Feature Information for Memory Leak Detector 11

Contents

Memory Leak Detector

The Memory Leak Detector feature is a tool that can be used to detect memory leaks on a router that is running Cisco IOS software. The Memory Leak Detector feature is capable of finding leaks in all memory pools, packet buffers, and chunks.

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information for Memory Leak Detector.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Memory Leak Detector

- You should have at least a basic familiarity with the Cisco IOS environment and the command-line interface.
- You should have at least a minimal configuration running on your system.

Restrictions for Memory Leak Detector

- You must have your network up and running, with Cisco IOS Release 12.2 or a later release installed.
- Some of the Cisco IOS configuration commands are only available on certain router platforms, and the command syntax may vary on different platforms.

Information About Memory Leak Detector

Memory Leaks

Memory leaks are static or dynamic allocations of memory that do not serve any useful purpose. Although technology is available for detection of leaks among statically allocated memory, in this document the focus is on memory allocations that are made dynamically.

Memory Leak Detection

From the detection point of view, leaks among the dynamically allocated memory blocks can be classified into the following three types:

- Type 1 leaks have no references. These blocks of memory can not be accessed.
- Type 2 leaks are part of one or more cycles of allocations but none of the blocks in these cycles is accessible from outside of the cycles. Blocks within each cycle have references to other elements in the cycle(s). An example of a Type 2 leak is a circular list that is not needed anymore. Though individual elements are reachable, the circular list is not reachable.
- Type 3 leaks are accessible or reachable but are not needed, for example, elements in data structures
 that are not needed anymore. A subclass of Type 3 leaks are those where allocations are made but never
 written to. You can look for these subclass leaks using the showmemorydebugreferenceunused
 command.

The Memory Leak Detector feature provides the technology to detect Type 1 and Type 2 memory leaks.

The Memory Leak Detector feature works in the following two modes:

- Normal mode--Where memory leak detector uses memory to speed up its operations.
- Low memory mode--Where memory leak detector runs without attempting to allocate memory.

Low memory mode is considerably slower than the normal mode and can handle only blocks. There is no support for chunks in low memory mode. Low memory mode is useful when there is little or no memory available on the router.

The memory leak detector has a simple interface and can be invoked by the command line interface (CLI) at any time to get a report of memory leaks. For testing purposes, you can perform all tests, then invoke memory leak detector to get a report on leaks. If you are interested only in leaks generated by your test cases alone, memory leak detector has an incremental option, which can be enabled at the start of testing. After testing completes, you can get a report on only the leaks that occurred after the incremental option was enabled.

To reduce false alarms, it is mandatory that memory leak detector be invoked multiple times and that only leaks that consistently appear in all reports be interpreted as leaks. This is especially true for packet buffer leaks.

Note

When submitting defects based on the reports of memory leak detector, please add "memleak-detection" to the attribute field of the defect report.

Danger

Executing memory leak detection commands on a device with a serious memory leak issue may cause loss of connectivity.

How to Use Memory Leak Detector

Displaying Memory Leak Information

To display detected memory leak information, complete the task in this section:

SUMMARY STEPS

- 1. enable
- 2. show memory debug leaks [chunks | largest | lowmem | summary]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example: Router> enable	Enter your password if prompted.
Step 2	show memory debug leaks [chunks largest lowmem summary]	Invokes normal mode memory leak detection and displays detected memory leaks. Optional keywords are as follows:

Command or Action	Purpose
Example:	chunksInvokes normal mode memory leak detection and displays detected memory leaks in chunks.
Router# show memory debug leaks chunks	• largestInvokes memory leak detection and displays the top ten leaking allocator_pcs and total amount of memory that they have leaked. Additionally, each time this command is invoked it remembers the previous invocation's report and compares it to the current invocation's report.
	• lowmemInvokes low memory mode memory leak detection and displays detected memory leaks. The amount of time taken for analysis is considerably greater than that of normal mode. The output for this command is similar to the showmemorydebugleaks command.
	• summary Invokes normal mode memory leak detection and displays detected memory leaks based on allocator_pc and then on the size of the block.

Setting the Memory Debug Incremental Starting Time

To set the starting time for incremental analysis of memory leaks, complete the task in this section:

SUMMARY STEPS

- 1. enable
- 2. set memory debug incremental starting-time

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	set memory debug incremental starting-time	Sets the starting time for incremental analysis to the time when the command is issued. When the starting time is set, only memory
	Example:	allocated after the starting time will be considered for reporting as leaks.
	Router# set memory debug incremental starting-time	ICANS.

Displaying Memory Leak Information Incrementally

To display memory leak information after a starting time has been established, complete the tasks in this section:

SUMMARY STEPS

- 1. enable
- 2. set memory debug incremental starting-time
- 3. show memory debug incremental {allocations | leaks [lowmem] | status}

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	set memory debug incremental starting-time	Sets the starting time for incremental analysis to the time when the command is issued.
	Example:	
	Router# set memory debug incremental starting-time	
Step 3	show memory debug incremental {allocations leaks [lowmem] status}	• allocationsDisplays all the memory blocks that were allocated after the issue of a setmemorydebugincrementalstarting-time command. The displayed memory blocks are just memory allocations, they are not necessarily leaks.
	Example: Router# show memory debug incremental allocations	• leaksDisplays output similar to the showmemorydebugleaks command, except that it displays only memory that was leaked after the issue of a setmemorydebugincrementalstarting-time command.
	Example:	• lowmemForces memory leak detection to work in low memory mode. The output for this command is similar to the showmemorydebugleaks command, except that it displays only memory that was leaked after the issue of a setmemorydebugincrementalstarting-time command.
		• In low memory mode, the analysis time is considerably greater than it is in normal mode.
		 You can use this command when you already know that normal mode memory leak detection will fail (perhaps by an unsuccessful previous attempt to invoke normal mode memory leak detection).
		• statusDisplays whether a starting point for incremental analysis has been set and the elapsed time since then.

Command or Action Purpose

Examples for Memory Leak Detector

Example show memory debug leaks

The following example shows output from the **showmemorydebugleaks** command with no optional keywords specified:

```
Router# show memory debug leaks
Adding blocks for GD...
                PCI memory
                 Alloc_pc PID
Address
           Size
                                 Name
                I/O memory
Address
                 Alloc_pc PID Name
           Size
                 Processor memory
Address
           Size
                 Alloc pc PID Name
62DABD28
              80 60616<del>7</del>50
                                 Init
62DABD78
              80 606167A0
                                 Init
              88 605B7E70
62DCF240
                                 Init
62DCF298
              96 605B7E98
                                 Init
62DCF2F8
             88 605B7EB4
                                 Init
62DCF350
               96 605B7EDC
                                 Init
             104 60C67D74
                           -2
63336C28
                                 Init
63370D58
              96 60C656AC
                                 Init
633710A0
              304 60C656AC
                                 Init
63B2BF68
               96 60C659D4
                                 Init
            32832 608D2848
                            104 Audit Process
63BA3FE0
            32832 608D2FD8
                            104
63BB4020
                                 Audit Process
```

The table below describes the significant fields shown in the display.

Table 1: show memory debug leaks Field Descriptions

Field	Description
Address	Hexadecimal address of the leaked block.
Size	Size of the leaked block (in bytes).
Alloc_pc	Address of the system call that allocated the block.
PID	The process identifier of the process that allocated the block.
Name	The name of the process that allocated the block.

Example show memory debug leaks chunks

The following example shows output from the **showmemorydebugleakschunks** command:

```
Router# show memory debug leaks chunks
Adding blocks for GD...
                PCI memory
Address
          Size
                 Alloc_pc PID Name
Chunk Elements:
Address Size Parent
                       Name
                I/O memory
Address
         Size
                Alloc pc PID Name
Chunk Elements:
Address Size Parent Name
                Processor memory
Address
          Size
                 Alloc_pc
                           PID Name
          80 60616<del>7</del>50
62DABD28
                                Init
62DABD78
              80 606167A0
                                Init
62DCF240
              88 605B7E70
                                Tnit.
             96 605B7E98
62DCF298
                           -2
                                Init
62DCF2F8
              88 605B7EB4
                                Init
62DCF350
              96 605B7EDC
                                Init
63336C28
             104 60C67D74
                                Init
63370D58
              96 60C656AC
                                Init
             304 60C656AC
633710A0
                           -2
                                Init
63B2BF68
              96 60C659D4
                                Init
63BA3FE0
          32832 608D2848 104 Audit Process
63BB4020
           32832 608D2FD8 104 Audit Process
Chunk Elements:
Address Size Parent
                       Name
62D80DA8
           16 62D7BFD0 (Managed Chunk
62D80DB8
           16 62D7BFD0 (Managed Chunk
62D80DC8

           16 62D7BFD0 (Managed Chunk
800080
62D80DE8
           16 62D7BFD0 (Managed Chunk )
62E8FD60
           216 62E8F888 (IPC Message He)
```

The table below describes the significant fields shown in the display.

Table 2: show memory debug leaks chunks Field Descriptions

Field	Description
Address	Hexadecimal address of the leaked block.
Size	Size of the leaked block (in bytes).
Alloc_pc	Address of the system call that allocated the block.
PID	The process identifier of the process that allocated the block.
Name	The name of the process that allocated the block.
Size	(Chunk Elements) Size of the leaked element (bytes).
Parent	(Chunk Elements) Parent chunk of the leaked chunk.
Name	(Chunk Elements) The name of the leaked chunk.

Example show memory debug leaks largest

The following example shows output from the **showmemorydebugleakslargest** command:

```
Router# show memory debug leaks largest
Adding blocks for GD...
                 PCI memory
            total leak size
Alloc pc
                 I/O memory
Alloc pc
            total leak size
                 Processor memory
Alloc pc
            total leak size
608D2848
            32776
                       inconclusive
            32776
608D2FD8
                       inconclusive
60C656AC
            2.88
                       inconclusive
60C67D74
            48
                       inconclusive
605B7E98
            40
                       inconclusive
605B7EDC
            40
                       inconclusive
60C659D4
            40
                       inconclusive
605B7E70
            32
                       inconclusive
605B7EB4
            32
                       inconclusive
60616750
                       inconclusive
```

The following example shows output from the second invocation of the **showmemorydebugleakslargest** command:

```
Router# show memory debug leaks largest
Adding blocks for GD...
                  PCI memory
            total leak size
Alloc pc
                 I/O memory
Alloc pc
            total leak size
                  Processor memory
Alloc pc
            total leak size
608D2848
            32776
            32776

The table below describes the significant fields shown in the display.

Table 3: show memory debug leaks summary Field Descriptions

Field	Description
Alloc PC	Address of the system call that allocated the block.
Size	Size of the leaked block.
Blocks	Number of blocks leaked.
Bytes	Total amount of memory leaked.
What	Name of the process that owns the block.

Example show memory debug incremental allocations

The following example shows output from the **showmemorydebugincremental** command when entered with the **allocations** keyword:

```
Router# show memory debug incremental allocations
Address
           Size
                Alloc_pc
                           PID Name
             176 608CDC7C
62DA4E98
                           44
                                 CDP Protocol
                                 CDP Protocol
62DA4F48
              88 608CCCC8
                            44
62DA4FA0
              88 606224A0
                           3
                                 Exec
62DA4FF8
              96 606224A0
                                 Exec
635BF040
              96 606224A0
                                 Exec
63905E50
              200 606A4DA4
                           69
                                 Process Events
```

Example show memory debug incremental status

The following example shows output from the **showmemorydebugincremental** command entered with the **status** keyword:

```
Router# show memory debug incremental status
Incremental debugging is enabled
Time elapsed since start of incremental debugging: 00:00:10
```

Feature Information for Memory Leak Detector

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 4: Feature Information for Memory Leak Detector

Feature Name	Releases	Feature Information
Memory Leak Detector	12.3(8)T1 12.2(25)S	The Memory Leak Detector feature is a tool that can be used to detect memory leaks on a router that is running Cisco IOS software. The Memory Leak Detector feature is capable of finding leaks in all memory pools, packet buffers, and chunks.
