VPN Access Control Using 802.1X Authentication

The home access router provides connectivity to the corporate network through a Virtual Private Network (VPN) tunnel through the Internet. In the home LAN, apart from the employee, other members of the household may also be using the same access router. The VPN Access Control Using 802.1X Authentication feature allows enterprise employees to access their enterprise networks from home while allowing other household members to access only the Internet. The feature uses the IEEE 802.1X protocol framework to achieve the VPN access control. The authenticated employee has access to the VPN tunnel and others (unauthenticated users on the same LAN) have access only to the Internet.

An authentication manager has been added to allow more flexible authentication between different authentication methods like, dot1x, MAC address bypass, and web authentication. See the 802.1X Flexible Authentication feature for more information.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for VPN Access Control Using 802.1X Authentication

- The PCs connecting behind the router should have 802.1X clients running on them.
- You should know how to configure authentication, authorization, and accounting (AAA) and RADIUS.
- You should be familiar with IP Security (IPSec).
- You should be familiar with Dynamic Host Configuration Protocol (DHCP).
- You should know how to configure user lists on a Cisco access control server (ACS).

Restrictions for VPN Access Control Using 802.1X Authentication

- Easy VPN is not supported.
- VLAN interfaces are currently not supported.
- If there is a switch located between the router and the supplicant (client PC), the Extensible Authentication Protocol over LAN (EAPOL) frames will not reach the router because the switch discards them.

Information About VPN Access Control Using 802.1X Authentication

- How VPN Control Using 802.1X Authentication Works, page 2
- Authentication Using Passwords and MD5, page 4

How VPN Control Using 802.1X Authentication Works

The home access router provides connectivity to the corporate network through a VPN tunnel through the Internet. In the home LAN, both authenticated (employee) and unauthenticated (other household members) users exist, and both have access to the corporate VPN tunnel. Currently there is no existing mechanism to prevent the unauthenticated user from accessing the VPN tunnel.

To distinguish between the users, the VPN Access Control Using 802.1X Authentication feature uses the IEEE 802.1X protocol that allows end hosts to send user credentials on Layer 2 of the network operating system. Unauthenticated traffic users will be allowed to pass through the Internet but will be blocked from accessing the corporate VPN tunnel. The VPN Access Control Using 802.1X feature expands the scope of the 802.1X standard to authenticate devices rather than ports, meaning that multiple devices can be independently authenticated for any given port. This feature separates traffic from authenticated and unauthenticated users so that separate access policies can be applied.

When an 802.1X-capable host starts up, it will initiate the authentication phase by sending the EAPOL-Start 802.1X protocol data unit (PDU) to the reserved IEEE multicast MAC address (01-80-C2-00-00-03) with the Ethernet type or length set to 0x888E.
All 802.1X PDUs will be identified as such by the Ethernet driver and will be enqueued to be handled by an 802.1X process. On some platforms, Ethernet drivers have to program the interface address filter so that EAPOL packets can be accepted.

On the router, the receipt of the EAPOL-Start message will result in the source MAC address being “remembered,” and an EAPOL-request or identity PDU being sent to the host. The router will send all host-addressed PDUs to the individual MAC address of the host rather than to the multicast address.

### 802.1X Authentication Sample Topology and Configuration

The figure below illustrates a typical scenario in which VPN access control using 802.1X authentication is in place.

![Typical 802.1X Authentication Setup](image)

In the figure above, all the PCs are 802.1X capable hosts, and the Cisco router is an authenticator. All the PCs are connected to the built-in hub or to an external hub. If a PC does not support 802.1X authentication, MAC-based authentication is supported on the Cisco router. You can have any kind of connectivity or network beyond the Cisco router WAN.

---

**Note**

If there is a switch located between the router and the supplicant (client PC), the EAPOL frames will not reach the router because the switch discards them.

- A supplicant is an entity at one end of a point-to-point LAN segment that is being authenticated by an authenticator that is attached to the other end of that link.

### Converged 802.1X Authenticator Support

The Cisco IOS commands in Cisco IOS Release 12.4(6)T for 802.1X authenticators have been standardized to work the same way on various Cisco IOS platforms.
802.1X Supplicant Support

There are deployment scenarios in which a network device (a router acting as an 802.1X authenticator) is placed in an unsecured location and cannot be trusted as an authenticator. This scenario requires that a network device be able to authenticate itself against another network device. The 802.1X supplicant support functionality provides the following solutions for this requirement:

- An Extensible Authentication Protocol (EAP) framework has been included so that the supplicant has the ability to “understand” and “respond” to EAP requests. EAP-Message Digest 5 (EAP-MD5) is currently supported.
- Two network devices that are connected through an Ethernet link can act as a supplicant and as an authenticator simultaneously, thus providing mutual authentication capability.
- A network device that is acting as a supplicant can authenticate itself with more than one authenticator (that is, a single port on a supplicant can be connected to multiple authenticators).

The following illustration is an example of 802.1X supplicant support. The illustration shows that a single supplicant port has been connected to multiple authenticators. Router A is acting as an authenticator to devices that are sitting behind it on the LAN while those devices are acting as supplicants. At the same time, Router B is an authenticator to Router A (which is acting as a supplicant). The RADIUS server is located in the enterprise network.

When Router A tries to authenticate devices on the LAN, it needs to “talk” to the RADIUS server, but before it can allow access to any of the devices that are sitting behind it, it has to prove its identity to Router B. Router B checks the credential of Router A and gives access.

Converged 802.1X Supplicant Support

The Cisco IOS commands in Cisco IOS Release 12.4(6)T for 802.1X supplicants have been standardized to work the same way on various Cisco IOS platforms. See the Configuring a Router As an 802.1X Supplicant module.

Authentication Using Passwords and MD5

For information about using passwords and Message Digest 5 (MD5), see the following document on Cisco.com:
How to Configure VPN Access Control Using 802.1X Authentication

• Configuring a AAA RADIUS Server, page 5
• Configuring a Router, page 5
• Configuring a PC As an 802.1X Supplicant, page 20
• Configuring a Router As an 802.1X Supplicant, page 23
• Monitoring VPN Access Control Using 802.1X Authentication, page 25
• Verifying VPN Access Control Using 802.1X Authentication, page 26

Configuring a AAA RADIUS Server
To configure an AAA RADIUS server, perform the following steps.

SUMMARY STEPS
1. Configure entries for the network access server and associated shared secrets.
2. Add the username and configure the password of the user.
3. Configure a global or per-user authentication scheme.

DETAILED STEPS

Step 1 Configure entries for the network access server and associated shared secrets.

Note The AAA server can be FreeRADIUS or Cisco Secure ACS or any other similar product with 802.1X support.

Step 2 Add the username and configure the password of the user.

Step 3 Configure a global or per-user authentication scheme.

Configuring a Router

• Enabling 802.1X Authentication, page 6
• Configuring Router and RADIUS Communication, page 8
• Configuring 802.1X Parameters Retransmissions and Timeouts, page 9
• Configuring the Identity Profile, page 12
• Configuring the Identity Profile, page 14
• Configuring the DHCP Private Pool, page 15
• Configuring the DHCP Public Pool, page 16
• Configuring the Interface, page 17
• Configuring an Interface Without Assigning an Explicit IP Address to the Interface, page 18
• Configuring the Necessary Access Control Policies, page 20
Enabling 802.1X Authentication

To enable 802.1X port-based authentication, you should configure the router so that it can communicate with the AAA server, enable 802.1X globally, and enable 802.1X on the interface. To enable 802.1X port-based authentication, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication dot1x [default | listname] method1 [method2...]`
5. `dot1x system-auth-control`
6. `identity profile default`
7. `interface type slot / port`
8. `dot1x port-control auto`

**DETAILED STEPS**

<table>
<thead>
<tr>

<td>Enters interface configuration mode and specifies the interface to be enabled for 802.1X port-based authentication.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router (config-identity-prof)# interface fastethernet 0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> <code>dot1x port-control auto</code></td>
<td>Enables 802.1X port-based authentication on the interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router (config-if)# dot1x port-control auto</code></td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example shows that 802.1X authentication has been configured on a router:

```
Router# configure terminal
Router(config)# aaa new-model
Router(config)# aaa authentication dot1x default group radius group radius
Router(config)# dot1x system-auth-control
Router(config)# interface fastethernet 1
Router(config-if)# dot1x port-control auto
```

The following `show dot1x` command sample output shows that 802.1X authentication has been configured on a router:

```
Router# show dot1x all
Sysauthcontrol       Enabled
Dot1x Protocol Version 2
Dot1x Info for FastEthernet1
---------------------------------------------------------------
PAE                   = AUTHENTICATOR
PortControl           = AUTO
ControlDirection      = Both
HostMode              = MULTI_HOST
ReAuthentication      = Enabled
QuietPeriod           = 600
ServerTimeout         = 60
SuppTimeout           = 30
ReAuthPeriod          = 1800 (Locally configured)
ReAuthMax             = 2
MaxReq                = 3
```
Configuring Router and RADIUS Communication

To configure RADIUS server parameters, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip radius source-interface interface-name`
4. `radius-server host {hostname | ip-address}`
5. `radius-server key string`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>ip radius source-interface interface-name</code></td>
<td>Forces RADIUS to use the IP address of a specified interface for all outgoing RADIUS packets.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config)# ip radius source-interface fastethernet1</td>
</tr>
<tr>
<td><strong>Step 4</strong> `radius-server host {hostname</td>
<td>ip-address}`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config)# radius-server host 192.0.2.0</td>
</tr>
<tr>
<td></td>
<td>• To use multiple RADIUS servers, reenter this command for each server.</td>
</tr>
</tbody>
</table>
Step 5  radius-server key string

Example:

Router (config)# radius-server key radiuskey

Configures the authorization and encryption key used between the router and the RADIUS daemon running on the RADIUS server.

- The key is a text string that must match the encryption key used on the RADIUS server.

Example

The following example shows that RADIUS server parameters have been configured on the router:

Router# configure terminal
Router(config)# ip radius source-interface ethernet1
Router(config)# radius-server host 192.0.2.1
Router(config)# radius-server key radiuskey

Configuring 802.1X Parameters Retransmissions and Timeouts

Various 802.1X retransmission and timeout parameters can be configured. Because all of these parameters have default values, configuring them is optional. To configure the retransmission and timeout parameters, perform the following steps.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type slot / port
4. dot1x max-req number-of-retries
5. dot1x port-control {auto|force-authorized|force-unauthorized}
6. dot1x control-direction {both | in}
7. dot1x reauthentication
8. dot1x timeout tx-period seconds
9. dot1x timeout server-timeout seconds
10. dot1x timeout reauth-period seconds
11. dot1x timeout quiet-period seconds
12. dot1x timeout ratelimit-period seconds

DETAILED STEPS

Command or Action | Purpose
--- | ---
Step 1 | enable
Example:
Router> enable

Enables privileged EXEC mode.

- Enter your password if prompted.
<table>
<thead>
<tr>

</tbody>
</table>

**Configuring 802.1X Parameters Retransmissions and Timeouts**

- **Step 5** dot1x port-control [auto|force-authorized|force-unauthorized]
  - **Example:**
  - Router (config-if)# dot1x port-control auto

- **Step 6** dot1x control-direction {both|in}
  - **Example:**
  - Router (config-if)# dot1x control-direction both

- **Step 7** dot1x reauthentication
  - **Example:**
  - Router (config-if)# dot1x reauthentication

- **Step 2** configure terminal
  - **Purpose:** Enters global configuration mode.
  - **Example:**
  - Router# configure terminal

- **Step 3** interface *type* *slot* / *port*
  - **Purpose:** Enters interface configuration mode and specifies the interface to be enabled for 802.1X port-based authentication.
  - **Example:**
  - Router (config)# interface FastEthernet 0/1

- **Step 4** dot1x max-req *number-of-retries*
  - **Purpose:** Sets the maximum number of times that the router sends an EAP request/identity frame (assuming that no response is received) to the supplicant before concluding that the supplicant does not support 802.1X.
  - **Example:**
  - Router (config-if)# dot1x max-req 3

- **Step 5** dot1x port-control [auto|force-authorized|force-unauthorized]
  - **Example:**
  - Router (config-if)# dot1x port-control auto

- **Step 6** dot1x control-direction {both|in}
  - **Example:**
  - Router (config-if)# dot1x control-direction both

- **Step 7** dot1x reauthentication
  - **Example:**
  - Router (config-if)# dot1x reauthentication

- **Step 2** configure terminal
  - **Purpose:** Enters global configuration mode.
  - **Example:**
  - Router# configure terminal

- **Step 3** interface *type* *slot* / *port*
  - **Purpose:** Enters interface configuration mode and specifies the interface to be enabled for 802.1X port-based authentication.
  - **Example:**
  - Router (config)# interface FastEthernet 0/1

- **Step 4** dot1x max-req *number-of-retries*
  - **Purpose:** Sets the maximum number of times that the router sends an EAP request/identity frame (assuming that no response is received) to the supplicant before concluding that the supplicant does not support 802.1X.
  - **Example:**
  - Router (config-if)# dot1x max-req 3

- **Step 5** dot1x port-control [auto|force-authorized|force-unauthorized]
  - **Example:**
  - Router (config-if)# dot1x port-control auto

- **Step 6** dot1x control-direction {both|in}
  - **Example:**
  - Router (config-if)# dot1x control-direction both

- **Step 7** dot1x reauthentication
  - **Example:**
  - Router (config-if)# dot1x reauthentication

**Configuring a Router**

- **Step 2** configure terminal
  - **Purpose:** Enters global configuration mode.
  - **Example:**
  - Router# configure terminal

- **Step 3** interface *type* *slot* / *port*
  - **Purpose:** Enters interface configuration mode and specifies the interface to be enabled for 802.1X port-based authentication.
  - **Example:**
  - Router (config)# interface FastEthernet 0/1

- **Step 4** dot1x max-req *number-of-retries*
  - **Purpose:** Sets the maximum number of times that the router sends an EAP request/identity frame (assuming that no response is received) to the supplicant before concluding that the supplicant does not support 802.1X.
  - **Example:**
  - Router (config-if)# dot1x max-req 3

- **Step 5** dot1x port-control [auto|force-authorized|force-unauthorized]
  - **Example:**
  - Router (config-if)# dot1x port-control auto

- **Step 6** dot1x control-direction {both|in}
  - **Example:**
  - Router (config-if)# dot1x control-direction both

- **Step 7** dot1x reauthentication
  - **Example:**
  - Router (config-if)# dot1x reauthentication

**Configuring 802.1X Parameters Retransmissions and Timeouts**

- **Step 2** configure terminal
  - **Purpose:** Enters global configuration mode.
  - **Example:**
  - Router# configure terminal

- **Step 3** interface *type* *slot* / *port*
  - **Purpose:** Enters interface configuration mode and specifies the interface to be enabled for 802.1X port-based authentication.
  - **Example:**
  - Router (config)# interface FastEthernet 0/1

- **Step 4** dot1x max-req *number-of-retries*
  - **Purpose:** Sets the maximum number of times that the router sends an EAP request/identity frame (assuming that no response is received) to the supplicant before concluding that the supplicant does not support 802.1X.
  - **Example:**
  - Router (config-if)# dot1x max-req 3

- **Step 5** dot1x port-control [auto|force-authorized|force-unauthorized]
  - **Example:**
  - Router (config-if)# dot1x port-control auto

- **Step 6** dot1x control-direction {both|in}
  - **Example:**
  - Router (config-if)# dot1x control-direction both

- **Step 7** dot1x reauthentication
  - **Example:**
  - Router (config-if)# dot1x reauthentication

- **Step 2** configure terminal
  - **Purpose:** Enters global configuration mode.
  - **Example:**
  - Router# configure terminal

- **Step 3** interface *type* *slot* / *port*
  - **Purpose:** Enters interface configuration mode and specifies the interface to be enabled for 802.1X port-based authentication.
  - **Example:**
  - Router (config)# interface FastEthernet 0/1

- **Step 4** dot1x max-req *number-of-retries*
  - **Purpose:** Sets the maximum number of times that the router sends an EAP request/identity frame (assuming that no response is received) to the supplicant before concluding that the supplicant does not support 802.1X.
  - **Example:**
  - Router (config-if)# dot1x max-req 3

- **Step 5** dot1x port-control [auto|force-authorized|force-unauthorized]
  - **Example:**
  - Router (config-if)# dot1x port-control auto

- **Step 6** dot1x control-direction {both|in}
  - **Example:**
  - Router (config-if)# dot1x control-direction both

- **Step 7** dot1x reauthentication
  - **Example:**
  - Router (config-if)# dot1x reauthentication
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 8** dot1x timeout tx-period *seconds* | Sets the timeout for supplicant retries.  
  - If an 802.1X packet is sent to the supplicant and the supplicant does not send a response, the packet will be sent again after the time that was set using the *seconds* argument.  
  - The value is 1 through 65535 seconds. The default is 30 seconds. |
| **Example:** | Router (config-if)# dot1x timeout tx-period 60 |

| **Step 9** dot1x timeout server-timeout *seconds* | Sets the timeout for RADIUS retries.  
  - If an 802.1X packet is sent to the server, and the server does not send a response, the packet will be sent again after the time that was set using the *seconds* argument.  
  - The value is from 1 to 65535 seconds. The default is 30 seconds. |
| **Example:** | Router (config-if)# dot1x timeout server-timeout 60 |

| **Step 10** dot1x timeout reauth-period *seconds* | Sets the time after which an automatic reauthentication should be initiated.  
  - The value is from 1 to 65535 seconds. The default is 3600 seconds. |
| **Example:** | Router (config-if)# dot1x timeout reauth-period 1800 |

| **Step 11** dot1x timeout quiet-period *seconds* | The time after which authentication is restarted after the authentication has failed.  
  - The value is from 1 to 65535 seconds. The default is 120 seconds. |
| **Example:** | Router (config-if)# dot1x timeout quiet-period 600 |

| **Step 12** dot1x timeout ratelimit-period *seconds* | The rate limit period throttles the EAP-START packets from misbehaving supplicants.  
  - The value is from 1 to 65535 seconds. |
| **Example:** | Router (config-if)# dot1x timeout ratelimit-period 60 |
Examples
The following configuration example shows that various retransmission and timeout parameters have been configured:

Router# configure terminal

Router(config)# interface FastEthernet1

Router(config-if)# dot1x port-control auto

Router(config-if)# dot1x reauthentication

Router(config-if)# dot1x timeout reauth-period 1800

Router(config-if)# dot1x timeout quiet-period 600

Router(config-if)# dot1x timeout supp-timeout 60

Router(config-if)# dot1x timeout server-timeout 60

Configuring the Identity Profile
The identity profile default command allows you to configure the static MAC addresses of the client that do not support 802.1X and to authorize or unauthorize them statically. The VPN Access Control Using 802.1X Authentication feature allows authenticated and unauthenticated users to be mapped to different interfaces. Under the dot1x profile configuration mode, you can specify the virtual template interface that should be used to create the virtual-access interface to which unauthenticated supplicants will be mapped. To specify which virtual template interface should be used to create the virtual access interface, perform the following steps.

SUMMARY STEPS
1. enable
2. configure terminal
3. identity profile default
4. description line-of-description
5. template virtual-template
6. device [authorize | not-authorize] mac-address mac-address
7. device authorize type device-type

**Configuring the DHCP Private Pool**

The VPN Access Control Using 802.1X Authentication feature can be configured with one DHCP pool or two. If there are two pools, the unauthenticated and authenticated devices will get their addresses from separate DHCP pools. For example, the public pool can have an address block that has only local significance, and the private pool can have an address that is routable over the VPN tunnel.

**SUMMARY STEPS**

1. ip dhcp pool name
2. network network-number [mask]
3. default-router address
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> ip dhcp pool name</td>
<td>Configures a DHCP private address pool on a Cisco IOS DHCP server and enters DHCP pool configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config)# ip dhcp pool private</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> network network-number [mask]</td>
<td>Configures the subnet number and mask for a DHCP private address pool on a Cisco IOS DHCP server.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (dhcp-config)# network 209.165.200.225 255.255.255.224</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> default-router address</td>
<td>Specifies the default router list for a DHCP client.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (dhcp-config)# default-router 192.0.2.2</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring the DHCP Public Pool**

The VPN Access Control Using 802.1X Authentication feature can be configured with one DHCP pool or two. If there are two pools, the unauthenticated and authenticated devices will get their addresses from separate DHCP pools. For example, the public pool can have an address block that has only local significance, and the private pool can have an address that is routable over the VPN tunnel.

**SUMMARY STEPS**

1. ip dhcp pool name
2. network network-number [mask]
3. default-router address
4. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> ip dhcp pool name</td>
<td>Configures the DHCP public address pool on a Cisco IOS DHCP server.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config-dhcp)# ip dhcp pool public</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 2</th>
<th>network network-number [mask]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-dhcp)# network 209.165.200.226 255.255.255.224</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Configures the subnet number and mask for a DHCP public address pool on a Cisco IOS DHCP server.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>default-router address</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-dhcp)# default-router 192.0.2.3</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Specifies the default router list for a DHCP client.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>exit</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config-dhcp)# exit</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Exits DHCP pool configuration mode.</td>
</tr>
</tbody>
</table>

### Configuring the Interface

#### SUMMARY STEPS

1. `configure terminal`
2. `interface type slot / port`
3. `ip address ip-address mask [secondary]`
4. `interface virtual-template number`
5. `ip address ip-address mask [secondary]`
6. `exit`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

| **Example:** | Router# configure terminal |
### Configuring an Interface Without Assigning an Explicit IP Address to the Interface

#### SUMMARY STEPS

1. enable
2. configure terminal
3. interface type slot / port
4. ip unnumbered type number

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> interface type slot / port</td>
<td>Enters interface configuration mode and specifies the interface to be enabled.</td>
</tr>
</tbody>
</table>

**Example:**
```
Router (config)# interface loopback 0/1
```

<table>
<thead>
<tr>
<th><strong>Step 3</strong> ip address ip-address mask [secondary]</th>
<th>Sets the private IP address for the interface.</th>
</tr>
</thead>
</table>

**Example:**
```
Router (config-if)# ip address 209.165.200.227 255.255.255.224
```

<table>
<thead>
<tr>
<th><strong>Step 4</strong> interface virtual-template number</th>
<th>Creates a virtual template interface that can be configured and applied dynamically in creating virtual access interfaces.</th>
</tr>
</thead>
</table>

**Example:**
```
Router (config-if)# interface virtual-template 1
```

<table>
<thead>
<tr>
<th><strong>Step 5</strong> ip address ip-address mask [secondary]</th>
<th>Sets the public IP address for the interface.</th>
</tr>
</thead>
</table>

**Example:**
```
Router (config-if)# ip address 209.165.200.227 255.255.255.224
```

<table>
<thead>
<tr>
<th><strong>Step 6</strong> exit</th>
<th>Exits interface configuration mode.</th>
</tr>
</thead>
</table>

**Example:**
```
Router (config-if)# exit
```
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface type slot / port</td>
<td>Enters interface configuration mode and specifies the interface to be enabled.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router (config)# interface virtual-template 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip unnumbered type number</td>
<td>Enables IP processing on an interface without assigning an explicit IP address to the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router (config-if)# ip unnumbered loopback 0</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

The following example shows that the identity profile associates virtual-template1 with unauthenticated supplicants. Virtual-template1 gets its IP address from interface loopback 0, and unauthenticated supplicants are associated with a public pool. Authenticated users are associated with a private pool.

```
Router(config)# identity profile default
Router(config-identity-prof)# description put the description here
Router(config-identity-prof)# template virtual-template1
Router(config-identity-prof)# exit
Router(config)# ip dhcp pool private
Router(dhcp-config)# default-router 192.0.2.0
Router(dhcp-config)# exit
Router(config)# ip dhcp pool public
Router(dhcp-config)# default-router 192.0.2.1
Router(dhcp-config)# exit
Router(config)# interface
Router(dhcp-config)# network 209.165.200.225 255.255.255.224
Router(dhcp-config)# default-router 192.0.2.1
Router(dhcp-config)# exit
Router(config)# interface loopback0
Router(config-if)# interface ethernet0
Router(config-if)# ip address 209.165.200.226 255.255.255.224
Router(config-if)# exit
Router(config)# interface virtual-template1
Router(config-if)# ip unnumbered loopback 0
```
Configuring the Necessary Access Control Policies

802.1X authentication separates traffic from authenticated and unauthenticated devices. Traffic from authenticated devices transit through the physical interface, and unauthenticated traffic transits through the Virtual-Template1. Therefore, different policies can be applied on each interface. The configuration will also depend on whether two DHCP pools or a single DHCP pool is being used. If a single DHCP pool is being used, access control can be configured on Virtual-Template1, which will block any traffic from going to the networks to which unauthenticated devices should not have access. These networks (to which unauthenticated devices should not have access) could be the corporate subnetworks protected by the VPN or encapsulated by generic routing encapsulation (GRE). There can also be access control that restricts the access between authenticated and unauthenticated devices.

If two pools are configured, the traffic from a non-trusted pool is routed to the Internet using Network Address Translation (NAT), whereas trusted pool traffic is forwarded through a VPN tunnel. The routing can be achieved by configuring ACLs used by NAT and VPN accordingly.

For an example of an access control policy configuration, see the Access Control Policies Example section.

Configuring a PC As an 802.1X Supplicant

To configure your PC for VPN Access Control Using 802.1X Authentication, perform the following steps.

**SUMMARY STEPS**

1. Enable 802.1X for MD5.
2. Enable DHCP.

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enable 802.1X for MD5.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Enable DHCP.</td>
</tr>
</tbody>
</table>

Enabling 802.1X Authentication on a Windows 2000 XP PC

802.1X implementation on a Windows 2000/XP PC is unstable. A more stable 802.1X client, AEGIS (beta) for Microsoft Windows, is available at the Meetinghouse Data Communications website at www.mtghouse.com.
Enabling 802.1X Authentication on a Windows 2000 PC

To enable 802.1X authentication on your Windows 2000 PC, perform the following steps.

**SUMMARY STEPS**

1. Make sure that the PC has at least Service Pack 3.
2. Reboot your PC after installing the client.
3. Go to the Microsoft Windows registry and add or install the following entry:
4. Reboot your PC.

**DETAILED STEPS**

**Step 1**
Make sure that the PC has at least Service Pack 3.
Go to the page “Microsoft 802.1x Authentication Client” on the Microsoft Windows 2000 website at the following URL:
At the above site, download and install 802.1X client for Windows 2000.
If the above site is unavailable, search for the “Q313664: Recommended Update” page on the Microsoft Windows 2000 website at the following URL: http://www.microsoft.com/windows2000/downloads/recommended/q313664/default.asp

**Step 2**
Reboot your PC after installing the client.

**Step 3**
Go to the Microsoft Windows registry and add or install the following entry:
“HKLM\Software\Microsoft\EAPOL\Parameters\General\Global\SupplicantMode REG_DWORD 3”
(“SupplicantMode” key entry is not there by default under Global option in the registry. So add a new entry named “SupplicantMode” as REG_DOWORD and then set its value to 3.)

**Step 4**
Reboot your PC.

Enabling 802.1X Authentication on a Windows XP PC

To enable 802.1X authentication on a Windows XP PC, perform the following steps.

**SUMMARY STEPS**

1. Go to the Microsoft Windows registry and install the following entry there:
2. Reboot your PC.

**DETAILED STEPS**

**Step 1**
Go to the Microsoft Windows registry and install the following entry there:
“HKLM\Software\Microsoft\EAPOL\Parameters\General\Global\SupplicantMode REG_DWORD 3”

**Step 2**
Reboot your PC.
Enabling 802.1X Authentication on Windows 2000 and Windows XP PCs

To enable 802.1X authentication on Windows 2000 and Windows XP PCs, that is, if you are operating both at the same time, perform the following steps.

**SUMMARY STEPS**

1. Open the Network and Dial-up Connections window on your computer.
2. Right-click the Ethernet interface (Local Area Connection) to open the properties window. It should have a tab called “Authentication.”

**DETAILED STEPS**

**Step 1**
Open the Network and Dial-up Connections window on your computer.

**Step 2**
Right-click the Ethernet interface (Local Area Connection) to open the properties window. It should have a tab called “Authentication.”

Click the Authentication tab. Select the check box titled “Enable network access control using IEEE 802.1X.”

In a short period of time you should see a dialog box (for Windows 2000) or a floating window asking you to select it. Select it, and when the next window appears, enter the username and password in this dialog box. See the figure below.

---

![Local Area Connection Properties Window](image.png)

**Figure 3** **Local Area Connection Properties Window**

Select this option to provide authenticated network access for wired and wireless Ethernet networks.

- **Enable network access control using IEEE 802.1X**

- **EAP type:** MD5-Challenge

- **Authenticate as computer when computer information is available**

- **Authenticate as guest when user or computer information is unavailable**

---
### Configuring a Router As an 802.1X Supplicant

To configure a router as an 802.1X supplicant, perform the following steps.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa authentication dot1x {default | listname} method1 [method2...]`
4. `dot1x credentials name`
5. `username name`
6. `password [0 | 7] password`
7. `exit`
8. `interface type number`
9. `dot1x pae supplicant`
10. `dot1x credentials name`
11. `end`

- Troubleshooting Tips, page 25
Troubleshooting Tips

Use the debug commands in the Monitoring VPN Access Control Using 802.1X Authentication section to debug the supplicant.

Monitoring VPN Access Control Using 802.1X Authentication

To monitor VPN Access Control Using 802.1X Authentication, perform the following steps. The commands shown in the steps may be used one at a time and in no particular order.

**SUMMARY STEPS**

1. `enable`
2. `clear dot1x {all | interface}
3. `clear eap sessions [credentials credentials-name | interface interface-name | method method-name | transport transport-name]]`
4. `debug dot1x [ all | errors | events | feature | packets | redundancy | registry | state-machine ]`
5. `debug eap [ all | method | authenticator | peer ] { all | errors | events | packets | sm}`
6. `dot1x initialize [interface interface-name]`
7. `dot1x re-authenticate interface-type interface-number`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
| Example: | • Enter your password if prompted. |
| **Step 2** clear dot1x {all | interface} | Clears 802.1X interface information. |
| Example: | Router# clear dot1x all |
| **Step 3** clear eap sessions [credentials credentials-name | interface interface-name | method method-name | transport transport-name]] | Clears EAP information on a switch or for a specified port. |
| Example: | Router# clear eap sessions credentials typel |
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>debug dot1x [ all</td>
</tr>
</tbody>
</table>

**Example:**

Router# debug dot1x all

Displays 802.1X debugging information.
- **all** - Enables all 802.1X debugging messages.
- **errors** - Provides information about all 802.1X errors.
- **events** - Provides information about all 802.1X events.
- **feature** - Provides information about 802.1X features for switches only.
- **packets** - Provides information about all 802.1X packets.
- **redundancy** - Provides information about 802.1X redundancy.
- **registry** - Provides information about 802.1X registries.
- **state-machine** -- Provides information regarding the 802.1X state machine.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>debug eap [ all</td>
</tr>
</tbody>
</table>

**Example:**

Router# debug eap all

Displays information about EAP.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>dot1x initialize [interface interface-name]</td>
</tr>
</tbody>
</table>

**Example:**

Router# dot1x initialize interface FastEthernet1

Initializes an interface.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>dot1x re-authenticate interface-type interface-number</td>
</tr>
</tbody>
</table>

**Example:**

Router# dot1x re-authenticate FastEthernet1

Reauthenticates all the authenticated devices that are attached to the specified interface.

## Verifying VPN Access Control Using 802.1X Authentication

To verify VPN Access Control Using 802.1X Authentication, perform the following steps.
### SUMMARY STEPS

1. `enable`
2. `show dot1x [interface interface-name [details]]`
3. `show eap registrations [method | transport]`
4. `show eap sessions [credentials credentials-name | interface interface-name | method method-name | transport transport-name]`

### DETAILED STEPS

<table>
<thead>
<tr>

Access Control Policies Example

The following output example shows that access control policies have been configured.

**Single DHCP pool**

```
ip dhcp pool private
 network 209.165.200.236 255.255.255.224
 default-router 20.0.0.1
 exit
crypto isakmp policy 1
  authentication pre-share
 exit
 crypto isakmp key test address address
 crypto ipsec transform-set t1 esp-3des esp-sha-hmac
 mode tunnel
 crypto map test 1 ipsec-isakmp
 set peer address
 set transform-set t1
 match address 101
 access-list 101 permit ip 10.0.0.0 0.0.0.255 50.0.0.0 0.0.0.255
```
access-list 102 deny ip 10.0.0.0 0.0.0.255 50.0.0.0 0.0.0.255
access-list 102 permit ip any any
!

Feature Information for VPN Access Control Using 802.1X Authentication

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
