, the IKEv2 security association (SA) is validated successfully and the INITIAL_CONTACT is processed to decide on redirecting the request. If there is a redirect, the gateway creates the IKE SA and sends the IKE_AUTH response with the redirect notification.

A child SA is not created in this method. The IKE_AUTH does not contain a payload pertaining to a child SA. When the client receives the IKE_AUTH response, the client verifies the gateway authentication payload and deletes the IKEv2 SA with the gateway by sending a delete notification. The client acts on the redirect notification payload to establish connection with the new gateway. The client does not wait for an acknowledgment for the delete notification before establishing a connection with the new gateway. If the IKE_AUTH exchange involves the Extensible Authentication Protocol (EAP) authentication, the gateway has the choice of sending the redirect payload in the first or last IKE_AUTH response. The EAP authentication is included in the first IKE_AUTH response because it is not necessary to provide credentials for each redirect.

Compatibility and Interoperability

The IKEv2 redirect mechanism is based on RFC 5685. The gateway (IKEv2 responder) is compatible with clients (IKEv2 initiator) that implement the standard. Similarly, the client (initiator) implementation must be compatible with third party servers (responder) implementing the standard. The load management mechanism is Cisco proprietary and is only supported on Cisco IOS devices.

Handling Redirect Loops

A client request could be redirected multiple times in a sequence because of either an incorrect configuration or a denial of service (DoS) attack. In some cases, a client could enter a loop with two or more gateways redirecting the client to the other gateway thereby denying service to the client. To prevent this, a client can be configured, using the crypto ikev2 redirect client command with the max-redirects number keyword argument pair, to not accept more than a specific number of redirects for a particular IKEv2 security association (SA) setup.

IKEv2 Cluster Reconnect

The IKEv2 cluster reconnect feature allows Cisco AnyConnect client to reconnect to any server in the cluster. The crypto ikev2 reconnect key is introduced on the server to encrypt the opaque data pushed to the client. During failure detection, the client does reconnect with new or existing server without having to prompt for authentication credentials again.

There are only two key index values, 1 and 2 and at any point in time, any one of the keys configured using this will be active. The Cisco IOS server will be able to decrypt the reconnect data as long as the reconnect key is configured using the reconnect key CLI on the IOS server. This is true even if the key is only the back-up key.

This feature does not support when the anyconnect-eap keyword as authentication method in the IKEv2 profile through the authentication command.

Note

This feature is available on Cisco IOS devices configured to work as Cisco AnyConnect server. The AnyConnect client software version that supports this feature are 4.2 and future releases. This feature is applicable for new deployments only. Once this feature is enabled on the Cisco IOS server, older releases of Cisco AnyConnect clients will not be supported.
How to Configure IKEv2 Load Balancer

Configuring the Server Cluster

Configuring an HSRP Group for Load Balancing

Perform this task to configure a single Hot Standby Router Protocol (HSRP) group for a cluster.

Hot Standby Router Protocol (HSRP) is used to elect the HSRP master or Active Router (AR). For HSRP to elect a designated device, you must configure the VIP for one device in the group. This address is learned by other devices in the group. The IP address that is assigned to the master is used as the VIP for the group. The HSRP active router (also called CLB master) receives the IKEv2 requests and redirects these requests to the LLG in the cluster. The redirection is performed at the IKEv2 protocol level thereby achieving the following:

- All requests from the FlexVPN client reach the HSRP master as the VIP is configured on the FlexVPN clients. The configuration of FlexVPN clients is minimized because the FlexVPN clients must only know the VIP of the HSRP cluster.

- The CLB master is run on the same gateway as the HSRP master, thereby maintaining the load information of all CLB slaves. The CLB master enables effective redirection of requests and avoids multiple redirects and loops.

Note
This task describes the minimum commands required to configure an HSRP group for load balancing.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. ip address ip-address mask [secondary]
5. standby [group-number] priority priority
6. standby group-name
7. exit
8. Repeat Steps 3 to 7 to configure an HSRP group for another cluster.

DETAILED STEPS

<table>
<thead>
<tr>

**Configuring the Load Management Mechanism**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto ikev2 cluster
4. holdtime milliseconds
5. master {overload-limit percent | weight {crypto-load weight-number | system-load weight-number} }
6. port port-number
7. slave {hello milliseconds | max-session number | priority number | update milliseconds}
8. standby-group group-name
9. shutdown
10. exit
11. crypto ikev2 reconnect key key index active name
12. end
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  Example:  
  Device> enable |  
  • Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode.  
  Example:  
  Device# configure terminal | |
| **Step 3** crypto ikev2 cluster | Defines an IKEv2 cluster policy and enters IKEv2 cluster configuration mode.  
  Example:  
  Device(config)# crypto ikev2 cluster | |
| **Step 4** holdtime milliseconds | (Optional) Specifies the time, in milliseconds, to receive messages from a peer.  
  Example:  
  Device(config-ikev2-cluster)# holdtime 10000  
  • If no messages are received within the configured time, the peer is declared “dead.” | |
| **Step 5** master {overload-limit percent | weight {crypto-load weight-number | system-load weight-number} | Specifies settings for the master in the HSRP cluster.  
  Example:  
  Device(config-ikev2-cluster)# master weight crypto-load 10  
  • overload-limit percent—The threshold load of the cluster. The load limit to decide when a device is busy and to ignore it when redirecting it for requests.  
  • weight—Specifies the weight of a load attribute. Range: 0 to 100. Default: 100.  
  • crypto-load weight-number—The IKE and IPsec security association (SA) load.  
  • system-load weight-number—The system and memory load. | |
| **Step 6** port port-number | (Optional) Specifies the cluster master listen port.  
  Example:  
  Device(config-ikev2-cluster)# port 2000 | |
| **Step 7** slave {hello milliseconds | max-session number | priority number | update milliseconds} | Specifies settings for slave gateways in the HSRP group.  
  Example:  
  Device(config-ikev2-cluster)# slave max-session 90  
  • hello milliseconds—The hello interval, in milliseconds, for a slave gateway.  
  • max-session number—The maximum number of SAs allowed on a slave. This keyword is mandatory and cannot be skipped.  
  • priority number—The slave priority. | |
### Activating the IKEv2 Redirect Mechanism on the Server

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto ikev2 redirect gateway init
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

---

### Configuring IKEv2 Load Balancer

#### Purpose Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>update milliseconds</td>
<td>The interval, in milliseconds, between two update messages for a slave gateway.</td>
</tr>
</tbody>
</table>

#### Step 8

**standby-group group-name**

*Example:*

```bash
Device(config-ikev2-cluster)# standby-group group1
```

Defines the HSRP group containing the slaves.

- **group-name** — The group name is derived from the `group-name` argument specified in the `standby name` command.

#### Step 9

**shutdown**

*Example:*

```bash
Device(config-ikev2-cluster)# shutdown
```

(Optional) Disables the IKEv2 cluster policy.

#### Step 10

**exit**

*Example:*

```bash
Device(config-ikev2-cluster)# exit
```

Exits IKEv2 cluster configuration mode and returns to global configuration mode.

#### Step 11

**crypto ikev2 reconnect key key index active name**

*Example:*

```bash
Device(config)# crypto ikev2 reconnect key 1 active test123
```

Enables the IKEv2 opaque data support for session reconnect.

**Note**

The ikev2 cluster reconnect feature is enabled for encryption only when the `active` keyword is present in the `ikev2 reconnect key active name key-string`. The `active` keyword is mandatory to enable the cluster reconnect feature. If you use the `ikev2 reconnect key key-name key-string` command without the `active` keyword in the command, the headend will only be able to decrypt.

#### Step 12

**end**

*Example:*

```bash
Device(config-ikev2-cluster)# end
```

Exits IKEv2 cluster configuration mode and returns to privileged EXEC mode.
### Activating the IKEv2 Redirect Mechanism on the Client

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto ikev2 redirect client [max-redirects number]`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>crypto ikev2 redirect gateway init</code></td>
<td>Enables the IKEv2 redirect mechanism on the gateway during SA initiation.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# crypto ikev2 redirect gateway init</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>end</code></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
### Configuration Examples for IKEv2 Load Balancer

#### Example: Configuring an HSRP Group for Load Balancing

The following example shows RouterA configured as the active router for an Hot Standby Router Protocol (HSRP) group with a priority of 110. The default priority level is 100. This HSRP group is assigned the group name of group1. The group name is referred in the cluster policy.

```
Device(config)# hostname RouterA
Device(config)# interface GigabitEthernet 0/0/0
Device(config-if)# ip address 10.0.0.1 255.255.255.0
Device(config-if)# standby 1 priority 110
Device(config-if)# standby group1
Device(config-if)# end
```

#### Example: Configuring the Load Management Mechanism

The following example shows how to configure the load management mechanism in IKEv2:

```
Device> enable
Device# configure terminal
Device(config)# crypto ikev2 cluster
Device(config-ikev2-cluster)# holdtime 10000
Device(config-ikev2-cluster)# master crypto-load 10
Device(config-ikev2-cluster)# port 2000
Device(config-ikev2-cluster)# slave priority 90
Device(config-ikev2-cluster)# standby-group group1
Device(config-ikev2-cluster)# shutdown
Device(config-ikev2-cluster)# end
```

#### Example: Configuring the Redirect Mechanism

The following example shows how to enable the redirect mechanism on a client and during initiation on a gateway:

```
Device> enable
Device# configure terminal
Device(config)# crypto ikev2 redirect client
Device(config)# crypto ikev2 redirect gateway init
Device(config)# end
```

#### Example: Configuring the Cluster Reconnect Key

The following example shows how to enable the reconnect key on a server:

```
```
Device> enable
Device# configure terminal
Device(config)# crypto ikev2 reconnect key 1 active key
Device(config)# crypto ikev2 reconnect key 2 test
Device(config)# end

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IKEv2 Fragmentation

IKEv2 Fragmentation

The Internet Key Exchange Version 2 (IKEv2) fragmentation protocol splits large IKEv2 message into a set of smaller ones, called IKE Fragment Messages. The IKEv2 fragmentation methodology, implemented on Cisco IOS software through the IKEv2 Remote Access Headend feature, is a Cisco proprietary method, which restricts interoperability with non-Cisco peers. The fragmentation is performed only on an encrypted IKEv2 packet, and hence, a peer cannot decrypt or authenticate the message until the peer receives all fragments. The IKE Fragmentation adhering to RFC feature implements the IETF draft-ietf-ipsecme-ikev2-fragmentation-10 document by encrypting packets after fragmentation, enabling interoperability with non-Cisco peers while continuing to support the Cisco proprietary fragmentation method.
**Negotiation Between Peers**

Effective with the IKE Fragmentation adhering to RFC feature, the support for the IETF standard fragmentation method is added the IKE_SA_INIT message as a notify payload, while Cisco proprietary Fragmentation method continues to be indicated using the Vendor ID payload in the same IKE_SA_INIT message. When fragmentation is enabled, support for both methodologies is displayed as appropriate in the `show crypto ikev2 sa detail` command. The maximum transmission unit (MTU) is configured locally and is not negotiated or exchanged along with the messages. After the INIT exchange, the peers in a network configured with either methodology are aware of the authentication method that must be used and whether the AUTH message can be fragmented.

The following is a sample output from device when debug is enabled showing capability negotiation in INIT request message.

```
Exchange type: IKE_SA_INIT, flags: INITIATOR Message id: 0, length: 524
Payload contents:
SA Next payload: KE, reserved: 0x0, length: 144
...
Security protocol id: IKE, spi size: 0, type: NAT_DETECTION_DESTINATION_IP
NOTIFY(IKEV2_FRAGMENTATION_SUPPORTED) Next payload: VID, reserved: 0x0, length: 8
Security protocol id: Unknown - 0, spi size: 0, type: IKEV2_FRAGMENTATION_SUPPORTED
VID Next payload: NONE, reserved: 0x0, length: 20
```

In the above output, the INIT request contains the initiator’s message to a responder indicating support for both IETF standard fragmentation method and Cisco proprietary fragmentation method through the `IKEV2_FRAGMENTATION_SUPPORTED` and `VID` values in the message.

The following is a sample output from device when debug is enabled showing capability negotiation in INIT response message.

```
Exchange type: IKE_SA_INIT, flags: INITIATOR Message id: 0, length: 524
Payload contents:
SA Next payload: KE, reserved: 0x0, length: 144
last proposal: 0x0, reserved: 0x0, length: 140
...
NOTIFY(IKEV2_FRAGMENTATION_SUPPORTED) Next payload: VID, reserved: 0x0, length: 8
Security protocol id: Unknown - 0, spi size: 0, type: IKEV2_FRAGMENTATION_SUPPORTED
Response, supporting both
VID Next payload: NONE, reserved: 0x0, length: 20
```

In the above output, the response request contains the responder’s message to the initiator indicating support for both IETF standard fragmentation method and Cisco proprietary fragmentation method through the `IKEV2_FRAGMENTATION_SUPPORTED` and `VID` values in the message.

**Fragmentation Support for Older Releases**

To ensure fragmentation support for older releases having Cisco proprietary fragmentation method, IKEv2 continues to use the Vendor ID along with the IKEv2 notification payload type for the IETF standard fragmentation method. If both fragmentation methods are supported, IKEv2 prefers the IETF standard fragmentation method.

The following table indicates how the fragmentation type is determined based on the capability of peers. CISCO refers to Cisco proprietary fragmentation method and STD refers to the IETF standard fragmentation method.

*FlexVPN and Internet Key Exchange Version 2 Configuration Guide, Cisco IOS XE Gibraltar 16.11.x*
## Encryption, Decryption, and Retransmission of Fragments

### Fragmentation and Encryption

A packet is fragmented either based on the maximum transmission unit (MTU) value specified in the `crypto ikev2 fragmentation` command or the default MTU value. IKE messages that only contain the encrypted payload are fragmented. A new payload type—Encrypted and Authenticated Fragment—in the announcement message indicates the fragment number out of the total fragments. This payload is annotated as SKF and the value is 53.

Before the outgoing packet is encrypted, the packet length is checked. The security association established is also verified if the SA is enabled with the IETF standard fragmentation method. The following is a sample output from device displaying the transmission of fragmented packets.

```
Exchange type: INFORMATIONAL, flags: INITIATOR Message id: 1, length: 244
Payload contents:
SKF Next payload: COOP, reserved: 0x90, length: 216
SKF Fragment number: 1 OF Total Fragments: 3
```

```
Exchange type: INFORMATIONAL, flags: INITIATOR Message id: 1, length: 244
Payload contents:
SKF Next payload: COOP, reserved: 0x90, length: 216
SKF Fragment number: 2 OF Total Fragments: 3
```

```
Exchange type: INFORMATIONAL, flags: INITIATOR Message id: 1, length: 244
Payload contents:
SKF Next payload: COOP, reserved: 0x90, length: 216
SKF Fragment number: 3 OF Total Fragments: 3
```

The line “SKF Next payload: COOP, reserved: 0x90, length: 216” and “SKF Fragment number: 1 OF Total Fragments: 3” indicate that the message is a Cooperative key server announcement (ANN) packet fragmented into three fragments.

### Decryption and Defragmentation

When incoming fragments are received on a responder, each fragment is decrypted and stored temporarily. During defragmentation (assembling the fragments to the original pack), duplicate fragments, fragment

numbers outside of total fragment number, and fragments having an entirely different fragment number are dropped. The fragments are added in ascending order of fragment number and not according to the received order), that way, packet assembly is faster. However, out of order fragments are allowed and processed. Each fragment is verified to ensure that all fragments that pertain to a message are received. If all fragments are received, the packet is assembled from the fragments and processed as a newly received message. Acknowledgment (ACK) message is sent when the original packet is assembled, and not for each fragment.

Retransmissions

IKEv2 retransmissions happen as prompted by IKEv2 retransmission timers. The fragments once constructed and sent out for the first time, are held in a list, ready to be resent when the retransmission timers are triggered. When a retransmitted request is received, IKEv2 resends the response. The response is resent when the first fragment (#1) retransmission is received. The remaining fragment numbers are ignored, thereby allowing faster processing of the response.

Enabling Fragmentation

Use the `crypto ikev2 fragmentation` command to globally enable fragmentation per security association (SA). Fragmentation is enabled on SA when both peers indicate support for fragmentation after INIT exchange on each peers, to be used for IKE_AUTH exchange.

Note

This command was introduced through IKEv2 Remote Access Headend feature and has not changed.

You can specify the maximum transmission unit (MTU), in bytes, using the `mtu mtu-size` keyword-argument pair. The MTU size refers to the IP or UDP encapsulated IKEv2 packets. The MTU range is from 68 to 1500 bytes. The default MTU size is 576 for IPv4 packets and 1280 bytes for IPv6 packets.

Effective with the IKE Fragmentation adhering to RFC feature, the `crypto ikev2 fragmentation` command:

- Affects future SAs only and does not affect the existing, old SAs.
- Supports Cisco proprietary fragmentation method and the IETF standard fragmentation method.

The `show crypto ikev2 sa detail` command displays the following information:

- The fragmentation method enabled on the peer. If the enabled fragmentation method is IETF standard fragmentation, the output displays the MTU, which is in use.
- Whether fragmentation is enabled on both peers or enabled on the local peer only.

IPv6 Support

The IKE Fragmentation adhering to RFC feature adds support for fragmenting IPv6 packets in IPv6 IKE endpoints when the IETF standard fragmentation method is used. The default MTU value is 1280 bytes and is used when the MTU is not specified in the `crypto ikev2 fragmentation` command. The MTU used in fragmentation is displayed in the output of the `show crypto ikev2 sa detail` command.
How to Configure Configuring IKEv2 Fragmentation

Configuring IKEv2 Fragmentation

Perform this task to enable automatic fragmentation of large IKEv2 packets.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto ikev2 fragmentation [mtu mtu-size]`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device&gt; enable</td>
<td>Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>crypto ikev2 fragmentation [mtu mtu-size]</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# crypto ikev2 fragmentation mtu 100</td>
<td>Configures IKEv2 fragmentation.&lt;br&gt;• The MTU range is from 68 to 1500 bytes. The default MTU size is 576 for IPv4 packets and 1280 bytes for IPv6 packets.&lt;br&gt;Note: The MTU size refers to the IP or UDP encapsulated IKEv2 packets.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# end</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>

Feature Information for Configuring IKEv2 Fragmentation

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Feature Information for Configuring IKEv2 Fragmentation
Configuring IKEv2 Reconnect

The IOS IKEv2 support for AutoReconnect feature of AnyConnect feature helps in reestablishing IKEv2 negotiation without user interaction with the Cisco AnyConnect client.

• Finding Feature Information, on page 113
• Prerequisites for Configuring IKEv2 Reconnect, on page 113
• Restrictions for Configuring IKEv2 Reconnect, on page 113
• Information About Configured IKEv2 Reconnect, on page 114
• How to Configure IKEv2 Reconnect, on page 115
• Configuration Examples for Configuring IKEv2 Reconnect, on page 117
• Additional References for Configuring IKEv2 Reconnect, on page 117
• Feature Information for Configuring IKEv2 Reconnect, on page 118

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring IKEv2 Reconnect

• You must enable the BypassDownloader function in the AnyConnectLocalPolicy file by setting the <BypassDownloader> value to true. If your device does not support SSL, the BypassDownloader function will not work. You must disable the function manually by setting the <BypassDownloader> value to false, else the connection will fail.

Restrictions for Configuring IKEv2 Reconnect

• The preshared key authorization method cannot be configured on the Internet Key Exchange Version 2 (IKEv2) profile. This is because the IOS IKEv2 support for AutoReconnect feature of AnyConnect...
feature uses the preshared key authorization method and configuring the preshared key on the same IKEv2 profile may lead to confusion.

• The following commands cannot be configured on the IKEv2 profile: authentication local pre-share, authentication remote pre-share, keyring, aaa authorization group psk, and aaa authorization user psk.

Information About Configured IKEv2 Reconnect

IKEv2 and Cisco AnyConnect Client Reconnect Feature

The Auto Reconnect feature in the Cisco AnyConnect client helps the Cisco AnyConnect VPN client to remember the session for a period of time and to resume the connection after establishing the secure channel. As the Cisco AnyConnect Client is extensively used with Internet Key Exchange Version 2 (IKEv2), IKEv2 extends the Auto Reconnect feature support on Cisco IOS software through the IOS IKEv2 support for Auto Reconnect feature of AnyConnect feature.

Auto Reconnect in the Cisco AnyConnect client occurs in the following scenarios:

• The intermediate network is down. The Cisco AnyConnect client tries to resume the session when it is up.
• The Cisco AnyConnect client device switches between networks. This results in source IP or port change, which brings down the existing security association (SA) and, hence, the Cisco AnyConnect client tries to resume the SA using the Auto Reconnect feature.
• The Cisco AnyConnect client device tries to resume SA after returning from sleep or hibernate mode.

Advantages of Using the Auto Reconnect Feature

• The copy attributes used in the original session are reused without querying the authentication, authorization, and accounting (AAA) server.
• The Cisco IOS gateway does not have to contact the RADIUS server for reconnecting to the client.
• No user interaction for authentication or authorization is needed during resuming the session.
• The authentication method is the preshared key when reconnecting a session. This authentication method is quick compared to other authentication methods (that include Rivest, Shamir, and Adelman (RSA) signature authentication method, Elliptic Curve Digital Signature Algorithm (ECDSA) signature authentication method, and Extensible Authentication Protocol (EAP) authentication method). The preshared key authentication method helps in resuming a session on the IOS software with minimal resources.
• The unused security associations (SAs) are removed thereby freeing the crypto resources.

Auto Reconnect and DPD

Dead Peer Detection (DPD) is configured to confirm the availability of a peer send by sending queries to a peer. If there are no responses from the peer, the security association created for that peer is deleted. You need not configure DPD in a reconnect profile if DPD configured on the FlexVPN server because in both configuration scenarios, the purpose is the same. However, if the feature is enabled, DPD is queued as on demand DPD in IKEv2, which also stores the platform specific handle when deleting the SA.
Message Exchanges Between Cisco IOS Gateway and Cisco AnyConnect Client

The Cisco AnyConnect client contacts the Cisco IOS gateway to establish a security association (SA). During authorization or AUTH exchange (CFGMODE_REQ payload of IKE_AUTH request), IKEv2 checks if the IOS IKEv2 support for the Auto Reconnect feature of AnyConnect feature is enabled in the IKEv2 profile using the reconnect command, selects the IKEv2 policy of the chosen IKEv2 profile, and sends the session ID and the session token attributes to the Cisco AnyConnect client in CFGMODE_REPLY payload of the IKE_AUTH response. The authorization method is the preshared key between the client and Cisco IOS software for the SA.

IKEv2 periodically sends dead peer detection (DPD) messages to the Cisco AnyConnect client to validate if the client is active. The Cisco AnyConnect client responds to the DPD messages, which the Cisco IOS gateway understands as an active client and creates a security association (SA) with the client. However, if the client does not reconnect within 30 minutes, which is the default reconnect timeout period, the Cisco IOS gateway assumes that the client is inactive and deletes the SA for that client. The Cisco AnyConnect client needs to start a fresh connection.

Use the show crypto ikev2 stats reconnect command to view the connection statistics and the clear crypto ikev2 session and clear crypto ikev2 sa reconnect commands to delete the SA with the client.

How to Configure IKEv2 Reconnect

Enabling IKEv2 Reconnect

Perform this task to enable the IOS IKEv2 support for AutoReconnect feature of AnyConnect feature.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto ikev2 profile profile-name
4. reconnect [timeout seconds]
5. end

DETAILED STEPS

<table>

### Troubleshooting IKEv2 Reconnect Configuration

Use the following commands to verify or clear the IOS IKEv2 support for AutoReconnect feature of AnyConnect feature configuration.

**SUMMARY STEPS**

1. enable
2. show crypto ikev2 stats reconnect
3. clear crypto ikev2 stats reconnect

**DETAILED STEPS**

**Step 1** enable
Enables privileged EXEC mode.
- Enter your password if prompted.

Example:
Device> enable

**Step 2** show crypto ikev2 stats reconnect
Displays the reconnect statistics.

Example:
Device# show crypto ikev2 stats reconnect

| Total incoming reconnect connection | 10 |
| Total success reconnect connection | 10 |
| Total failed reconnect connection  | 0  |
| Total reconnect capable active session count | 4  |
| Total reconnect capable inactive session count | 6  |

**Step 3** clear crypto ikev2 stats reconnect
Clears the reconnect statistics.
Example:

Device# clear crypto ikev2 stats reconnect

Total incoming reconnect connection: 0
Success reconnect connection: 0
Failed reconnect connection: 0
Reconnect capable active session count: 4
Reconnect capable inactive session count: 6

Configuration Examples for Configuring IKEv2 Reconnect

Example: Enabling IKEv2 Reconnect

The following example shows how to enable the IOS IKEv2 support for AutoReconnect feature of AnyConnect feature.

Device> enable
Device# configure terminal
Device(config)# crypto ikev2 profile profile1
Device(config-ikev2-profile)# reconnect timeout 600
Device(config-ikev2-profile)# end

Feature Information for Configuring IKEv2 Reconnect

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Configuring IKEv2 Packet of Disconnect

The IKEv2 Remote Access Change of Authorization (CoA)—Packet of Disconnect feature terminates an active crypto IKEv2 session on Cisco supported devices.

- Finding Feature Information, on page 119
- Information About IKEv2 Packet of Disconnect, on page 119
- How to Configure IKEv2 Packet of Disconnect, on page 120

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About IKEv2 Packet of Disconnect

Disconnect Request

The Packet of Disconnect (POD) is a RADIUS disconnect_request packet and is intended to be used in situations where the authenticating agent server wants to disconnect a crypto session.

When the POD is Needed

The Packet of Disconnect is required in the following situations:

- Enforce reauthentication—As a network administrator, you might want to terminate a user on FlexVPN server to forcefully reauthenticate if a session is connected for a very long duration.
• Apply a new policy—As a network administrator, you may want to terminate an active crypto session and apply the new policy on the session when the client reconnects.
• Free resources—A session may need to be terminated to free resources and exit rekey.

**IKEv2 Packet of Disconnect**

The IKEv2 Remote Access Change of Authorization (CoA)—Packet of Disconnect feature uses the RADIUS Packet of Disconnect (POD) feature to delete a crypto session. The crypto session is deleted to update VPN users to the new user or group policy on the AAA server.

1. AAA passes the attribute key-value pair list, provided by the RADIUS server, to IKEv2.
2. IKEv2 parses the list and locates the Audit-Session-ID, a Cisco AV pair, as a key and validates the pair value.
3. IKEv2 searches the session and deletes the specific session.
4. IKEv2 notifies AAA and AAA notifies the RADIUS server.
5. The session pertaining to the Audit-Session-ID is deleted.

**Parameters in IKEv2 Packet of Disconnect**

RFC 3576 specifies the following POD codes that are supported for IKEv2 Packet of Disconnect:

- 40 - Disconnect-Request
- 41 - Disconnect-ACK
- 42 - Disconnect-NAK

The Disconnect-ACK code indicates that a session existed for an audit-session-ID and that the session, pertaining to an audit-session-ID was terminated successfully. The Disconnect-NACK code indicates that there are no session corresponding to the audit-session-ID. No reply message is sent to the gateway.

**How to Configure IKEv2 Packet of Disconnect**

**Configuring AAA on the FlexVPN Server**

There is no IKEv2-specific configuration required on the FlexVPN server for the IKEv2 Remote Access Change of Authorization (CoA)—Packet of Disconnect feature. You only need to configure authentication, authorization, and accounting (AAA) on the FlexVPN server. For additional information on AAA configuration, see .

**SUMMARY STEPS**

1. enable
2. configure terminal
3. aaa new-model
4. aaa server radius dynamic-author
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  
   | Example:          |         |
|      | Device> enable    |         |
| 2    | configure terminal | Enters global configuration mode.  
   | Example:          |         |
|      | Device# configure terminal |         |
| 3    | aaa new-model     | Enables AAA globally.  
   | Example:          |         |
|      | Device(config)# aaa new-model |         |
| 4    | aaa server radius dynamic-author | Sets up the local AAA server for the dynamic authorization service and enters dynamic authorization local server configuration mode.  
   | Example:          |         |
|      | Device(config)# aaa server radius dynamic-author |         |
|      | • In this mode, the RADIUS application commands are configured. | |
| 5    | client {hostname | ip-address} [server-key string | vrf vrf-id] | Configures the IP address or hostname of the AAA server client.  
   | Example:          |         |
|      | Device(config-locsvr-da-radius)# client 192.168.0.5 |         |
|      | server-key cisco  |         |
|      | Note: Configuring the server key at the client level overrides the server key configured at the global level. | |
| 6    | port number       | Configures the UDP port.  
   | Example:          |         |
|      | Device(config-locsvr-da-radius)# port 1812 |         |
| 7    | end               | Exits dynamic authorization local server configuration mode and returns to privileged EXEC mode.  
   | Example:          |         |
|      | Device(config-locsvr-da-radius)# end |         |
Configuration Examples for IKEv2 Packet of Disconnect

Example: Terminating an IKEv2 Session

The following is a sample output from the `show aaa sessions` command. This command must be executed to identify the IKEv2 session that needs to be terminated.

```
Device# show aaa sessions

Total sessions since last reload: 32
Session Id: 3
  Unique Id: 14
  User Name: *not available*
  IP Address: 0.0.0.0
  Idle Time: 0
  CT Call Handle: 0
Session Id: 30
  Unique Id: 41
  User Name: pskuser2.g1.engdt.com
  IP Address: 0.0.0.0
  Idle Time: 0
  CT Call Handle: 0
Session Id: 32
  Unique Id: 43
  User Name: pskuser4.g2.engdt.com
  IP Address: 0.0.0.0
  Idle Time: 0
  CT Call Handle: 0

```

In the above output, ID 41 and 43 pertain to IKEv2 sessions. Optionally, you can run the `show aaa user` command to view detailed information about the session.

```
Device# show aaa user 41

Unique id 41 is currently in use.

General:
Note the audit-session-id in the above output, which is 
L2L433010101ZO2L4C0A8CA02ZH119404ZP37. The following sample output is displayed on 
the FlexVPN server on starting an accounting session starts with a RADIUS server.

The following output is displayed on the FlexVPN server when disconnecting a session for a specific 
audit-session-id. The terminate session request is sent to the RADIUS server via a RADIUS client. 
In this example, the session for the audit-session-ID, which is 
L2L433010101ZO2L4C0A8CA02ZH119404ZP37 is terminated and, hence, not visible in the output. 

The following output is displayed on the FlexVPN server when disconnecting a session for a specific

Feature Information for IKEv2 Packet of Disconnect

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for IKEv2 Change of Authorization Support

- IKEv2 must be registered as a component, via a registry entry, on Cisco AAA component.

Restrictions for IKEv2 Change of Authorization Support

- This feature supports change of authorization (CoA) packets received from RADIUS-based AAA server only.
Information About IKEv2 Change of Authorization Support

RADIUS Change of Authorization

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated. When a policy changes for a user or user group in AAA, administrators can send the RADIUS CoA packets from the AAA server such as a Cisco Secure Access Control Server (ACS) to reinitialize authentication and apply the new policy.

A standard RADIUS interface is typically used in a pulled model, in which the request originates from a device attached to a network and the response is sent from the queried servers. Cisco software supports the RADIUS CoA request defined in RFC 5176 that is used in a pushed model, in which the request originates from the external server to the device attached to the network, and enables the dynamic reconfiguring of sessions from external authentication, authorization, and accounting (AAA) or policy servers.

For more information on RADIUS CoA, see Authentication, Authorization, and Accounting Configuration Guide, Cisco IOS Release 15M&T or Authentication, Authorization, and Accounting Configuration Guide, Cisco IOS XE Release 3S

Working of Change of Authorization on IKEv2

The FlexVPN - IKEv2 CoA for QoS and ACL feature allows to change attributes of an active IKEv2 crypto session to apply a new authorization attributes. The Cisco AAA component receives a Change of Authorization (CoA) packet from a AAA server and checks if the received CoA packet is meant for any of the components registered with it. If a component sees that the CoA packet is meant for itself, it processes it further. Based on the fields in the CoA packet, if the packet is relevant for a given component, such as IKEv2, the packet is consumed by that component. AAA will not forward the packet to the next component in the list.

In case of this feature, after IKEv2 receives a CoA packet, IKEv2 verifies the CoA packet for the Cisco (AV) pairs. IKEv2 identifies the session based on the audit-session-id which is already stored in the RADIUS server. If the CoA packet contains attributes not supported by IKEv2, IKEv2 discards the packet and sends a CoA-NACK to AAA component.

Supported AV Pairs for IKEv2 Change of Authorization

The FlexVPN - IKEv2 CoA for QoS and ACL feature supports the following Cisco AV pairs:

- ip:interface-config
- ip:sub-policy-In
- ip:sub-policy-Out
- ip:sub-qos-policy-in
- ip:sub-qos-policy-out
- ipsec:inac1
- ipsec:outacl
How to Configure IKEv2 Change of Authorization Support

Configuring Change of Authorization on the FlexVPN Server

There is no IKEv2-specific configuration required for this feature on the FlexVPN server for the IKEv2 Change of Authorization (CoA) Support feature. You only need to configure the RADIUS Change of Authorization on the FlexVPN server. For more information on AAA configuration, see the “RADIUS Change of Authorization” feature module in the *Authentication, Authorization, and Accounting Configuration Guide, Cisco IOS Release 15M&T*.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa server radius dynamic-author`
5. `client {ip-address | name [vrf vrf-name]} server-key [0 | 7] string`
6. `port port-number`
7. `auth-type {any | all | session-key}`
8. `ignore session-key`
9. `ignore server-key`
10. `exit`

**DETAILED STEPS**

Configuration Examples for IKEv2 Change of Authorization Support

Example: Triggering a Change of Authorization

The following sample output is displayed when an administrator triggers a change of authorization (CoA). The session is identified based on the audit-session-id, a dynamic string, which is an encoded form of 6 tuple information of a session with peer.

IKEv2 receives a change of authorization (CoA) packet from a RADIUS server. The session is identified based on audit-session-id.

CHAPTER 11

Configuring Aggregate Authentication

The FlexVPN RA - Aggregate Auth Support for AnyConnect feature implements aggregate authentication method by extending support for Cisco AnyConnect client that uses the proprietary AnyConnect EAP authentication method to establish a secure tunnel over the Internet between Cisco AnyConnect client and FlexVPN server.

- Finding Feature Information, on page 137
- Prerequisites for Configuring Aggregate Authentication, on page 137
- Information for Configuring Aggregate Authentication, on page 138
- How to Configure Aggregate Authentication, on page 141
- Configuration Examples for Aggregate Authentication, on page 143
- Additional References for Configuring Aggregate Authentication, on page 143
- Feature Information for Configuring Aggregate Authentication, on page 144

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Aggregate Authentication

- You must enable the BypassDownloader function in the AnyConnectLocalPolicy file by setting the <BypassDownloader> value to true. If your device does not support SSL, the BypassDownloader function will not work. You must disable the function manually by setting the <BypassDownloader> value to false, else the connection will fail.
Information for Configuring Aggregate Authentication

Cisco AnyConnect and FlexVPN

To establish a VPN connection, the VPN client must obtain user credentials using authentication methods such as, extensible authentication protocol (EAP), Extended Authentication (XAUTH), etc. and forward the user credentials to a hub, which contacts an access control server. The access control server sends an external database or active directory (AD) to validate the credentials.

FlexVPN server (as a hub) works with Cisco Secure Access Control Server to validate user credentials to establish VPN connections. However, Cisco AnyConnect uses EAP to obtain user credentials and does not support XAUTH. On the other hand, Cisco Secure Access Control Server does not support EAP-MD5 with external database (in this case AD). This leads to a scenario where either Cisco Secure Access Control Server must support EAP-MD5 or FlexVPN must authenticate the information from Cisco AnyConnect separately and connect separately with Cisco Secure Access Control Server. FlexVPN can use the Aggregate Authentication method to authenticate information from Cisco AnyConnect. Implementing aggregate authentication method on FlexVPN server would provide a window to add more feature support on Cisco IOS software.

The FlexVPN RA - Aggregate Auth Support for AnyConnect feature implements aggregate authentication method by extending support for Cisco AnyConnect client that uses the proprietary AnyConnect EAP authentication method to establish a secure tunnel over the Internet using Cisco AnyConnect and FlexVPN server. This is a server-specific feature and works with Cisco AnyConnect.

How Aggregate Authentication Works

Internet Key Exchange Version 2 supports Cisco AnyConnect that uses the proprietary AnyConnect EAP authentication method by implementing basic aggregate authentication where authentication is performed via authentication, authorization, and accounting (AAA) using the remote RADIUS server. The following is an example of a network topology explains aggregate authentication implementation on Cisco IOS software.

In this diagram:

- Cisco Secure Access Control Server acts as a RADIUS server for authorization.
• The credentials are stored in Microsoft Active Directory, which acts as the active directory for authentication.

Note
Microsoft Active Directory is referred for example purpose only. It does not matter where the credentials are stored.

• Cisco device acts as FlexVPN server.
• Windows 7 PC acts as Cisco AnyConnect client.

1. To initiate a VPN connection, Cisco AnyConnect client verifies a FlexVPN server using certifications.
2. After verifying the certificates, Cisco AnyConnect client sends Cisco AnyConnect EAP loaded message to FlexVPN server.
3. When FlexVPN server receives Cisco AnyConnect EAP loaded message from Cisco AnyConnect, FlexVPN server downloads the message and strips the message of EAP.
4. FlexVPN establishes a connection with RADIUS server for authorization and Microsoft Active Directory (AD) for authentication, and forwards the stripped message to verify the credentials provided by Cisco AnyConnect client.
5. When the credentials are verified and approved by RADIUS server and Microsoft Active Directory (AD), an appropriate reply is sent to FlexVPN server, which in turn replies to Cisco AnyConnect and a VPN connection is established.

IKE Exchanges Using Cisco AnyConnect EAP

Authentication in IKE using AnyConnect EAP is a variation of the standards EAP model as described in RFC 3748. When using AnyConnect EAP the public configuration or authentication XML is transported via EAP payloads. The following figure illustrates the typical message flow used by Cisco AnyConnect.
Cisco AnyConnect client initiates IKE connection to FlexVPN server. The client sends vendor ID payloads to indicate support for Cisco AnyConnect EAP in addition to the typical IKE payloads. The client identifies itself as a Cisco product by including the Cisco copyright vendor ID.

2. The server gateway sends vendor ID payloads to indicate fragmentation and AnyConnect EAP support and identifies itself as a Cisco product by including the Cisco copyright vendor ID.

3. The configuration payload requests the tunnel configuration. The client indicates its desire to use Cisco AnyConnect EAP authentication by omitting the AUTH Payload from this message.

4. The Aggregate Authentication and Configuration protocol is carried over EAP

5. FlexVPN server sends a EAP success message.

6. Cisco AnyConnect client sends the AUTH payload.

7. FlexVPN server sends the AUTH payload and the tunnel configuration attributes that Cisco AnyConnect client requested.

**Dual-Factor Authentication Support with IKEv2**

The aggregate authentication implementation on Cisco IOS software can be extended for dual-factor authentication. Double authentication can be done by introducing new AnyConnect EAP exchange during Aggregate Authentication which exchange and validate the device certificate information. This mechanism of authenticating 'device' as well as 'user' is called 'Double Authentication'.
How to Configure Aggregate Authentication

Configuring the FlexVPN Server for Aggregate Authentication

Perform this task to configure aggregate authentication on the FlexVPN server.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto ikev2 profile profile-name
4. aaa accounting anyconnect-eap list-name
5. match identity remote key-id opaque-string
6. authentication remote anyconnect-eap aggregate [cert-request]
7. authentication local rsa-sig
8. pki trustpoint trustpoint-label
9. aaa authentication anyconnect-eap list-name
10. aaa authorization group anyconnect-eap list aaa-listname name-mangler mangler-name
11. aaa authorization user anyconnect-eap cached
12. aaa authorization user anyconnect-eap list aaa-listname name-mangler mangler-name
13. end
14. show crypto ikev2 session detailed

<td>String</td>
</tr>
<tr>
<td><strong>Local config</strong></td>
<td>route accept any [tag tag-id] [distance distance]</td>
</tr>
<tr>
<td><strong>Radius config</strong></td>
<td>cisco-avpair=&quot;ipsec:route-accept=any [tag:tag] [distance:distance]&quot;</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td>ipsec:route-accept=any tag=100</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>This attribute is used locally and specifies the filter for the subnets received from the peer via IKEv2 standard config attribute INTERNAL_IP4_SUBNET. The attribute also specifies the tag and distance for the routes added by IKEv2 for the filtered subnets.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note</strong></td>
<td>In Cisco IOS Release 15.2(2)T, the AV pair “ipsec:route-accept=any” replaced “ipsec:route-accept=accept acl: any” and the AV pair “ipsec:route-accept=none” replaced “ipsec:route-accept=deny”.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Attribute</th>
<th>ipsec:ipsec-flow-limit</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Cisco AV Pair</td>
</tr>
<tr>
<td><strong>Format</strong></td>
<td>Integer</td>
</tr>
<tr>
<td><strong>Local config</strong></td>
<td>ipsec flow-limit limit</td>
</tr>
<tr>
<td><strong>Radius config</strong></td>
<td>cisco-avpair=&quot;ipsec:ipsec-flow-limit=limit&quot;</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>This attribute is used by FlexVPN server and specifies the maximum number of IPsec SAs that an IPSec dVTI session can have. There is no limit by default. This parameter is similar to the crypto ipsec profile and set security-policy limit commands.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Attribute</th>
<th>ip:interface-config</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Cisco AV Pair</td>
</tr>
<tr>
<td><strong>Format</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Local config</strong></td>
<td>aaa attribute list list attribute type interface-config string</td>
</tr>
<tr>
<td><strong>Radius config</strong></td>
<td>cisco-avpair=&quot;ip:interface-config=interface cmd string&quot;</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td>ip:interface-config=ip vrf forwarding red</td>
</tr>
</tbody>
</table>
### Description
This attribute is used locally and specifies an interface configuration mode command string that is applied on the virtual access interface for the session. For local configuration, the IKEv2 authorization policy points to an AAA attribute list that must have interface-config attribute.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Tunnel-Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>IETF</td>
</tr>
<tr>
<td>Format</td>
<td>Integer</td>

</tr>
<tr>
<td>Route-set remote</td>
<td>Cisco AV Pair</td>
<td>String</td>
<td>route set remote *ipv4 ip-address mask</td>
<td>ipv6 ip-address/mask)</td>
<td>Specifies a subnet protected by FlexVPN server. This is pushed to the client through IKEv2 standard configuration attribute INTERNAL_IP4_SUBNET. While route-set prefix is working with a subnet mask represented in decimal fashion [ e.g. /24], route-set remote requires the standard subnet mask representation. [ e.g. 255.255.255.0 ]</td>
</tr>
</tbody>
</table>

**Note** This AV pair was introduced in Cisco IOS Release 3.10.0S
### Route-setlocal Attribute

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Route-set local</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Cisco AV Pair</td>
</tr>
<tr>
<td>Format</td>
<td>String</td>
</tr>
<tr>
<td>Local config</td>
<td>`route set local {ipv4 ip-address mask</td>
</tr>
<tr>
<td>Radius config</td>
<td>`cisco-avpair=&quot;ipsec:route-set=local {ipv4 network subnet_mask</td>
</tr>
</tbody>
</table>

**Description**

This attribute is useful in an extranet scenario where you do not necessarily trust the routing information that you receive from the remote device. In other words, remote routes can be denied and route addition can be locally controlled by using this AV pair.

**Note**

This AV pair was introduced in Cisco IOS Release 3.10.0S.
Appendix: IKEv2 and Legacy VPNs

This module provides examples on how to configure IKEv2 on crypto map based configurations.

Note
Crypto maps are considered a legacy configuration construct. It is recommended that you migrate existing crypto map based setups to use tunnel protection and virtual interfaces.

• Example: Configuring Crypto-Map-Based IKEv2 Peers Using Preshared Key Authentication Method, on page 159
• Example: Configuring Crypto Map-Based IKEv2 Peers Using Certification Authentication Method, on page 162
• Example: Configuring Crypto Map- and dVTI-Based IKEv2 Peers, on page 166
• Example: Configuring IPSec Using sVTI-Based IKEv2 Peers, on page 168
• Example: Configuring IKEv2 on DMVPN Networks, on page 171

Example: Configuring Crypto-Map-Based IKEv2 Peers Using Preshared Key Authentication Method

The following example shows how to configure crypto-map-based IKEv2 peers using the preshared key authentication method between a static crypto-map IKEv2 initiator and a dynamic crypto-map IKEv2 responder. The initiator configuration is as follows:

```
crypto ikev2 proposal prop-1
  encryption aes-cbc-128
  integrity sha1
  group 14
!
crypto ikev2 policy pol-1
  match fvrf any
  proposal prop-1
!
crypto ikev2 keyring v2-kr1
  peer abc
  address 209.165.200.231 255.255.255.224
  pre-shared-key abc
!
```
crypto ikev2 profile prof
  match fvrf any
  match identity remote fqdn smap-responder
  identity local fqdn dmap-initiator
  authentication local pre-share
  authentication remote pre-share
  authentication remote pre-share
  keyring v2-kr1
!}
crypto ipsec transform-set trans esp-aes-cbc-128 esp-sha-hmac
!
crypto map cmap 1 ipsec-isakmp
  set peer 209.165.200.225
  set transform-set trans
  set ikev2-profile prof
  match address ikev2list
!}
interface Loopback0
  ip address 209.165.200.226 255.255.255.224
!}
interface Ethernet0/0
  ip address 209.165.200.227 255.255.255.224
  crypto map cmap
!}
interface Loopback0
  ip address 209.165.200.226 255.255.255.224
!}
interface Ethernet0/0
  ip address 209.165.200.227 255.255.255.224
  crypto map cmap
!}
interface Loopback0
  ip route 209.165.200.229 255.255.255.224 209.165.200.225
!}
ip access-list extended ikev2list
  permit ip any any
!

The responder configuration is as follows:

crypto ikev2 proposal prop-1
  encryption aes-cbc-128
  integrity sha1
  group 14
!}
crypto ikev2 policy pol-1
  match fvrf any

   DPD configured for 0 seconds, retry 0
   NAT-T is not detected
```

Example: Configuring IPsec Using sVTI-Based IKEv2 Peers

The following example shows how to configure IPsec using the preshared key authentication method between an sVTI IKEv2 initiator and an sVTI IKEv2 responder. The initiator configuration is as follows:

```
crypto ikev2 proposal prop-1
   encryption aes-cbc-128
   integrity sha1
   group 14
!
crypto ikev2 policy pol-1
   match fvrf any
   proposal prop-1
!
crypto ikev2 keyring v2-kr1
   peer abc
   address 209.165.200.225
   pre-shared-key abc
!```
crypto ikev2 profile prof
  match fvrf any
  match identity remote address 209.165.200.231 255.255.255.224
  authentication local pre-share
  authentication remote pre-share
  keyring v2-kr1
!

crypto ipsec transform-set trans esp-aes-cbc-128 esp-sha-hmac
!
crypto ipsec profile ipsecprof
  set transform-set trans
  set ikev2-profile prof
!
interface Loopback0
  ip address 209.165.200.226 255.255.255.224
!
interface Tunnel0
  ip address 10.0.0.1 255.255.255.0
  tunnel source 209.165.200.231
  tunnel mode ipsec ipv4
  tunnel destination 209.165.200.225
  tunnel protection ipsec profile ipsecprof
!
interface Ethernet0/0
  ip address 209.165.200.231 255.255.255.224
!
  ip route 209.165.200.229 255.255.255.224 Tunnel0
!

The responder configuration is as follows:

crypto ikev2 proposal prop-1
  encryption aes-cbc-128
  integrity sha1
  group 14
!
crypto ikev2 policy pol-1
  match fvrf any
  proposal prop-1
!
crypto ikev2 keyring v2-kr1
  peer abc
    address 209.165.200.231
    pre-shared-key abc
!
!
crypto ikev2 profile prof
  match fvrf any
  match identity remote address 209.165.200.231 255.255.255.224
  authentication local pre-share
  authentication remote pre-share
  keyring v2-kr1
!

crypto ipsec transform-set trans esp-aes-cbc-128 esp-sha-hmac
!
crypto ipsec profile ipsecprof
  set transform-set trans
  set ikev2-profile prof
!
crypto map cmap 1 ipsec-isakmp dynamic dmap

interface Loopback0
  ip address 209.165.200.230 255.255.255.224

interface Tunnel0
  ip address 10.0.0.2 255.255.255.0
  tunnel source 209.165.200.225
  tunnel mode ipsec ipv4
  tunnel destination 209.165.200.231
  tunnel protection ipsec profile ipsecprof

interface Ethernet0/0
  ip address 209.165.200.231 255.255.255.224

With sVTI on IKEv2 peers, the session is initiated only when the sVTI interfaces are enabled. In other words, network traffic is not required to initiate the session. To verify the traffic between the initiator and the responder, enter the following command at the initiator’s CLI:

```
ping 209.165.200.230 source 209.165.200.226
```

```
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 209.165.200.230, timeout is 2 seconds:
Packet sent with a source address of 209.165.200.226
IKEV2-5-OSAL_INITIATE_TUNNEL: Received request to establish an IPsec tunnel; local traffic
remote traffic selector = Address Range: 209.165.200.230-209.165.200.23 Protocol: 1 Port
Range: 0-65535
IKEV2-5-SA_UP: SA UP

Success rate is 80 percent (4/5), round-trip min/avg/max = 8/11/12 ms
```

Enter the following `show` command in the initiator's CLI to display the session details:

```
show crypto session
```

```
Crypto session current status
Interface: Ethernet0/0
Session status: UP-ACTIVE
Peer: 209.165.200.225 port 500
IKEv2 SA: local 209.165.200.231/500 remote 209.165.200.225/500 Active
IPSEC FLOW: permit ip 0.0.0.0/0.0.0.0 0.0.0.0/0.0.0.0
Active SAs: 2, origin: crypto map
```

```
show crypto ikev2 sa detailed
```

```

     DPD configured for 5 seconds, retry 0
     NAT-T is not detected
```
Example: Configuring IKEv2 on DMVPN Networks

DMVPN uses a tunnel protection CLI that is identical between IKEv1 and IKEv2. The IPsec profile applied on a DMVPN tunnel only refers to an IKEv2 profile. The DMVPN Hub configuration is as follows:

crypto ikev2 keyring cisco-ikev2-keyring
peer dmvpn-node
description symmetric pre-shared key for the hub/spoke
address 0.0.0.0 0.0.0.0
pre-shared-key cisco123
crypto ikev2 profile cisco-ikev2-profile
keyring cisco-ikev2-keyring
description symmetric pre-shared
match local address 0.0.0.0
crypto ipsec profile cisco-ipsec-ikev2
set transform-set cisco-ts
set ikev2-profile cisco-ikev2-profile
! interface Tunnel 0
    description This is the Legacy IKEV1 facing tunnel on the hub
    ip address 1.1.1.99 255.255.255.0
    no ip redirects
    ip nhrp map multicast dynamic
    ip nhrp network-id 99
    ip nhrp redirect
    no ip split-horizon eigrp 1
    tunnel source Ethernet0/0
    tunnel mode gre multipoint
    tunnel protection ipsec profile cisco-ipsec
!
interface Tunnel1
    description This would be the new IKEv2 facing tunnel on the hub
    ip address 2.2.2.99 255.255.255.0
    no ip redirects
    ip nhrp map multicast dynamic
    ip nhrp network-id 100
    no ip split-horizon eigrp 1
    tunnel source Ethernet0/1
    tunnel mode gre multipoint
    tunnel protection ipsec profile cisco-ipsec-ikev2

The IKEv2 configuration is as follows:

crypto ikev2 profile cisco-ikev2-profile
keyring cisco-ikev2-keyring
authentication pre-shared
match local address 0.0.0.0
crypto ipsec profile cisco-ipsec-ikev2
set transform-set cisco-ts
set ikev2-profile cisco-ikev2-profile
interface Tunnel1
    ip address 2.2.2.11 255.255.255.0
    no ip redirects
    ip nhrp map 2.2.2.99 22.22.22.99
    ip nhrp map multicast 22.22.22.99
    ip nhrp network-id 100 ? Keep this same for all IKEv2 spokes for clarity
    ip nhrp nhs 2.2.2.99 ? This points to the hub’s IKEv2 facing interface
    tunnel source Ethernet0/1
    tunnel mode gre multipoint
    tunnel protection ipsec profile cisco-ipsec-ikev2
