Secure Shell Version 2 Support

The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2. (SSH Version 1 support was implemented in an earlier Cisco software release.) SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. The only reliable transport that is defined for SSH is TCP. SSH provides a means to securely access and securely execute commands on another computer over a network. The Secure Copy Protocol (SCP) feature that is provided with SSH allows for the secure transfer of files.

- Feature Information for Secure Shell Version 2 Support, page 26

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for Secure Shell Version 2 Support

- Before configuring SSH, ensure that the required image is loaded on your device. The SSH server requires you to have a k9 (Triple Data Encryption Standard [3DES]) software image depending on your release.
- You have to use a SSH remote device that supports SSH Version 2 and connect to a Cisco device.
- SCP relies on authentication, authorization, and accounting (AAA) to function correctly. Therefore, AAA must be configured on the device to enable the secure copy protocol on the SSH Server.

**Note**

The SSH Version 2 server and the SSH Version 2 client are supported on your Cisco software, depending on your release. (The SSH client runs both the SSH Version 1 protocol and the SSH Version 2 protocol. The SSH client is supported in both k8 and k9 images depending on your release.)

For more information about downloading a software image, refer to the *Configuration Fundamentals Configuration Guide*.

Restrictions for Secure Shell Version 2 Support

- Secure Shell (SSH) servers and SSH clients are supported in Triple Data Encryption Standard (3DES) software images.
- Execution Shell, remote command execution, and Secure Copy Protocol (SCP) are the only applications supported.
- Rivest, Shamir, and Adleman (RSA) key generation is an SSH server-side requirement. Devices that act as SSH clients need not generate RSA keys.
- The RSA key pair size must be greater than or equal to 768 bits.
- The following features are not supported:
  - Port forwarding
  - Compression

Information About Secure Shell Version 2 Support

Secure Shell Version 2

The configuration for the SSH Version 2 server is similar to the configuration for SSH Version 1. The `ip ssh version` command defines the SSH version to be configured. If you do not configure this command, SSH by default runs in compatibility mode; that is, both SSH Version 1 and SSH Version 2 connections are honored.
SSH Version 1 is a protocol that has never been defined in a standard. If you do not want your device to fall back to the undefined protocol (Version 1), you should use the `ip ssh version` command and specify Version 2.

The `ip ssh rsa keypair-name` command enables an SSH connection using the Rivest, Shamir, and Adleman (RSA) keys that you have configured. Previously, SSH was linked to the first RSA keys that were generated (that is, SSH was enabled when the first RSA key pair was generated). This behavior still exists, but by using the `ip ssh rsa keypair-name` command, you can overcome this behavior. If you configure the `ip ssh rsa keypair-name` command with a key pair name, SSH is enabled if the key pair exists or SSH will be enabled if the key pair is generated later. If you use this command to enable SSH, you are not forced to configure a hostname and a domain name, which was required in SSH Version 1 of the Cisco software.

The login banner is supported in SSH Version 2, but it is not supported in Secure Shell Version 1.

**Secure Shell Version 2 Enhancements**

The SSH Version 2 Enhancements feature includes a number of additional capabilities such as supporting Virtual Routing and Forwarding (VRF)-Aware SSH, SSH debug enhancements, and Diffie-Hellman (DH) group exchange support.

The VRF-Aware SSH feature is supported depending on your release.

The Cisco SSH implementation has traditionally used 768-bit modulus, but with an increasing need for higher key sizes to accommodate DH Group 14 (2048 bits) and Group 16 (4096 bits) cryptographic applications, a message exchange between the client and the server to establish the favored DH group becomes necessary. The `ip ssh dh min size` command configures the modulus size on the SSH server. In addition to this, the `ssh` command was extended to add VRF awareness to the SSH client-side functionality through which the VRF instance name in the client is provided with the IP address to look up the correct routing table and establish a connection.

Debugging was enhanced by modifying SSH debug commands. The `debug ip ssh` command was extended to simplify the debugging process. Before the simplification of the debugging process, this command printed all debug messages related to SSH regardless of what was specifically required. The behavior still exists, but if you configure the `debug ip ssh` command with a keyword, messages are limited to information specified by the keyword.

**Secure Shell Version 2 Enhancements for RSA Keys**

Cisco SSH Version 2 supports keyboard-interactive and password-based authentication methods. The SSH Version 2 Enhancements for RSA Keys feature also supports RSA-based public key authentication for the client and the server.

User authentication—RSA-based user authentication uses a private/public key pair associated with each user for authentication. The user must generate a private/public key pair on the client and configure a public key on the Cisco SSH server to complete the authentication.
An SSH user trying to establish credentials provides an encrypted signature using the private key. The signature and the user’s public key are sent to the SSH server for authentication. The SSH server computes a hash over the public key provided by the user. The hash is used to determine if the server has a matching entry. If a match is found, an RSA-based message verification is performed using the public key. Hence, the user is authenticated or denied access based on the encrypted signature.

Server authentication—While establishing an SSH session, the Cisco SSH client authenticates the SSH server by using the server host keys available during the key exchange phase. SSH server keys are used to identify the SSH server. These keys are created at the time of enabling SSH and must be configured on the client.

For server authentication, the Cisco SSH client must assign a host key for each server. When the client tries to establish an SSH session with a server, the client receives the signature of the server as part of the key exchange message. If the strict host key checking flag is enabled on the client, the client checks if it has the host key entry corresponding to the server. If a match is found, the client tries to validate the signature by using the server host key. If the server is successfully authenticated, the session establishment continues; otherwise, it is terminated and displays a “Server Authentication Failed” message.

Note: Storing public keys on a server uses memory; therefore, the number of public keys configurable on an SSH server is restricted to ten users, with a maximum of two public keys per user.

Note: RSA-based user authentication is supported by the Cisco server, but Cisco clients cannot propose public key as an authentication method. If the Cisco server receives a request from an open SSH client for RSA-based authentication, the server accepts the authentication request.

Note: For server authentication, configure the RSA public key of the server manually and configure the `ip ssh stricthostkeycheck` command on the Cisco SSH client.

### SNMP Trap Generation

Depending on your release, Simple Network Management Protocol (SNMP) traps are generated automatically when an SSH session terminates if the traps have been enabled and SNMP debugging has been enabled. For information about enabling SNMP traps, see the “Configuring SNMP Support” module in the SNMP Configuration Guide.

Note: When you configure the `snmp-server host` command, the IP address must be the address of the PC that has the SSH (telnet) client and that has IP connectivity to the SSH server. For an example of an SNMP trap generation configuration, see the “” section.

You must also enable SNMP debugging using the `debug snmp packet` command to display the traps. The trap information includes information such as the number of bytes sent and the protocol that was used for the SSH session. For an example of SNMP debugging, see the “Example: SNMP Debugging” section.
SSH Keyboard Interactive Authentication

The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature. The feature is automatically enabled.

The following methods are supported:

- Password
- SecurID and hardware tokens printing a number or a string in response to a challenge sent by the server
- Pluggable Authentication Module (PAM)
- S/KEY (and other One-Time-Pads)

For examples of various scenarios in which the SSH Keyboard Interactive Authentication feature has been automatically enabled, see the “Examples: SSH Keyboard Interactive Authentication, on page 22” section.

How to Configure Secure Shell Version 2 Support

Configuring a Device for SSH Version 2 Using a Hostname and Domain Name

SUMMARY STEPS

1. enable
2. configure terminal
3. hostname name
4. ip domain-name name
5. crypto key generate rsa
6. ip ssh [time-out seconds | authentication-retries integer]
7. ip ssh version [1 | 2]
8. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

<th>Step 6</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>ip ssh pubkey-chain</code></td>
<td>Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> host1(config)# ip ssh pubkey-chain</td>
<td>- The user authentication is successful if the RSA public key stored on the server is verified with the public or the private key pair stored on the client.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>username username</code></td>
<td>Configures the SSH username and enters public-key user configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> host1(conf-ssh-pubkey)# username user1</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 8</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>key-string</code></td>
<td>Specifies the RSA public key of the remote peer and enters public-key data configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> host1(conf-ssh-pubkey-user)# key-string</td>
<td><strong>Note</strong> You can obtain the public key value from an open SSH client; that is, from the .ssh/id_rsa.pub file.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 9</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>key-hash key-type key-name</code></td>
<td>(Optional) Specifies the SSH key type and version.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> host1(conf-ssh-pubkey-data)# key-hash ssh-rsa key1</td>
<td>- The key type must be ssh-rsa for the configuration of private public key pairs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- This step is optional only if the <code>key-string</code> command is configured.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- You must configure either the <code>key-string</code> command or the <code>key-hash</code> command.</td>
</tr>
</tbody>
</table>
You can use a hashing software to compute the hash of the public key string, or you can also copy the hash value from another Cisco device. Entering the public key data using the `key-string` command is the preferred way to enter the public key data for the first time.

**Note**

Exits public-key data configuration mode and returns to privileged EXEC mode.

**Step 10**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Exits public-key data configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

```bash
host1(conf-ssh-pubkey-data)# end
```

</table>

Troubleshooting Tips

The `ip ssh version` command can be used for troubleshooting your SSH configuration. By changing versions, you can determine the SSH version that has a problem.

Enabling Secure Copy Protocol on the SSH Server

**Note**

The following task configures the server-side functionality for SCP. This task shows a typical configuration that allows the device to securely copy files from a remote workstation.
**SUMMARY STEPS**

1. enable
2. configure terminal
3. aaa new-model
4. aaa authentication login default local
5. aaa authorization exec default local
6. username name privilege privilege-level password password
7. ip ssh time-out seconds
8. ip ssh authentication-retries integer
9. ip scp server enable
10. exit
11. debug ip scp

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

### Examples

The following sample output from the `show ssh` command displays status of various SSH Version 1 and Version 2 connections for Version 1 and Version 2 connections:

```
Device# show ssh
Connection  Version  Encryption  State     Username
0           1.5       3DES        Session started  lab
Connection  Version  Mode    Encryption  Hmac    State
Username
1           2.0       IN         aes128-cbc  hmac-md5  Session started  lab
1           2.0       OUT        aes128-cbc  hmac-md5  Session started  lab
```

The following sample output from the `show ssh` command displays status of various SSH Version 1 and Version 2 connections for a Version 2 connection with no Version 1 connection:

```
Device# show ssh
Connection  Version  Mode    Encryption  Hmac    State
Username
1           2.0       IN         aes128-cbc  hmac-md5  Session started  lab
1           2.0       OUT        aes128-cbc  hmac-md5  Session started  lab
%No SSHv1 server connections running.
```

The following sample output from the `show ssh` command displays status of various SSH Version 1 and Version 2 connections for a Version 1 connection with no Version 2 connection:

```
Device# show ssh
Connection  Version  Encryption  Hmac    State
Username
1           2.0       IN         aes128-cbc  hmac-md5  Session started  lab
1           2.0       OUT        aes128-cbc  hmac-md5  Session started  lab
```
### Verifying the Secure Shell Status

#### SUMMARY STEPS

1. `enable`
2. `show ip ssh`
3. `exit`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>show ip ssh</code></td>
<td>Displays the version and configuration data for SSH.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Device# show ip ssh</td>
</tr>
<tr>
<td>3</td>
<td><code>exit</code></td>
<td>Exits privileged EXEC mode and returns to user EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Device# exit</td>
</tr>
</tbody>
</table>

#### Examples

The following sample output from the `show ip ssh` command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for Version 1 and Version 2 connections:

```
Device# show ip ssh
SSH Enabled - version 1.99
Authentication timeout: 120 secs; Authentication retries: 3
```

The following sample output from the `show ip ssh` command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 2 connection with no Version 1 connection:

```
SSH Enabled - version 1.99
Authentication timeout: 120 secs; Authentication retries: 3
```
Device# show ip ssh

SSH Enabled - version 2.0
Authentication timeout: 120 secs; Authentication retries: 3

The following sample output from the show ip ssh command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 1 connection with no Version 2 connection:

Device# show ip ssh

3d06h: %SYS-5-CONFIG_I: Configured from console by console
SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3

Monitoring and Maintaining Secure Shell Version 2

SUMMARY STEPS

1. enable
2. debug ip ssh
3. debug snmp packet

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

Configuration Examples for Secure Shell Version 2 Support

Example: Configuring Secure Shell Version 1

Device# configure terminal
Device(config)# ip ssh version 1

Example: Configuring Secure Shell Version 2

Device# configure terminal
Device(config)# ip ssh version 2

Example: Configuring Secure Shell Versions 1 and 2

Router# configure terminal
Router(config)# no ip ssh version

Example: Starting an Encrypted Session with a Remote Device

Device# ssh -v 2 -c aes256-cbc -m hmac-sha1-160 -l sship 10.76.82.24

Example: Configuring Server-Side SCP

Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authentication login default local
Device(config)# aaa authorization exec default local
Device(config)# username samplename privilege 15 password password1
Device(config)# ip ssh time-out 120
Device(config)# ip ssh authentication-retries 3
Device(config)# ip scp server enable
Example: Setting an SNMP Trap

The following example shows that an SNMP trap is set. The trap notification is generated automatically when the SSH session terminates. In the example, a.b.c.d is the IP address of the SSH client. For an example of SNMP trap debug output, see the "Example: SNMP Debugging, on page 24" section.

```
snmp-server
snmp-server host a.b.c.d public tty
```

Examples: SSH Keyboard Interactive Authentication

Example: Enabling Client-Side Debugs

The following example shows that the client-side debugs are turned on, and the maximum number of prompts is six (three for the SSH keyboard interactive authentication method and three for the password authentication method).

*Nov 17 12:51:11.411: SSH CLIENT0: session open
Example: Enabling ChPass with a Blank Password Change

In the following example, the ChPass feature is enabled, and a blank password change is accomplished using the SSH Keyboard Interactive Authentication method. A TACACS+ access control server (ACS) is used as the back-end AAA server.

Device1# ssh -l cisco 10.1.1.3
Password: cisco
Old Password: cisco
New Password: cisco123
Re-enter New password: cisco123
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]

Example: Enabling ChPass and Changing the Password on First Login

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end server. The password is changed on the first login using the SSH keyboard interactive authentication method.

Device1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -l cisco 10.1.1.3
Password: cisco1
Your password has expired.
Enter a new one now.
New Password: cisco
Re-enter New password: cisco12
The New and Re-entered passwords have to be the same.
Try again.
New Password: cisco
Re-enter New password: cisco
Device2>

Example: Enabling ChPass and Expiring the Password After Three Logins

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end AAA server. The password expires after three logins using the SSH keyboard interactive authentication method.

Device# ssh -l cisco 10.1.1.3
Password: cisco
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -l cisco 10.1.1.3
Password: cisco
Device2> exit
Device1# ssh -l cisco 10.1.1.3
Password: cisco
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired. Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123
Device2>

Example: SNMP Debugging

The following is sample output from the `debug snmp packet` command. The output provides SNMP trap information for an SSH session.

Device1# debug snmp packet
SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password:
Device2# exit
[Connection to 10.0.0.2 closed by foreign host]
Device1#

Examples: SSH Debugging Enhancements

The following is sample output from the `debug ip ssh detail` command. The output provides debugging information about the SSH protocol and channel requests.

Device# debug ip ssh detail
00:04:22: SSH0: starting SSH control process
00:04:22: SSH0: sent protocol version id SSH-1.99-Cisco-1.25
00:04:22: SSH0: protocol version id is - SSH-1.99-Cisco-1.25
00:04:22: SSH2 0: SSH2_MSG_KEXINIT sent
00:04:22: SSH2 0: SSH2_MSG_KEXINIT received
00:04:22: SSH2 0: expecting SSH2_MSG_KEXDH_INIT
00:04:22: SSH2 0: SSH2_MSG_KEXDH_INIT received
00:04:22: SSH2: kex_derive_keys complete
00:04:22: SSH2 0: SSH2_MSG_NEWKEYS sent
00:04:22: SSH2 0: waiting for SSH2_MSG_NEWKEYS
00:04:22: SSH2 0: SSH2_MSG_NEWKEYS received
00:04:24: SSH2 0: authentication successful for lab
00:04:24: SSH2 0: channel open request
00:04:24: SSH2 0: setting TTY - requested: height 24, width 80; set: height 24, width 80
00:04:24: SSH2 0: shell request
00:04:24: SSH2 0: shell message received
00:04:24: SSH2 0: starting shell for vty
00:04:38: SSH0: Session terminated normally

The following is sample output from the `debug ip ssh packet` command. The output provides debugging information about the SSH packet.

```
Device# debug ip ssh packet
00:05:43: SSH2 0: send:packet of length 280 (length also includes padlen of 4)
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: input: total packet length of 280 bytes
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 24 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 272 bytes, maclen 0
00:05:43: SSH2 0: input: padlength 4 bytes
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: input: total packet length of 144 bytes
00:05:43: SSH2 0: partial packet length(block size)8 bytes,needed 136 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received

00:05:43: SSH2 0: ssh_receive: 52 bytes received
00:05:43: SSH2 0: input: total packet length of 32 bytes
00:05:43: SSH2 0: partial packet length(block size)16 bytes,needed 16 bytes, maclen 20
00:05:43: SSH2 0: MAC compared for #3 :ok
```
Feature Information for Secure Shell Version 2 Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
### Table 1: Feature Information for Secure Shell Version 2 Support

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Secure Shell Version 2 Support</td>
<td>Cisco IOS 12.2(11)T</td>
<td>The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2 (SSH Version 1 support was implemented in an earlier Cisco IOS software release). SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. SSH version 2 also supports AES counter-based encryption mode. The following commands were introduced or modified: <code>debug ip ssh</code>, <code>ip ssh min dh size</code>, <code>ip ssh rsa keypair-name</code>, <code>ip ssh version</code>, <code>ssh</code>.</td>
</tr>
<tr>
<td>Secure Shell Version 2 Client and Server Support</td>
<td>Cisco IOS 12.3(7)JA</td>
<td>The Cisco IOS image was updated to provide for the automatic generation of SNMP traps when an SSH session terminates.</td>
</tr>
<tr>
<td>SSH Keyboard Interactive Authentication</td>
<td>Cisco IOS 12.2(33)SXH3</td>
<td>The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature.</td>
</tr>

<td>---------------------</td>
</tr>
<tr>
<td>Secure Shell Version 2 Enhancements</td>
<td>Cisco IOS 12.2(50)SY Cisco IOS 12.4(20)T Cisco IOS 15.1(2)S</td>
<td>The Secure Shell Version 2 Enhancements feature includes a number of additional capabilities such as support for VRF-aware SSH, SSH debug enhancements, and DH Group 14 and Group 16 exchange support. In Cisco IOS 15.1(2)S, support was added for the Cisco 7600 series router. <strong>Note</strong> Only the VRF-aware SSH feature is supported in Cisco IOS Release 12.2(50)SY. The following commands were introduced or modified: <code>debug ip ssh</code>, <code>ip ssh dh min size</code>.</td>
</tr>
<tr>
<td>Secure Shell Version 2 Enhancements for RSA Keys</td>
<td>Cisco IOS 15.0(1)M Cisco IOS 15.1(1)S</td>
<td>The Secure Shell Version 2 Enhancements for RSA Keys feature includes a number of additional capabilities to support RSA key-based user authentication for SSH and SSH server host key storage and verification. The following commands were introduced or modified: <code>ip ssh pubkey-chain</code>, <code>ip ssh stricthostkeycheck</code>.</td>
</tr>
