

# Flexible Packet Matching

Flexible Packet Matching (FPM) is an access control list (ACL) pattern matching tool, providing more thorough and customized packet filters. FPM enables users to match on arbitrary bits of a packet at an arbitrary depth in the packet header and payload. FPM removes constraints to specific fields that had limited packet inspection.

FPM enables users to create their own stateless packet classification criteria and to define policies with multiple actions (such as drop, log, or send Internet Control Message Protocol [ICMP] unreachable<sup>1</sup>) to immediately block new viruses, worms, and attacks.

# **Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="https://www.cisco.com/go/cfn">www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

# **Prerequisites for Flexible Packet Matching**

Although access to an XML editor is not required, XML will ease the creation of protocol header description files (PHDFs).

<sup>&</sup>lt;sup>1</sup> Send ICMP unreachable is currently not supported on the Supervisor Engine 32 PISA.

# **Restrictions for Flexible Packet Matching**

- FPM can search for patterns up to 32 bytes in length within the first 256 bytes of the packet.
- A maximum of 32 classes are supported in a policy-map.
- For IP option packets, FPM inspects only the fields in the Layer 2 header and the first 20 bytes of the IP header
- For noninitial IP fragments, FPM inspects only the fields in the Layer 2 header and the first 20 bytes of the IP header.
- FPM cannot be used to mitigate an attack that requires stateful classification.
- Because FPM is stateless, it cannot keep track of port numbers being used by protocols that dynamically negotiate ports. Thus, when using FPM, port numbers must be explicitly specified.
- FPM cannot perform IP fragmentation or TCP flow reassembly.
- FPM inspects only IPv4 unicast packets.
- FPM cannot classify packets with IP options.
- FPM does not support multicast packet inspection.
- FPM is not supported on tunnel and MPLS interfaces.
- Noninitial fragments will not be matched by the FPM engine.
- Offset can be only a constant in a match start construct.
- FPM cannot match across packets.
- Mapping of FPM policies to control-plane is not supported.

## **Information About Flexible Packet Matching**

### Flexible Packet Matching Functional Overview

FPM allows customers to create their own filtering policies that can immediately detect and block new viruses and attacks.

A filtering policy is defined via the following tasks:

- Load a PHDF (for protocol header field matching)
- Define a class map and define the protocol stack chain (traffic class)
- Define a service policy (traffic policy)
- Apply the service policy to an interface

### **Protocol Header Description File**

Protocol headers are defined in separate files called PHDFs; the field names that are defined within the PHDFs are used for defining the packet filters. A PHDF is a file that allows the user to leverage the flexibility of XML to describe almost any protocol header. The important components of the PHDF are the version, the XML file schema location, and the protocol field definitions. The protocol field definitions name the appropriate field in the protocol header, allow for a comment describing the field, provide the location of the protocol header field in the header (the offset is relative to the start of the protocol header), and provide the length of the field. Users can choose to specify the measurement in bytes or in bits.

Note

The total length of the header must be specified at the end of each PHDF.

Note

When redundant sup PHDF files are used by FPM policy, the files should also be on standby sup's corresponding disk. If the files are not available FPM policy will not work after the switch over.

Users can write their own custom PHDFs via XML for existing or proprietary protocols. However, the following standard PHDFs can also be loaded onto the router via the **load protocol** command: ip.phdf, ether.phdf, tcp.phdf, and udp.phdf.

Note

Because PHDFs are defined via XML, they are not shown in a running configuration. However, you can use the **show protocol phdf** command to verify the loaded PHDF.

Standard PHDFs are available on Cisco.com at the following URL: http://www.cisco.com/cgi-bin/tablebuild.pl/fpm

### **Filter Description**

A filter description is a definition of a traffic class that can contain the header fields defined in a PHDF (using the **match field** command). If a PHDF is not loaded, the traffic class can be defined through the datagram header start (Layer 2) or the network header start (Layer 3) (using the **match start** command). If a PHDF has been loaded onto the router, the class specification begins with a list of the protocol headers in the packet.

A filter definition also includes the policy map; that is, after a class map has been defined, a policy map is needed to bind the match to an action. A policy map is an ordered set of classes and associated actions, such as drop, log, or send ICMP unreachable.

For information on how to configure a class map and a policy map for FPM, see the How to Configure a Flexible Packet Matching Traffic Class and Traffic Policy section.

# **How to Configure Flexible Packet Matching**

## **Creating a Traffic Class for Flexible Packet Matching**

Note

If the PHDF protocol fields are referenced in the access-control classmap, the stack classmap is required in order to make FPM work properly

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. load protocol location: filename
- 4. class-map [type {stack | access-control}] class-map-name [match-all | match-any]
- **5. description** *character-string*
- **6.** match field protocol protocol-field {eq [mask] | neq | [mask] | gt | lt | range range | regex string} value [next next-protocol]
- 7. match start {12-start | 13-start} offset number size number {eq | neq | gt | lt | range range | regex string} {value [value2] | [string]}
- 8. match class class-name [packet-range low high | byte-range low high] session
- 9. exit
- 10. exit
- 11. show class-map [type {stack | access-control} | class-map-name]

#### **DETAILED STEPS**

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Router> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Router# configure terminal		
Step 3	load protocol location:filename	(Optional) Loads a PHDF onto a router.	
	Example:	• The specified location must be local to the router.	
	Router(config)# load protocol disk2:udp.phdf	Note If a PHDF is not loaded, only the match start command can be used; that is, you cannot issue the match field command.	

	Command or Action	Purpose	
		Note For the ASR platform, PHDF files should be manually copied (through the load protocol command) to the active and standby route processor (RP) file systems.	
Step 4	class-map [type {stack   access-control}] class-map-name [match-all   match-any]	Creates a class map to be used for matching packets to a specified class and enters class-map configuration mode.	
	Example:	• type stack Enables FPM to determine the correct protocol stack in which to examine.	
	Router(config)# class-map type access-control c1	• type access-control Determines the exact pattern to look for in the protocol stack of interest.	
		• <i>class-map-name</i> Can be a maximum of 40 alphanumeric characters.	
		<ul> <li>If match-all or match-anyor are not specified, traffic must match all the match criterion to be classified as part of the traffic class.</li> </ul>	
Step 5	description character-string	(Optional) Adds a description to the class map.	
	Example:		
	Router(config-cmap) # description "match on slammer packets"		
Step 6	match field protocol protocol-field {eq [mask]   neq   [mask]   gt   lt   range range   regex string} value [next next-protocol]	(Optional) Configures the match criteria for a class map on the basis of the fields defined in the PHDFs.	
	Example:	<ul> <li>The next next-protocol keyword-argument pair is available only after configuring the class-map type stack command.</li> </ul>	
	Router(config-cmap) # match field udp dest-port econx59A		
Step 7	match start {12-start   13-start} offset number size number {eq   neq   gt   lt   range range   regex string} {value [value2]   [string]}	(Optional) Configures the match criteria for a class map on the basis of the datagram header (Layer 2) or the network header (Layer 3).	
	Example:		
	Router(config-cmap)# match start 13-start offset 224 size 4 eq 0x4011010		
Step 8	match class class-name [packet-range low high   byte-range low high] session	(Optional) Configures match criteria for a class map that identifies a session (flow) containing packets of interest,	
	Example:	which is then applied to all packets transmitted during t session.	
	Router(config-cmap)# match class c2 packet-range 1 5 session	The <b>packet-range</b> and <b>byte-range</b> keywords create a filter mechanism that increases the performance and matching accuracy of regex-based FPM class maps by classifying	

	Command or Action	Purpose	
		traffic that resides in the narrow packet number or packet byte ranges of each packet flow.	
		When the <b>session</b> keyword is used with the <i>class-name</i> argument, the classification results are preserved for the subsequent packets of the same packet session.	
		When the <b>session</b> keyword is used with the <b>packet-range</b> or <b>byte-range</b> keywords, the classification results are preserved for the specified packets or bytes of the same packet session.	
Step 9	exit	Exits class-map configuration mode.	
	Example:		
	Router(config-cmap)# exit		
Step 10	exit	Exits global configuration mode.	
	Example:		
	Router(config)# exit		
Step 11	show class-map [type {stack   access-control}   class-map-name]	(Optional) Displays configured FPM class maps.	
	Example:		
	Router# show class-map type access-control slammer		

### **Troubleshooting Tips**

To track all FPM events, issue the **debug fpm event** command.

The following sample output is from the **debug fpm event**command:

\*Jun 21 09:22:21.607: policy-classification-inline(): matches class: class-default \*Jun 21 09:22:21.607: packet-access-control(): policy-map: fpm-policy, dir: input, match. retval: 0x0, ip-flags: 0x80000000

### What to Do Next

After you have defined at least one class map for your network, you must create a traffic policy and apply that policy to an interface as shown in the following task "Creating a Traffic Policy for Flexible Packet Matching."

## **Creating a Traffic Policy for Flexible Packet Matching**

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal

- **3. policy-map type access-control** *policy-map-name*
- 4. description character-string
- 5. class class-name insert-before class-name
- 6. drop [all]
- **7**. log [all]
- **8**. **service-policy** *policy-map-name*
- 9. exit
- **10**. **interface** *type number*
- 11. service-policy type access-control {input | output} policy-map-name
- **12**. exit
- **13**. exit
- **14.** show policy-map [type access-control | interface type number | input | output]

### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	policy-map type access-control policy-map-name	Creates or modifies a policy map that can be attached to
	Example:	one or more interfaces to specify a service policy, and enters policy-map configuration mode.
	<pre>Router(config) # policy-map type access-control fpm-udp-policy</pre>	
Step 4	description character-string	(Optional) Adds a description to the policy map.
	Example:	
	Router(config-pmap)# description "policy for UDP based attacks"	
Step 5	class class-name insert-before class-name	Specifies the name of a predefined traffic class, which was
	Example:	configured with the <b>class-map</b> command. The <b>class</b> command also classifies traffic to the traffic policy and
	Router(config-pmap)# class slammer	enters policy-map class configuration mode.
		• The <b>insert-before</b> <i>class-name</i> keyword and argument adds a class map to any location within the policy map. If this option is not issued, the class map is appended to the end of the policy map.

	Command or Action	Purpose	
Step 6	drop [all] Example:	(Optional) Configures a traffic class to discard packets belonging to a specific class.	
	Router(config-pmap-c)# drop all	The <b>all</b> keyword is used to discard the entire stream of packets belonging to the traffic class.	
		If this command is issued, note the following restrictions:	
		<ul> <li>Discarding packets is the only action that can be configured in a traffic class.</li> </ul>	
		• When a traffic class is configured with the <b>drop</b> command, a "child" (nested) policy cannot be configured for this specific traffic class through the <b>service policy</b> command.	
		<ul> <li>Discarding packets cannot be configured for the default class specified via the class class-default command.</li> </ul>	
		• If the <b>drop all</b> command is specified, then this command can only be associated with a <b>class map type access-control</b> command.	
Step 7	log [all]	(Optional) Generates log messages for the traffic class.	
	<pre>Example: Router(config-pmap-c)# log all</pre>	The <b>all</b> keyword is used to log the entire stream of discarded packets belonging to the traffic class. This keyword is only available for a class map that is created with the <b>class-map type access-control</b> command.	
Step 8	service-policy policy-map-name	Creates hierarchical service policies.	
	Example:		
	Router(config-pmap-c)# service policy fpm-udp-policy		
Step 9	exit	Exits policy-map class configuration mode and policy-map	
	Example:	configuration mode.	
	Router(config-pmap-c)# exit		
	Example:		
	Router(config-pmap)# exit		
Step 10	interface type number	Configures an interface type and enters interface	
	Example:	configuration mode.	
	Router(config)# interface gigabitEthernet 0/1		

	Command or Action	Purpose	
Step 11	service-policy type access-control {input   output} policy-map-name	Specifies the type and the name of the traffic policy to b attached to the input or output direction of an interface.	
	Example:		
	Router(config-if)# service-policy type access-control input fpm-policy		
Step 12	exit	Exits interface configuration mode.	
	Example:		
	Router(config-if)# exit		
Step 13	exit	Exits global configuration mode.	
	Example:		
	Router(config)# exit		
Step 14	show policy-map [type access-control   interface type	(Optional) Verifies the FPM configuration.	
	number   input   output]	<b>Note</b> Once a traffic policy is created for FPM, a	
	Example:	matched packet can be copied or redirected to a different destination interface.	
	Router# show policy-map type access-control interface gigabitethernet 0/1		

# **Configuration Examples for an FPM Configuration**

## Configuring and Verifying FPM on ASR Platform: Example

The following example shows how to configure FPM on the ASR platform.

```
load protocol bootflash:ip.phdf
load protocol bootflash:tcp.phdf
class-map type stack match-all ip_tcp
match field IP protocol eq 6 next TCP
class-map type access-control match-all test_class
match field TCP dest-port gt 10
match start 13-start offset 40 size 32 regex "ABCD"
policy-map type access-control child
class test_class
drop
policy-map type access-control parent
class ip_tcp
service-policy child
interface GigabitEthernet0/3/0
ip address 10.1.1.1 255.0.0.0
service-policy type access-control input parent
```

In the following sample output, all TCP packets are seen under the class-map "ip\_tcp" and all packets matching the specific pattern are seen under the class-map "test\_class." TCP packets without the specific pattern are

seen under the child policy "class-default," while all non-TCP packets are seen under the parent policy "class-default." (The counter is 0 in this example.)

```
Router# show policy-map type access-control interface GigabitEthernet0/3/0
GigabitEthernet0/3/0
Service-policy access-control input: parent
 Class-map: ip tcp (match-all)
 2024995578 packets, 170099628552 bytes
  5 minute offered rate 775915000 bps
 Match: field IP version eq 4
 Match: field IP ihl eq 5
 Match: field IP protocol eq 6 next TCP
 Service-policy access-control : child
 Class-map: test class (match-all)
 1598134279 packets, 134243279436 bytes
 5 minute offered rate 771012000 bps, drop rate 771012000 bps
 Match: field TCP dest-port gt 10
 Match: start 13-start offset 40 size 32 regex "ABCD"
Class-map: class-default (match-any)
 426861294 packets, 35856348696 bytes
  5 minute offered rate 4846000 bps, drop rate 0 bps
 Match: any
 Class-map: class-default (match-any)
 0 packets, 0 bytes
  5 minute offered rate 0 bps, drop rate 0 bps
 Match: any
Router#
```

# **Feature Information for Flexible Packet Matching**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Flexible Packet Matching

Feature Name	Releases	Feature Information
Flexible Packet Matching	Cisco IOS XE Release 2.2	FPM is a packet classification feature that allows users to define one or more classes of network traffic by pairing a set of standard matching operators with user-defined protocol header fields.  The following commands were introduced or modified: class (policy-map) class-map debug fpm event, description (class-map) load protocol match field match start, policy-map, service-policy, show class-map, show policy-map interface, show protocol phdf.

Feature Information for Flexible Packet Matching
