

## Segment Routing On Demand for L2VPN/VPWS

On-Demand Next Hop (ODN) for Layer 2 Virtual Private Network (L2VPN) creates a segment routing (SR) traffic-engineering (TE) auto-tunnel and uses the auto-tunnel for pseudowire dataplane.

## Feature Information for Segment Routing On Demand Next Hop for L2VPN/VPWS

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Table 1: Feature Information for Segment Routing On Demand Next Hop for L2VPN/VPWS

Feature Name	Releases	Feature Information
Segment Routing On Demand Next Hop for L2VPN/VPWS	Cisco IOS XE Amsterdam 17.3.2	<p>ODN for L2VPN is to create a SR TE auto-tunnel and use the auto-tunnel for pseudo-wire data-plane. The peer IP address is the destination of tunnel and TE LSP attribute determines the path of the tunnel.</p> <p>The following commands were added or modified:</p> <p><b>sh mpls l2 vc, sh mpls l2 vc detail, sh l2vpn atom preferred-path, sh l2vpn atom vc, sh mpls traffic-eng tun tun 2000, sh mpls ldp discovery, sh mpls ldp nei, sh int pseudowire 4243, sh xconnect all.</b></p>

## Restrictions for Segment Routing On Demand Next Hop for L2VPN/VPWS

- Layer-2 VPN/VPWS (Virtual Private Wire Service) On Demand Next Hop (ODN) is not supported with pseudowire (PW) class.
- The segment routing on demand for L2VPN or VPWS is not supported for BGP signaled/ADVPWS or Virtual Private LAN Service (VPLS).
- Only Segment-Routing TE tunnels are supported and created for L2VPN using attribute-set.
- L2VPN preferred path bandwidth related configuration does not take effect when TE attribute-set is configured.
- Only L2-VPN ODN VPWS with LDP signaling is supported.

## Information About Segment Routing On Demand Next Hop for L2VPN/VPWS

On Demand Next Hop (ODN) for L2VPN creates an SR TE auto-tunnel and uses the auto-tunnel for pseudowire dataplane. The peer IP address is the destination of tunnel and TE LSP attribute determines path of the tunnel. Sometimes a pseudowire connection may need to span multiple interior gateway protocol (IGP) areas while LDP is used as signaling protocol. The pseudowire endpoint provider edge's (PE) loopback addresses are not distributed across IGP area boundaries. In this case, one PE may not have a default route (or an exact match route) in its RIB to reach the peer PE of the pseudowire connection. Thus the pseudowire connection can not be signaled by LDP. A new option **autoroute destination** is introduced under LSP attribute to address this problem. When a LSP attribute is configured using the **autoroute destination** command, auto-tunnel uses the LSP attribute to automatically create a static route for the tunnel destination with the auto-tunnel interface as the next hop. This static route enables LDP to establish a LDP a session and exchange label mapping messages between two pseudowire endpoints.

**Note** Use the autoroute destination command only to configure LSP attribute used by LDP signaled L2VPN. It is not needed for BGP signaled Layer-3 VPN ODN.

## AToM Manager

Any Transport over MPLS (AToM) manager maintains a database of auto-tunnels on a pair of attribute set and peer ip addresses, the AToM manager can add or delete an SR TE auto-tunnel for a pseudowire interface (VC).

Any VC that is configured with the same attribute-set or peer uses the same auto-tunnel. An auto-tunnel can be removed from the database using TE service if an attribute set or peer pair is no longer used by any pseudowire interfaces.

## Inter-Area L2VPN ODN

When LDP is used as a signaling protocol and pseudowire connection is spanned across multiple Interior Gateway Protocols (IGPs), the pseudowire endpoint PE's loopback addresses are not distributed across IGP area boundaries. In this case, one PE may not have a default route (or an exact match route) in its RIB to reach the peer PE of the pseudowire connection. Thus the pseudowire connection can not be signaled by LDP.

# How to Configure Segment Routing On Demand Next Hop for L2VPN/VPWS

You can use either pseudowire interface command or template method to configure L2VPN/VPWS.

## Configuring Segment Routing On Demand Next Hop for L2VPN/VPWS Using Pseudowire Interface Commands

1. Run the following command on headend node (R1):

```
R1#
!
mpls traffic-eng auto-tunnel p2p tunnel-num min 2000 max 2002
!
interface GigabitEthernet0/3/1
 no ip address
 negotiation auto
 service instance 300 ethernet
 encapsulation dot1q 300
!
interface pseudowire4243
 encapsulation mpls
 neighbor 56.6.6.6 300
 preferred-path segment-routing traffic-eng attribute-set L2VPNODN
!
l2vpn xconnect context foobar
 member GigabitEthernet0/3/1 service-instance 300
```

```

    member pseudowire4243
    !
mpls traffic-eng lsp attributes L2VPNODN
  priority 7 7
  path-selection metric te
    !
end

```

2. Run the following command at tail end (R2):

```

R2#
!
mpls traffic-eng auto-tunnel p2p tunnel-num min 2000 max 2002

interface pseudowire4243
  encapsulation mpls
  neighbor 51.1.1.1 300
  preferred-path segment-routing traffic-eng attribute-set L2VPNODN
  !
interface GigabitEthernet0/2/2
  no ip address
  negotiation auto
  service instance 300 ethernet
  encapsulation dot1q 300
  !
l2vpn xconnect context foobar
  member GigabitEthernet0/3/1 service-instance 300
  member pseudowire4243
  !
mpls traffic-eng lsp attributes L2VPNODN
  priority 7 7
  path-selection metric te
  !
end

```

## Configuring Segment Routing On Demand Next Hop for L2VPN/VPWS Using Template Commands

1. Run the following command at headend node (R1):

```

R1#
template type pseudowire test
  encapsulation mpls
  preferred-path segment-routing traffic-eng attribute-set L2VPNODN
  !
interface GigabitEthernet0/3/1
  no ip address
  negotiation auto
  service instance 400 ethernet
  encapsulation dot1q 400
  !
l2vpn xconnect context foobar2
  member 56.6.6.6 400 template test
  member GigabitEthernet0/3/1 service-instance 400

```

2. Run the following command at tail end (R2):

```

R2#
!

```

```

template type pseudowire test
  encapsulation mpls
  preferred-path segment-routing traffic-eng attribute-set L2VPNODN
!
interface GigabitEthernet0/2/2
  no ip address
  negotiation auto
  service instance 400 ethernet
  encapsulation dot1q 400
!
l2vpn xconnect context foobar2
  member 51.1.1.1 400 template test
  member GigabitEthernet0/2/2 service-instance 400
!
end

```

## Configuring Segment Routing On Demand Next Hop for L2VPN/VPWS With Prepend Option

To control the path of LSP it is possible to enable prepend option. The prepend option is only supported with intra-area and supports labeled paths only. To enable prepend option use the following CLI:

```

R1(config-lsp-attr)#path-selection segment-routing prepend
R1(config-lsp-attr-sr-prepend)#?
Segment-routing label prepend commands:
  exit      Exist from segment-routing prepend config mode
  index     Specify the next entry index to add, edit or delete
  list      List all prepend entries
  no        Delete a specific entry index
R1(config-lsp-attr-sr-prepend)#index ?
<1-10>     Entry index number
last-hop    Indicates the end of label list
next-label  Specify the next MPLS label in the path

```

---

**Note** If last-hop option indicates tail end node. If this option is only used no control on LSP path can be done.

---

## Configuring Preferred Path for Segment Routing On Demand Next Hop for L2VPN/VPWS

To bring down virtual circuit (VC) in case of LSP failure, which could be either because of path fail or removing a command, disable the fallback mode.

```

preferred-path segment-routing traffic-eng attribute-set L2VPNODN
disable-fallback  disable fall back to alternative route

```

## Configuring Autoroute Destination for Segment Routing On Demand Next Hop for L2VPN/VPWS

For inter-area destination, IP address may not be installed at headend. You need to have destination IP address installed to enable a targeted LDP session for L2-VPN VPWS. To enable a targeted LDP session for L2VPN VPWS, configure the auto-route destination under the attribute set:

```
Device#
mpls traffic-eng lsp attributes L2VPNODN
  priority 7 7
  path-selection metric te
  pce
  autoroute destination
!
```

The destination address gets installed via L2-VPN ODN LSP as a static route.

Run the following commands to verify autoroute destination configuration:

```
Device#sh ip route 56.6.6.6
Routing entry for 56.6.6.6/32
  Known via "static", distance 1, metric 0 (connected)
  Routing Descriptor Blocks:
  * directly connected, via Tunnel2000-----□ L2-VPN ODN LSP
    Route metric is 0, traffic share count is 1
```

```
Device#sh mpls for 56.6.6.6
Local      Outgoing      Prefix      Bytes Label  Outgoing  Next Hop
Label      Label          or Tunnel Id  Switched     interface
25         [T] Pop Label  56.6.6.6/32  0            Tu2000     point2point
```

## Verifying Segment Routing On Demand Next Hop for L2VPN/VPWS

### 1. sh mpls l2 vc

```
Device#sh mpls l2 vc
Local intf   Local circuit   Dest address   VC ID   Status
