

Snort IPS

The Snort IPS feature enables Intrusion Prevention System (IPS) or Intrusion Detection System (IDS) for branch offices on Cisco 4000 Series Integrated Services Routers and Cisco Cloud Services Router 1000v Series. This feature uses the open source Snort solution to enable IPS and IDS. The Snort IPS feature is available in Cisco IOS XE Release 3.16.1S, 3.17S, and later releases.

The Virtual Routing and Forwarding (VRF) feature is supported on Snort IPS configuration from Cisco IOS XE Denali Release 16.3.1 and later releases.

This module explains the feature and how it works.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Snort IPS

The following restrictions apply to the Snort IPS feature:

- Incompatible with the Zone-Based Firewall SYN-cookie feature.
- Network Address Translation 64 (NAT64) is not supported.
- IOS syslog is rate limited and as a result, all alerts generated by Snort may not be visible via the IOS Syslog. However, you can view all Syslog messages if you export them to an external log server.

Information About Snort IPS

Snort IPS Overview

The Snort IPS feature enables Intrusion Prevention System (IPS) or Intrusion Detection System (IDS) for branch offices on Cisco 4000 Series Integrated Services Routers and Cisco Cloud Services Router 1000v Series. This feature uses the Snort engine to provide IPS and IDS functionalities.

Snort is an open source network IPS that performs real-time traffic analysis and generates alerts when threats are detected on IP networks. It can also perform protocol analysis, content searching or matching, and detect a variety of attacks and probes, such as buffer overflows, stealth port scans, and so on. The Snort engine runs as a virtual container service on Cisco 4000 Series Integrated Services Routers and Cisco Cloud Services Router 1000v Series.

The Snort IPS feature works in the network intrusion detection and prevention mode that provides IPS or IDS functionalities. In the network intrusion detection and prevention mode, Snort performs the following actions:

- Monitors network traffic and analyzes against a defined rule set.
- Performs attack classification.
- · Invokes actions against matched rules.

Based on your requirements, you can enable Snort either in IPS or IDS mode. In IDS mode, Snort inspects the traffic and reports alerts, but does not take any action to prevent attacks. In IPS mode, in addition to intrusion detection, actions are taken to prevent attacks.

The Snort IPS monitors the traffic and reports events to an external log server or the IOS syslog. Enabling logging to the IOS syslog may impact performance due to the potential volume of log messages. External third-party monitoring tools, which supports Snort logs, can be used for log collection and analysis.

Snort IPS Signature Package

The UTD OVA is included in the security license of the router. By default, the router is loaded only with community signature package. There are two types of subscriptions:

- Community Signature Package
- · Subscriber-based Signature Package

The community signature package rule set offers limited coverage against threats. The subscriber-based signature package rule set offers the best protection against threats. It includes coverage in advance of exploits, and also provides the fastest access to the updated signatures in response to a security incident or the proactive discovery of a new threat. This subscription is fully supported by Cisco and the package will be updated on Cisco.com. You can download the subscriber-based signature package from the Download Software page.

If the user downloads the signature package manually from the download software page, then the user should ensure that the package has the same version as the Snort engine version. For example, if the Snort engine version is 2982, then the user should download the same version of the signature package. If there is a version mismatch, the signature package update will be rejected and it will fail.

When the signature package is updated, the engine will be restarted and the traffic will be interrupted or bypass inspection for a short period depending on their data plane fail-open/fail-close configuration.

Snort IPS Solution

The Snort IPS solution consists of the following entities:

- Snort sensor—Monitors the traffic to detect anomalies based on the configured security policies (that includes signatures, statistics, protocol analysis, and so on) and sends alert messages to the Alert/Reporting server. The Snort sensor is deployed as a virtual container service on the router.
- Signature store—Hosts the Cisco Signature packages that are updated periodically. These signature
 packages are downloaded to Snort sensors either periodically or on demand. Validated signature packages
 are posted to Cisco.com. Based on the configuration, signature packages can be downloaded from
 Cisco.com or a local server.

Note

If you are downloading signature packages from a local server to hold the signature packages, only HTTP is supported.

Signature packages must be manually downloaded from Cisco.com to the local server by using Cisco.com credentials before the Snort sensor can retrieve them.

The Snort container performs a domain-name lookup (on the DNS server(s) configured on the router) to resolve the location for automatic signature updates from Cisco.com or on the local server, if the URL is not specified as the IP address.

- Alert/Reporting server—Receives alert events from the Snort sensor. Alert events generated by the Snort sensor can either be sent to the IOS syslog or an external syslog server or to both IOS syslog and external syslog server. No external log servers are bundled with the Snort IPS solution.
- Management—Manages the Snort IPS solution. Management is configured using the IOS CLI. Snort Sensor cannot be accessed directly, and all configuration can only be done using the IOS CLI.

Overview of Snort Virtual Service Interfaces

The Snort sensor runs as a service on routers. Service containers use virtualization technology to provide a hosting environment on Cisco devices for applications.

You can enable Snort traffic inspection either on a per interface basis or globally on all supported interfaces. The traffic to be inspected is diverted to the Snort sensor and injected back. In Intrusion Detection System (IDS), identified threats are reported as log events and allowed. However, in Intrusion Prevention System (IPS), action is taken to prevent attacks along with log events.

The Snort sensor requires two VirtualPortGroup interfaces. The first VirtualPortGroup interface is used for management traffic and the second for data traffic between the forwarding plane and the Snort virtual container service. Guest IP addresses must be configured for these VirtualPortGroup interfaces. The IP subnet assigned to the management VirtualPortGroup interface should be able to communicate with the Signature server and Alert/Reporting server.

The IP subnet of the second VirtualPortGroup interface must not be routable on the customer network because the traffic on this interface is internal to the router. Exposing the internal subnet to the outside world is a security risk. We recommend the use of 192.0.2.0/30 IP address range for the second VirtualPortGroup subnet. The use of 192.0.2.0/24 subnet is defined in RFC 3330.

You can also use the management interface under the **virtual-service** command for management traffic. If you configure the management interface, you still need two VirtualPortGroup interfaces. However, do not configure the **guest ip address** for the first VirtualPortGroup interface.

You can assign the Snort virtual container service IP address on the same management network as the router on which the virtual service is running. This configuration helps if the syslog or update server is on the management network and is not accessible by any other interfaces.

Virtual Service Resource Profile

The Snort IPS virtual service supports three resource profiles: Low, Medium, and High. These profiles indicate the CPU and memory resources required to run the virtual service. You can configure one of these resource profiles. The resource profile configuration is optional. If you do not configure a profile, the virtual service is activated with its default resource profile. This table provides the resource profiles details for Cisco 4000 Series ISR and Cisco Cloud Services Router 1000v Series.

Platform	Profile	Virtual Service Resource Requirements		Platform
		System CPU	Memory	Requirements
Cisco 4321 ISR	Default	50%	Min: 1GB (RAM)	Min: 8GB (RAM)
			Min: 750MB (Disk/Flash)	Min: 8GB(Disk/Flash)

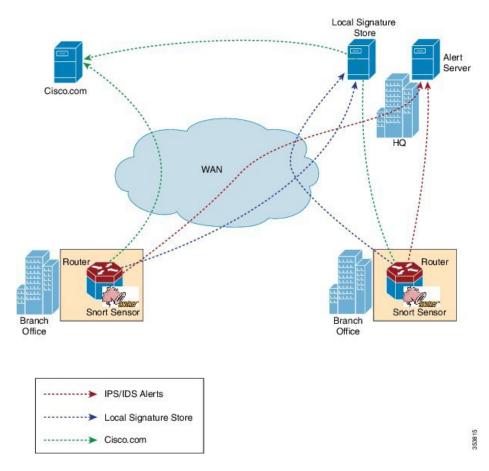

Platform	Profile	Virtual Service I	Resource Requirements	Platform
		System CPU	Memory	Requirements
Cisco 4331 ISR	Low (Default)	25%	Min: 1GB (RAM)	Min: 8GB (RAM)
			Min: 750MB (Disk/Flash)	Min: 8GB(Disk/Flash)
	Medium	50%	Min: 2GB (RAM)	Min: 8GB (RAM)
			Min: 1GB (Disk/Flash)	Min: 8GB(Disk/Flash)
	High	75%	Min: 4GB (RAM)	Min: 8GB (RAM)
			Min: 2GB (Disk/Flash)	Min: 8GB(Disk/Flash)
Cisco 4351 ISR	Low (Default)	25%	Min: 1GB (RAM)	Min: 8GB (RAM)
			Min: 750MB (Disk/Flash)	Min: 8GB(Disk/Flash)
	Medium	50%	Min: 2GB (RAM)	Min: 8GB (RAM)
			Min: 1GB (Disk/Flash)	Min: 8GB(Disk/Flash)
	High	75%	Min: 4GB (RAM)	Min: 8GB (RAM)
			Min: 2GB (Disk/Flash)	Min: 8GB(Disk/Flash)
Cisco 4431 ISR	Low (Default)	25%	Min: 1GB (RAM)	Min: 8GB (RAM)
			Min: 750MB (Disk/Flash)	Min: 8GB(Disk/Flash)
	Medium	50%	Min: 2GB (RAM)	Min: 8GB (RAM)
			Min: 1GB (Disk/Flash)	Min: 8GB(Disk/Flash)
	High	75%	Min: 4GB (RAM)	Min: 12GB (RAM)
			Min: 2GB (Disk/Flash)	Min: 12GB(Disk/Flash)

Platform	Profile	Virtual Service Resource Requirements		Platform
		System CPU	Memory	Requirements
Cisco 4451 ISR	Low (Default)	25%	Min: 1GB (RAM)	Min: 8GB (RAM)
			Min: 750MB (Disk/Flash)	Min: 8GB(Disk/Flash)
	Medium	50%	Min: 2GB (RAM)	Min: 8GB (RAM)
			Min: 1GB (Disk/Flash)	Min: 8GB(Disk/Flash)
	High	75%	Min: 4GB (RAM)	Min: 12GB (RAM)
			Min: 2GB (Disk/Flash)	Min: 12GB(Disk/Flash)
Cisco CSR 1000V	Low (Default)	25%	Min: 1GB (RAM)	Min: 8GB (RAM)
			Min: 750MB (Disk/Flash)	Min: 8GB(Disk/Flash)
	Medium	50%	Min: 2GB (RAM)	Min: 8GB (RAM)
			Min: 1GB (Disk/Flash)	Min: 8GB(Disk/Flash)
	High	75%	Min: 3GB (RAM)	Min: 12GB (RAM)
			Min: 2GB (Disk/Flash)	Min: 12GB(Disk/Flash)

Deploying Snort IPS

The figure illustrates a Snort IPS deployment scenario:

Figure 1: Snort IPS Deployment Scenario

The following steps describes the deployment of the Snort IPS solution:

- The Snort OVA file is copied to Cisco routers, installed, and then activated.
- Signature packages are downloaded either from Cisco.com or a configured local server to Cisco routers.
- Network intrusion detection or prevention functionality is configured.
- The Alert/Reporting server is configured to receive alerts from the Snort sensor.

Threat Inspection Alerts Visibility

From the Cisco IOS XE Fuji 16.8 release, you can get summarized details for the following threat-inspection alerts:

• The top 10 threat-inspection alerts (IDS/IPS) and counts are summarized for last 24 hours.

• For each signature-ID top 10 SIP, DIP, and VRF summary for the last 24 hours.

Note

The last 24 hours period accounts for exact prior 24 hour duration from the time you request alert summary using CLI.

The visibility feature is available only on single tenancy and not on multi-tenancy.

Use **show utd engine standard logging threat-inspection statistics** *detail* command to view the alert summary.

Enabling and Disabling Logging of the Threat Inspection Alerts

To enable logging of the threat inspection alert statistics, perform the following steps:

```
config#utd eng standard
config-utd-eng-std#threat-inspection
config-utd-engstd-insp#logging statistics enable
config-utd-engstd-insp#exit
```

To disable logging of the threat inspection alert statistics, perform the following steps:

```
config#utd eng standard
config-utd-eng-std#threat-inspection
config-utd-engstd-insp#no logging statistics enable
config-utd-engstd-insp#exit
```

How to Deploy Snort IPS

To deploy Snort IPS on supported devices, perform the following tasks:

- Provision the device.
 Identify the device to install the Snort IPS feature.
- 2 Obtain the license.

The Snort IPS functionality is available only in Security Packages which require a security license to enable the service. This feature is available in Cisco IOS XE Release 3.16.1S, 3.17S, and later releases.

Note

Contact Cisco Support to obtain the license.

- 3 Install the Snort OVA file.
- 4 Configure VirtualPortGroup interfaces and virtual-service.
- 5 Activate the Snort virtual container service.
- **6** Configure Snort IPS or IDS mode and policy.
- 7 Configure the reporting of events to an external alert/log server or IOS syslog or both.
- 8 Configure the Signature update method.
- **9** Update the Signatures.
- 10 Enable IPS globally or on desired interfaces.

Installing the Snort OVA File

An OVA file is an Open Virtualization Archive that contains a compressed, installable version of a virtual machine. The Snort IPS is available as a virtual container service. You must download this OVA file on to the router and use the **virtual-service install** CLI to install the service.

The service OVA file is not bundled with the Cisco IOS XE Release images that are installed on the router. However, the OVA files may be preinstalled in the flash of the router.

You must use a Cisco IOS XE image with security license. During the OVA file installation, the security license is checked and an error is reported if the license is not present.

SUMMARY STEPS

- 1. enable
- 2. virtual-service install name virtual-service-name package file-url media file-system
- 3. show virtual-service list

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Device> enable	Enter your password if prompted.
Step 2	virtual-service install name virtual-service-name package file-url media file-system Example: Device# virtual-service install name UTDIPS package harddisk:utd-ips-v102.ova media harddisk:	 Installs an application on the virtual services container of a device. The length of the name is 20 characters. Hyphen (-) is not a valid character. You must specify the complete path of the OVA package to be installed. Note OVA installation works on both hard disk and bootflash, the preferred filesystem to install the OVA will be hard disk.
Step 3	show virtual-service list	Displays the status of the installation of all applications installed on the virtual service container.
	Example: Device# show virtual-service list	

Configuring VirtualPortGroup Interfaces and Virtual Service

You must configure two VirtualPortGroup interfaces and configure guest IP addresses for both interfaces. However, if you configure a management interface by using the **vnic management GigabitEthernet0** command, then do not configure the guest IP address for the first VirtualPortGroup interface.

Note

The VirtualPortGroup interface for data traffic must use a private or nonroutable IP address. We recommend the use of 192.0.2.0/30 IP address range for this interface.

Note

Before you change the Cisco IOS software image from any of the XE 3.x versions to XE 16.2.1, or from XE 16.2.1 to any of the XE 3.x versions, uninstall the virtual-service by using the **virtual-service uninstall name [name]** command for each virtual-service on the device. If one of the virtual-service is the ISR-WAAS service, which is installed with the **service waas enable** command, use the **service waas disable** command.

After the device is upgraded with the new version of Cisco IOS software image, re-install the virtual-services. For ISR-WAAS, use the **service wass enable** command, and for other virtual-services, use the **virtual-service install name [name] package [.ova file]** command.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. interface** *VirtualPortGroup number*
- 4. ip address ip-address mask
- 5. exit
- **6. interface** *type number*
- 7. ip address ip-address mask
- 8. exit
- 9. virtual-service name
- **10. profile** *profile-name*
- 11. vnic gateway VirtualPortGroup interface-number
- 12. guest ip address ip-address
- 13. exi
- 14. vnic gateway VirtualPortGroup interface-number
- 15. guest ip address ip-address
- **16.** exit
- 17. vnic management GigabitEthernet0
- 18. guest ip address ip-address
- 19. exit
- 20. activate
- 21. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Device> enable	• Enter your password if prompted.
Step 2	configure terminal	Enters global configuration mode.
	Example: Device# configure terminal	
Step 3	interface VirtualPortGroup number	Configures an interface and enters interface configuration mode.
	Example: Device(config) # interface VirtualPortGroup 0	• Configure a VirtualPortGroup interface. This interface is used for management traffic when the management interface GigabitEthernet0 is not used.
Step 4	ip address ip-address mask	Sets a primary IP address for an interface. This interface needs to be routable to the signature update server and external log server.
	Example: Device(config-if)# ip address 10.1.1.1 255.255.255.252	
Step 5	exit	Exits interface configuration mode and returns to global configuration mode.
	<pre>Example: Device(config-if)# exit</pre>	
Step 6	interface type number	Configures an interface and enters interface configuration mode.
	Example:	Configure a VirtualPortGroup interface.
	Device(config) # interface VirtualPortGroup 1	This interface is used for data traffic.
Step 7	ip address ip-address mask	Sets a primary IP address for an interface.
	Example:	• This IP address should not be routable to the outside network.
	Device(config-if) # ip address 192.0.2.1 255.255.255.252	• The IP address is assigned from the recommended 192.0.2.0/30 subnet.
Step 8	exit	Exits interface configuration mode and returns to global configuration mode.
	<pre>Example: Device(config-if)# exit</pre>	
Step 9	virtual-service name	Configures a virtual container service and enters virtual service configuration mode.
	<pre>Example: Device(config) # virtual-service UTDIPS</pre>	• The <i>name</i> argument is the logical name that is used to identify the virtual container service.

	Command or Action	Purpose
Step 10	<pre>profile profile-name Example: Device(config-virt-serv) #profile high Example: Device(config-virt-serv) #profile multi-tenancy</pre>	(Optional) Configures a resource profile. If you do not configure the resource profile, the virtual service is activated with its default resource profile. The options are: low, medium, high, and multi-tenancy. (For multi-tenancy mode (Cisco CSR 1000v only), a profile multi-tenancy command must be configured.)
Step 11	<pre>vnic gateway VirtualPortGroup interface-number Example: Device(config-virt-serv) # vnic gateway VirtualPortGroup 0</pre>	Creates a virtual network interface card (vNIC) gateway interface for the virtual container service, maps the vNIC gateway interface to the virtual port group, and enters the virtual-service vNIC configuration mode. • The interface referenced in this command must be the one configured in Step 3. This command maps the interface that is used for management purposes.
Step 12	<pre>guest ip address ip-address Example: Device(config-virt-serv-vnic)# guest ip address 10.1.1.2</pre>	(Optional) Configures a guest vNIC address for the vNIC gateway interface. • Note Configure this command only if the vnic management gigabitethernet0 command specified in Step 17 is not configured.
Step 13	<pre>exit Example: Device(config-virt-serv-vnic)# exit</pre>	Exits virtual-service vNIC configuration mode and returns to virtual service configuration mode.
Step 14	<pre>vnic gateway VirtualPortGroup interface-number Example: Device(config-virt-serv) # vnic gateway VirtualPortGroup 1</pre>	Creates a vNIC gateway interface for the virtual container service, maps the vNIC gateway interface to the virtual port group, and enters the virtual-service vNIC configuration mode. • This interface referenced in this command must be the one configured in Step 6. This command maps the interface in the virtual container service that is used by Snort for monitoring the user traffic.
Step 15	<pre>guest ip address ip-address Example: Device(config-virt-serv-vnic) # guest ip address 192.0.2.2</pre>	Configures a guest vNIC address for the vNIC gateway interface.
Step 16	exit Example: Device(config-virt-serv-vnic)# exit	Exits virtual-service vNIC configuration mode and returns to virtual service configuration mode.

	Command or Action	Purpose
Step 17	vnic management GigabitEthernet0	(Optional) Configures the GigabitEthernet interface as the vNIC management interface.
	Example: Device(config-virt-serv) # vnic management GigabitEthernet0	• The management interface must either be a VirtualPortGroup interface or GibagitEthernet0 interface.
		• If you do not configure the vnic management GigabitEthernet0 command, then you must configure the guest ip address command specified in Step 12.
Step 18	guest ip address ip-address Example:	(Optional) Configures a guest vNIC address for the vNIC management interface and it must be in the same subnet as the management interface and GigabitEthernet0 configuration.
	Device(config-virt-serv-vnic)# guest ip address 209.165.201.1	
Step 19	exit	Exits virtual-service vNIC configuration mode and returns to virtual service configuration mode.
	<pre>Example: Device(config-virt-serv-vnic)# exit</pre>	
Step 20	activate	Activates an application installed in a virtual container service.
	<pre>Example: Device(config-virt-serv)# activate</pre>	
Step 21	end	Exits virtual service configuration mode and returns to privileged EXEC mode.
	Example: Device(config-virt-serv)# end	

Configuring Snort IPS Globally

Based on your requirements, configure the Intrusion Prevention System (IPS) or Intrusion Detection System (IDS) inspection at a global level or at an interface. Perform this task to configure IPS globally on a device.

The term global refers to Snort IPS running on all supported interfaces.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. utd threat-inspection whitelist
- **4. signature id** *signature-id* [**comment** *description*]
- 5. exit
- 6. utd engine standard
- 7. logging {server hostname [syslog] | syslog}
- 8. threat-inspection
- 9. threat {detection | protection }
- 10. policy {balanced | connectivity | security}
- 11. whitelist
- 12. signature update occur-at {daily | monthly day-of-month | weekly day-of-week} hour minute
- **13.** signature update server {cisco | url url } [username username [password password]]
- 14. logging level {alert | crit | debug | emerg | err | info | notice | warning}
- **15.** exit
- 16. utd
- 17. redirect interface virtualPortGroup interface-number
- 18. all-interfaces
- 19. engine standard
- 20. fail close
- **21**. exit
- **22**. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Device> enable	• Enter you password if prompted.
Step 2	configure terminal	Enters global configuration mode.
	Example: Device# configure terminal	
Step 3	utd threat-inspection whitelist	(Optional) Enables the UTD whitelist configuration mode.
	<pre>Example: Device(config)# utd threat-inspection whitelist</pre>	
Step 4	signature id signature-id [comment description]	Configures signature IDs to be whitelisted.

	Command or Action	Purpose
	Example: Device(config-utd-whitelist) # signature id 24245 comment traffic from branchoffice1	 Signature IDs can be copied from alerts that needs to be suppressed. You can configure multiple signature IDs. Repeat this step for each signature ID that needs to be whitelisted.
Step 5	<pre>exit Example: Device(config-utd-whitelist)# exit</pre>	Exits UTD whitelist configuration mode and returns to global configuration mode.
Step 6	<pre>utd engine standard Example: Device(config)# utd engine standard</pre>	Configures the unified threat defense (UTD) standard engine and enters UTD standard engine configuration mode.
Step 7	<pre>logging {server hostname [syslog] syslog} Example: Device(config-utd-eng-std) # logging server syslog.yourcompany.com</pre>	Enables the logging of emergency messages to a server.
Step 8	<pre>threat-inspection Example: Device(config-utd-eng-std) # threat-inspection</pre>	Configures threat inspection for the Snort engine.
Step 9	<pre>threat {detection protection } Example: Device(config-utd-eng-std-insp) # threat protection</pre>	Configures threat detection or Intrusion Prevention System (IPS) as the operating mode for the Snort engine. • The default is detection . • Configure the detection keyword to configure Intrusion Detection System (IDS).
Step 10	<pre>policy {balanced connectivity security} Example: Device (config-utd-eng-std-insp) # policy security</pre>	Configures the security policy for the Snort engine. • The default policy option is balanced .
Step 11	<pre>whitelist Example: Device (config-utd-eng-std-insp) # whitelist</pre>	(Optional) Enables whitelisting under the UTD engine.
Step 12	<pre>signature update occur-at {daily monthly day-of-month weekly day-of-week} hour minute Example: Device (config-utd-eng-std-insp) # signature update occur-at daily 0 0</pre>	Configures the signature update interval parameters. This configuration will trigger the signature update to occur at midnight.

	Command or Action	Purpose
Step 13	<pre>signature update server {cisco url url } [username username [password password]] Example: Device(config-utd-eng-std-insp) # signature update server cisco username abcd password cisco123</pre>	Configures the signature update server parameters. You must specify the signature update parameters with the server details. If you use Cisco.com for signature updates, you must provide the username and password. If you use local server for signature updates, based on the server settings you can provide the username and password.
Step 14	logging level {alert crit debug emerg err info notice warning} Example:	Enables the log level.
	<pre>Device(config-utd-eng-std-insp)# logging level emerg</pre>	
Step 15	exit	Exits UTD standard engine configuration mode and returns to global configuration mode.
	Example: Device(config-utd-eng-std-insp)# exit	
Step 16	utd	Enables unified threat defense (UTD) and enters UTD configuration mode.
	<pre>Example: Device(config) # utd</pre>	
Step 17	redirect interface virtualPortGroup interface-number	(Optional) Redirects to a VirtualPortGroup interface. This is the data traffic interface. If you do not configure this interface, it is auto-detected.
	<pre>Example: Device(config-utd) # redirect interface virtualPortGroup 1</pre>	
Step 18	all-interfaces	Configures UTD on all Layer 3 interfaces of the device.
	<pre>Example: Device(config-utd)# all-interfaces</pre>	
Step 19	engine standard	Configures the Snort-based unified threat defense (UTD) engine and enters standard engine configuration mode.
	<pre>Example: Device(config-utd) # engine standard</pre>	
Step 20	fail close Example:	(Optional) Defines the action when there is a UTD engine failure. Default option is fail-open. Fail-close option drops all the IPS/IDS traffic when there is an UTD engine failure.
	Device(config-engine-std)# fail close	Fail-open option allows all the IPS/IDS traffic when there is an UTD engine failure.
Step 21	exit	Exits standard engine configuration mode and returns to global configuration mode.
	Example: Device(config-eng-std)# exit	

	Command or Action	Purpose
Step 22	end	Exits UTD configuration mode and returns to global configuration mode.
	<pre>Example: Device(config-utd) # end</pre>	

Configuring Snort IDS Inspection Globally

Based on your requirements, configure either Intrusion Prevention System (IPS) or Intrusion Detection System (IDS) inspection at a global level or at an interface level. Perform this task to configure IDS on a per-interface basis.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. interface** *type number*
- 4. utd enable
- 5. exit
- **6.** Repeat Steps 3 to 5, on all interfaces that require inspection.
- 7. utd threat-inspection whitelist
- **8. signature id signature**-id [**comment** description]
- 9. exit
- 10. utd engine standard
- 11. logging {server hostname [syslog] | syslog}
- 12. threat-inspection
- 13. threat {detection | protection }
- 14. policy {balanced | connectivity | security}
- 15. whitelist
- **16.** signature update occur-at {daily | monthly day-of-month | weekly day-of-week} hour minute
- 17. signature update server {cisco | url url} [username username [password password]]
- 18. logging level {alert | crit | debug | emerg | err | info | notice | warning}
- **19**. exit
- 20. utd
- 21. redirect interface virtualPortGroup interface-number
- 22. engine standard
- **23**. exit
- 24. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Device> enable	• Enter you password if prompted.
Step 2	configure terminal	Enters global configuration mode.
	Example: Device# configure terminal	
Step 3	interface type number	Configures an interface and enters interface configuration mode.
	<pre>Example: Device(config) # interface gigabitethernet 0/0/0</pre>	
Step 4	utd enable	Enables unified threat defense (UTD).
	<pre>Example: Device(config-if)# utd enable</pre>	
Step 5	exit	Exits interface configuration mode and returns to global configuration mode.
	<pre>Example: Device(config-if)# exit</pre>	
Step 6	Repeat Steps 3 to 5, on all interfaces that require inspection.	_
Step 7	utd threat-inspection whitelist	(Optional) Enables the UTD whitelist configuration mode.
	<pre>Example: Device(config) # utd threat-inspection whitelist</pre>	
Step 8	signature id signature-id [comment description]	Configures signature IDs to be whitelisted.
	<pre>Example: Device(config-utd-whitelist)# signature id</pre>	• Signature IDs can be copied from alerts that needs to be suppressed.
	24245 comment traffic from branchoffice1	You can configure multiple signature IDs.
		Repeat this step for each signature ID that needs to be whitelisted.
Step 9	exit	Exits UTD whitelist configuration mode and returns to globa configuration mode.
	<pre>Example: Device(config-utd-whitelist)# exit</pre>	

	Command or Action	Purpose
Step 10	utd engine standard Example:	Configures the unified threat defense (UTD) standard engine and enters UTD standard engine configuration mode.
0. 44	Device(config)# utd engine standard	
Step 11	<pre>logging {server hostname [syslog] syslog} Example: Device(config-utd-eng-std) # logging syslog</pre>	Enables the logging of critical messages to the IOSd syslog.
Step 12	threat-inspection	Configures threat inspection for the Snort engine.
	Example: Device(config-utd-eng-std)# threat-inspection	
Step 13	threat {detection protection }	Configures threat protection or Intrusion Detection System (IDS) as the operating mode for the Snort sensor.
	<pre>Example: Device(config-utd-eng-std-insp)# threat detection</pre>	Configure the protection keyword to configure Intrusion Prevention System (IPS).
Step 14	policy {balanced connectivity security}	Configures the security policy for the Snort sensor.
	<pre>Example: Device(config-utd-eng-std-insp)# policy balanced</pre>	
Step 15	whitelist	(Optional) Enables whitelisting of traffic.
	<pre>Example: Device(config-utd-eng-std-insp)# whitelist</pre>	
Step 16	signature update occur-at {daily monthly day-of-month weekly day-of-week} hour minute	Configures the signature update interval parameters. This configuration will trigger the signature update to occur at midnight.
	Example: Device(config-utd-eng-std-insp)# signature update occur-at daily 0 0	
Step 17	signature update server {cisco url url} [username username [password password]]	Configures the signature update server parameters. You must specify the signature update parameters with the server details. If you use Cisco.com for signature updates, you must
	Example: Device(config-utd-eng-std-insp)# signature update server cisco username abcd password cisco123	provide the username and password. If you use local server for signature updates, based on the server settings you can provide the username and password.
Step 18	logging level {alert crit debug emerg err info notice warning}	Enables the log level.
	<pre>Example: Device(config-utd-eng-std-insp)# logging level crit</pre>	

	Command or Action	Purpose
Step 19	exit	Exits UTD standard engine configuration mode and returns to global configuration mode.
	<pre>Example: Device(config-utd-eng-std-insp)# exit</pre>	
Step 20	utd	Enables unified threat defense (UTD) and enters UTD configuration mode.
	<pre>Example: Device(config)# utd</pre>	
Step 21	redirect interface virtualPortGroup interface-number	(Optional) Redirects to a VirtualPortGroup interface. This is the data traffic interface. If you do not configure this interface, it is auto-detected.
	<pre>Example: Device(config-utd) # redirect interface virtualPortGroup 1</pre>	
Step 22	engine standard	Configures the Snort-based unified threat defense (UTD) engine and enters standard engine configuration mode.
	<pre>Example: Device(config-utd) # engine standard</pre>	
Step 23	exit	Exits standard engine configuration mode and returns to global configuration mode.
	<pre>Example: Device(config-eng-std)# exit</pre>	
Step 24	end	Exits UTD configuration mode and returns to global configuration mode.
	<pre>Example: Device(config-utd) # end</pre>	

Displaying the List of Active Signatures

Active signatures are the ones that prompt Snort IDS/IPS to take action against threats. If the traffic matches with any of the active signatures, Snort container triggers alert in the IDS mode, and drops the traffic in the IPS mode.

The **utd threat-inspection signature active-list write-to bootflash: file name** command provides a list of active signatures and a summary of the total number of active signatures, drop signatures, and alert signatures.

Configuration Examples for Snort IPS

Example: Configuring VirtualPortGroup Interfaces and Virtual Service

Device# configure terminal
Device(config)# interface VirtualPortGroup 0

```
Device(config-if) # ip address 10.1.1.1 255.255.255.252
Device(config-if) # exit
Device(config) # interface VirtualPortGroup 1
Device(config-if) # ip address 192.0.2.1 255.255.255.252
Device(config-if)# exit
Device(config)# virtual-service UTDIPS
Device(config-virt-serv) # vnic gateway VirtualPortGroup 0
Device (config-virt-serv-vnic) # exit
Device(config-virt-serv)# vnic gateway VirtualPortGroup 1
Device(config-virt-serv-vnic)# guest ip address 192.0.2.2
Device(config-virt-serv-vnic)# exit
Device(config-virt-serv) # vnic management GigabitEthernet0
Device(config-virt-serv-vnic)# guest ip address 209.165.201.1
Device(config-virt-serv-vnic)# exit
Device(config-virt-serv)# activate
Device(config-virt-serv-vnic)# end
```

Example: Configuring a Different Resource Profile

```
Device# configure terminal
Device(config)# virtual-service UTDIPS
Device(config-virt-serv)# no activate
*Sep 7 13:57:04.660 IST: %VIRT_SERVICE-5-ACTIVATION_STATE: Successfully
deactivated virtual service UTDIPS
Device(config-virt-serv)# profile medium
Device(config-virt-serv)# activate
Device(config-virt-serv)# end
```

Example: Configuring UTD with Operation Mode IPS and Policy Security

The following example shows how to configure the UTD with operation mode IPS and policy security:

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-eng-std-insp)# threat protection
Device(config-utd-eng-std-insp)# policy security
Device(config-utd-eng-std)# end
Device#
```

Example: Configuring Snort IPS Globally

The following example shows how to configure Intrusion Prevention System (IPS) globally on a device:

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-eng-std-insp)# threat protection
Device(config-utd-eng-std-insp)# policy security
Device(config-utd-eng-std)# exit
Device(config)# utd
Device(config-utd)# all-interfaces
Device(config-utd)# engine standard
Device(config-utd-whitelist)# end
Device#
```

Example: Configuring Snort IPS Inspection per Interface

The following example shows how to configure Snort Intrusion Detection System (IDS) on a per-interface basis:

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-eng-std-insp)# threat detection
Device(config-utd-eng-std-insp)# policy security
Device(config-utd-eng-std)# exit
Device(config-utd)# engine standard
Device(config-eng-std)# exit
Device(config)# interface gigabitethernet 0/0/0
Device(config-if)# utd enable
Device(config-if)# exit
```

Example: Configuring UTD with VRF on both Inbound and Outbound Interface

```
Device# configure terminal
Device(config) # vrf definition VRF1
Device(config-vrf) # rd 100:1
Device (config-vrf) # route-target export 100:1
Device(config-vrf) # route-target import 100:1
Device (config-vrf) # route-target import 100:2
Device (config-vrf) # address-family ipv4
Device(config-vrf-af) # exit
Device(config-vrf) # address-family ipv6
Device(config-vrf-af)# exit
Device(config-vrf-af) # vrf definition VRF2
Device (config-vrf) # rd 100:2
Device(config-vrf)# route-target export 100:2
Device(config-vrf) # route-target import 100:2
Device(config-vrf)# route-target import 100:1
Device(config-vrf) # address-family ipv4
Device(config-vrf-af)# exit
Device(config-vrf) # address-family ipv6
Device(config-vrf-af)# exit
Device(config-vrf) # interface VirtualPortGroup0
Device(config-if) # ip address 192.0.0.1 255.255.255.0
Device (config-if) # no mop enabled
Device (config-if) # no mop sysid
Device(config-if)# interface VirtualPortGroup1
Device(config-if) # ip address 192.0.0.1 255.255.255.0
Device (config-if) # no mop enabled
Device(config-if) # no mop sysid
Device(config-if)# interface GigabitEthernet0/0/2
Device(config-if) # vrf forwarding VRF1
Device (config-if-vrf) # ip address 192.1.1.5 255.255.255.0
Device (config-if-vrf) # ipv6 address A000::1/64
Device(config-if) # interface GigabitEthernet0/0/3
Device (config-if) # vrf forwarding VRF2
Device (config-if-vrf) # ip address 192.1.1.5 255.255.255.0
Device(config-if-vrf) # ipv6 address B000::1/64
Device(config-if-vrf) # router bgp 100
```

```
Device(config-if-vrf) # bgp log-neighbor-changes
Device(config-vrf) # address-family ipv4 vrf VRF1
Device (config-vrf-af) # redistribute connected
Device(config-vrf-af) # redistribute static
Device(config-vrf-af)# exit
Device(config-vrf) # address-family ipv6 vrf VRF1
Device(config-vrf-af) # redistribute connected
Device(config-vrf-af) # redistribute static
Device(config-vrf-af)# exit
Device(config-vrf) # address-family ipv4 vrf VRF2
Device(config-vrf-af)# redistribute connected
Device(config-vrf-af) # redistribute static
Device(config-vrf-af)# exit
Device(config-vrf) # address-family ipv6 vrf VRF2
Device(config-vrf-af) # redistribute connected
Device(config-vrf-af) # redistribute static
Device(config-vrf-af)# exit
Device(config) # utd
Device(config-utd) # all-interfaces
Device(config-utd) # engine standard
Device(config) # utd engine standard
Device(config-utd-eng-std) # logging syslog
Device(config-utd-eng-std) # threat-inspection
Device (config-utd-engstd-insp) # threat protection
Device (config-utd-engstd-insp) # policy security
Device(config) # virtual-service utd
Device(config-virt-serv) # profile low
Device(config-virt-serv)# vnic gateway VirtualPortGroup0
Device(config-virt-serv-vnic) # guest ip address 47.0.0.2
Device(config-virt-serv-vnic)# exit
Device(config-virt-serv) # vnic gateway VirtualPortGroup1
Device(config-virt-serv-vnic) # guest ip address 48.0.0.2
Device (config-virt-serv-vnic) # exit
Device(config-virt-serv) # activate
UTD Snort IPS Drop Log
2016/06/13-14:32:09.524475 IST [**] [Instance ID: 1] [**] Drop [**]
[1:30561:1] BLACKLIST DNS request for known malware
domain domai.ddns2.biz - Win.Trojan.Beebone [**]
[Classification: A Network Trojan was Detected]
[Priority: 1] [VRF ID: 2] {UDP} 11.1.1.10:58016 -> 21.1.1.10:53
```

Example: Configuring Logging IOS Syslog

The following example shows how to configure logging IOS syslog with the log levels on a device:

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std)# logging syslog
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-engstd-insp)# logging level debug
Device(config-utd-eng-std-insp)# end
Device#
```

Example: Configuring Logging to Centralized Log Server

The following example shows how to configure logging to a centralized log server:

```
Device# configure terminal
Device(config) # utd engine standard
Device (config-utd-eng-std-insp) # logging server syslog.yourcompany.com
Device(config-utd-eng-std) # threat-inspection
Device (config-utd-eng-std-insp) # logging level info
Device (config-utd-eng-std-insp) # end
```

Example: Configuring Signature Update from a Cisco Server

The following example shows how to configure the signature update from a Cisco server:

```
Device# configure terminal
Device (config) # utd engine standard
Device(config-utd-eng-std) # threat-inspection
Device (config-utd-eng-std-insp) # signature update server cisco username CCOuser password
Device (config-utd-eng-std-insp) # end
Device#
```

Ensure that the DNS is configured to download signatures from the Cisco server.

Example: Configuring Signature Update from a Local Server

The following example shows how to configure the signature update from a local server:

```
Device# configure terminal
Device (config) # utd engine standard
Device(config-utd-eng-std) # threat-inspection
Device (config-utd-eng-std-insp) # signature update server url http://192.168.1.2/sig-1.pkg
Device(config-utd-eng-std-insp) # end
Device#
```

Example: Configuring Automatic Signature Update

The following example shows how to configure the automatic signature update on a server:

```
Device# configure terminal
Device (config) # utd engine standard
Device(config-utd-eng-std) # threat-inspection
Device (config-utd-eng-std-insp) # signature update occur-at daily 0 0
Device (config-utd-eng-std-insp) # signature update server cisco username abcd password
cisco123
Device (config-utd-eng-std-insp) # end
Device#
```

Note

When the signature update is not in detail, you can get the signature update from the server.

Example: Performing Manual Signature Update

The following examples show how to perform a manual signature update in different ways:

```
Device# utd threat-inspection signature update
It takes the existing server configuration to download from
or the explicit server information configured with it.
These commands perform a manual signature update with the below settings:
Device# show utd engine standard threat-inspection signature update status
Current signature package version: 2983.4.s
Current signature package name: UTD-STD-SIGNATURE-2983-4-S.pkg
Previous signature package version: 29.0.c
Last update status: Successful
Last successful update time: Mon Aug 7 02:02:32 2017 UTC
Last successful update method: Manual
Last successful update server: cisco
Last successful update speed: 3022328 bytes in 25 secs
Last failed update time: Mon Aug 7 01:53:21 2017 UTC
Last failed update method: Manual
Last failed update server: cisco
Last failed update reason: ('Connection aborted.', gaierror(-2, 'Name or service hnot
known'))
Last attempted update time: Mon Aug 7 02:02:32 2017 UTC
Last attempted update method: Manual
Last attempted update server: cisco
Total num of updates successful: 1
Num of attempts successful: 1
Num of attempts failed: 3
Total num of attempts: 4
Next update scheduled at: None
Current status: Idle
Device# utd threat-inspection signature update server cisco username ccouser password
Device# utd threat-inspection signature update server url http://192.168.1.2/sig-1.pkg
```

Example: Configuring Signature Whitelist

The following example shows how to configure signature whitelist:

```
Device# configure terminal
Device(config)# utd threat-inspection whitelist
Device(config-utd-whitelist)# signature id 23456 comment "traffic from client x"
Device(config-utd-whitelist)# exit
Device(config)# utd engine standard
Device(config-utd-eng-std)# whitelist
Device(config-utd-eng-std)# end
Device#
```

After the whitelist signature ID is configured, Snort will allow the flow to pass through the device without any alerts and drops.

Examples for Displaying Active Signatures

Example: Displaying Active Signatures List With Balanced Policy

Example: Displaying Active Signatures List With Security Policy

Example: Displaying Active Signatures List With Connectivity Policy

Verifying the Integrated Snort IPS Configuration

Use the following commands to troubleshoot your configuration.

SUMMARY STEPS

- 1. enable
- 2. show virtual-service list
- 3. show virtual-service detail
- 4. show service-insertion type utd service-node-group
- 5. show service-insertion type utd service-context
- 6. show utd engine standard config
- 7. show utd engine standard status
- 8. show utd engine standard threat-inspection signature update status
- 9. show utd engine standard logging events
- 10. clear utd engine standard logging events
- 11. show platform hardware qfp active feature utd config
- 12. show platform software utd global
- 13. show platform software utd interfaces
- 14. show platform hardware qfp active feature utd stats
- 15. show utd engine standard statistics daq all

DETAILED STEPS

Step 1 enable

Example:

Device> enable

Enables privileged EXEC mode.

• Enter your password if prompted.

Step 2 show virtual-service list

Displays the status of the installation of all applications on the virtual service container.

Example:

Device# show virtual-service list

Virtual Service List:

Name	Status	Package Name
UTDIPS	Activated	utdsnort.1_0_1_SV2982_XE_16_3.20160701_131509.ova

Step 3 show virtual-service detail

Displays the resources used by applications installed in the virtual services container of a device.

Example:

Device# show virtual-service detail

```
Device#show virtual-service detail
Virtual service UTDIPS detail
            : Activated
  State
  Owner
                        : IOSd

    VCPUs
                 : Not specified
```

Step 4 show service-insertion type utd service-node-group

Displays the status of service node groups.

Example:

```
Device# show service-insertion type utd service-node-group

Service Node Group name : utd_sng_1
Service Context : utd/1

Member Service Node count : 1

Service Node (SN) : 30.30.30.2

Auto discovered : No
SN belongs to SNG : utd_sng_1
Current status of SN : Alive
Time current status was reached : Tue Jul 26 11:57:48 2016

Cluster protocol VPATH version : 1
Cluster protocol incarnation number : 1
Cluster protocol last sent sequence number : 1469514497
Cluster protocol last received sequence number: 1464
Cluster protocol last received ack number : 1469514496
```

Step 5 show service-insertion type utd service-context

Displays the AppNav and service node views.

Example:

```
Device# show service-insertion type utd service-context

Service Context: utd/1
Cluster protocol VPATH version: 1
Time service context was enabled: Tue Jul 26 11:57:47 2016
Current FSM state: Operational
Time FSM entered current state: Tue Jul 26 11:57:58 2016
Last FSM state: Converging
Time FSM entered last state: Tue Jul 26 11:57:47 2016
Cluster operational state: Operational

Stable AppNav controller View:
30.30.30.1

Stable SN View:
```

```
30.30.30.2

Current AppNav Controller View: 30.30.30.1

Current SN View: 30.30.30.2
```

Step 6 show utd engine standard config

Displays the unified threat defense (UTD) configuration.

Example:

Device# show utd engine standard config

```
UTD Engine Standard Configuration:
   Operation Mode: Intrusion Prevention
   Policy: Security

Signature Update:
   Server: cisco
   User Name: ccouser
   Password: YEX^SH\fhdOeEGaOBIQAIcOVLgaVGf
   Occurs-at: weekly; Days:0; Hour: 23; Minute: 50

Logging:
   Server: IOS Syslog; 10.104.49.223
   Level: debug

Whitelist Signature IDs:
   28878
```

Step 7 show utd engine standard status

Displays the status of the utd engine.

Example:

```
Device# show utd engine standard status
```

```
Profile : High
System memory :
Usage : 8.00 %
Status : Green
Number of engines : 4
Engine Running CFT flows Health Reason
______
Engine(#1): Yes O Green None
Engine(#2): Yes 0 Green None
Engine (#3): Yes O Green None
Engine(#4): Yes O Green None
   ______
Overall system status: Green
Signature update status:
______
Current signature package version: 2983.4.s
Last update status: Successful
Last successful update time: Mon Aug 7 02:02:32 2017 UTC
Last failed update time: Mon Aug \ 7\ 01:53:21\ 2017\ UTC
Last failed update reason: ('Connection aborted.', gaierror(-2, 'Name or service not known'))
Next update scheduled at: None
Current status: Idle
```

Step 8 show utd engine standard threat-inspection signature update status

Displays the status of the signature update process.

Example:

Device# show utd engine standard threat-inspection signature update status

```
Current signature package version: 2983.4.s
Current signature package name: UTD-STD-SIGNATURE-2983-4-S.pkg
Previous signature package version: 29.0.c
Last update status: Successful
-----
Last successful update time: Mon Aug 7 02:02:32 2017 UTC
Last successful update method: Manual
Last successful update server: cisco
Last successful update speed: 3022328 bytes in 25 secs
Last failed update time: Mon Aug 7 01:53:21 2017 UTC
Last failed update method: Manual
Last failed update server: cisco
Last failed update reason: ('Connection aborted.', gaierror(-2, 'Name or service hnot known'))
Last attempted update time: Mon Aug 7 02:02:32 2017 UTC
Last attempted update method: Manual
Last attempted update server: cisco
Total num of updates successful: 1
Num of attempts successful: 1
Num of attempts failed: 3
Total num of attempts: 4
Next update scheduled at: None
Current status: Idle
```

Step 9 show utd engine standard logging events

Displays log events from the Snort sensor.

Example:

Device# show utd engine standard logging events

Step 10 clear utd engine standard logging events

Example:

Device# clear utd engine standard logging events

Clears logged events from the Snort sensor.

Step 11 show platform hardware qfp active feature utd config

Displays information about the health of the service node.

Example:

Device# show platform hardware qfp active feature utd config

Global configuration NAT64: disabled SN threads: 12 CFT inst id 0 feat id 1 fo id 1 chunk id 8 Context Id: 0, Name: Base Security Ctx Ctx Flags: (0x60000) Engine: Standard SN Redirect Mode : Fail-open, Divert Threat-inspection: Enabled, Mode: IDS Domain Filtering : Not Enabled URL Filtering : Not Enabled SN Health: Green

Step 12 show platform software utd global

Displays the interfaces on which UTD is enabled.

Example:

Device# show platform software utd global

UTD Global state : Standard Engine Global Inspection : Enabled Operational Mode : Intrusion Prevention Fail Policy : Fail-open Container technnlogy : LXC Redirect interface : VirtualPortGroup1 UTD interfaces

All dataplane interfaces

Step 13 show platform software utd interfaces

Displays the information about all interfaces.

Example:

Device# show platform software utd interfaces

UTD interfaces All dataplane interfaces

Step 14 show platform hardware qfp active feature utd stats

Displays dataplane UTD statistics.

Example:

Device# show platform hardware qfp active feature utd stats Security Context: Id:0 Name: Base Security Ctx Summary Statistics: pkt 228 Pkts entered policy feature byt 31083 Drop Statistics: Service Node flagged flow for dropping 48 Service Node not healthy 62

General Statistics:

Non Diverted Pkts to/from divert interface Inspection skipped - UTD policy not applicable Policy already inspected Pkts Skipped - L2 adjacency glean Pkts Skipped - For Us Pkts Skipped - New pkt from RP Response Packet Seen Feature memory allocations Feature memory free Feature Object Delete	32913 48892 2226 1 67 102 891 891 891 863

Step 15 show utd engine standard statistics daq all

Displays serviceplane data acquistion (DAQ) statistics.

Example:

Device# show utd engine standard statistics daq all

IOS-XE DAQ Counters(Engine #1):

Deploying Snort IPS Using Cisco Prime CLI Templates

You can use the Cisco Prime CLI templates to provision the Snort IPS deployment. The Cisco Prime CLI templates make provisioning Snort IPS deployment simple. To use the Cisco Prime CLI templates to provision the Snort IPS deployment, perform these steps:

- Step 1 Download the Prime templates from the Software Download page, corresponding to the IOS XE version running on your system.
- **Step 2** Unzip the file, if it is a zipped version.
- **Step 3** From Prime, choose Configuration > Templates > Features and Technologies, select CLI Templates.
- Step 4 Click Import.
- Step 5 Select the folder where you want to import the templates to and click Select Templates and choose the templates that you just downloaded to import.

The following Snort IPS CLI templates are available:

- Copy OVA to Device—Use this template to copy the Snort IPS OVA file to the router file system.
- Delete OVA—Use this template to delete the copied Snort IPS OVA file from the router file system.
- Dynamic NAT—Use this template if Dynamic NAT (Network Address Translation) is configured in your
 environment and an Access List is used to select the NAT translation that needs to be modified for Snort IPS
 Management Interface IP.
- Dynamic NAT Cleanup—Use this template to delete the NAT configuration for Snort IPS.
- Dynamic PAT—Use this template if Dynamic PAT (Port Address Translation) is configured in your environment and an Access List is used to select the PAT translation that needs to be modified for Snort IPS Management Interface IP.
- Dynamic PAT Cleanup—Use this template to delete the PAT configuration for Snort IPS.
- IP Unnumbered—Use this template to configure Snort IPS and required Virtual-Service for IP Unnumbered deployment.
- IP Unnumbered Cleanup—Use this template to delete the configured Snort IPS Management interface with IP Unnumbered.

- Management Interface—Use this template if you would like to use System Management interface (e.g. GigabitEthernet0) to route Snort IPS Management traffic.
- Management Interface Cleanup—Use this template to delete the configured System Management interface (e.g. GigabitEthernet0) to route the Snort IPS Management traffic.
- Static NAT—Use this template to configure Snort IPS and required Virtual-Service for existing Static NAT deployment.
- Static NAT Cleanup—Use this template to delete the configured Snort IPS in a Static NAT deployment.
- Upgrade OVA—Use this template to upgrade Snort IPS OVA file.

Troubleshooting Snort IPS

Traffic is not Diverted

Problem Traffic is not diverted.

Possible Cause Vitual-service may not be activated.

Solution Check whether the virtual-service is activated by using the **show virtual-service list** command. The following is sample output from the command:

```
Device# show virtual-service list

Virtual Service List:

Name Status Package Name

snort Activated utdsnort.1 0 1 SV2982 XE 16 3.20160701 131509.ova
```

Possible Cause Unified threat defense (UTD) may not be enabled for specified interface or interfaces.

Solution Use the show platform software utd global command to verify if UTD is enabled for the interface: Device# show platform software utd global

```
UTD Global state
Engine : Standard
Global Inspection : Disabled
Operational Mode : Intrusion Prevention
Fail Policy : Fail-open
Container technology : LXC
Redirect interface : VirtualPortGroup1
UTD interfaces
GigabitEthernet0/0/0
```

Possible Cause The service node may not be working properly.

Solution Use the show platform hardware qfp active feature utd config command to verify if the health of the service node is green:

Device# show platform hardware qfp active feature utd config

```
Global configuration
NAT64: disabled
SN threads: 12
CFT inst id 0 feat id 0 fo id 0 chunk id 4
Context Id: 0, Name: Base Security Ctx
Ctx Flags: (0x60000)
Engine: Standard
SN Redirect Mode : Fail-open, Divert
Threat-inspection: Enabled, Mode: IDS
Domain Filtering : Not Enabled
URL Filtering : Not Enabled
SN Health: Green
```

Possible Cause The Snort process may not be activated.

Solution Use the **show virtual-service detail** command to verify if the Snort process is up and running: Device# show virtual-service detail

```
Virtual service UTDIPS detail

0.0.0.0/0
                                        47.0.0.1
                                                                             et.h1
  Resource admission (without profile) : passed
    Disk space : 710MB
    Memory : 1024Mb
CPU : 25% system CPU
    VCPUs
                  : Not specified
```

Possible Cause The AppNav tunnel may not be activated.

Solution Use the **show service-insertion type utd service-node-group** and **show service-insertion type utd service-context** commands to verify if the AppNav tunnel is activated.

Solution The following is sample output from the **show service-insertion type utd service-node-group** command:

```
Device# show service-insertion type utd service-node-group

Service Node Group name : utd_sng_1
Service Context : utd/1

Member Service Node count : 1

Service Node (SN) : 30.30.30.2

Auto discovered : No
SN belongs to SNG : utd_sng_1
Current status of SN : Alive
Time current status was reached : Tue Jul 26 11:57:48 2016

Cluster protocol VPATH version : 1
Cluster protocol incarnation number : 1
Cluster protocol last sent sequence number : 1469514497
Cluster protocol last received sequence number: 1464
Cluster protocol last received ack number : 1469514496
```

Solution The following is sample output from the **show service-insertion type utd service-context** command: Device# **show service-insertion type utd service-context**

```
Service Context : utd/1
Cluster protocol VPATH version: 1
Time service context was enabled: Tue Jul 26 11:57:47 2016
Current FSM state : Operational
Time FSM entered current state : Tue Jul 26 11:57:58 2016
Last FSM state : Converging
Time FSM entered last state: Tue Jul 26 11:57:47 2016
Cluster operational state : Operational
Stable AppNav controller View:
30.30.30.1
Stable SN View:
30.30.30.2
Current AppNav Controller View:
30.30.30.1
Current SN View:
30.30.30.2
```

Possible Cause Check data plane UTD statistics for the status of the traffic. If the traffic is not diverted, the number of packets diverted and rejected will be zero. If the numbers are nonzero, then traffic diversion is happening, and the Snort sensor is resending packets back to the dataplane.

Solution Use the show platform hardware qfp active feature utd stats commands to verify the status of the traffic.

Device# show platform hardware qfp active feature utd stats

```
Security Context:
                      Id:0
                              Name: Base Security Ctx
Summary Statistics:
                                                                             29

TCP Connections Created
                                                                         712910
UDP Connections Created
                                                                             80
Pkts entered policy feature
                                                      pkt
                                                                        3537977
                                                                      273232057
                                                      bvt
Pkts entered divert feature
                                                      pkt
                                                                        3229148
                                                                      249344841
                                                      byt
Pkts slow path
                                                      pkt
                                                                         712990
                                                                       45391747
                                                      byt
                                                                        3224752
Pkts Diverted
                                                      pkt
                                                      byt
                                                                      249103697
Pkts Re-injected
                                                      pkt
                                                                        3224746
                                                      byt
                                                                      249103373
```

Signature Update is not Working

Problem Signature update from Cisco Borderless Software Distribution (BSD) server is not working.

Possible Cause Signature update may have failed due to various reasons. Check for the reason for the last failure to update the signatures.

Solution Use the **show utd engine standard threat-inspection signature update status** command to display the reason for the last failure to update the signatures:

```
Device# show utd eng standard threat-inspection signature update status
Current signature package version: 29.0.c
Current signature package name: default
Previous signature package version: None
Last update status: Failed
Last successful update time: None
Last successful update method: None
Last successful update server: None
Last successful update speed: None
Last failed update time: Thu Jan 11 13:34:36 2018 PST
Last failed update method: Manual
Last failed update server: http://172.27.57.252/UTD-STD-SIGNATURE-2983-1-S.pkg
Last failed update reason: [Errno 113] No route to host
Last attempted update time: Thu Jan 11 13:34:36 2018 PST
Last attempted update method: Manual
Last attempted update server: http://172.27.57.252/UTD-STD-SIGNATURE-2983-1-S.pkg
Total num of updates successful: 0
Num of attempts successful: 0
Num of attempts failed: 1
Total num of attempts: 1
Next update scheduled at: None
Current status: Idle
```

Possible Cause Domain Name System (DNS) is not configured correctly.

```
Solution Use the show running-config | i name-server command to display the name server details:

Device# show run | i name-server

ip name-server 10.104.49.223
```

Possible Cause System error—Failed to process the username and password combination.

Solution Ensure that you have provided the correct credentials for signature package download.

Signature Update from the Local Server is not Working

Problem Signature update from the local server not working.

Possible Cause Last failure Reason: Invalid scheme—only HTTP/HTTPS supported.

Solution Ensure that you have provided the HTTP or secure HTTP (HTTPS) as the local download method.

Possible Cause Last failure Reason: Name or service not known.

Solution Ensure that the hostname or IP address provided for the local server is correct.

Possible Cause Last failure Reason: Credentials not supplied.

Solution Ensure that you have provided the credentials for local HTTP/HTTPS server.

Possible Cause Last failure Reason: File not found.

Solution Ensure that the signature file name or URL that you have provided is correct.

Possible Cause Last failure Reason: Download corrupted.

Solution

- Verify whether the retry signature update is corrupted as the previous signature download.
- Ensure that the correct signature package is available.

Logging to IOSd Syslog is not Working

Problem Logging to IOSd syslog is not working.

Possible Cause Logging to syslog may not be configured in the unified threat defense (UTD) configuration.

Solution Use the **show utd engine standard config** command to display the UTD configuration and to ensure that logging to syslog is configured.

Device# show utd engine standard config

```
UTD Engine Standard Configuration:
   Operation Mode: Intrusion Prevention
   Policy: Security

Signature Update:
   Server: cisco
   User Name: ccouser
   Password: YEX^SH\fhdOeEGaOBIQAIcOVLgaVGf
   Occurs-at: weekly; Days:0; Hour: 23; Minute: 50

Logging:
   Server: IOS Syslog; 10.104.49.223
   Level: debug

Whitelist Signature IDs:
   28878
```

Solution Use the following **show utd engine standard logging events** command to display the event logs for the UTD engine.

```
Device# show utd engine standard logging events
```

Logging to an External Server is not Working

Problem Logging to an external server is not working.

Possible Cause Syslog may not be running on the external server.

Solution Verify whether syslog server is running on the external server. Configure the following command on the external server to view its status:

```
ps -eaf | grep syslog
root 2073 1 0 Apr12 ? 00:00:02 syslogd -r -m
```

Possible Cause Connectivity between unified threat defense (UTD) Linux Container (LXC) and external server may be lost.

Solution Verify the connectivity from the management interface to the external syslog server.

UTD Conditional Debugging

Conditional debugging is supported by multi-tenancy for Unified Threat Defense. For further details about how to configure conditional debugging, see:

http://www.cisco.com/c/en/us/td/docs/routers/asr1000/troubleshooting/guide/ Tblshooting-xe-3s-asr-1000-book.html#task_AC969BB06B414DCBBDEF7ADD29EF8131

Technical Assistance

Description	Link
The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies.	http://www.cisco.com/support
To receive security and technical information about your products, you can subscribe to various services, such as the Product Alert Tool (accessed from Field Notices), the Cisco Technical Services Newsletter, and Really Simple Syndication (RSS) Feeds.	
Access to most tools on the Cisco Support website requires a Cisco.com user ID and password.	

Feature Information for Snort IPS

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Snort IPS

Feature Name	Releases	Feature Information
Snort IPS	Cisco IOS XE 3.16.1S, 3.17S and later releases	The Snort IPS feature, enables Intrusion Prevention System (IPS) and Intrusion Detection System (IDS) for branch offices on Cisco IOS XE-based platforms. This feature uses the open source Snort solution to enable IPS and IDS.
VRF support on Snort IPS	Cisco IOS XE Denali 16.3.1	Supports Virtual Fragmentation Reassembly (VFR) on Snort IPS configuration.
Snort IPS support on Cisco Cloud Services Router 1000v Series	Cisco IOS XE Denali 16.3.1	Cisco Cloud Services Router 1000v Series supports Snot IPS.
UTD Snort IPS Enhancements for 16.4 Release	Cisco IOS XE Everest 16.4.1	The UTD Snort IPS enhancements for 16.4 release adds a feature for displaying the list of active signatures.

Releases	Feature Information
Cisco IOS XE Fuji 16.8.1	This feature provides summary of threat inspection alerts. The following commands are introduced:
	 show utd engine standard logging statistics threat-inspection
	• show utd engine standard logging statistics threat-inspection detail
	Following commands are modified as part of UTD Serviceability Enahancement:
	• show utd engine standard status
	• show utd engine standard threat-inspection signature update status
	Cisco IOS XE Fuji
