IPsec Virtual Tunnel Interfaces

IPsec virtual tunnel interfaces (VTIs) provide a routable interface type for terminating IPsec tunnels and an easy way to define protection between sites to form an overlay network. IPsec VTIs simplify the configuration of IPsec for protection of remote links, support multicast, and simplify network management and load balancing.

Note

Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for IPsec Virtual Tunnel Interfaces

Fragmentation

Fragmentation is not supported over IPsec tunnel. You can choose to set the lower MTU on hosts to avoid packet fragments or choose to fragment the packets on any device before it reaches ASR 920.
**IPsec Transform Set**

The IPsec transform set must be configured in tunnel mode only.

**IKE Security Association**

The Internet Key Exchange (IKE) security association (SA) is bound to the VTI.

**IPsec SA Traffic Selectors**

Static VTIs (SVTIs) support only a single IPsec SA that is attached to the VTI interface. The traffic selector for the IPsec SA is always “IP any any.”

**IPv4**

This feature supports SVTIs that are configured to encapsulate IPv4 packets.

**Tunnel Protection**

Do not configure the `shared` keyword when using the `tunnel mode ipsec ipv4` command for IPsec IPv4 mode.

**Traceroute**

The traceroute function with crypto offload on VTIs is not supported.

---

**Information About IPsec Virtual Tunnel Interfaces**

The use of IPsec VTIs can simplify the configuration process when you need to provide protection for remote access and it provides an alternative to using generic routing encapsulation (GRE) or Layer 2 Tunneling Protocol (L2TP) tunnels for encapsulation. A benefit of using IPsec VTIs is that the configuration does not require static mapping of IPsec sessions to a physical interface. The IPsec tunnel endpoint is associated with an actual (virtual) interface. Because there is a routable interface at the tunnel endpoint, many common interface capabilities can be applied to the IPsec tunnel.

The IPsec VTI allows for the flexibility of sending and receiving both IP unicast and multicast encrypted traffic on any physical interface, such as in the case of multiple paths. Traffic is encrypted or decrypted when it is forwarded from or to the tunnel interface and is managed by the IP routing table. Using IP routing to forward the traffic to the tunnel interface simplifies the IPsec VPN configuration. Because DVTIs function like any other real interface you can apply quality of service (QoS), firewall, and other security services as soon as the tunnel is active.

The following sections provide details about the IPsec VTI:

---

**Benefits of Using IPsec Virtual Tunnel Interfaces**

IPsec VTIs allow you to configure a virtual interface to which you can apply features. Features for clear-text packets are configured on the VTI. Features for encrypted packets are applied on the physical outside interface. When IPsec VTIs are used, you can separate the application of features such as Network Address Translation (NAT), ACLs, and QoS and apply them to clear-text, or encrypted text, or both.

There are two types of VTI interfaces: static VTIs (SVTIs) and dynamic VTIs (DVTIs).
**Static Virtual Tunnel Interfaces**

SVTI configurations can be used for site-to-site connectivity in which a tunnel provides always-on access between two sites.

Additionally, multiple Cisco IOS software features can be configured directly on the tunnel interface and on the physical egress interface of the tunnel interface. This direct configuration allows users to have solid control on the application of the features in the pre- or post-encryption path.

The figure below illustrates how a SVTI is used.

*Figure 1: IPsec SVTI*

The IPsec VTI supports native IPsec tunneling and exhibits most of the properties of a physical interface.

**Dynamic Virtual Tunnel Interfaces**

DVTIs can provide highly secure and scalable connectivity for remote-access VPNs. The DVTI technology replaces dynamic crypto maps and the dynamic hub-and-spoke method for establishing tunnels.

---

**Note**

You can configure DVTIs with IKEv1 or IKEv2. The legacy crypto map based configuration supports DVTIs with IKEv1 only. A DVTI configuration with IKEv2 is supported only in FlexVPN.

DVTIs can be used for both the server and the remote configuration. The tunnels provide an on-demand separate virtual access interface for each VPN session. The configuration of the virtual access interfaces is cloned from a virtual template configuration, which includes the IPsec configuration and any Cisco IOS software feature configured on the virtual template interface, such as QoS, NetFlow, or ACLs.

DVTIs function like any other real interface, so you can apply QoS, firewall, or other security services as soon as the tunnel is active. QoS features can be used to improve the performance of various applications across the network. Any combination of QoS features offered in Cisco IOS software can be used to support voice, video, or data applications.

DVTIs provide efficiency in the use of IP addresses and provide secure connectivity. DVTIs allow dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. The per-group or per-user definition can be created using an extended authentication (Xauth) User or Unity group, or can be derived from a certificate. DVTIs are standards based, so interoperability in a multiple-vendor environment is supported. IPsec DVTIs allow you to create highly secure connectivity for remote access VPNs and can be combined with Cisco Architecture for Voice, Video, and Integrated Data (AVVID) to deliver converged voice, video, and data over IP networks. The DVTI simplifies VPN routing and forwarding-(VRF-) aware IPsec deployment. The VRF is configured on the interface.
A DVTI requires minimal configuration on the router. A single virtual template can be configured and cloned.

The DVTI creates an interface for IPsec sessions and uses the virtual template infrastructure for dynamic instantiation and management of dynamic IPsec VTIs. The virtual template infrastructure is extended to create dynamic virtual-access tunnel interfaces. DVTIs are used in hub-and-spoke configurations. A single DVTI can support several static VTIs.

The figure below illustrates the DVTI authentication path.

Figure 2: Dynamic IPsec VTI

The authentication shown in the figure above follows this path:
1. User 1 calls the router.
2. Router 1 authenticates User 1.
3. IPsec clones the virtual access interface from the virtual template interface.

Traffic Encryption with the IPsec Virtual Tunnel Interface

When an IPsec VTI is configured, encryption occurs in the tunnel. Traffic is encrypted when it is forwarded to the tunnel interface. Traffic forwarding is handled by the IP routing table, and dynamic or static routing can be used to route traffic to the SVTI. DVTI uses reverse route injection to further simplify the routing configurations. Using IP routing to forward the traffic to encryption simplifies the IPsec VPN configuration. The IPsec virtual tunnel also allows you to encrypt multicast traffic with IPsec.

IPsec packet flow into the IPSec tunnel is illustrated in the figure below.
After packets arrive on the inside interface, the forwarding engine switches the packets to the VTI, where they are encrypted. The encrypted packets are handed back to the forwarding engine, where they are switched through the outside interface.

The figure below shows the packet flow out of the IPsec tunnel.

**Dynamic Virtual Tunnel Interface Life Cycle**

IPsec profiles define the policy for DVTIs. The dynamic interface is created at the end of IKE Phase 1 and IKE Phase 1.5. The interface is deleted when the IPsec session to the peer is closed. The IPsec session is closed when both IKE and IPsec SAs to the peer are deleted.

**Routing with IPsec Virtual Tunnel Interfaces**

Because VTIs are routable interfaces, routing plays an important role in the encryption process. Traffic is encrypted only if it is forwarded out of the VTI, and traffic arriving on the VTI is decrypted and routed.
accordingly. VTIs allow you to establish an encryption tunnel using a real interface as the tunnel endpoint. You can route to the interface or apply services such as QoS, firewalls, network address translation (NAT), and NetFlow statistics as you would to any other interface. You can monitor the interface and route to it, and the interface provides benefits similar to other Cisco IOS interface.

**FlexVPN Mixed Mode Support**

The FlexVPN Mixed Mode feature provides support for carrying IPv4 traffic over IPsec IPv6 transport. This is the first phase towards providing dual stack support on the IPsec stack. This implementation does not support using a single IPsec security association (SA) pair for both IPv4 and IPv6 traffic.

This feature is only supported for Remote Access VPN with IKEv2 and Dynamic VTI.

The FlexVPN Mixed Mode feature provides support for carrying IPv6 traffic over IPsec IPv4 transport from Cisco IOS XE Everest 16.4.1.

**Auto Tunnel Mode Support in IPsec**

When configuring a VPN headend in a multiple vendor scenario, you must be aware of the technical details of the peer or responder. For example, some devices may use IPsec tunnels while others may use generic routing encapsulation (GRE) or IPsec tunnel, and sometimes, a tunnel may be IPv4 or IPv6. In the last case, you must configure an Internet Key Exchange (IKE) profile and a virtual template.

The Tunnel Mode Auto Selection feature eases the configuration and spares you about knowing the responder’s details. This feature automatically applies the tunneling protocol (GRE or IPsec) and transport protocol (IPv4 or IPv6) on the virtual template as soon as the IKE profile creates the virtual access interface. This feature is useful on dual stack hubs aggregating multivendor remote access, such as Cisco AnyConnect VPN Client, Microsoft Windows7 Client, and so on.

---

**Note**

The Tunnel Mode Auto Selection feature eases the configuration for a responder only. The tunnel must be statically configured for an initiator.

**IPSec Mixed Mode Support for VTI**

The IPSec Mixed Mode feature provides support for carrying IPv4 traffic over IPsec IPv6 transport. This is the first phase towards providing dual stack support on the IPsec stack. This implementation does not support using a single IPsec security association (SA) pair for both IPv4 and IPv6 traffic.

This feature is supported for SVTI as well as DVTI and IKEv1 as well as IKEv2.
How to Configure IPsec Virtual Tunnel Interfaces

Configuring Static IPsec Virtual Tunnel Interfaces

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto IPsec profile profile-name
4. set transform-set transform-set-name [transform-set-name2...transform-set-name6]
5. exit
6. interface type number
7. ip address address mask
8. tunnel mode ipsec ipv4
9. tunnel source interface-type interface-number
10. tunnel destination ip-address
11. tunnel protection IPsec profile profile-name
12. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>

<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

Device(ipsec-profile)# exit

**Purpose**

Specifies the interface on which the tunnel will be configured and enters interface configuration mode.

**Step 6**

**interface** *type number*

**Example:**

Device(config)# interface tunnel 0

**Step 7**

**ip address** *address mask*

**Example:**

Device(config-if)# ip address 10.1.1.1 255.255.255.0

**Step 8**

**tunnel mode** ipsec ipv4

**Example:**

Device(config-if)# tunnel mode ipsec ipv4

**Step 9**

**tunnel source** *interface-type interface-number*

**Example:**

Device(config-if)# tunnel source loopback 0

**Step 10**

**tunnel destination** *ip-address*

**Example:**

Device(config-if)# tunnel destination 172.16.1.1

**Step 11**

**tunnel protection IPsec profile** *profile-name*

**Example:**

Device(config-if)# tunnel protection IPsec profile PROF

**Step 12**

**end**

**Example:**

Device(config-if)# end

---

### Configuring BGP over IPsec Virtual Tunnel Interfaces

Perform this task to optionally configure BGP over the virtual tunnel interfaces of two routers.

**Before you begin**

Perform steps in Configuring Static IPsec Virtual Tunnel Interfaces, on page 7.

**SUMMARY STEPS**

1. **router bgp** *autonomous-system-number*
2. `neighbor ip-address remote-as autonomous-system-number`

3. `network network-ip-address mask subnet-mask`

4. `exit`

5. Enter the following commands on the second router.

6. `router bgp autonomous-system-number`

7. `neighbor ip-address remote-as autonomous-system-number`

8. `network network-ip-address mask subnet-mask`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `router bgp autonomous-system-number`  
   **Example:**  
   `Device(config)# router bgp 65510` | Enters router configuration mode and creates a BGP routing process.  
   `autonomous-system-number` — Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. Number in the range from 1 to 65535.  
   In the example, the first router in this procedure is identified as "65510". |
| 2    | `neighbor ip-address remote-as autonomous-system-number`  
   **Example:**  
   `Device(config-router)# neighbor 10.1.1.2 remote-as 65511` | `ip-address` — IP address of the adjacent router's tunnel interface.  
   `autonomous-system-number` — Number of an autonomous system that identifies the router of the second router. Number in the range from 1 to 65535. |
| 3    | `network network-ip-address mask subnet-mask`  
   **Example:**  
   `Device(config-router)# network 2.2.2.0 mask 255.255.255.0` | `network-ip-address` — IP address of the network advertised in BGP. For example, the IP address of a loopback interface.  
   `subnet-mask` — Subnet mask of the network advertised in BGP.  
   **Note**  
   The BGP network command network and mask must exactly match a route that is already in the routing table for it to be brought into BGP and advertised to BGP neighbors. This is different from EIGRP, OSPF where the network statement just has to "cover" an interface network and it will pick up the network with mask from the interface. |
| 4    | `exit`  
   **Example:**  
   `Device(config-router)# exit` | Exits router configuration mode. |
| 5    | Enter the following commands on the second router. |
| 6    | `router bgp autonomous-system-number`  
   **Example:** | Enters router configuration mode and creates a BGP routing process. |

<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>Device(conf-isa-prof)# keyring cisco-100-1</td>
<td>Matches an identity from the ISAKMP profile.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 11**

**match identity address mask**

**Example:**

Device(conf-isa-prof)# match identity address 10.1.1.0 255.255.255.0

**Step 12**

**virtual-template template-number**

**Example:**

Device(conf-isa-prof)# virtual-template 101

**Step 13**

**exit**

**Example:**

Device(conf-isa-prof)# exit

**Step 14**

**crypto ipsec transform-set transform-set-name transform1 [transform2] [transform3]**

**Example:**

Device(config)# crypto ipsec transform-set cisco esp-aes esp-sha-hmac

**Step 15**

**exit**

**Example:**

Device(config-crypto-trans)# exit

**Step 16**

**crypto ipsec profile name**

**Example:**

Device(config)# crypto ipsec profile cisco-ipsec-profile-101

**Step 17**

**set security-policy limit maximum-limit**

**Example:**

Device(ipsec-profile)# set security-policy limit 3

**Step 18**

**set transform-set transform-set-name [transform-set-name2 .... transform-set-name6]**

**Example:**

Device(ipsec-profile)# set transform-set cisco

**Step 19**

**exit**

**Example:**

Device(ipsec-profile)# exit

**Step 20**

**interface virtual-template number type tunnel**

**Example:**

Create a virtual template interface that can be configured interface and enters interface configuration mode.
**Command or Action** | **Purpose**  
--- | ---  
Device(config)# interface virtual-template 101 type tunnel | Associates a VRF instance with a virtual-template interface.  
**Step 21** | ip vrf forwarding vrf-name  
Example: Device(config-if)# ip vrf forwarding VRF=100-1 | Enables IP processing on an interface without assigning an explicit IP address to the interface.  
**Step 22** | ip unnumbered type number  
Example: Device(config-if)# ip unnumbered GigabitEthernet 0.0 | Defines the mode for the tunnel.  
**Step 23** | tunnel mode ipsec ipv4  
Example: Device(config-if)# tunnel mode ipsec ipv4 | Associates a tunnel interface with an IPsec profile.  
**Step 24** | tunnel protection profile ipsec profile-name  
Example: Device(config-if)# tunnel protection ipsec profile PROF |  
**Step 25** | end  
Example: Device(config-if)# end | Exits interface configuration mode, and returns to privileged EXEC mode.  

## Configuring IPsec Mixed Mode Support for SVTIs

### SUMMARY STEPS

1. enable  
2. configure terminal  
3. crypto IPsec profile profile-name  
4. set transform-set transform-set-name [transform-set-name2...transform-set-name6]  
5. exit  
6. interface type number  
7. ip address address mask  
8. Do one of the following:  
   - tunnel mode ipsec ipv4 v6-overlay  
   - tunnel mode ipsec ipv6 v4-overlay  
9. tunnel source interface-type interface-type  
10. tunnel destination ip-address  
11. tunnel protection IPsec profile profile-name  
12. end
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
  **Example:**  
  Device> enable  
  - Enter your password if prompted. |
| Step 2 | `configure terminal` | Enters global configuration mode.  
  **Example:**  
  Device# configure terminal |
| Step 3 | `crypto IPsec profile profile-name` | Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec devices, and enters IPsec profile configuration mode.  
  **Example:**  
  Device(config)# crypto IPsec profile PROF |
| Step 4 | `set transform-set transform-set-name [transform-set-name2...transform-set-name6]` | Specifies which transform sets can be used with the crypto map entry.  
  **Example:**  
  Device(ipsec-profile)# set transform-set tset |
| Step 5 | `exit` | Exits IPsec profile configuration mode, and enters global configuration mode.  
  **Example:**  
  Device(ipsec-profile)# exit |
| Step 6 | `interface type number` | Specifies the interface on which the tunnel will be configured and enters interface configuration mode.  
  **Example:**  
  Device(config)# interface tunnel 0 |
| Step 7 | `ip address address mask` | Specifies the IP address and mask.  
  **Example:**  
  Device(config-if)# ip address 10.1.1.1 255.255.255.0 |
| Step 8 | Do one of the following:  
  - `tunnel mode ipsec ipv4 v6-overlay`  
  - `tunnel mode ipsec ipv6 v4-overlay` | Defines the mode for the tunnel.  
  **Example:**  
  Device(config-if)# tunnel mode ipsec ipv4 v6-overlay |
| Step 9 | `tunnel source interface-type interface-type` | Specifies the tunnel source as a loopback interface.  
  **Example:**  
  |
### Command or Action

**Purpose**

**Step 10**

Use `tunnel destination ip-address` to identify the IP address of the tunnel destination.

**Example:**

Device(config-if)# tunnel destination 172.16.1.1

**Step 11**

Use `tunnel protection IPsec profile profile-name` to associate a tunnel interface with an IPsec profile.

**Example:**

Device(config-if)# tunnel protection IPsec profile PROF

**Step 12**

Use `end` to exit interface configuration mode and return to privileged EXEC mode.

**Example:**

Device(config-if)# end

### Configuring IPsec Mixed Mode Support for Dynamic VTIs

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto ipsec profile profile-name`
4. `set mixed mode`
5. `set transform-set transform-set-name [transform-set-name2...transform-set-name6]`
6. `exit`
7. `interface virtual-template number type tunnel`
8. `tunnel mode ipsec ipv4`
9. `tunnel protection IPsec profile profile-name`
10. `exit`
11. `crypto isakamp profile profile-name`
12. `match identity address ip-address mask`
13. `virtual template template-number`
14. `end`

**DETAILED STEPS**

**Step 1**

Use `enable` to enable privileged EXEC mode.

**Example:**

Device> enable

- Enter your password if prompted.

Enables privileged EXEC mode.

### IPsec Virtual Tunnel Interfaces

#### Configuration Examples for IPsec Virtual Tunnel Interfaces

**Example: Static Virtual Tunnel Interface with IPsec**

The following example configuration uses a preshared key for authentication between peers. VPN traffic is forwarded to the IPsec VTI for encryption and then sent out the physical interface. The tunnel on subnet 10 checks packets for the IPsec policy and passes them to the Crypto Engine (CE) for IPsec encapsulation. The figure below illustrates the IPsec VTI configuration.

**Figure 5: VTI with IPsec**

**Router Configuration**

```plaintext
version 12.3
service timestamps debug datetime
service timestamps log datetime
hostname 7200-3
no aaa new-model
ip subnet-zero
ip cef
controller ISA 6/1
!
crypto isakmp policy 1
  encr aes
  authentication pre-share
group 14
crypto isakmp key Cisco12345 address 0.0.0.0 0.0.0.0
crypto ipsec transform-set T1 esp-aes esp-sha-hmac
crypto ipsec profile P1
  set transform-set T1
!
interface Tunnel0
  ip address 10.0.51.203 255.255.255.0
    load-interval 30
tunnel source 10.0.149.203
tunnel destination 10.0.149.217
tunnel mode IPsec ipv4
tunnel protection IPsec profile P1
```

</tr>
</tbody>
</table>
| **Step 13** virtual template *template-number*<br>**Example:**

Device(config)# virtual-template 1 | Exits global configuration mode and enters privileged EXEC mode. |
| **Step 14** end <br>**Example:**

Device(config)# end | |
Example: Verifying the Results for the IPsec Static Virtual Tunnel Interface

This section provides information that you can use to confirm that your configuration is working properly. In this display, Tunnel 0 is “up,” and the line protocol is “up.” If the line protocol is “down,” the session is not active.
Verifying the IPsec Static Virtual Tunnel Interface

Router# show interface tunnel 0

Tunnel0 is up, line protocol is up
Hardware is Tunnel
Internet address is 10.0.51.203/24
MTU 1514 bytes, BW 9 Kbit, DLY 500000 usec,
reliability 255/255, txload 103/255, rxload 110/255
Encapsulation TUNNEL, loopback not set
Keepalive not set
Tunnel source 10.0.149.203, destination 10.0.149.217
Tunnel protocol/transport ipsec/ip, key disabled, sequencing disabled
Tunnel TTL 255
Checksumming of packets disabled, fast tunneling enabled
Tunnel transmit bandwidth 8000 (kbps)
Tunnel receive bandwidth 8000 (kbps)
Tunnel protection via IPsec (profile "P1")
Last input never, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 1/75/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue: 0/0 (size/max)
30 second input rate 13000 bits/sec, 34 packets/sec
30 second output rate 36000 bits/sec, 34 packets/sec
191320 packets input, 30129126 bytes, 0 no buffer
Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
59968 packets output, 15369696 bytes, 0 underruns
0 output errors, 0 collisions, 0 interface resets
0 output buffer failures, 0 output buffers swapped out

Active SAs: 4,
Router# show ip route

Example: VRF-Aware Static Virtual Tunnel Interface

Example: VRF-Aware Static Virtual Tunnel Interface

To add the VRF to the static VTI example, include the `ipvrf` and `ip vrf forwarding` commands to the configuration as shown in the following example.
Cisco 7206 Router Configuration

hostname cisco 7206
ip vrf sample-vti1
rd 1:1
route-target export 1:1
route-target import 1:1

interface Tunnel0
ip vrf forwarding sample-vti1
ip address 10.0.51.217 255.255.255.0
tunnel source 10.0.149.217
tunnel destination 10.0.149.203
tunnel mode ipsec ipv4
tunnel protection ipsec profile P1
end

Example: Static Virtual Tunnel Interface with QoS

You can apply any QoS policy to the tunnel endpoint by including the `service-policy` statement under the tunnel interface. The following example shows how to police traffic out the tunnel interface.

Cisco 7206 Router Configuration

hostname cisco 7206

class-map match-all VTI
match any

policy-map VTI
class VTI
police cir 2000000
conform-action transmit
exceed-action drop

interface Tunnel0
ip address 10.0.51.217 255.255.255.0
tunnel source 10.0.149.217
tunnel destination 10.0.149.203
tunnel mode ipsec ipv4
tunnel protection ipsec profile P1
service-policy output VTI
end
Example: Static Virtual Tunnel Interface with Virtual Firewall

Applying the virtual firewall to the SVTI tunnel allows traffic from the spoke to pass through the hub to reach the Internet. The figure below illustrates an SVTI with the spoke protected inherently by the corporate firewall.

Figure 6: Static VTI with Virtual Firewall

![Diagram of Static VTI with Virtual Firewall]

The basic SVTI configuration has been modified to include the virtual firewall definition:

Cisco 7206 Router Configuration

```
hostname cisco 7206
.
  ip  inspect max-incomplete high 1000000
  ip  inspect max-incomplete low 800000
  ip  inspect one-minute high 1000000

    ip unnumbered ethernet 0/0
    tunnel mode ipsec ipv4
    tunnel protection ipsec profile cisco-ipsec-profile
!

Example: VRF-Aware IPsec with a Dynamic VTI When VRF Is Configured Under an ISAKMP Profile and a Gateway Option in an IPsec Profile

The following example shows how to configure VRF-aware IPsec to take advantage of the DVTI, when the VRF is configured under an ISAKMP profile and a gateway option in an IPsec profile:

hostname ASR 1000
!
ip vrf VRF-100-1
    rd 1:1
!
ip vrf VRF-100-2
    rd 1:1

crypto keyring cisco-100-1
  pre-shared-key address 10.1.1.1 key cisco-100-1
crypto keyring cisco-100-2
  pre-shared-key address 10.1.2.1 key cisco-100-2
crypto isakmp profile cisco-isakmp-profile-100-1
  vrf VRF-100-1
  keyring cisco-100-1
  match identity address 10.1.1.0 255.255.255.0
  virtual-template 1
crypto isakmp profile cisco-isakmp-profile-100-2
  vrf VRF-100-2
  keyring cisco-100-2
  match identity address 10.1.2.0 255.255.255.0
  virtual-template 1
!
crypto ipsec transform-set cisco esp-3des esp-sha-hmac
crypto ipsec profile cisco-ipsec-profile
  set security-policy limit 3
  set transform-set cisco
  set reverse-route gateway 172.16.0.1
!
interface Virtual-Template1 type tunnel
  ip unnumbered Ethernet 0/0
  tunnel mode ipsec ipv4
  tunnel protection ipsec profile cisco-ipsec-profile
!

Example: VRF-Aware IPsec with a Dynamic VTI When a VRF Is Configured Under Both a Virtual Template and an ISAKMP Profile

Note
When separate VRFs are configured under an ISAKMP profile and a virtual template, the VRF configured under the virtual template takes precedence. This configuration is not recommended.

The following example shows how to configure VRF-aware IPsec to take advantage of the DVTI when the VRF is configured under both a virtual template and an ISAKMP profile:

hostname ASR 1000

ip vrf test-vti2
  rd 1:2
  route-target export 1:1
  route-target import 1:1
!

ip vrf test-vti1
  rd 1:1
  route-target export 1:1
route-target import 1:1
!
.
.
crypto isakmp profile cisco-isakmp-profile
vrf test-vti2
keyring key
match identity address 10.1.1.0 255.255.255.0
!
.
.
interface Virtual-Template1 type tunnel
ip vrf forwarding test-vti1
ip unnumbered Loopback 0
ip virtual-reassembly
tunnel mode ipsec ipv4
tunnel protection ipsec profile test-vti1
!
.
.
end

Example: Dynamic Virtual Tunnel Interface with Virtual Firewall

The DVTI Easy VPN server can be configured behind a virtual firewall. Behind-the-firewall configuration allows users to enter the network, while the network firewall is protected from unauthorized access. The virtual firewall uses Context-Based Access Control (CBAC) and NAT applied to the Internet interface as well as to the virtual template.

hostname cisco 7206
.
.
ip inspect max-incomplete high 1000000
ip inspect max-incomplete low 800000
ip inspect one-minute high 1000000
ip inspect one-minute low 800000
ip inspect tcp synwait-time 60
ip inspect tcp max-incomplete host 100000 block-time 2
ip inspect name IOSFW1 tcp timeout 300
ip inspect name IOSFW1 udp
!
.
interface GigabitEthernet0/1
description Internet Connection
ip address 172.18.143.246 255.255.255.0
ip access-group 100 in
ip nat outside
!
interface GigabitEthernet0/2
description Internal Network
ip address 10.2.1.1 255.255.255.0
!
interface Virtual-Template1 type tunnel
ip unnumbered Loopback0
ip nat inside
ip inspect IOSFW1 in
Example: Dynamic Virtual Tunnel Interface with QoS

You can add QoS to the DVTI tunnel by applying the service policy to the virtual template. When the template is cloned to make the virtual access interface, the service policy will also be applied to the virtual access interface. The following example shows the basic DVTI configuration with QoS added.

```plaintext
tunnel mode ipsec ipv4
tunnel protection ipsec profile test-vti1
!
ip classless
ip route 0.0.0.0 0.0.0.0 172.18.143.1
!
ip nat translation timeout 120
ip nat translation finrst-timeout 2
ip nat translation max-entries 300000
ip nat pool test1 10.2.100.1 10.2.100.50 netmask 255.255.255.0
ip nat inside source list 110 pool test1 vrf test-vti1 overload
!
access-list 100 permit esp any any
access-list 100 permit udp any eq isakmp any
access-list 100 permit udp any eq non500-isakmp any
access-list 100 permit icmp any any
!
access-list 110 deny esp any any
access-list 110 deny udp any eq isakmp any
access-list 110 permit ip any any
!
access-list 110 deny udp any eq non500-isakmp any
!
end
```

Example: Dynamic Virtual Tunnel Interface with QoS

You can add QoS to the DVTI tunnel by applying the service policy to the virtual template. When the template is cloned to make the virtual access interface, the service policy will also be applied to the virtual access interface. The following example shows the basic DVTI configuration with QoS added.

```plaintext
tunnel mode ipsec ipv4
tunnel protection ipsec profile test-vti1
!
ip classless
ip route 0.0.0.0 0.0.0.0 172.18.143.1
!
ip nat translation timeout 120
ip nat translation finrst-timeout 2
ip nat translation max-entries 300000
ip nat pool test1 10.2.100.1 10.2.100.50 netmask 255.255.255.0
ip nat inside source list 110 pool test1 vrf test-vti1 overload
!
access-list 100 permit esp any any
access-list 100 permit udp any eq isakmp any
access-list 100 permit udp any eq non500-isakmp any
access-list 100 permit icmp any any
!
access-list 110 deny esp any any
access-list 110 deny udp any eq isakmp any
access-list 110 permit ip any any
!
access-list 110 deny udp any eq non500-isakmp any
!
end
```

Feature Information for IPsec Virtual Tunnel Interfaces

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

<tbody>
<tr>
<td>Dynamic IPsec VTIs</td>
<td></td>
<td>Dynamic VTIs enable efficient use of IP addresses and provide secure connectivity. Dynamic VTIs allow dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. IPsec dynamic VTIs allow you to create highly secure connectivity for remote access VPNs. The dynamic VTI simplifies VRF-aware IPsec deployment. The following commands were introduced or modified: <code>crypto isakmp profile</code>, <code>interface virtual-template</code>, <code>show vtemplate</code>, <code>tunnel mode</code>, <code>virtual-template</code>.</td>
</tr>
<tr>
<td>FlexVPN Mixed Mode Support</td>
<td></td>
<td>The FlexVPN Mixed Mode feature provides support for carrying IPv4 traffic over IPsec IPv6 transport. This is the first phase towards providing dual stack support on the IPsec stack. This implementation does not support using a single IPsec security association (SA) pair for both IPv4 and IPv6 traffic. This feature is only supported for Remote Access VPN with IKEv2 and Dynamic VTI.</td>

<tbody>
<tr>
<td>Multi-SA for Dynamic VTIs</td>
<td></td>
<td>The DVTI can accept multiple IPsec selectors that are proposed by the initiator. The following commands were introduced or modified: <code>set security-policy limit</code>, <code>set reverse-route</code>.</td>
</tr>
<tr>
<td>Static IPsec VTIs</td>
<td></td>
<td>IPsec VTIs provide a routable interface type for terminating IPsec tunnels and an easy way to define protection between sites to form an overlay network. IPsec VTIs simplify configuration of IPsec for protection of remote links, support multicast, and simplify network management and load balancing.</td>
</tr>
<tr>
<td>Tunnel Mode Auto Selection</td>
<td></td>
<td>The Tunnel Mode Auto Selection feature eases the configuration and spares you about knowing the responder’s details. This feature automatically applies the tunneling protocol (GRE or IPsec) and transport protocol (IPv4 or IPv6) on the virtual template as soon as the IKE profile creates the virtual access interface. The following command was introduced or modified: <code>virtual-template</code></td>
</tr>
<tr>
<td>FlexVPN Mixed Mode v6 over v4 Transport</td>
<td></td>
<td>The FlexVPN Mixed Mode v6 over v4 Transport feature provides support for carrying IPv6 traffic over IPsec IPv4 transport. This implementation does not support using a single IPsec security association (SA) pair for both IPv4 and IPv6 traffic.</td>
