Configuring Internet Key Exchange Version 2

This module contains information about and instructions for configuring basic and advanced Internet Key Exchange Version 2 (IKEv2). The tasks and configuration examples for IKEv2 in this module are divided as follows:

- **Basic IKEv2**—Provides information about basic IKEv2 commands, IKEv2 smart defaults, basic IKEv2 profile, and IKEv2 key ring.
- **Advanced IKEv2**—Provides information about global IKEv2 commands and how to override IKEv2 smart defaults.

Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To
find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

## Prerequisites for Configuring Internet Key Exchange Version 2

You should be familiar with the concepts and tasks described in the "Configuring Security for VPNs with IPsec" module.

## Restrictions for Configuring Internet Key Exchange Version 2

You cannot configure an option that is not supported on a specific platform. For example, in a security protocol, the capability of the hardware-crypto engine is important, and you cannot specify the Triple Data Encryption Standard (3DES) or the Advanced Encryption Standard (AES) type of encryption transform in a nonexportable image, or specify an encryption algorithm that a crypto engine does not support.

**Note**

IKEv2 is not supported on Integrated Service Routers (ISR) G1.

### Scaling Limitations

The following table details the FlexVPN scaling limitations on Cisco ASR 1000 Series Aggregation Services Routers.

**Table 1: FlexVPN Scaling Limitations**

Information About Internet Key Exchange Version 2

IKEv2 Supported Standards

Note

Cisco no longer recommends using DES or MD5 (including HMAC variant); instead, you should use AES and SHA-256. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

The component technologies implemented in IKEv2 are as follows:

- AES-CBC—Advanced Encryption Standard-Cipher Block Chaining
- SHA (HMAC variant)—Secure Hash Algorithm
- Diffie-Hellman—A public-key cryptography protocol
- DES—Data Encryption Standard (No longer recommended)
- MD5 (HMAC [Hash-based Message Authentication Code] variant)—Message digest algorithm 5 (No longer recommended)

For more information about supported standards and component technologies, see the "Supported Standards for Use with IKE" section in the "Configuring Internet Key Exchange for IPsec VPNs" module in the Internet Key Exchange for IPsec VPNs Configuration Guide.

Benefits of IKEv2

Dead Peer Detection and Network Address Translation-Traversals

Internet Key Exchange Version 2 (IKEv2) provides built-in support for Dead Peer Detection (DPD) and Network Address Translation-Traversals (NAT-T).

Certificate URLs

Certificates can be referenced through a URL and hash, instead of being sent within IKEv2 packets, to avoid fragmentation.
Denial of Service Attack Resilience

IKEv2 does not process a request until it determines the requester, which addresses to some extent the Denial of Service (DoS) problems in IKEv1, which can be spoofed into performing substantial cryptographic (expensive) processing from false locations.

EAP Support

IKEv2 allows the use of Extensible Authentication Protocol (EAP) for authentication.

Multiple Crypto Engines

If your network has both IPv4 and IPv6 traffic and you have multiple crypto engines, choose one of the following configuration options:

• One engine handles IPv4 traffic and the other engine handles IPv6 traffic.
• One engine handles both IPv4 and IPv6 traffic.

Reliability and State Management (Windowing)

IKEv2 uses sequence numbers and acknowledgments to provide reliability, and mandates some error-processing logistics and shared state management.

Internet Key Exchange Version 2 CLI Constructs

IKEv2 Proposal

An Internet Key Exchange Version 2 (IKEv2) proposal is a collection of transforms used in the negotiation of Internet Key Exchange (IKE) security associations (SAs) as part of the IKE_SA_INIT exchange. The transform types used in the negotiation are as follows:

• Encryption algorithm
• Integrity algorithm
• Pseudo-Random Function (PRF) algorithm
• Diffie-Hellman (DH) group

See the “IKEv2 Smart Defaults” section for information about the default IKEv2 proposal. See the “Configuring Advanced IKEv2 CLI Constructs” section for information about how to override the default IKEv2 proposal and to define new proposals.

IKEv2 Policy

An IKEv2 policy contains proposals that are used to negotiate the encryption, integrity, PRF algorithms, and DH group in the IKE_SA_INIT exchange. It can have match statements, which are used as selection criteria to select a policy during negotiation.

See the “IKEv2 Smart Defaults” section for information about the default IKEv2 policy. See the “Configuring Advanced IKEv2 CLI Constructs” section for information about how to override the default IKEv2 policy and to define new policies.
IKEv2 Profile

An IKEv2 profile is a repository of nonnegotiable parameters of the IKE SA, such as local or remote identities and authentication methods and services that are available to authenticated peers that match the profile. An IKEv2 profile must be attached to either a crypto map or an IPsec profile on the initiator. An IKEv2 profile is not mandatory on the responder.

IKEv2 Key Ring

An IKEv2 key ring is a repository of symmetric and asymmetric preshared keys and is independent of the IKEv1 key ring. The IKEv2 key ring is associated with an IKEv2 profile and hence supports a set of peers that match the IKEv2 profile. The IKEv2 key ring gets its VPN routing and forwarding (VRF) context from the associated IKEv2 profile.

IKEv2 Smart Defaults

The IKEv2 Smart Defaults feature minimizes the FlexVPN configuration by covering most of the use cases. IKEv2 smart defaults can be customized for specific use cases, though this is not recommended.

See the “Configuring Advanced IKEv2 CLI Constructs” section for information about how to modify the default IKEv2 constructs.

The following rules apply to the IKEv2 Smart Defaults feature:

1. A default configuration is displayed in the corresponding show command with default as a keyword and with no argument. For example, the `show crypto ikev2 proposal default` command displays the default IKEv2 proposal and the `show crypto ikev2 proposal` command displays the default IKEv2 proposal, along with any user-configured proposals.

2. A default configuration is displayed in the `show running-config all` command; it is not displayed in the `show running-config` command.

3. You can modify the default configuration, which is displayed in the `show running-config all` command.

4. A default configuration can be disabled using the no form of the command; for example, `no crypto ikev2 proposal default`. A disabled default configuration is not used in negotiation but the configuration is displayed in the `show running-config` command. A disabled default configuration loses any user modification and restores system-configured values.

5. A default configuration can be reenabled using the default form of the command, which restores system-configured values; for example, `default crypto ikev2 proposal`.

6. The default mode for the default transform set is transport; the default mode for all other transform sets is tunnel.

---

**Note**

Cisco no longer recommends using MD5 (including HMAC variant) and Diffie-Hellman (DH) groups 1, 2 and 5; instead, you should use SHA-256 and DH Groups 14 or higher. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.
The following table lists the commands that are enabled with the IKEv2 Smart Defaults feature, along with the default values.

**Note** Before you can use the default IPsec profile, explicitly specify the crypto ipsec profile command on a tunnel interface using the tunnel protection ipsec profile default command.
IKEv2 Suite-B Support

IKEv2 Suite-B Support

Suite-B is a set of cryptographic algorithms promulgated by the National Security Agency as part of its Cryptographic Modernization Program. Suite-B for Internet Key Exchange (IKE) and IPsec is defined in RFC 4869. The Suite-B components are as follows:

- Advanced Encryption Standard (AES) 128- and 256-bit keys configured in the IKEv2 proposal. For data traffic, AES should be used in Galois Counter Mode (GCM) that is configured in the IPsec transform set.
- Elliptic Curve Digital Signature Algorithm (ECDSA) configured in the IKEv2 profile.
- Secure Hashing Algorithm 2 (SHA-256 and SHA-384) configured in the IKEv2 proposal and IPsec transform set.

Suite-B requirements comprise four user-interface suites of cryptographic algorithms for use with IKE and IPsec. Each suite consists of an encryption algorithm, a digital-signature algorithm, a key-agreement algorithm, and a hash- or message-digest algorithm. See the “Configuring Security for VPNs with IPsec” feature module for detailed information about Cisco Suite-B support.

AES-GCM Support

AES-GCM Support

An authenticated encryption algorithm provides a combined functionality of encryption and integrity. Such algorithms are called combined mode algorithms. The Support of AES-GCM as an IKEv2 Cipher on IOS feature provides the use of authenticated encryption algorithms for encrypted messages in IKEv2 protocol by adding the Advanced Encryption Standard in Galois/Counter Mode (AES-GCM). AES-GCM supports the key size of 128- and 256-bits—AES-GCM-128 and AES-GCM-256.

Note: If AES-GCM is the only encryption algorithm, integrity algorithms cannot be added to the proposal.

Auto Tunnel Mode Support in IKEv2

Auto Tunnel Mode Support in IKEv2

When configuring a VPN headend in a multiple vendor scenario, you must be aware of the technical details of the peer or responder. For example, some devices may use IPsec tunnels while others may use generic routing encapsulation (GRE) or IPsec tunnel, and sometimes, a tunnel may be IPv4 or IPv6. In the last case, you must configure an Internet Key Exchange (IKE) profile and a virtual template.

The Tunnel Mode Auto Selection feature eases the configuration and spares you about knowing the responder’s details. This feature automatically handles the tunneling protocol (GRE or IPsec) and transport protocol (IPv4 or IPv6) on the virtual template as soon as the IKE profile creates the virtual access interface. This feature is useful on dual stack hubs aggregating multivendor remote access, such as Cisco AnyConnect VPN Client, Microsoft Windows 7 Client, and so on.

Note: The Tunnel Mode Auto Selection feature eases the configuration for a responder only. The tunnel must be statically configured for an initiator.
The Tunnel Mode Auto Selection feature can be activated using the `auto mode` keywords in the `virtual-template` command in the IKEv2 profile configuration.

How to Configure Internet Key Exchange Version 2

Configuring Basic Internet Key Exchange Version 2 CLI Constructs

To enable IKEv2 on a crypto interface, attach an Internet Key Exchange Version 2 (IKEv2) profile to the crypto map or IPsec profile applied to the interface. This step is optional on the IKEv2 responder.

Note: The difference between IKEv1 and IKEv2 is that you need not enable IKEv1 on individual interfaces because IKEv1 is enabled globally on all interfaces on a device.

Perform the following tasks to manually configure basic IKEv2 constructs:

Configuring the IKEv2 Keyring

Perform this task to configure the IKEv2 key ring if the local or remote authentication method is a preshared key.

IKEv2 key ring keys must be configured in the peer configuration submode that defines a peer subblock. An IKEv2 key ring can have multiple peer subblocks. A peer subblock contains a single symmetric or asymmetric key pair for a peer or peer group identified by any combination of the hostname, identity, and IP address.

IKEv2 key rings are independent of IKEv1 key rings. The key differences are as follows:

- IKEv2 key rings support symmetric and asymmetric preshared keys.
- IKEv2 key rings do not support Rivest, Shamir, and Adleman (RSA) public keys.
- IKEv2 key rings are specified in the IKEv2 profile and are not looked up, unlike IKEv1, where keys are looked up on receipt of MM1 to negotiate the preshared key authentication method. The authentication method is not negotiated in IKEv2.
- IKEv2 key rings are not associated with VPN routing and forwarding (VRF) during configuration. The VRF of an IKEv2 key ring is the VRF of the IKEv2 profile that refers to the key ring.
- A single key ring can be specified in an IKEv2 profile, unlike an IKEv1 profile, which can specify multiple key rings.
- A single key ring can be specified in more than one IKEv2 profile, if the same keys are shared across peers matching different profiles.
- An IKEv2 key ring is structured as one or more peer subblocks.

On an IKEv2 initiator, the IKEv2 key ring key lookup is performed using the peer’s hostname or the address, in that order. On an IKEv2 responder, the key lookup is performed using the peer’s IKEv2 identity or the address, in that order.
**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto ikev2 keyring keyring-name`
4. `peer name`
5. `description line-of-description`
6. `hostname name`
7. `address {ipv4-address [mask] | ipv6-address prefix}`
8. `identity {address {ipv4-address | ipv6-address} | fqdn domain domain-name | email domain domain-name | key-id key-id}`
9. `pre-shared-key {local | remote} [0 | 6] line hex hexadecimal-string`
10. `end`

**DETAILED STEPS**

<td>Device(config-ikev2-keyring-peer)# pre-shared-key local key1</td>
<td></td>
</tr>
<tr>
<td>Step 10</td>
<td>end</td>
<td>Exits IKEv2 key ring peer configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-ikev2-keyring-peer)# end</td>
<td></td>
</tr>
</tbody>
</table>

### What to Do Next

After configuring the IKEv2 key ring, configure the IKEv2 profile. For more information, see the "Configuring IKEv2 Profile (Basic)" section.

### Configuring an IKEv2 Profile (Basic)

Perform this task to configure the mandatory commands for an IKEv2 profile.

An IKEv2 profile is a repository of nonnegotiable parameters of the IKE security association (SA) (such as local or remote identities and authentication methods) and services available to authenticated peers that match the profile. An IKEv2 profile must be configured and associated with either a crypto map or an IPsec profile.
on the IKEv2 initiator. Use the `set ikev2-profile profile-name` command to associate a profile with a crypto map or an IPsec profile. To disassociate the profile, use the `no` form of the command.

The following rules apply to match statements:

- An IKEv2 profile must contain a match identity or a match certificate statement; otherwise, the profile is considered incomplete and is not used. An IKEv2 profile can have more than one match identity or match certificate statements.
- An IKEv2 profile must have a single match Front Door VPN routing and forwarding (FVRF) statement.
- When a profile is selected, multiple match statements of the same type are logically ORed, and multiple match statements of different types are logically ANDed.
- The match identity and match certificate statements are considered to be the same type of statements and are ORed.
- Configuration of overlapping profiles is considered a misconfiguration. In the case of multiple profile matches, no profile is selected.

Use the `show crypto ikev2 profile profile-name` command to display the IKEv2 profile.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto ikev2 profile profile-name
4. description line-of-description
5. aaa accounting {psk | cert | eap} list-name
6. authentication {local {rsa-sig | pre-share [key {0 | 6} password] | ecdsa-sig | eap [gtc | md5 | ms-chapv2] [username username] [password {0 | 6} password]} | remote {eap [query-identity | timeout seconds] | rsa-sig | pre-share [key {0 | 6} password] | ecdsa-sig} }
7. dpd interval retry-interval {on-demand | periodic}
8. identity local {address {ipv4-address | ipv6-address} | dn | email email-string | fqdn fqdn-string | key-id opaque-string}
9. initial-contact force
10. ivrf name
11. keyring {local keyring-name | aaa list-name [name-mangler mangler-name | password password]}
12. lifetime seconds
13. match {address local {ipv4-address | ipv6-address | interface name} | certificate certificate-map | fvrf {fvrf-name | any} | identity remote address {ipv4-address [mask] | ipv6-address prefix} | {email [domain string] | fqdn [domain string]} string | key-id opaque-string}
14. nat keepalive seconds
15. pki trustpoint trustpoint-label [sign | verify]
16. virtual-template number mode auto
17. shutdown
18. end
# DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Example:** | Device> enable |
| **Step 2** | configure terminal | Enters global configuration mode. |
| **Example:** | Device# configure terminal |
| **Step 3** | crypto ikev2 profile *profile-name* | Defines an IKEv2 profile and enters IKEv2 profile configuration mode. |
| **Example:** | Device(config)# crypto ikev2 profile profile1 |
| **Step 4** | description *line-of-description* | (Optional) Describes the profile. |
| **Example:** | Device(config-ikev2-profile)# description This is an IKEv2 profile |
| **Step 5** | aaa accounting {psk | cert | eap} *list-name* | (Optional) Enables authentication, authorization, and accounting (AAA) accounting method lists for IPsec sessions.  
**Note**  
If the *psk*, *cert*, or *eap* keyword is not specified, the AAA accounting method list is used irrespective of the peer authentication method. |
| **Example:** | Device(config-ikev2-profile)# aaa accounting eap list1 |
| **Step 6** | authentication {local {rsa-sig | pre-share [key {0 | 6} password] | ecdsa-sig | eap [gtc | md5 | ms-chapv2] [username username] [password {0 | 6} password]] | remote {eap [query-identity | timeout seconds] | rsa-sig [pre-share [key {0 | 6} password]] | ecdsa-sig} } | Specifies the local or remote authentication method.  
- *rsa-sig*—Specifies RSA-sig as the authentication method.  
- *pre-share*—Specifies the preshared key as the authentication method.  
- *ecdsa-sig*—Specifies ECDSA-sig as the authentication method.  
- *eap*—Specifies EAP as the remote authentication method.  
- *query-identity*—Queries the EAP identity from the peer.  
- *timeout seconds*—Specifies the duration, in seconds, to wait for the next IKE_AUTH request after sending the first IKE_AUTH response.  
**Note**  
You can specify only one local authentication method but multiple remote authentication methods. |
<p>| <strong>Example:</strong> | Device(config-ikev2-profile)# authentication local ecdsa-sig |
| <strong>Step 7</strong> | dpd interval retry-interval {on-demand | periodic} | (Optional) Configures Dead Peer Detection (DPD) globally for peers matching the profile. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Device(config-ikev2-profile)# dpd 1000 250 periodic</td>
<td>Note DPD is disabled by default.</td>

<tr>
<td><strong>Step 8</strong> identity local {address {ipv4-address</td>
<td>ipv6-address}</td>
</tr>
<tr>
<td>Example: Device(config-ikev2-profile)# identity local email <a href="mailto:abc@example.com">abc@example.com</a></td>
<td>Note If the local authentication method is a preshared key, the default local identity is the IP address. If the local authentication method is a Rivest, Shamir, and Adleman (RSA) signature, the default local identity is a Distinguished Name.</td>
</tr>
<tr>
<td><strong>Step 9</strong> initial-contact force</td>
<td>Enforces initial contact processing if the initial contact notification is not received in the IKE_AUTH exchange.</td>
</tr>
<tr>
<td>Example: Device(config-ikev2-profile)# initial-contact force</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> ivrf name</td>
<td>(Optional) Specifies a user-defined VPN routing and forwarding (VRF) or global VRF if the IKEv2 profile is attached to a crypto map.</td>
</tr>
<tr>
<td>Example: Device(config-ikev2-profile)# ivrf vrf1</td>
<td></td>
</tr>
<tr>
<td>• If the IKEv2 profile is used for tunnel protection, the Inside VRF (IVRF) for the tunnel interface should be configured on the tunnel interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> keyring {local keyring-name</td>
<td>aaa list-name [name-mangler mangler-name</td>
</tr>
<tr>
<td>Example: Device(config-ikev2-profile)# keyring aaa keyring1 name-mangler mangler1</td>
<td>Note You can specify only one key ring. Local AAA is not supported for AAA-based preshared keys.</td>
</tr>
<tr>
<td>Note Depending on your release, the local keyword and the name-mangler mangler-name keyword-argument pair should be used.</td>
<td></td>
</tr>
<tr>
<td>Note When using AAA, the default password for a Radius access request is &quot;cisco&quot;. You can use the password keyword within the keyring command to change the password.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> lifetime seconds</td>
<td>Specifies the lifetime, in seconds, for the IKEv2 SA.</td>
</tr>
<tr>
<td>Example: Device(config-ikev2-profile)# lifetime 1000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong> match {address local {ipv4-address</td>
<td>ipv6-address</td>
</tr>
</tbody>
</table>
### Configuring Advanced Internet Key Exchange Version 2 CLI Constructs

This section describes the global IKEv2 CLI constructs and how to override the IKEv2 default CLI constructs. IKEv2 smart defaults support most use cases and hence, we recommend that you override the defaults only if they are required for specific use cases not covered by the defaults.

Perform the following tasks to configure advanced IKEv2 CLI constructs:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# match address local interface Ethernet 2/0</td>
<td><strong>Step 14</strong> <strong>nat keepalive seconds</strong> (Optional) Enables NAT keepalive and specifies the duration in seconds.  - NAT is disabled by default.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# nat keepalive 500</td>
<td><strong>Step 15</strong> **pki trustpoint trustpoint-label [sign</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# pki trustpoint tsp1 sign</td>
<td><strong>Step 16</strong> <strong>virtual-template number mode auto</strong> (Optional) Specifies the virtual template for cloning a virtual access interface (VAI).  - <strong>Note</strong> If <strong>mode auto</strong>—Enables the tunnel mode auto selection feature.  - <strong>Note</strong> For the IPsec Dynamic Virtual Tunnel Interface (DVTI), a virtual template must be specified in an IKEv2 profile, without which an IKEv2 session is not initiated.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# virtual-template 1 mode auto</td>
<td><strong>Step 17</strong> <strong>shutdown</strong> (Optional) Shuts down the IKEv2 profile.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# shutdown</td>
<td><strong>Step 18</strong> <strong>end</strong> Exits IKEv2 profile configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ikev2-profile)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring Advanced Internet Key Exchange Version 2 CLI Constructs**

This section describes the global IKEv2 CLI constructs and how to override the IKEv2 default CLI constructs. IKEv2 smart defaults support most use cases and hence, we recommend that you override the defaults only if they are required for specific use cases not covered by the defaults.

Perform the following tasks to configure advanced IKEv2 CLI constructs:
Configuring Global IKEv2 Options

Perform this task to configure global IKEv2 options that are independent of peers.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto ikev2 certificate-cache number-of-certificates
4. crypto ikev2 cookie-challenge number
5. crypto ikev2 diagnose error number
6. crypto ikev2 dpd interval retry-interval {on-demand | periodic}
7. crypto ikev2 http-url cert
8. crypto ikev2 limit {max-in-negotiation-sa limit [incoming | outgoing] | max-sa limit}
9. crypto ikev2 route redistribute {update-interval seconds | update-per-msg number}
10. crypto ikev2 nat keepalive interval
11. crypto ikev2 window size
12. crypto logging ikev2
13. end

DETAILED STEPS

<table>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| configure terminal |                     |
| Example:          | Device# configure terminal |

| **Step 3**        | Defines the cache size for storing certificates fetched from HTTP URLs. |
| crypto ikev2 certificate-cache number-of-certificates | |
| Example:          | Device(config)# crypto ikev2 certificate-cache 750 |

<p>| <strong>Step 4</strong>        | Enables an IKEv2 cookie challenge only when the number of half-open security associations (SAs) exceeds the configured number. |
| crypto ikev2 cookie-challenge number | |
| Example:          | Device(config)# crypto ikev2 cookie-challenge 450 |
|                   | • Cookie challenge is disabled by default. |</p>

Configuring IKEv2 Proposal

Refer to the “IKEv2 Smart Defaults” section for information on the default IKEv2 proposal.

Perform this task to override the default IKEv2 proposal or to manually configure the proposals if you do not want to use the default proposal.

An IKEv2 proposal is a set of transforms used in the negotiation of IKEv2 SA as part of the IKE_SA_INIT exchange. An IKEv2 proposal is regarded as complete only when it has at least an encryption algorithm, an integrity algorithm, and a Diffie-Hellman (DH) group configured. If no proposal is configured and attached to an IKEv2 policy, the default proposal in the default IKEv2 policy is used in negotiation.

Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Although the IKEv2 proposal is similar to the `crypto isakmp policy` command, the IKEv2 proposal differs as follows:

- An IKEv2 proposal allows configuring one or more transforms for each transform type.
- An IKEv2 proposal does not have any associated priority.

SUMMARY STEPS

1.  enable
2.  configure terminal
3.  crypto ikev2 proposal name
4.  encryption encryption-type...
5.  integrity integrity-type...
6.  group group-type...
7.  prf prf-algorithm
8.  end
9.  show crypto ikev2 proposal [name | default]
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><em>enable</em></td>
<td>Enables privileged EXEC mode.</td>
</tr>

<td>Device&gt; enable</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><em>configure terminal</em></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Overrides the default IKEv2 proposal, defines an IKEv2 proposal name, and enters IKEv2 proposal configuration mode.</td>
</tr>
<tr>
<td><em>crypto ikev2 proposal name</em></td>
<td>Overrides the default IKEv2 proposal, defines an IKEv2 proposal name, and enters IKEv2 proposal configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# crypto ikev2 proposal proposal1</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Specifies one or more transforms of the encryption type, which are as follows:</td>
</tr>
<tr>
<td><em>encryption encryption-type...</em></td>
<td>Specifies one or more transforms of the encryption type, which are as follows:</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-proposal)# encryption aes-cbc-128 aes-cbc-192</td>
</tr>
<tr>
<td></td>
<td>• 3des (No longer recommended)</td>
</tr>
<tr>
<td></td>
<td>• aes-cbc-128</td>
</tr>
<tr>
<td></td>
<td>• aes-cbc-192</td>
</tr>
<tr>
<td></td>
<td>• aes-cbc-256</td>
</tr>
<tr>
<td></td>
<td>• aes-gcm-128</td>
</tr>
<tr>
<td></td>
<td>• aes-gcm-256</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Specifies one or more transforms of the integrity algorithm type, which are as follows:</td>
</tr>
<tr>
<td><em>integrity integrity-type...</em></td>
<td>Specifies one or more transforms of the integrity algorithm type, which are as follows:</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ikev2-proposal)# integrity sha1</td>
</tr>
<tr>
<td></td>
<td>• The md5 keyword specifies MD5 (HMAC variant) as the hash algorithm. (No longer recommended)</td>
</tr>
<tr>
<td></td>
<td>• The sha1 keyword specifies SHA-1 (HMAC variant) as the hash algorithm.</td>
</tr>
<tr>
<td></td>
<td>• The sha256 keyword specifies SHA-2 family 256-bit (HMAC variant) as the hash algorithm.</td>
</tr>
<tr>
<td></td>
<td>• The sha384 keyword specifies SHA-2 family 384-bit (HMAC variant) as the hash algorithm.</td>
</tr>
<tr>
<td></td>
<td>• The sha512 keyword specifies SHA-2 family 512-bit (HMAC variant) as the hash algorithm.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>An integrity algorithm type cannot be specified if you specify Advanced Encryption Standard (AES) in Galois/Counter Mode (AES GCM) as the encryption type.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Specifies the Diffie-Hellman (DH) group identifier.</td>
</tr>
<tr>
<td><em>group group-type...</em></td>
<td>Specifies the Diffie-Hellman (DH) group identifier.</td>
</tr>
</tbody>
</table>
### Command or Action

#### Purpose

- The default DH group identifiers are group 2 and 5 in the IKEv2 proposal.
  - 1—768-bit DH (No longer recommended).
  - 2—1024-bit DH (No longer recommended).
  - 5—1536-bit DH (No longer recommended).
  - 14—Specifies the 2048-bit DH group.
  - 15—Specifies the 3072-bit DH group.
  - 16—Specifies the 4096-bit DH group.
  - 19—Specifies the 256-bit elliptic curve DH (ECDH) group.
  - 20—Specifies the 384-bit ECDH group.
  - 24—Specifies the 2048-bit DH group.

The group chosen must be strong enough (have enough bits) to protect the IPsec keys during negotiation. A generally accepted guideline recommends the use of a 2048-bit group after 2013 (until 2030). Either group 14 or group 24 can be selected to meet this guideline. Even if a longer-lived security method is needed, the use of Elliptic Curve Cryptography is recommended, but group 15 and group 16 can also be considered.

#### Step 7

**prf prf-algorithm**

*Example:*
Device(config-ikev2-proposal)#
<prf> prf sha256 sha512

Specifies one or more of the Pseudo-Random Function (PRF) algorithm, which are as follows:

- md5
- sha1
- sha256
- sha384
- sha512

**Note**
This step is mandatory if the encryption type is AES-GCM—*aes-gmc-128* or *aes-gmc-256*. If the encryption algorithm is not AES-GCM, the PRF algorithm is the same as the specified integrity algorithm. However, you can specify a PRF algorithm, if required.

#### Step 8

**end**

*Example:*
Device(config-ikev2-proposal)#
<end>

Exits IKEv2 proposal configuration mode and returns to privileged EXEC mode.

#### Step 9

**show crypto ikev2 proposal [name | default]**

(Optional) Displays the IKEv2 proposal.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# show crypto ikev2 proposal default</td>
<td></td>
</tr>
</tbody>
</table>

**What to Do Next**

After you create the IKEv2 proposal, attach it to a policy so that the proposal is picked for negotiation. For information about completing this task, see the “Configuring IKEv2 Policy” section.

**Configuring IKEv2 Policies**

See the “IKEv2 Smart Defaults” section for information about the default IKEv2 policy.

Perform this task to override the default IKEv2 policy or to manually configure the policies if you do not want to use the default policy.

An IKEv2 policy must contain at least one proposal to be considered as complete and can have match statements, which are used as selection criteria to select a policy for negotiation. During the initial exchange, the local address (IPv4 or IPv6) and the Front Door VRF (FVRF) of the negotiating SA are matched with the policy and the proposal is selected.

The following rules apply to the match statements:

- An IKEv2 policy without any match statements will match all peers in the global FVRF.
- An IKEv2 policy can have only one match FVRF statement.
- An IKEv2 policy can have one or more match address local statements.
- When a policy is selected, multiple match statements of the same type are logically ORed and match statements of different types are logically ANDed.
- There is no precedence between match statements of different types.
- Configuration of overlapping policies is considered a misconfiguration. In the case of multiple, possible policy matches, the first policy is selected.
### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ikev2 policy** *name*
4. **proposal** *name*
5. **match fvrf** `{fvrf-name | any}`
6. **match address local** `{ipv4-address | ipv6-address}`
7. **end**
8. **show crypto ikev2 policy** `[policy-name | default]`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><strong>configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><strong>crypto ikev2 policy</strong> <em>name</em></td>
<td>Overrides the default IKEv2 policy, defines an IKEv2 policy name, and enters IKEv2 policy configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# crypto ikev2 policy policy1</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><strong>proposal</strong> <em>name</em></td>
<td>Specifies the proposals that must be used with the policy.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-ikev2-policy)# proposal proposal1</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
<td>You must specify at least one proposal. You can specify additional proposals with each proposal in a separate statement.</td>
</tr>
<tr>
<td>Step 5</td>
<td><strong>match fvrf</strong> `{fvrf-name</td>
<td>any}`</td>
</tr>
<tr>
<td></td>

<tr>
<td></td>
<td>Device(config-ikev2-policy)# match fvrf any</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
<td>The match fvrf any command must be explicitly configured in order to match any VRF. The FVRF specifies the VRF in which the IKEv2 packets are negotiated.</td>
</tr>
<tr>
<td>Step 6</td>
<td><strong>match address local</strong> `{ipv4-address</td>
<td>ipv6-address}`</td>
</tr>
</tbody>
</table>
Step 7

**end**

Example:
Device(config-ikev2-policy)# end

**Step 8**

**show crypto ikev2 policy** [policy-name | default]

Example:
Device# show crypto ikev2 policy policy1

---

**Configuration Examples for Internet Key Exchange Version 2**

**Configuration Examples for Basic Internet Key Exchange Version 2 CLI Constructs**

**Example: Configuring the IKEv2 Key Ring**

**Example: IKEv2 Key Ring with Multiple Peer Subblocks**

The following example shows how to configure an Internet Key Exchange Version 2 (IKEv2) key ring with multiple peer subblocks:

```plaintext
crypto ikev2 keyring keyring-1
peer peer1
description peer1
address 209.165.200.225 255.255.255.224
pre-shared-key key-1
peer peer2
description peer2
hostname peer1.example.com
pre-shared-key key-2
peer peer3
description peer3
hostname peer3.example.com
identity key-id abc
address 209.165.200.228 255.255.255.224
pre-shared-key key-3
```
Example: IKEv2 Key Ring with Symmetric Preshared Keys Based on an IP Address

The following example shows how to configure an IKEv2 key ring with symmetric preshared keys based on an IP address. The following is the initiator’s key ring:

```
crypto ikev2 keyring keyring-1
  peer peer1
    description peer1
    address 209.165.200.225 255.255.255.255
    pre-shared-key key1
```

The following is the responder’s key ring:

```
crypto ikev2 keyring keyring-1
  peer peer2
    description peer2
    address 209.165.200.228 255.255.255.255
    pre-shared-key key1
```

Example: IKEv2 Key Ring with Asymmetric Preshared Keys Based on an IP Address

The following example shows how to configure an IKEv2 key ring with asymmetric preshared keys based on an IP address. The following is the initiator’s key ring:

```
crypto ikev2 keyring keyring-1
  peer peer1
    description peer1 with asymmetric keys
    address 209.165.200.225 255.255.255.255
    pre-shared-key local key1
    pre-shared-key remote key2
```

The following is the responder’s key ring:

```
crypto ikev2 keyring keyring-1
  peer peer2
    description peer2 with asymmetric keys
    address 209.165.200.228 255.255.255.255
    pre-shared-key local key2
    pre-shared-key remote key1
```

Example: IKEv2 Key Ring with Asymmetric Preshared Keys Based on a Hostname

The following example shows how to configure an IKEv2 key ring with asymmetric preshared keys based on the hostname. The following is the initiator’s key ring:

```
crypto ikev2 keyring keyring-1
  peer host1
    description host1 in example domain
    hostname host1.example.com
    pre-shared-key local key1
    pre-shared-key remote key2
```

The following is the responder’s key ring:

```
crypto ikev2 keyring keyring-1
  peer host2
    description host2 in abc domain
    hostname host2.example.com
    pre-shared-key local key2
    pre-shared-key remote key1
```
Example: IKEv2 Key Ring with Symmetric Preshared Keys Based on an Identity

The following example shows how to configure an IKEv2 key ring with symmetric preshared keys based on an identity:

```
crypto ikev2 keyring keyring-4
peer abc
description example domain
identity fqdn example.com
pre-shared-key abc-key-1
peer user1
description user1 in example domain
identity email user1@example.com
pre-shared-key abc-key-2
peer user1-remote
description user1 example remote users
identity key-id example
pre-shared-key example-key-3
```

Example: IKEv2 Key Ring with a Wildcard Key

The following example shows how to configure an IKEv2 key ring with a wildcard key:

```
crypto ikev2 keyring keyring-1
peer cisco
description example domain
address 0.0.0.0 0.0.0.0
pre-shared-key example-key
```

Example: Matching a Key Ring

The following example shows how a key ring is matched:

```
crypto ikev2 keyring keyring-1
peer cisco
description example.com
address 0.0.0.0 0.0.0.0
pre-shared-key xyz-key
peer peer1
description abc.example.com
address 10.0.0.0 255.255.0.0
pre-shared-key abc-key
peer host1
description host1@abc.example.com
address 10.0.0.1
pre-shared-key host1-example-key
```

In the example shown, the key lookup for peer 10.0.0.1 first matches the wildcard key example-key, then the prefix key example-key, and finally the host key host1-example-key. The best match host1-example-key is used.

```
crypto ikev2 keyring keyring-2
peer host1
description host1 in abc.example.com sub-domain
address 10.0.0.1
pre-shared-key host1-example-key
peer host2
description example domain
address 0.0.0.0 0.0.0.0
pre-shared-key example-key
```

In the example shown, the key lookup for peer 10.0.0.1 would first match the host key host1-abc-key. Because this is a specific match, no further lookup is performed.
Example: Configuring the Profile

Example: IKEv2 Profile Matched on Remote Identity

The following profile supports peers that identify themselves using fully qualified domain name (FQDN) example.com and authenticate with the RSA signature using trustpoint-remote. The local node authenticates itself with a pre-shared key using keyring-1.

crypto ikev2 profile profile2
match identity remote fqdn example.com
identity local email router2@example.com
authentication local pre-share
authentication remote rsa-sig
keyring keyring-1
pki trustpoint trustpoint-remote verify
lifetime 300
dpd 5 10 on-demand
virtual-template 1

Example: IKEv2 Profile Supporting Two Peers

The following example shows how to configure an IKEv2 profile supporting two peers that use different authentication methods:

crypto ikev2 profile profile2
match identity remote email user1@example.com
match identity remote email user2@example.com
identity local email router2@cisco.com
authentication local rsa-sig
authentication remote pre-share
authentication remote rsa-sig
keyring keyring-1
pki trustpoint trustpoint-local sign
pki trustpoint trustpoint-remote verify
lifetime 300
dpd 5 10 on-demand
virtual-template 1

Example: Configuring FlexVPN with Dynamic Routing Using Certificates and IKEv2 Smart Defaults

The following examples show a connection between a branch device (initiator, using a static virtual tunnel interface [sVTI]) and a central device (responder, using a dynamic virtual tunnel interface [dVTI]) with dynamic routing over the tunnel. The example uses IKEv2 smart defaults, and the authentication is performed using certificates (RSA signatures).

Note

A RSA modulus size of 2048 is recommended.

The peers use the FQDN as their IKEv2 identity, and the IKEv2 profile on the responder matches the domain in the identity FQDN.

The configuration on the initiator (branch device) is as follows:

hostname branch
ip domain name cisco.com
crypto ikev2 profile branch-to-central
match identity remote fqdn central.cisco.com
identity local fqdn branch.cisco.com
authentication local rsa-sig
authentication remote rsa-sig
pki trustpoint CA
!
crypto ipsec profile svti
set ikev2-profile branch-to-central
!
interface Tunnel0
ip address 172.16.0.101 255.255.255.0
tunnel source Ethernet0/0

Configuration Examples for Advanced Internet Key Exchange Version 2 CLI Constructs

Example: Configuring the Proposal

Example: IKEv2 Proposal with One Transform for Each Transform Type

This example shows how to configure an IKEv2 proposal with one transform for each transform type:

```
crypto ikev2 proposal proposal-1
  encryption aes-cbc-128
  integrity sha1
  group 14
```

Example: IKEv2 Proposal with Multiple Transforms for Each Transform Type

This example shows how to configure an IKEv2 proposal with multiple transforms for each transform type:

```
crypto ikev2 proposal proposal-2
  encryption aes-cbc-128 aes-cbc-192
  integrity sha1
  group 14
```

Note: Cisco no longer recommends using 3DES, MD5 (including HMAC variant), and Diffie-Hellman (DH) groups 1, 2 and 5; instead, you should use AES, SHA-256 and DH Groups 14 or higher. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

The IKEv2 proposal proposal-2 shown translates to the following prioritized list of transform combinations:

- aes-cbc-128, sha1, 14
- aes-cbc-192, sha1, 14

Example: IKEv2 Proposals on the Initiator and Responder

The following example shows how to configure IKEv2 proposals on the initiator and the responder. The proposal on the initiator is as follows:

```
crypto ikev2 proposal proposal-1
  encryption aes-cbc-192 aes-cbc-128
  integrity sha-256 sha1
  group 14 24
```

The proposal on the responder is as follows:

```
crypto ikev2 proposal proposal-2
  encryption aes-cbc-128 aes-cbc-192
  peer
  integrity sha1 sha-256
  group 24 14
```
The selected proposal will be as follows:

```
encryption aes-cbc-128
integrity sha1
group 14
```

In the proposals shown for the initiator and responder, the initiator and responder have conflicting preferences. In this case, the initiator is preferred over the responder.

**Example: Configuring the Policy**

**Example: IKEv2 Policy Matched on a VRF and Local Address**

The following example shows how an IKEv2 policy is matched based on a VRF and local address:

```
crypto ikev2 policy policy2
  match vrf vrf1
  match local address 10.0.0.1
  proposal proposal-1
```

**Example: IKEv2 Policy with Multiple Proposals That Match All Peers in a Global VRF**

The following example shows how an IKEv2 policy with multiple proposals matches the peers in a global VRF:

```
crypto ikev2 policy policy2
  proposal proposal-A
  proposal proposal-B
```

**Example: IKEv2 Policy That Matches All Peers in Any VRF**

The following example shows how an IKEv2 policy matches the peers in any VRF:

```
crypto ikev2 policy policy2
  match vrf any
  proposal proposal-1
```

**Example: Matching a Policy**

Do not configure overlapping policies. If there are multiple possible policy matches, the best match is used, as shown in the following example:

```
crypto ikev2 policy policy1
  match fvrf fvrf1

crypto ikev2 policy policy2
  match fvrf fvrf1
```

The proposal with FVRF as fvrf1 and the local peer as 10.0.0.1 matches policy1 and policy2, but policy2 is selected because it is the best match.
Where to Go Next

After configuring IKEv2, proceed to configure IPsec VPNs. For more information, see the “Configuring Security for VPNs with IPsec” module.

Feature Information for Configuring Internet Key Exchange Version 2 (IKEv2)

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

<tr>
<td>FlexVPN Config Simplification</td>
<td>15.3(3)M</td>
<td>The FlexVPN Config Simplification feature simplifies IKEv2 configuration thereby making the IKEv2 system manageable and scalable. The following commands were introduced or modified: <code>identity (IKEv2 keyring)</code>, <code>authentication</code>, <code>match (IKEv2 profile)</code>.</td>
</tr>
<tr>
<td>IKEv2 Dynamic Routing Support</td>
<td>15.6(3)M2</td>
<td>With IKEv2 static routing, route information is exchanged during initial session bring up. The IKEv2 Dynamic Routing Support feature enables exchange of route information even after a session is established. Changes in routing information such as new routes, addition or deletion of routes can be propagated from FlexVPN client to FlexVPN server. The route information is included in the IKEv2 information exchange messages. The following commands were introduced or modified: <code>crypto ikev2 route redistribute</code>, <code>route redistribute</code>, <code>show crypto ikev2 sa</code>, <code>show crypto session</code>.</td>
</tr>
<tr>
<td>IPv6 Support for IPsec and IKEv2</td>
<td>15.1(4)M</td>
<td>This feature allows IPv6 addresses to be added to IPsec and IKEv2 protocols. The following commands were introduced or modified: <code>address (IKEv2 keyring)</code>, <code>identity (IKEv2 keyring)</code>, <code>identity local</code>, <code>match (IKEv2 policy)</code>, <code>match (IKEv2 profile)</code>, <code>show crypto ikev2 session</code>, <code>show crypto ikev2 sa</code>, <code>show crypto ikev2 profile</code>, <code>show crypto ikev2 policy</code>, <code>debug crypto condition</code>, <code>clear crypto ikev2 sa</code>.</td>

</tr>
<tr>
<td>Suite-B Support in IOS SW Crypto</td>
<td>15.1(2)T</td>
<td>Suite-B adds support for the SHA-2 family (HMAC variant) hash algorithm used to authenticate packet data and verify the integrity verification mechanisms for the IKEv2 proposal configuration. HMAC is a variant that provides an additional level of hashing. Suite-B also allows the Elliptic Curve Digital Signature Algorithm (ECDSA) signature (ECDSA-sig), as defined in RFC 4754, to be the authentication method for IKEv2. Suite-B requirements comprise of four user interface suites of cryptographic algorithms for use with IKE and IPsec that are described in RFC 4869. Each suite consists of an encryption algorithm, a digital signature algorithm, a key agreement algorithm, and a hash or message digest algorithm. See the Configuring Security for VPNs with IPsec module for more information about Cisco IOS Suite-B support. The following commands were introduced or modified: <strong>authentication</strong>, <strong>group</strong>, <strong>identity</strong> (IKEv2 proposal), <strong>integrity</strong>, <strong>match</strong> (IKEv2 profile).</td>
