

## Encrypted Traffic Analytics

Encrypted Traffic Analytics (ET-Analytics) is used to identify malware communications in encrypted traffic. ET-Analytics uses passive monitoring, extraction of relevant data elements, and supervised machine learning with cloud-based global visibility. ET-Analytics exports the relevant data elements in the form of NetFlow record fields to detect whether the packet flow has malware, and these NetFlow record fields include IDP (initial data packet) and SPLT (Sequence of Packet Length and Time).

- [Information About Encrypted Traffic Analytics, on page 2](#)
- [How to Configure Encrypted Traffic Analytics, on page 3](#)
- [Verifying the ET-Analytics Configuration, on page 4](#)

## Feature Information for Encrypted Traffic Analytics

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 1: Feature Information for Encrypted Traffic Analytics (ET-Analytics)**

Feature Name	Releases	Feature Information
Encrypted Traffic Analytics	Cisco IOS XE Fuji 16.7.1 Cisco IOS XE Everest 16.6.2	Encrypted Traffic Analytics (ET-Analytics) is used to identify malware communications in encrypted traffic. ET-Analytics uses passive monitoring, extraction of relevant data elements, and supervised machine learning with cloud-based global visibility. ET-Analytics exports the relevant data elements in the form of NetFlow record fields to detect whether the packet flow has malware, and these NetFlow record fields include IDP (initial data packet) and SPLT (Sequence of Packet Length and Time).

Feature Name	Releases	Feature Information
Encrypted Traffic Analytics	Cisco IOS XE Fuji 16.8.1	Support for VRF keyword in flow destinations was added.
Show commands for Encrypted Traffic Analytics	Cisco IOS XE Gibraltar 16.11.1	Simplified <b>show</b> commands to display ETA configurations, flow statistics, and export statistics for quick troubleshooting.
IPFIX support for Encrypted Traffic Analytics	Cisco IOS XE Gibraltar 16.11.1	IP Flow Information Export (IPFIX) protocol is another way for transmitting traffic flow information over the network. Support for <b>ipfix</b> keyword in flow destinations was added.
Source interface support for ETA Netflow records	Cisco IOS XE Gibraltar 16.11.1	Support for <b>source-interface</b> <i>interface-name</i> for ETA Netflow records was added.

## Restrictions for Encrypted Traffic Analytics

ET-Analytics is not supported on management interfaces, VRF-Aware Software Infrastructure (VASI) interface, and internal interfaces.

## Information About Encrypted Traffic Analytics

### Data Elements for Encrypted Traffic

ET-Analytics uses intraflow metadata to identify malware components, maintaining the integrity of the encrypted traffic without the need for bulk decryption and without compromising on data integrity.

ET-Analytics extracts the following main data elements from the network flow: the sequence of packet lengths and times (SPLT), TLS-specific features, and the initial data packet (IDP). Cisco's Application-Specific Integrated Circuit (ASIC) architecture provides the ability to extract these data elements without slowing down the data network. Separate templates can be defined for each of the data elements.

Transport Layer Security (TLS) is a cryptographic protocol that provides privacy for applications. TLS is usually implemented with common protocols such as HTTP for web browsing or Simple Mail Transfer Protocol (SMTP) for email. HTTPS is the use of TLS over HTTP; this protocol is used to secure communication between a web server and client and is supported by most major web servers.

The TLS template is used to report several of the TLS parameters in use for a flow. These parameters help in finding the use of insecure cipher suites, out-of-date protocol version, and so on.

- Sequence of Packet Lengths and Times (SPLT) - SPLT contains the length (number of bytes) of each packet's application payload for the first several packets of a flow, along with the inter-arrival times of those packets. SPLT can be represented as an array of packet sizes (in bytes) along with an array of times (in milliseconds) indicating the time since the previous packet was observed. The SPLT template is used to report packet size and timing information for a flow, which is useful to analyze encrypted traffic and find malicious flows or perform other classifications.

- Initial Data Packet (IDP) - IDP obtains packet data from the first packet of a flow. It allows extraction of data such as an HTTP URL, DNS hostname/address, and other data elements. The TLS handshake is composed of several messages that contain unencrypted metadata used to extract data elements such as cipher suites, TLS versions, and the client's public key length. The IDP template is used to report packet data from the first data packet of a flow. This template allows collectors to perform application classification of a flow (for example, using Snort).

# How to Configure Encrypted Traffic Analytics

## Enabling ET-Analytics on an Interface

### Procedure

	Command or Action	Purpose
Step 1	<code>enable</code>	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	<code>configure terminal</code>	Enters global configuration mode.
Step 3	<code>et-analytics</code>	Enters encrypted traffic analytics configuration mode.
Step 4	<code>ip flow-export destination ip-address port [vrf vrf-name] [source-interface interface-name] [ipfix]</code>	Configures the destination IP address optional VRF name. The ETA records are exported to this destination.  <b>Note</b> Use the <b>ipfix</b> option to export the data in IPFIX format. IP Flow Information Export (IPFIX) protocol is a way for transmitting traffic flow information over the network.
Step 5	<code>exit</code>	Returns to global configuration mode.
Step 6	<code>interface interface-id</code>	Specifies the interface and port number and enters interface configuration mode.
Step 7	<code>et-analytics enable</code>	Enables encrypted traffic analytics on this interface.
Step 8	<code>end</code>	Returns to privileged EXEC mode.

### Example

```
Device> enable
Device# configure terminal
Device(config)# et-analytics
Device(config-et-analytics)# ip flow-export destination 192.0.2.1 2055 vrf green
Device(config-et-analytics)# exit
Device(config)# interface gigabitethernet 0/0/1
```

```
Device(config-if)# et-analytics enable
Device(config-if)# end
```

## Applying an ACL for Whitelisting

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>	Enables privileged EXEC mode. • Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>et-analytics</b>	Enters encrypted traffic analytics configuration mode.
<b>Step 4</b>	<b>whitelist acl</b> <i>access-list</i>	Whitelists the specified access list traffic. The access list can be a standard, extended, or named ACL.
<b>Step 5</b>	<b>exit</b>	Returns to global configuration mode.
<b>Step 6</b>	<b>ip access-list extended</b> <i>access-list</i>	Specifies a named extended access list and enters extended access list configuration mode.
<b>Step 7</b>	<b>permit ip</b> { <i>ip-address</i>   <b>any</b>   <b>host</b>   <b>object-group</b> }	Specifies the packets to forward to a source host or source IP address.
<b>Step 8</b>	<b>end</b>	Returns to privileged EXEC mode.

### Example

```
Device> enable
Device# configure terminal
Device(config)# et-analytics
Device(config-et-analytics)# whitelist acl eta_whitelist
Device(config-et-analytics)# exit
Device(config)# ip access-list extended eta_whitelist
Device(config-ext-nacl)# permit ip host 198.51.100.1 any
Device(config-ext-nacl)# permit ip any host 198.51.100.1
Device(config-ext-nacl)# permit ip host 198.51.200.1 any
Device(config-ext-nacl)# permit ip any host 198.51.200.1
Device(config-ext-nacl)# end
```

## Verifying the ET-Analytics Configuration

The following **show** commands are used to display ETA configurations, flow statistics, and export statistics to allow quick troubleshooting. Given below are the sample outputs of the **show** commands.

**Note** These commands are applicable for Cisco IOS XE Gibraltar 16.11.1 and later.

**Device# show et-analytics configuration**

```
ET-Analytics Global state
