

Nested Class Map Support for Zone-Based Policy Firewall

The Nested Class Map Support for Zone-Based Policy Firewall feature provides the Cisco IOS XE firewall the functionality to configure multiple traffic classes (which are also called nested class maps or hierarchical class maps) as a single traffic class. When packets meet more than one match criterion, you can configure multiple class maps that can be associated with a single traffic policy. The Cisco IOS XE firewall supports up to three levels of class map hierarchy.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Nested Class Map Support for Zone-Based Policy Firewall

Before configuring nested class maps, you should be familiar with the modular Quality of Service (QoS) CLI (MQC).

Information About Nested Class Map Support for Zone-Based Policy Firewall

Nested Class Maps

In Cisco IOS XE Release 3.5S and later releases, you can configure multiple traffic classes (which are also called nested class maps or hierarchical class maps) as a single traffic class. When packets meet more than one match criterion, you can configure multiple class maps that can be associated with a single traffic policy. The nesting of class maps can be achieved by configuring the **match class-map** command. The only method of combining the match-any and match-all characteristics within a single traffic class is by using the **class-map** command.

match-all and match-any Keywords of the class-map Command

To create a traffic class, you must configure the **class-map** command with the **match-all** and **match-any** keywords. You need to specify the **match-all** and **match-any** keywords only if more than one match criterion is configured in the traffic class. The following rules apply to the **match-all** and **match-any** keywords:

- Use the **match-all** keyword when all match criteria in the traffic class must be met to place a packet in the specified traffic class.
- Use the **match-any** keyword when only one of the match criterion in the traffic class must be met to place a packet in the specified traffic class.
- If you do not specify the **match-all** keyword or the **match-any** keyword, the traffic class behaves in a manner that is consistent with the **match-all** keyword.

Your zone-based policy firewall configuration supports nested class maps if the following criteria are met:

- Individual class maps in a hierarchy include multiple match class-map command references.
- Individual class maps in a hierarchy include match rules other than the **match class-map** command.

How to Configure Nested Class Map Support for Zone-Based Policy Firewall

Configuring a Two-Layer Nested Class Map

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. class-map match-any class-map-name
- 4. match protocol protocol-name
- 5. exit

- 6. class-map match-any class-map-name
- 7. match protocol protocol-name
- 8. exit
- 9. class-map match-any class-map-name
- **10.** match class-map class-map-name
- **11.** match class-map class-map-name
- 12. end

DETAILED STEPS

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Router> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Router# configure terminal		
Step 3	class-map match-any class-map-name	Creates a Layer 3 or Layer 4 class map and enters class	
	Example:	map configuration mode.	
	Router(config)# class-map match-any child1		
Step 4	match protocol protocol-name	Configures the match criteria for a class map on the basis	
	Example:	of a specified protocol.	
	Router(config-cmap)# match protocol tcp		
Step 5	exit	Exits class map configuration mode and enters global configuration mode.	
	Example:		
	Router(config-cmap)# exit		
Step 6	class-map match-any class-map-name	Creates a Layer 3 or Layer 4 class map and enters clas	
	Example:	map configuration mode.	
	Router(config)# class-map match-any child2		
Step 7	match protocol protocol-name	Configures the match criteria for a class map on the basis of a specified protocol.	
	Example:		
	Router(config-cmap)# match protocol udp		
Step 8	exit	Exits class map configuration mode and enters global	
·	Example:	configuration mode.	
	Router(config-cmap)# exit		
Step 9	class-map match-any class-map-name	Creates a Layer 3 or Layer 4 class map and enters class map configuration mode.	
	Example:		
	Router(config)# class-map match-any parent		

	Command or Action	Purpose
Step 10	match class-map class-map-name	Configures a traffic class as a classification policy.
	Example:	
	Router(config-cmap)# match class-map child1	
Step 11	match class-map class-map-name	Configures a traffic class as a classification policy.
	Example:	
	Router(config-cmap)# match class-map child2	
Step 12	end	Exits class map configuration mode and enters privileged
	Example:	EXEC mode.
	Router(config-cmap)# end	

Configuring a Policy Map for a Nested Class Map

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. policy-map type inspect** *policy-map-name*
- 4. class-type inspect class-map-name
- 5. inspect
- 6. end

DETAILED STEPS

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Router> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Router# configure terminal		
Step 3	policy-map type inspect policy-map-name	Creates a Layer 3 or Layer 4 inspect type policy map an enters policy map configuration mode.	
	Example:		
	Router(config)# policy-map type inspect pmap		
Step 4	class-type inspect class-map-name	Specifies the traffic (class) on which an action is to be performed and enters policy-map class configuration mode	
	Example:		
	• Router(config-pmap)# class-type inspect parent		

	Command or Action	Purpose
Step 5	inspect	Enables Cisco IOS XE stateful packet inspection.
	Example:	
	Router(config-pmap-c)# inspect	
Step 6	end Exits policy-map cl	Exits policy-map class configuration mode and enters
	Example:	privileged EXEC mode.
	Router(config-pmap-c)# end	

Attaching a Policy Map to a Zone Pair

SUMMARY STEPS

- 1. enable
- **2**. configure terminal
- **3. zone security** *zone-name*
- 4. exit
- 5. zone security zone-name
- 6. exit
- 7. zone-pair security zone-pair-name [source zone-name destination [zone-name]]
- 8. service-policy type inspect policy-map-name
- 9. exit
- **10. interface** *type number*
- **11.** zone-member security zone-name
- 12. end

DETAILED STEPS

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Router> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Router# configure terminal		
Step 3	zone security zone-name	Creates a security zone to which interfaces can be assigne and enters security zone configuration mode.	
	Example:		
	Router(config)# zone security source-zone		
Step 4	exit	Exits security zone configuration mode and enters globa configuration mode.	
	Example:		
	Router(config-sec-zone)# exit		

	Command or Action	Purpose
Step 5	<pre>zone security zone-name Example: Router(config)# zone security destination-zone</pre>	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 6	exit Example: Router(config-sec-zone)# exit	Exits security zone configuration mode and enters global configuration mode.
Step 7	<pre>zone-pair security zone-pair-name [source zone-name destination [zone-name]] Example: Router(config)# zone-pair security secure-zone source source-zone destination destination-zone</pre>	Creates a zone pair and enters security zone pair configuration mode. • To apply a policy, you must configure a zone pair.
Step 8	<pre>service-policy type inspect policy-map-name Example: Router(config-sec-zone-pair)# service-policy type inspect pmap</pre>	Attaches a firewall policy map to the destination zone pair.NoteIf a policy is not configured between a pair of zones, traffic is dropped by default.
Step 9	exit Example: Router(config-sec-zone-pair)# exit	Exits security zone pair configuration mode and enters global configuration mode.
Step 10	<pre>interface type number Example: Router(config)# interface gigabitethernet 0/0/1</pre>	Configures an interface and enters interface configuration mode.
Step 11	<pre>zone-member security zone-name Example: Router(config-if)# zone-member security source-zone</pre>	 Assigns an interface to a specified security zone. When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the router or initiated by the router) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 12	end Example: Router(config-if)# end	Exits interface configuration mode and enters privileged EXEC mode.

Configuration Examples for Nested Class Map Support for Zone-Based Policy Firewall

Example: Configuring a Two-Layer Nested Class Map

Router# configure terminal Router(config)# class-map match-any child1 Router(config-cmap)# match protocol tcp Router(config-cmap)# exit Router(config)# class-map match-any child2 Router(config-cmap)# match protocol udp Router(config-cmap)# exit Router(config)# class-map match-any parent Router(config-cmap)# match class-map child1 Router(config-cmap)# match class-map child2 Router(config-cmap)# match class-map child2 Router(config-cmap)# end

Example: Configuring a Policy Map for a Nested Class Map

```
Router# configure terminal
Router(config)# policy-map type inspect pmap
Router(config-pmap)# class-type inspect parent
Router(config-pmap-c)# inspect
Router(config-pmap-c)# end
```

Example: Attaching a Policy Map to a Zone Pair

```
Router# configure terminal
Router(config)# zone security source-zone
Router(config-sec-zone)# exit
Router(config)# zone security destination-zone
Router(config)# zone-pair security secure-zone source-zone destination destination-zone
Router(config)# zone-pair)# service-policy type inspect pmap
Router(config-sec-zone-pair)# exit
Router(config)# interface gigabitethernet 0/0/1
Router(config-if)# zone-member security source-zone
Router(config-if)# zone-member security source-zone
```
