LISP and Zone-Based Firewalls Integration and Interoperability

The LISP and Zone-Based Firewalls Integration and Interoperability feature enables inner-packet inspection of all Locator ID Separation Protocol (LISP) data packets that pass through a device. To enable LISP inner packet inspection, you have to configure the `lisp inner-packet inspection` command. Without LISP inner packet inspection, endpoint identifier (EID) devices in a LISP network will not have any firewall protection.

This module describes how to configure this feature.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for LISP and Zone-Based Firewall Integration and Interoperability

• The interchassis high availability configuration on active device and standby devices must be identical.
Restrictions for LISP and Zone-Based Firewall Integration and Interoperability

The following features are not supported:

- Locator ID Separator Protocol (LISP) mobility
- Zone-based firewall, LISP, and Web Cache Control Protocol (WCCP) interoperability

The following features are not supported when LISP inner packet inspection is enabled:

- Asymmetric routing
- LISP control message inspection
- LISP inner packet fragmentation
- Network Address Translation (NAT) and NAT 64
- TCP reset
- Virtual routing and forwarding (VRF)
- Virtual TCP (vTCP)
- VRF-Aware Software Infrastructure (VASI)
- Web Cache Communication Protocol (WCCP)

Information About LISP and Zone-Based Firewalls Integration and Interoperability

LISP Overview

The Locator ID Separation Protocol (LISP) is a network architecture and protocol. LISP replaces a single IP address with two numbering spaces—Routing Locators (RLOCs), which are topologically assigned to network attachment points and used for routing and forwarding of packets through the network; and Endpoint Identifiers (EIDs), which are assigned independently from the network topology and used for numbering devices, and are aggregated along administrative boundaries.

LISP defines functions for mapping between the two numbering spaces and encapsulating traffic originated by devices using non-routable EIDs for transport across a network infrastructure that routes and forwards using RLOCs. LISP provides a set of functions for devices to exchange information that is used to map non-routable EIDs to routable RLOCs.

LISP requires LISP-specific configuration of one or more LISP-related devices, such as the LISP egress tunnel router (ETR), ingress tunnel router (ITR), proxy ETR (PETR), proxy ITR (PITR), map resolver (MR), map server (MS), and LISP alternative logical topology (ALT) device.

Zone-Based Firewall and LISP Interoperability Overview

The zone-based firewall can be deployed either on the southbound or northbound of the Locator ID Separator Protocol (LISP) xTR device, depending on where the edge router (routers such as Cisco ASR 1000 Aggregation...
Services Routers) is located in the network. The ingress tunnel router (ITR) and egress tunnel router (ETR) together are called the xTR device.

When the zone-based firewall is at the northbound of the xTR device, then the firewall can view LISP encapsulated packets, such as LISP tunneled packets, that pass through the network.

When the zone-based firewall is at the southbound of the xTR device, then the firewall can view the original packet. However, the firewall is not aware of any LISP xTR processing or does not see any LISP header. For egress packets, the xTR device does LISP encapsulation and adds the LISP header on top of the original packet after the firewall inspection. For ingress packets, the xTR device does LISP decapsulation (removal of the LISP header) before the firewall inspection and as a result, the firewall only inspects the original packet; and has no interaction with LISP at all.

This section describes the scenario when the zone-based firewall is deployed at the southbound of the LISP xTR device:

If an edge router is configured as a LISP xTR device to perform LISP encapsulation and decapsulation functions, you can configure the zone-based firewall between the LISP interface and the interfaces that face the LISP local endpoint identifier (EID) devices on the same edge router. LISP header decapsulation is performed before the packet enters the zone-based firewall at the LISP interface. LISP header encapsulation is performed after the packet egresses from the firewall at the LISP interface. The firewall inspects only native traffic (what is native traffic here?) in the EID space.

This section describes the scenario when the zone-based firewall is deployed at the northbound of the LISP xTR device:

If more than one edge routers are deployed as load-sharing routers at the northbound of the xTR device, the firewall on the edge router is considered northbound of the xTR device. In this case, all packets that pass through the zone-based firewall are LISP encapsulated packets. When a packet arrives, the firewall inspects either the inner header or outer header of the LISP packets. By default, only the outer header is inspected. You can enable inner header inspection by using the `lisp inner-packet-inspection` command.

In Cisco IOS XE Release, if LISP inner packet inspection is enabled, the firewall only inspects the first fragmented inner packet, and all subsequent inner packets pass through the firewall without further inspection. If LISP inner packet inspection is enabled, the LISP instance ID is treated as virtual routing and forwarding (VRF) ID, and LISP packets that belong to different instance IDs are associated with different zone-based firewall sessions.

**Feature Interoperability LISP**

In Cisco IOS XE Release 3.13S, the LISP and Zone-Based Firewall Integration and Interoperability feature, works with the following features:

- IPv4 inner and outer headers
- IPv6 inner and outer headers
- LISP multitenancy
- Application layer gateways (ALGs)
- Application Inspection and Control (AIC)
- Multiprotocol Label Switching (MPLS)
- In-Service Software Upgrade (ISSU)
Intrachassis and Interchassis High Availability for Zone-Based Firewall and LISP Integration

In Cisco IOS XE Release 3.14S, the LISP and Zone-Based Firewall Integration and Interoperability feature supports both intrachassis and interchassis high availability. When Location ID Separation Protocol (LISP) inner packet inspection is enabled, interchassis and intrachassis redundancy are supported at the xTR northbound device.

For LISP inner packet inspection at the northbound device, LISP instance ID is used as the virtual routing and forwarding (VRF) instance. The VRF configuration at northbound device is ignored if LISP inner packet inspection is enabled.

When two devices are located at the northbound of the xTR device and the xTR device is located inside the cloud, if LISP inner packet inspection is enabled on both devices, zone-based firewall sessions that are created for LISP inner packet flow is synced to the standby device.

A typical interchassis (box-to-box) high availability topology will have two devices in the routing locator (RLOC) space at the northbound of the xTR device. The xTR device sits in the inside network. If LISP inner packet inspection is enabled on both devices, zone-based firewall sessions that are created for LISP inner packets are synced to the standby device.

There are no configuration changes for intrachassis redundancy.

How to Configure LISP and Zone-Based Firewalls Integration and Interoperability

Enabling LISP Inner Packet Inspection

You can configure LISP inner packet inspection after configuring the `parameter-map type inspect global` command or the `parameter-map type inspect-global` command.

Note

You cannot configure both these commands simultaneously.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `parameter-map type inspect global`
4. `lisp inner-packet-inspection`
5. `end`
6. `show parameter-map type {inspect global | inspect-global}`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>parameter-map type inspect global</code></td>
<td>Configures a global inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the inspect action, and enters parameter-map type inspect configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config)# parameter-map type inspect global</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>lisp inner-packet-inspection</code></td>
<td>Enables LISP inner packet inspection.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config-profile)# lisp inner-packet-inspection</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>end</code></td>
<td>Exits parameter-map type inspect configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config-profile)# end</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td>`show parameter-map type {inspect global</td>
<td>inspect-global`</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device# show parameter-map type inspect-global</td>
<td></td>
</tr>
</tbody>
</table>

### Example

The following sample output from the `show parameter-map type inspect-global` command displays that LISP inner-packet inspection is enabled:

```
Device# show parameter-map type inspect-global

parameter-map type inspect-global
  log dropped-packet off
  alert on
  aggressive aging disabled
  syn_flood_limit unlimited
  tcp window scaling enforcement loose off
  max_incomplete unlimited aggressive aging disabled
  max_incomplete TCP unlimited
  max_incomplete UDP unlimited
  max_incomplete ICMP unlimited
  application-inspect all
  vrf default inspect vrf-default
  vrf vrf2 inspect vrf-default
  vrf vrf3 inspect vrf-default
```
Configuring Interchassis High Availability for LISP Inner Packet Inspection

Configuring the xTR Southbound Interface for Interchassis High Availability

Before you begin

Prerequisites

- Zones and zone-pairs must be configured.
- Redundancy and redundancy groups must be configured. See, the "Configuring Firewall Stateful Interchassis Redundancy" module in the Zone-Based Policy Firewall Configuration Guide for more information.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. vrf forwarding vrf-name
5. description string
6. ip address ip-address mask
7. exit
8. interface type number
9. description string
10. zone-member security zone-name
11. exit
12. interface type number
13. description string
14. ip address ip-address mask
15. zone-member security zone-name
16. cdp enable
17. end

### Configuring the xTR Northbound Interface for LISP Inner Packet Inspection

In this configuration, a Locator ID Separation Protocol (LISP) virtual interface is not needed because at northbound the LISP header is not inspected. However, you can configure the zone-based firewall to inspect either LISP inner packets or outer packets.

**Before you begin**

- Zones and zone-pairs must be configured.
- Redundancy and redundancy groups must be configured. See, the "Configuring Firewall Stateful Interchassis Redundancy" module in the *Zone-Based Policy Firewall Configuration Guide* for more information.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `description string`
5. `ip address ip-address mask`
6. `zone-member security zone-name`
7. `negotiation auto`
8. `redundancy rii id`
### DETAILED STEPS

<table>

Device(config-if)# end | Exits interface configuration mode and returns to privileged EXEC mode. |

## Configuration Examples for LISP and Zone-Based Firewalls Integration and Interoperability

### Example: Enabling LISP Inner Packet Inspection

```
Device# configure terminal
Device(config)# parameter-map type inspect-global
Device(config-profile)# lisp inner-packet-inspection
Device(config-profile)# end
```

The following example shows a zone-based firewall configuration with LISP inner-packet inspection enabled:

```
address-family ipv4
exit-address-family
!
address-family ipv6
exit-address-family

class-map type inspect match-any c-ftp-tcp
match protocol ftp
match protocol telnet
match protocol http
match protocol tcp
match protocol udp
!
policy-map type inspect p1
class type inspect c-ftp-tcp
inspect
class class-default
!
zone security ge0-0-0
!
zone security ge0-0-3
!
zone-pair security zp-ge000-ge003 source ge0-0-0 destination ge0-0-3
service-policy type inspect p1
!
zone-pair security zp-ge003-ge000 source ge0-0-3 destination ge0-0-0
service-policy type inspect p1
!
interface TenGigabitEthernet 1/3/0
```
Example: Configuring Interchassis High Availability for LISP Inner Packet Inspection

In the figure below, LISP 0 is the LISP virtual interface and this interface performs LISP header encapsulation and decapsulation. Firewall zone pairs must be configured between the LISP 0 interface and LAN2. Redundant Groups (RGs) are configured on both LAN1 and LAN2. RGs configured under LAN2 is used to synchronize zone-based firewall sessions between active and standby devices.

*Figure 1: xTR Devices with Box-to-Box High Availability Deployment*

The following is a sample interchassis high availability configuration with a LISP virtual interface:

```
ip address 192.168.1.1 255.255.255.0
ipv6 address 2001:DB8:100::2/64
zone-member security ge0-0-0
!
interface TenGigabitEthernet 0/3/0
ip address 192.168.2.1 255.255.255.0
ipv6 address 2001:DB8:200::2/64
zone-member security ge0-0-3
!
parameter-map type inspect global
lisp inner-packet-inspection
log dropped-packet off
alert on
```

Feature Information for LISP and Zone-Based Firewall Integration and Interoperability

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for LISP and Zone-Based Firewall Integration and Interoperability

<tbody>
<tr>
<td>LISP and Zone-Based Firewall Integration and Interoperability</td>
<td>Cisco IOS XE Release 3.13S</td>
<td>The LISP and Zone-Based Firewall Integration and Interoperability feature enables inner-packet inspection of all Locator ID Separation Protocol (LISP) data packets that pass through a device. To enable LISP inner packet inspection, you have to configure the <code>lisp inner-packet-inspection</code> command. Without LISP inner inspection, endpoint identifier (EID) devices in a LISP network will not have any firewall protection. The following commands were introduced or modified by this feature: <code>lisp inner-packet-inspection</code>, <code>show parameter-map type inspect-global</code>, and <code>show parameter-map type inspect global</code>.</td>
