**CHAPTER 2**
New and Changed Information 3

**CHAPTER 3**
Supported Platforms 5

**PART I**
CUBE Fundamentals and Basic Setup 9

**CHAPTER 4**
Overview of Cisco Unified Border Element 11

Information About Cisco Unified Border Element 11
SIP/H.323 Trunking 13
Typical Deployment Scenarios for CUBE 15
How to Configure Basic CUBE Features 16
Enabling the Cisco UBE Application on a Device 17
Verifying the CUBE Application on the Device 18
Configuring a Trusted IP Address List for Toll-Fraud Prevention 19

**CHAPTER 5**
Virtual CUBE 21

Feature Information for Virtual CUBE 21
Prerequisites for Virtual CUBE 22
Hardware 22
Software 22
Features Supported with Virtual CUBE 22
Restrictions 23
Information about Virtual CUBE Support on Cisco CSR 1000V Series Routers 23
   Media 23
   Licensing Package Support 23
Installation 24
   Install Virtual CUBE Using an OVA File 24
   Install Virtual CUBE Using an ISO Image 24
How to Enable Virtual CUBE on Cisco CSR 1000V Series Router 24
Troubleshooting Virtual CUBE Support 24

CHAPTER 6
Dial-Peer Matching 25
   Dial Peers in CUBE 25
   Configuring Inbound and Outbound Dial-Peer Matching for CUBE 27
   Preference for Dial-Peer Matching 28

CHAPTER 7
DTMF Relay 31
   Feature Information for DTMF Relay 31
   Information About DTMF Relay 32
      DTMF Tones 32
      DTMF Relay 32
      Configuring DTMF Relays 35
      Interoperability and Priority with Multiple DTMF Relay Methods 35
      DTMF Interoperability Table 36
   Verifying DTMF Relay 40

CHAPTER 8
Introduction to Codecs 45
   Why CUBE Needs Codecs 45
   Voice Media Transmission 46
   Voice Activity Detection 47
   VoIP Bandwidth Requirements 47
   Supported Audio and Video Codecs 49
   How to Configure Codecs 51
      Configuring Audio and Video Codecs at the Dial Peer Level 51
      Configuring Audio Codecs Using a Codec Voice Class and Preference Lists 53
      Configuring Video Codecs Using Codec Voice Class 54
Contents

SIP Redirect Processing Enhancement 74
Sending SIP 300 Multiple Choice Messages 75
How to Perform Basic SIP Configuration 75
Configuring SIP VoIP Services on a Cisco Gateway 76
   Shut Down or Enable VoIP Service on Cisco Gateways 76
   Shut Down or Enable VoIP Submodes on Cisco Gateways 76
Configuring SIP Register Support 77
Configuring SIP Redirect Processing Enhancement 79
   Configure Call-Redirect Processing Enhancement 79
Configuring SIP 300 Multiple Choice Messages 82
   Configuring Sending of SIP 300 Multiple Choice Messages 82
Configuring SIP Implementation Enhancements 83
   Interaction with Forking Proxies 83
   SIP Intra-Gateway Hairpinning 84
Verifying SIP Gateway Status 85
General Troubleshooting Tips 89
Configuration Examples for Basic SIP Configuration 91
   SIP Register Support Example 91
   SIP Redirect Processing Enhancement Examples 93
   SIP 300 Multiple Choice Messages Example 97
Toll Fraud Prevention 98

CHAPTER 11  SIP Binding 101
   Feature Information for SIP Binding 101
   Information About SIP Binding 102
      Benefits of SIP Binding 102
      Source Address 103
      Voice Media Stream Processing 106
   Configuring SIP Binding 108
   Verifying SIP Binding 110

CHAPTER 12  Media Path 117
   Feature Information for Media Path 117
   Media Flow-Through 118
Restrictions for Media Flow-Through 118
Configuring Media Flow-Through 118
Media Flow-Around 119
Configuring Media Flow-Around 119
Media Anti-Trombone 120
Prerequisites 121
Restrictions for Media Anti-Tromboning 121
Configuring Media Anti-Tromboning 122

SIP Profiles 125
Feature Information for SIP Profiles 125
Information About SIP Profiles 126
   Important Characteristics of SIP Profiles 127
Restrictions for SIP Profiles 128
How to Configure SIP Profiles 129
   Configuring a SIP Profile to Manipulate SIP Request or Response Headers 129
   Configuring SIP Profiles for Copying Unsupported SDP Headers 131
      Example: Configuring SIP Profile Rules (Attribute Passing) 132
      Example: Configuring SIP Profile Rules (Parameter Passing) 133
      Example: Configuration to Remove an Attribute 133
   Configuring SIP Profile Using Rule Tag 133
   Configuring a SIP Profile for Non-standard SIP Header 135
Upgrading or Downgrading SIP Profile Configurations 136
   Configuring a SIP Profile as an Outbound Profile 137
   Configuring a SIP Profile as an Inbound Profile 138
Verifying SIP Profiles 140
Troubleshooting SIP Profiles 140
Examples: Adding, Modifying, Removing SIP Profiles 141
   Example: Adding a SIP, SDP, or Peer Header 141
   Example: Modifying a SIP, SDP, or Peer Header 143
   Example: Remove a SIP, SDP, or Peer Header 145
   Example: Inserting SIP Profile Rules 146
   Example: Upgrading and Downgrading SIP Profiles automatically 147
   Example: Modifying Diversion Headers 148

Prerequisites for VoIP for IPv6 185
Restrictions for Implementing VoIP for IPv6 186
Information About VoIP for IPv6 187
  SIP Features Supported on IPv6 187
  SIP Voice Gateways in VoIPv6 188
  VoIPv6 Support on Cisco UBE 189
How to Configure VoIP for IPv6 193
  Configuring VoIP for IPv6 193
    Shutting Down or Enabling VoIPv6 Service on Cisco Gateways 194
    Shutting Down or Enabling VoIPv6 Submodes on Cisco Gateways 195
    Configuring the Protocol Mode of the SIP Stack 196
  Verifying SIP Gateway Status 198
RTCP Pass-Through 200
  Configuring IPv6 Support for Cisco UBE 200
  Verifying RTP Pass-Through 201
Configuring the Source IPv6 Address of Signaling and Media Packets 201
Configuring the SIP Server 203
Configuring the Session Target 204
Configuring SIP Register Support 205
Configuring Outbound Proxy Server Globally on a SIP Gateway 206
Configuring UDP Checksum 207
Configuring IP Toll Fraud 208
Configuring the RTP Port Range for an Interface 209
Configuring Message Waiting Indicator Server Address 211
Configuring Voice Ports 212
Configuring Cisco UBE Mid-call Re-INVITE Consumption 213
  Configuring Passthrough of Mid-call Signalling 213
  Configuring Passthrough SIP Messages at Dial Peer Level 214
  Configuring H.323 IPv4-to-SIPv6 Connections in a Cisco UBE 215
Configuration Examples for VoIP over IPv6 217
  Example: Configuring the SIP Trunk 217
Troubleshooting Tips for VoIP for IPv6 217
Verifying and Troubleshooting Tips 218
  Verifying Cisco UBE ANAT Call Flows 218
Finding Feature Information 263
Feature Information for URI-Based Dialing Enhancements 263
Information About URI-Based Dialing Enhancements 264
Call Flows for URI-Based Dialing Enhancements 265
How to Configure URI-Based Dialing Enhancements 267
  Configuring Pass Through of SIP URI Headers 267
    Configuring Pass Though of Request URI and To Header URI (Global Level) 267
    Configuring Pass Though of Request URI and To Header URI (Dial Peer Level) 268
  Configuring Pass Through of 302 Contact Header 270
    Configuring Pass Through of 302 Contact Header (Global Level) 270
    Configuring Pass Through of 302 Contact Header (Dial Peer Level) 271
  Deriving of Session Target from URI 272
Configuration Examples for URI-Based Dialing Enhancements 274
  Example: Configuring Pass Though of Request URI and To Header URI 274
    Example: Configuring Pass Though of Request URI and To Header URI (Global Level) 274
    Example: Configuring Pass Though of Request URI and To Header URI (Dial Peer Level) 274
  Example: Configuring Pass Through of 302 Contact Header 275
    Example: Configuring Pass Through of 302 Contact Header (Global Level) 275
    Example: Configuring Pass Through of 302 Contact Header (Dial Peer Level) 275
  Example: Deriving Session Target from URI 275
Additional References for URI-Based Dialing Enhancements 276

CHAPTER 20  
Multiple Pattern Support on a Voice Dial Peer 277
  Feature Information for Multiple Pattern Support on a Voice Dial Peer 277
  Restrictions for Multiple Pattern Support on a Voice Dial Peer 278
  Information About Multiple Pattern Support on a Voice Dial Peer 278
  Configuring Multiple Pattern Support on a Voice Dial Peer 278
  Verifying Multiple Pattern Support on a Voice Dial Peer 280
  Configuration Examples for Multiple Pattern Support on a Voice Dial Peer 282

CHAPTER 21  
Outbound Dial-Peer Group as an Inbound Dial-Peer Destination 283
  Feature Information for Outbound Dial-Peer Group as an Inbound Dial-Peer Destination 283
  Restrictions 284
  Information About Outbound Dial-Peer Group as an Inbound Dial-Peer Destination 284
Configuring Outbound Dial-Peer Group as an Inbound Dial-Peer Destination 285
Verifying Outbound Dial-Peer Groups as an Inbound Dial-Peer Destination 287
Troubleshooting Tips 288
Configuration Examples for Outbound Dial Peer Group as an Inbound Dial-Peer Destination 289

CHAPTER 22

Inbound Leg Headers for Outbound Dial-Peer Matching 293
Feature Information for Inbound Leg Headers for Outbound Dial-Peer Matching 293
Prerequisites for Inbound Leg Headers for Outbound Dial-Peer Matching 294
Restrictions for Inbound Leg Headers for Outbound Dial-Peer Matching 294
Information About Inbound Leg Headers for Outbound Dial-Peer Matching 294
Configuring Inbound Leg Headers for Outbound Dial-Peer Matching 295
Verifying Inbound Leg Headers for Outbound Dial-Peer Matching 298
Configuration Example: Inbound Leg Headers for Outbound Dial-Peer Matching 300

CHAPTER 23

Server Groups in Outbound Dial Peers 303
Feature Information for Configuring Server Groups in Outbound Dial Peers 303
Information About Server Groups in Outbound Dial Peers 304
How to Configure Server Groups in Outbound Dial Peers 304
  Configuring Server Groups in Outbound Dial Peers 304
  Verifying Server Groups in Outbound Dial Peers 306
Configuration Examples for Server Groups in Outbound Dial Peers 307

CHAPTER 24

Domain-Based Routing Support on the Cisco UBE 311
Feature Information for Domain-Based Routing Support on the Cisco UBE 311
Restrictions for Domain-Based Routing Support on the Cisco UBE 312
Information About Domain-Based Routing Support on the Cisco UBE 312
How to Configure Domain-Based Routing Support on the Cisco UBE 313
  Configuring Domain-Based Routing at Global Level 313
  Configuring Domain-Based Routing at Dial Peer Level 314
  Verifying and Troubleshooting Domain-Based Routing Support on the Cisco UBE 315
Configuration Examples for Domain-Based Routing Support on the Cisco UBE 318
  Example Configuring Domain-Based Routing Support on the Cisco UBE 318

CHAPTER 25

ENUM Enhancement per Kaplan Draft RFC 319
Configuration Examples 350
  Example: Configuring Multi-VRF in Standalone Mode 350
  Example: Configuring RG Infra High Availability with VRF 354
  Example: Configuring HSRP High Availability with VRF 360
Troubleshooting Tips 368

CHAPTER 27
Configuring Multi-Tenants on SIP Trunks 369
  Feature Information for Configuring Multi-Tenants on SIP Trunks 369
  Information About Configuring Multi-tenants on SIP Trunks 369
  How to Configure Multi-Tenants on SIP Trunks 373
Configuring Multi-Tenants on SIP Trunks 373
  Example: SIP Trunk Registration in Multi-Tenant Configuration 375

PART IV
Codecs 377

CHAPTER 28
Codec Support and Restrictions 379
  Feature Information for Codec Support on CUBE 379
  ISAC Codec Support on CUBE 380
  Restrictions for ISAC Codec Support on CUBE 380
  AAC-LD MP4A-LATM Codec Support on Cisco UBE 380
  Restrictions for AAC-LD MP4A-LATM Codec Support on Cisco UBE 381

CHAPTER 29
Codec Preference Lists 383
  Feature Information for Negotiation of an Audio Codec from a List of Codecs 383
  Codecs Configured Using Preference Lists 384
  Prerequisites for Codec Preference Lists 384
  Restrictions for Codecs Preference Lists 385
  How to Configure Codec Preference Lists 385
  Configuring Audio Codecs Using a Codec Voice Class and Preference Lists 385
  Disabling Codec Filtering 387
  Troubleshooting Negotiation of an Audio Codec from a List of Codecs 388
  Verifying Negotiation of an Audio Codec from a List of Codecs 388

PART V
DSP Services 391
PART VII  Media Services  427

CHAPTER 34  Configuring RTCP Report Generation  429
   Finding Feature Information  429
   Prerequisites  429
   Restrictions  430
   Configuring RTCP Report Generation on Cisco UBE  430
   Troubleshooting Tips  431
   Feature Information for Configuring RTCP Report Generation  432

PART VIII  Media Recording  435

CHAPTER 35  Network-Based Recording  437
   Feature Information for Network-Based Recording  437
   Restrictions for Network-Based Recording  438
   Information About Network-Based Recording Using CUBE  439
   Deployment Scenarios for CUBE-based Recording  439
   Open Recording Architecture  440
      Network Layer  441
      Capture and Media Processing Layer  441
      Application Layer  441
   Media Forking Topologies  441
      Media Forking with Cisco UCM  441
      Media Forking without Cisco UCM  442
   SIP Recorder Interface  442
      Metadata  442
   How to Configure Network-Based Recording  442
Chapter 38

Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording

Feature Information for Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording
Restrictions for Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording
Information About Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording
How to Capture Third-Party GUID for Correlation Between Calls and SIP-based Recording
Verifying Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording
Configuration Examples for Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording

Chapter 39

Cisco Unified Communications Gateway Services—Extended Media Forking

Feature Information for Cisco Unified Communications Gateway Services—Extended Media Forking
Restrictions for Extended Media Forking
Information About Cisco Unified Communications Gateway Services
Extended Media Forking (XMF) Provider and XMF Connection
XMF Call-Based Media Forking
XMF Connection-Based Media Forking
Extended Media Forking API with Survivability TCL
Media Forking for SRTP Calls
  Crypto Tag
  Example of SDP Data sent in an SRTP Call
Multiple XMF Applications and Recording Tone
Forking Preservation
How to Configure UC Gateway Services
  Configuring Cisco Unified Communication IOS Services on the Device
Configuring the XMF Provider 512
Verifying the UC Gateway Services 513
Troubleshooting Tips 515
Configuration Examples for UC Gateway Services 516
  Example: Configuring Cisco Unified Communication IOS Services 516
  Example: Configuring the XMF Provider 516
  Example: Configuring UC Gateway Services 516

PART IX

CUBE Media Proxy 517

CHAPTER 40

CUBE Media Proxy 519

Feature Information for CUBE Media Proxy 519
Supported Platforms 520
Restrictions for CUBE Media Proxy 520
Information About Multiple Media Forking Using CUBE Media Proxy 520
  Deployment Scenarios for CUBE Media Proxy Based Media Forking 520
  Media Forking Topologies for CUBE Media Proxy 522
    Gateway Forking to CUBE Media Proxy 522
    Phone BiB Forking to CUBE Media Proxy 522
  Recording Metadata 523
  Session Identifier 523
    Configuring Support for Session Identifier 524
    Session-ID Handling 524
    Troubleshooting Tips 525
  How to Configure CUBE Media Proxy for Media Forking 526
    Configuring Outbound Dial-Peers to the Recorders 526
    Configuring CUBE Media Proxy 527
    Configuring Inbound Dial-Peer from CUCM 529
  Verifying Media Forking Using CUBE Media Proxy Configuration 530
  Recording State Notification 539
    SIP Info Messages from CUBE Media Proxy to CUCM 539
    SIP Info Message Sent During the Initial Call 540
      SIP Info Message Sent During the Initial Call (All the Recorders as Optional) 540
SIP Info Message Sent During the Initial Call (One Recorder as Mandatory and Remaining as Optional)  541
Support for Mid-Call Features  542
Secure Recording of Secure Calls  545
Support for High Availability (HA)  546
Media Latch  547

PART X  SIP Header Manipulation  549

CHAPTER 41  Passing Headers Unsupported by CUBE  551
Feature Information for Copying with SIP Profiles  551
Example: Passing a Header Not Supported by CUBE  551

CHAPTER 42  Copying SIP Headers  553
Feature Information for Copying with SIP Profiles  553
How to Copy SIP Header Fields to Another  554
Copying From an Incoming Header and Modifying an Outgoing Header  554
Copying From One Outgoing Header to Another  556
Example: Copying the To Header into the SIP-Req-URI  557

CHAPTER 43  Manipulating SIP Status-Line Header of SIP Responses  561
Feature Information for Manipulating SIP Responses  561
Copying Incoming SIP Response Status Line to Outgoing SIP Response  562
Modifying Status-Line Header of Outgoing SIP Response with User Defined Values  565

PART XI  Payload Type Interoperability  567

CHAPTER 44  Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls  569
Feature Information for Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls  569
Restrictions for Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls  570
Symmetric and Asymmetric Calls  570
High Availability Checkpointing Support for Asymmetric Payload  571
PART XII

Protocol Interworking 577

CHAPTER 45

Delayed-Offer to Early-Offer 579

Feature Information for Delayed-Offer to Early-Offer 579
Prerequisites for Delayed-Offer to Early-Offer 580
Restrictions for Delayed-Offer to Early-Offer Media Flow-Around 580
Delayed-Offer to Early-Offer in Media Flow-Around Calls 580
Configuring Delayed Offer to Early Offer 581
Configuring Delayed Offer to Early Offer for Video Calls 582
Configuring Delayed Offer to Early Offer Medial Flow-Around 583
MidCall Renegotiation Support for Delayed-Offer to Early-Offer Calls 584
Restrictions for MidCall Renegotiation Support for DO-EO Calls 585
Configuring Mid Call Renegotiation Support for Delayed-Offer to Early-Offer Calls 585
High-Density Transcoding Calls in Delayed-Offer to Early-Offer 586
Restrictions for High-Density Transcoding DO-EO Calls 587
Configuring High-Density Transcoding 587

CHAPTER 46

H323-to-SIP Interworking on CUBE 589

Prerequisites 589
Restrictions 589
H323-to-SIP Basic Call Interworking 590
H323-to-SIP Supplementary Features Interworking 592
H.323-to-SIP Codec Progress Indicator Interworking for Media Cut-Through 593
Configuring H323-to-SIP Interworking 593
CHAPTER 47  H.323-to-H.323 Interworking on CUBE  595
  Feature Information for H.323-to-H.323 Interworking  595
  Prerequisites  596
  Restrictions  596
  Slow Start to Fast-Start Interworking  596
    Restrictions for Slow-Start and Fast-Start Interworking  597
    Enabling Interworking between Slow Start and Fast Start  597
  Call Failure Recovery (Rotary)  598
    Enabling Call Failure Recovery (Rotary) without Identical Codec Configuration  598
  Managing H.323 IP Group Call Capacities  599
    Configuration Examples for Managing H.323 IP Group Call Capacities  601
  Overlap Signaling  604
    Configuring Overlap Signaling  604
  Verifying H.323-to-H.323 Interworking  605
  Troubleshooting H.323-to-H.323 Interworking  607

CHAPTER 48  SIP RFC 2782 Compliance with DNS SRV Queries  609
  Finding Feature Information  609
  Prerequisites SIP RFC 2782 Compliance with DNS SRV Queries  609
  Information SIP RFC 2782 Compliance with DNS SRV Queries  610
  How to Configure SIP-RFC 2782 Compliance with DNS SRV Queries  610
    Configuring DNS Server Query Format RFC 2782 Compliance with DNS SRV Queries  610
  Configuring DNS Server Lookups  611
  Verifying  613
  Feature Information for SIP RFC 2782 Compliance with DNS SRV Queries  613

PART XIII  Support for SRTP  615

CHAPTER 49  SRTP-SRTP Interworking  617
  Feature Information for SRTP-SRTP Interworking  617
  Prerequisites for SRTP-SRTP Interworking  618
  Restrictions for SRTP-SRTP Interworking  618
  Information About SRTP-SRTP Interworking  618
### Contents

- **PART XIV**
  - **High Availability** 655

#### CHAPTER 52
- **High Availability on Cisco 4000 Series Integrated Services Routers** 657
  - About Cisco UBE High Availability on Cisco 4000 Series ISR 657
    - Box-to-Box Redundancy 657
    - Redundancy Group (RG) Infrastructure 658
    - Network Topology 658
    - Considerations and Restrictions 659
      - Considerations 660
      - Restrictions 661
  - How to Configure Cisco UBE High Availability on Cisco 4000 Series ISR 661
    - Before You Begin 661
    - Configure High Availability 662
    - Configuration Examples 667
      - Example: Control Interface Protocol Configuration 667
      - Example: Redundancy Group Protocol Configuration 667
      - Example: Redundant Traffic Interface Configuration 667
    - Verify Your Configuration 667
    - Troubleshoot High Availability Issues 675

#### CHAPTER 53
- **High Availability on Cisco ASR 1000 Series Aggregation Services Routers** 677
  - About Cisco UBE High Availability on Cisco ASR 1000 Series Routers 677
    - Inbox Redundancy 678
    - Box-to-Box Redundancy 679
    - Redundancy Group (RG) Infrastructure 679
    - PROTECTED Mode 680
    - Network Topology 680
    - Considerations and Restrictions 681
      - Considerations 682
Restrictions 683
How to Configure Cisco UBE High Availability on Cisco ASR 1000 Series Router 683
Before You Begin 683
Configure Inbox High Availability 684
Configure Box-to-Box High Availability 684
Configuration Examples 690
Verify Your Configuration 695
Verify Redundancy State on Active and Standby Routers 695
Verify Call State After Switchover 697
Verify SIP IP Address Bindings 701
Verify Current CPU Use 701
Force a Manual Failover for Testing 702
Troubleshoot High Availability Issues 702

CHAPTER 54  High Availability on Cisco CSR 1000v Series Cloud Services Routers 705
About vCUBE High Availability on Cisco CSR 1000v Series Cloud Services Router 705
Box-to-Box Redundancy 705
Redundancy Group (RG) Infrastructure 706
Network Topology 707
Considerations and Restrictions 709
Considerations 709
Restrictions 710
How to Configure vCUBE High Availability on Cisco CSR 1000v 711
Before You Begin 711
Configure High Availability 711
Configuration Example 716
Troubleshoot High Availability Issues 717

CHAPTER 55  High Availability on Cisco Integrated Services Routers (ISR-G2) 719
About Cisco UBE High Availability on Cisco ISR-G2 719
Box-to-Box Redundancy 719
Hot Standby Router Protocol (HSRP) 720
Network Topology 720
Considerations and Restrictions 721
CHAPTER 58
CVP Survivability TCL support with High Availability 767
Feature Information for CVP Survivability TCL support with High Availability 767
Prerequisites 768
Restrictions 768
Recommendations 768
CVP Survivability TCL support with High Availability 768
Configuring CVP Survivability TCL support with High Availability 768

PART XV
ICE-Lite Support on CUBE 769

CHAPTER 59
ICE-Lite Support on CUBE 771
Feature Information for ICE-Lite Support on CUBE 771
Restrictions for ICE-lite Support on CUBE 772
Information About ICE-Lite Support on CUBE 772
Characteristics 772
ICE Candidate 773
ICE Lite 773
High Availability Support with ICE 773
How to Configure ICE-Lite Support on CUBE 774
Configuring ICE on the CUBE 774
Verifying ICE-Lite on the CUBE (Success Flow Calls) 775
ICE-Lite on CUBE (Error Flow Calls)  778
Troubleshooting ICE-Lite Support on CUBE  783
Additional References  783

PART XVI

SIP Protocol Handling  785

CHAPTER 60

Mid-call Signaling Consumption  787
Feature Information for Mid-call Signaling  787
Prerequisites  788
Mid-call Signaling Passthrough - Media Change  789
Restrictions for Mid-Call Signaling Passthrough - Media Change  789
Behavior of mid-call Re-INVITE Consumption  789
Configuring Passthrough of Mid-call Signalling  790
Example Configuring Passthrough SIP Messages at Dial Peer Level  791
Example Configuring Passthrough SIP Messages at the Global Level  792
Mid-call Signaling Block  792
Restrictions for Mid-Call Signaling Block  792
Blocking Mid-Call Signaling  793

Important Information about Cisco IOS XE 16

Effective Cisco IOS XE Release 3.7.0E for Catalyst Switching and Cisco IOS XE Release 3.17S (for Access and Edge Routing) the two releases evolve (merge) into a single version of converged release—the Cisco IOS XE 16—providing one release covering the extensive range of access and edge products in the Switching and Routing portfolio.

Feature Information

Use Cisco Feature Navigator to find information about feature support, platform support, and Cisco software image support. An account on Cisco.com is not required.

Overview of Cisco Unified Border Element

Cisco Unified Border Element (CUBE) bridges voice and video connectivity between two separate VoIP networks. It is similar to a traditional voice gateway, except for the replacement of physical voice trunks with an IP connection. Traditional gateways connect VoIP networks to telephone companies using a circuit-switched connection, such as PRI. The CUBE connects VoIP networks to other VoIP networks and is often used to connect enterprise networks to Internet telephony service providers (ITSPs).

- Information About Cisco Unified Border Element, on page 11
- How to Configure Basic CUBE Features, on page 16

Information About Cisco Unified Border Element

Cisco Unified Border Element (CUBE) can terminate and originate signaling (H.323 and Session Initiation Protocol [SIP]) and media streams (Real-Time Transport Protocol [RTP] and RTP Control Protocol [RTCP]). CUBE extends the functionality provided by conventional session border controllers (SBCs) in terms of protocol interworking, especially on the enterprise side. As shown in the chart below, the CUBE provides the following additional features:
Figure 1: Cisco Unified Border Element—More Than an SBC

The CUBE provides a network-to-network interface point for:

- Signaling interworking—H.323 and SIP.
- Media interworking—dual-tone multifrequency (DTMF), fax, modem, and codec transcoding.
- Address and port translations—privacy and topology hiding.
- Billing and call detail record (CDR) normalization.
- Quality-of-service (QoS) and bandwidth management—QoS marking using differentiated services code point (DSCP) or type of service (ToS), bandwidth enforcement using Resource Reservation Protocol (RSVP), and codec filtering.

CUBE functionality is implemented on devices using a special IOS feature set, which allows CUBE to route a call from one VoIP dial peer to another.

Protocol interworking is possible for the following combinations:

- H.323-to-SIP interworking
- H.323-to-H.323 interworking
- SIP-to-SIP interworking
The CUBE provides a network-to-network demarcation interface for signaling interworking, media interworking, address and port translations, billing, security, quality of service, call admission control, and bandwidth management.

The CUBE is used by enterprise and small and medium-sized organizations to interconnect SIP PSTN access with SIP and H.323 enterprise unified communications networks.

A CUBE interoperates with several different network elements including voice gateways, IP phones, and call-control servers in many different application environments, from advanced enterprise voice and/or video services with Cisco Unified Communications Manager or Cisco Unified Communications Manager Express, as well as simpler toll bypass and voice over IP (VoIP) transport applications. The CUBE provides organizations with all the border controller functions integrated into the network layer to interconnect unified communications voice and video enterprise-to-service-provider architectures.

**Figure 2: Why Does an Enterprise Need the CUBE?**

If an enterprise subscribes to VoIP services offered by an ITSP, connecting the enterprise CUCM through a CUBE provides network demarcation capabilities, such as security, topology hiding, transcoding, call admission control, protocol normalization and SIP registration, none of which is possible if CUCM connects directly to the ITSP. Another use case involves mergers or acquisitions in an enterprise and the need to integrate voice equipment, such as CUCMs, IP PBXs, VM servers, and so on. If the networks in the two organizations have overlapping IP addresses, CUBE can be used to connect the two distinct networks until the acquired organization can be migrated into the enterprise addressing plan.

**SIP/H.323 Trunking**

The Session Initiation Protocol (SIP) is a signaling communications protocol, widely used for controlling multimedia communication sessions such as voice and video calls over Internet Protocol (IP) networks. SIP (or H.323) trunking is the use of VoIP to facilitate the connection of a private branch exchange (PBX) to other VoIP endpoints across the Internet. To use SIP trunking, an enterprise must have a PBX (internal VoIP system) that connects to all internal end users, an Internet telephony service provider (ITSP) and a gateway that serves as the interface between the PBX and the ITSP. One of the most significant advantages of SIP and H.323
trunking is the ability to combine data, voice, and video in a single line, eliminating the need for separate physical media for each mode.

*Figure 3: SIP/H.323 Trunking*

SIP trunking overcomes TDM barriers, in that it:

- Improves efficiency of interconnection between networks
- Simplifies PSTN interconnection with IP end-to-end
- Enables rich media services to employees, customers, and partners
- Carries converged voice, video, and data traffic

*Figure 4: SIP Trunking Overcomes TDM Barriers*
For Cisco IOS XE Gibraltar 16.11.1a and later releases, the SIP processes are initiated only when either of the following CLIs are configured on CUBE:

- **voice dialpeer** with session protocol as SIP.
- **voice register global**
- **sip-ua**

In the releases before Cisco IOS XE Gibraltar 16.11.1a, the following commands that are configured on CUBE initiated the SIP processes:

- **dial-peer voice** *(any)*
- **ephone-dn**
- **max-dn under call-manager-fallback**
- **ds0-group 0 timeslots 1 type e&m-wink-start**

---

**Typical Deployment Scenarios for CUBE**

CUBE in an enterprise environment serves two main purposes:

- **External Connections**—CUBE is the demarcation point within a unified communications network and provides interconnectivity with external networks. This includes H.323 and SIP voice and video connections.
- **Internal Connections**—When used within a VoIP network, CUBE increases flexibility and interoperability between devices.
How to Configure Basic CUBE Features

Consider a scenario where XYZ corporation uses a VoIP network to provide phone services and uses a PRI connection for telecommunications services, and the PRI trunk is controlled by MGCP. Migration from MGCP PRI to SIP trunk is provided by ITSP telecommunications. CUCM sends the telephone number, as 10 digits, to CUBE. CUCM may send only the extension (4 digits) to the CUBE. When the call is diverted (using call-forward), the requirement of the ITSP is that they need the full 10-digit number in the SIP Diversion field.
The following sections describe the basic setup of CUBE through the steps involved in migrating the XYZ corporation to CUBE using a SIP trunk.

**Enabling the Cisco UBE Application on a Device**

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **mode border-element license capacity sessions**
5. **allow-connections from-type to to-type**
6. **end**

</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><code>Device(conf-voi-serv)# ip address trusted list</code></td>
<td><strong>Purpose</strong></td>
</tr>
</tbody>
</table>

**Step 5**  
`ipv4 ipv4-address [network-mask]`  
*Example:*  
`Device(cfg-iptrust-list)# ipv4 192.0.2.1 255.255.255.0`  
Allows you to add up to 100 IPv4 addresses in the IP address trusted list. Duplicate IP addresses are not allowed.  
- The `network-mask` argument allows you to define a subnet IP address.  

**Step 6**  
`ipv6 ipv6-address`  
*Example:*  
`Device(cfg-iptrust-list)# ipv6 2001:DB8:0:ABCD::1/48`  
Allows you to add IPv6 addresses to the trusted IP address list.  

**Step 7**  
`end`  
*Example:*  
`Device(cfg-iptrust-list)# end`  
Returns to privileged EXEC mode.
Virtual CUBE

Cisco Unified Border Element (CUBE) has been traditionally supported as an installation on physical routers such as Cisco Aggregation Services Router Series (ASR) and Cisco Integration Services Router Series (ISR). From Cisco IOS XE 3.15S release onwards, the CUBE feature set is supported on the Cisco CSR 1000V Series Cloud Services Routers (Cisco CSR 1000V) in a virtualized form factor. Virtual CUBE (vCUBE) enables the traditional CUBE feature set to be deployed in cloud-based data center deployments.

- Feature Information for Virtual CUBE, on page 21
- Prerequisites for Virtual CUBE, on page 22
- Features Supported with Virtual CUBE, on page 22
- Restrictions, on page 23
- Information about Virtual CUBE Support on Cisco CSR 1000V Series Routers, on page 23
- Installation, on page 24
- How to Enable Virtual CUBE on Cisco CSR 1000V Series Router, on page 24
- Troubleshooting Virtual CUBE Support, on page 24

Feature Information for Virtual CUBE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual CUBE Feature Support</td>
<td>Cisco IOS XE Release 3.15S</td>
<td>Provides support for virtual CUBE on Cisco Cloud Services Router, Cisco CSR 1000V Series.</td>
</tr>
</tbody>
</table>
Prerequisites for Virtual CUBE

Hardware

- The Virtual CUBE (vCUBE) feature set is bundled as part of the Cisco CSR 1000V Series and is supported on VMware's ESXi hypervisor and Cisco UCS servers (UCS-C and UCS-E series). For more information on the Cisco CSR1000V series and their supported ESXi versions, see Installing the Cisco CSR 1000v in VMware ESXi Environments.

  For Cisco IOS XE Gibraltar 16.10 and later releases, VMware ESXi 6.5 update 1 is the recommended VMware version. For more information on supported hypervisors, see Product Specifications.

- We recommend that you disable hyper threading while configuring Virtual CUBE on Cisco UCS. For more information on the best practices for setting BIOS parameters for performance, see BIOS Settings.

- A minimum of two network interfaces are required for configuring Virtual CUBE.

Software

- Obtain the relevant license for the Cisco CSR 1000V router. For details on the licensing package support, see Licensing Package Support, on page 23.

- Install the appropriate Cisco IOS image on the Cisco CSR 1000V router and configure a working VoIP network. For details on installation, see Installation, on page 24.

For details on the ESXi hypervisor support, see the section on Hardware, on page 22.

Features Supported with Virtual CUBE

Virtual CUBE supports most of the features available in CUBE. However, any feature that manages the media plane is not expected to work in the Cisco CSR 1000V router. The following features are not supported in virtual CUBE:

- All DSP based features
  - Codec Transcoding, Transrating
  - DTMF interworking
  - Call Progress Analysis (CPA)
  - Noise Reduction (NR), Acoustic Shock Protection (ASP), and Audio Gain

- Limited Voice Class Codec (VCC) support
  - Codec supported on peer leg will be included in offer. Other codecs will be filtered out.

- IOS Gatekeeper

- H.323 Interworking
• IOS based Hardware MTP

Restrictions

• Software MTP is not supported on Virtual CUBE.

• The Cisco CSR 1000v Cloud Services Router is supported in Amazon Web Services (AWS) but Virtual CUBE is not validated in AWS.

Note
All caveats, restrictions, and limitations of Cisco ASR IOS-XE 3.15 and later releases are applicable to Virtual CUBE.

Information about Virtual CUBE Support on Cisco CSR 1000V Series Routers

Media

Virtual CUBE media performance depends on the underlying VM platform consistently providing packet switching latency of less than 5 ms. Latency and jitter values observed on a virtual CUBE are same as the values obtained on CUBE running on a hardware platform with recommended hardware configuration and identical software configuration, under the same network conditions.

For more information on how to calculate the performance requirements, see Voice Quality Monitoring, on page 949.

Licensing Package Support

Virtual CUBE is enabled with the APPX and AX license packages. The AX license package provides access to all features supported in virtual CUBE. When the license is installed, the virtual CUBE related CLI commands such as voice and dial-peer configurations are visible. Also, relevant CUBE processes are instantiated.

The following table details the license package support for a virtual CUBE.

<table>
<thead>
<tr>
<th>Virtual CUBE Session License</th>
<th>CSR Package</th>
<th>Features</th>
<th>Throughput</th>
</tr>
</thead>
<tbody>
<tr>
<td>Same CUBE Licensing SKUs as Cisco ASR 1000 Series</td>
<td>APPX</td>
<td>No TLS / SRTP support</td>
<td>session count * (signaling + media bandwidth)</td>
</tr>
<tr>
<td></td>
<td>AX</td>
<td>All vCUBE features</td>
<td></td>
</tr>
</tbody>
</table>

For detailed information on licensing, see Cisco CSR 1000V Series Cloud Services Router Configuration Guide.
Installation

You can install Virtual CUBE in two ways:

- Install using an OVA file
- Install using an ISO image

Install Virtual CUBE Using an OVA File

You can use the OVA file that is included in the Cisco CSR 1000V router software image package to install virtual CUBE. The file is used for deploying the OVA template on the VM (in TAR format).

Note

Explicit subscription of CPUs and memory is required while deploying OVA provided by Cisco CSR 1000V.

For details on how to perform the deployment, see Cisco CSR 1000V Series Cloud Services Router Software Configuration Guide.

Install Virtual CUBE Using an ISO Image

You can use the .iso file to install virtual CUBE. This file is used for installing the software image on the VM (requires manually creating the VM).

For details on how to perform the installation, see Cisco CSR 1000V Series Cloud Services Router Software Configuration Guide.

How to Enable Virtual CUBE on Cisco CSR 1000V Series Router

For details on the steps to enable virtual CUBE on a CSR 1000V router, see Enabling the CUBE Application on a Device.

Troubleshooting Virtual CUBE Support

To troubleshoot virtual CUBE, follow the same procedure as that of Cisco ASR routers. This includes crash file decoding, decoding traceback, and so on. For more details, see http://www.cisco.com/c/en/us/support/docs/routers/asr-1000-series-aggregation-services-routers/109723-asr-crash.html.

To troubleshoot Virtual Machine (VM) issues, see Cisco CSR 1000V Series Cloud Services Router Software Configuration Guide.
CHAPTER 6

Dial-Peer Matching

CUBE allows VoIP-to-VoIP connection by routing calls from one VoIP dial peer to another. As VoIP dial peers can be handled by either SIP or H.323, CUBE can be used to interconnect VoIP networks of different signaling protocols. VoIP interworking is achieved by connecting an inbound dial peer with an outbound dial peer.

Note

All CUBE Enterprise deployments must have signaling and media bind statements specified at the dial-peer or voice class tenant level. For voice call tenants, you must apply tenants to dial-peers used for CUBE call flows if these dial-peers do not have bind statements specified.

- Dial Peers in CUBE, on page 25
- Configuring Inbound and Outbound Dial-Peer Matching for CUBE, on page 27
- Preference for Dial-Peer Matching, on page 28

Dial Peers in CUBE

A dial peer is a static routing table, mapping phone numbers to interfaces or IP addresses.

A call leg is a logical connection between two routers or between a router and a VoIP endpoint. A dial peer is associated or matched to each call leg according to attributes that define a packet-switched network, such as the destination address.

Voice-network dial peers are matched to call legs based on configured parameters, after which an outbound dial peer is provisioned to an external component using the component's IP address. For more information, refer to the Dial Peer Configuration Guide.

Dial-peer matching can also be done based on the VRF ID associated with a particular interface. For more information, see Inbound Dial-Peer Matching Based on Multi-VRF, on page 347.

In CUBE, dial peers can also be classified as LAN dial peers and WAN dial peers based on the connecting entity from which CUBE sends or receives calls.
A LAN dial peer is used to send or receive calls between CUBE and the Private Branch Exchange (PBX)—a system of telephone extensions within an enterprise. Given below are examples of inbound and outbound LAN dial peers.

**Inbound Dial-Peer for calls from CUCM to CUBE**

```plaintext
dial-peer voice 100 voip
   description *** Inbound LAN side dial-peer ***
   incoming called-number 9T
   session protocol sipv2
   codec g711ulaw
   dtmf-relay rtp-nte
```

**Outbound Dial-Peer for calls from CUBE to CUCM**

```plaintext
dial-peer voice 200 voip
   description *** Outbound LAN side dial-peer ***
   destination-pattern [2-9]........
   session protocol sipv2
   session target ipv4:<CUCM_Address>
   codec g711ulaw
   dtmf-relay rtp-nte
```

A WAN dial peer is used to send or receive calls between CUBE and the SIP trunk provider. Given below are examples of inbound and outbound WAN dial peers.
Configuring Inbound and Outbound Dial-Peer Matching for CUBE

The following commands can be used for inbound and outbound dial peer matching in the CUBE:

**Table 2: Incoming Dial-Peer Matching**

<table>
<thead>
<tr>
<th>Command in Dial-Peer Configuration</th>
<th>Description</th>
<th>Call Setup Element</th>
</tr>
</thead>
<tbody>
<tr>
<td>incoming called-number DNIS-string</td>
<td>This command uses the destination number that was called to match the incoming call leg to an inbound dial peer. This number is called the dialed number identification service (DNIS) number.</td>
<td>DNIS number</td>
</tr>
<tr>
<td>answer-address ANI-string</td>
<td>This command uses the calling number to match the incoming call leg to an inbound dial peer. This number is called the originating calling number or automatic number identification (ANI) string.</td>
<td>ANI string</td>
</tr>
<tr>
<td>destination-pattern ANI-string</td>
<td>This command uses the inbound call leg to the inbound dial peer.</td>
<td>ANI string for inbound</td>
</tr>
</tbody>
</table>
### Call Setup Element

<table>
<thead>
<tr>
<th>Command in Dial-Peer Configuration</th>
<th>Description</th>
<th>Call Setup Element</th>
</tr>
</thead>
<tbody>
<tr>
<td>{incoming called</td>
<td>incoming calling} e164-pattern-map pattern-map-group-id</td>
<td>This command uses a group of incoming called (DNIS) or incoming calling (ANI) number patterns to match the inbound call leg to an inbound dial peer. The command calls a globally defined voice class identifier where the E.164 pattern groups are configured.</td>
</tr>
<tr>
<td>voice class uri voice-class-identifier with incoming uri {from</td>
<td>request</td>
<td>to</td>
</tr>
<tr>
<td>incoming uri {called</td>
<td>calling} URI-class-identifier</td>
<td>This command uses the directory URI (Uniform Resource Identifier) number to match the outgoing H.323 call leg to an outgoing dial peer. The command calls a globally defined voice class identifier where the directory URI is configured.</td>
</tr>
</tbody>
</table>

### Preference for Dial-Peer Matching

The following is the order in which inbound dial-peer is matched for SIP call-legs:

<table>
<thead>
<tr>
<th>Dial-Peer Command</th>
<th>Description</th>
<th>Call Setup Element</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination-pattern DNIS-string</td>
<td>This command uses DNIS string to match the outbound call leg to the outbound dial peer.</td>
<td>DNIS string for outbound ANI string for inbound</td>
</tr>
<tr>
<td>destination URI-class-identifier</td>
<td>This command uses the directory URI (Uniform Resource Identifier) number to match the outgoing call leg to an outgoing dial peer. This directory URI is part of the SIP address of a device. The command actually refers to a globally defined voice class identifier where the directory URI is configured.</td>
<td>Directory URI</td>
</tr>
<tr>
<td>destination e164-pattern-map pattern-map-group-id</td>
<td>This command uses a group of destination number patterns to match the outbound call leg to an outbound dial peer. The command calls a globally defined voice class identifier where the E.164 pattern groups are configured.</td>
<td>E.164 patterns</td>
</tr>
</tbody>
</table>
The following is the order in which inbound dial-peer is matched for H.323 call-legs:

- **incoming uri** with **called**  
- **incoming uri** with **callling**  
- **incoming called-number**  
- **answer-address**

The following is the order in which outbound dial-peer is matched for SIP call-legs:

- **destination route-string**  
- **destination** with **target carrier-id**  
- **destination-pattern** with **target carrier-id**  
- **destination**  
- **destination-pattern**  
- **target carrier-id**

---

If CUBE with Cisco Unified Communications Manager Express (CUCME) is configured with the same DNs, then the ANI is given the preference. The system dial-peer for the DN is selected over the other dial-peers created.
Preference for Dial-Peer Matching
CHAPTER 7

DTMF Relay

The DTMF Relay feature allows CUBE to send dual-tone multi-frequency (DTMF) digits over IP.

This chapter talks about DTMF tones, DTMF relay mechanisms, how to configure DTMF relays, and interoperability and priority with multiple relay methods.

- Feature Information for DTMF Relay, on page 31
- Information About DTMF Relay, on page 32
- Verifying DTMF Relay, on page 40

Feature Information for DTMF Relay

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 4: Feature Information for DTMF Relay

<table>

</tr>
</tbody>
</table>
Information About DTMF Relay

DTMF Tones

DTMF tones are used during a call to signal to a far-end device; these signals may be for navigating a menu system, entering data, or for other types of manipulation. They are processed differently from the DTMF tones that are sent during the call setup as part of the call control. TDM interfaces on Cisco devices support DTMF by default. Cisco VoIP dial-peers do not support DTMF relay by default and require DTMF relay capabilities to be enabled.

Note

DTMF tones sent by phones do not traverse the CUBE.

DTMF Relay

Dual-tone multi-frequency (DTMF) relay is the mechanism for sending DTMF digits over IP. The VoIP dial peer can pass the DTMF digits either in band or out of band.

In-band DTMF-Relay passes the DTMF digits using the RTP media stream and uses a special payload type identifier in the RTP header to distinguish DTMF digits from actual voice communication. This method is more likely to work on lossless codecs, such as G.711.

Note

The main advantage of DTMF relay is that low bandwidth codecs like G.729 and G.723 is sent with greater fidelity when sent using in-band DTMF relay. Without the use of DTMF relay, calls established with low-bandwidth codecs may have trouble accessing automated DTMF-based systems, such as voice mail, menu-based Automatic Call Distributor (ACD) systems, and automated banking systems.

Out-of-band DTMF-Relay passes DTMF digits using a signaling protocol (SIP or H.323) instead of using the RTP media stream.

DTMF relay prevents loss of integrity of DTMF digits caused by VoIP compressed codecs. The relayed DTMF is then regenerated transparently on the peer side.

Figure 10: DTMF Relay Mechanism
DTMF relay mechanisms supported on VoIP dial-peers are listed below based on the keywords used to configure them. The DTMF relay mechanism can be either out-of-band (H.323 or SIP) or inband (RTP).

- **h245-alphanumeric and h245-signal**—These two methods are available only on H.323 dial peers. This is an out-of-band DTMF relay mechanism that transports the DTMF signals using H.245, which is the media control protocol of the H.323 protocol suite.

  The H245-signal method carries more information about the DTMF event (such as its actual duration) than the H245-Alphanumeric method. This addresses a potential problem with the alphanumeric method when interworking with other vendors' systems.

- **sip-notify**—This method is available on SIP dial peers only. This is a Cisco proprietary out-of-band DTMF relay mechanism that transports DTMF signals using SIP-Notify message. The SIP Call-Info header is used to indicate the use of the SIP-Notify DTMF relay mechanism. The message is acknowledged with a 180 or 200 response message containing a similar SIP Call-Info header.

  The Call-Info header for NOTIFY-based out-of-band relay is as follows:

  ```
  Call-Info: <sip: address>; method="NOTIFY;Event=telephone-event;Duration=msec"
  ```

  DTMF relay digits are sent as 4 bytes in a binary encoded format.

  This mechanism is useful for communicating with SCCP IP phones that do not support inband DTMF digits and analog phones attached to analog voice ports (FXS) on the router.

  If multiple DTMF relay mechanisms are enabled on a SIP dial peer and are negotiated successfully, NOTIFY-based out-of-band DTMF relay takes precedence.

- **sip-kpml**—This method is available only on SIP dial peers. This is an out-of-band DTMF relay mechanism defined by RFC 4730 that registers the DTMF signals using SIP-Subscribe messages and transports the DTMF signals using SIP-Notify messages containing an XML-encoded body. This method is also known as Key Press Markup Language.

  If you configure KPML on the dial peer, the gateway sends INVITE messages with kpml in the Allow-Events header.

  This method is mostly used for SIP endpoints registered to CUCM or CME. This method is useful for non-conferencing calls and for interoperability between SIP products and SIP phones.

  If you configure rtp-nte, sip-notify, and sip-kpml, the outgoing INVITE contains an SDP with rtp-nte payload, a SIP Call-Info header, and an Allow-Events header with KPML.

  The following SIP-Notify message is a sample taken after the subscription has taken place. The endpoints transmit digits using SIP-Notify messages with KPML events through XML. In the following example, the digit “1” is being transmitted:

  ```
  NOTIFY sip:192.168.105.25:5060 SIP/2.0
  Event: kpml
  <?xml version="1.0" encoding="UTF-8"?>
  <kpml-response version="1.0" code="200" text="OK" digits="1" tag="dtmf"/>
  ```

- **sip-info**—The sip-info method is available only on SIP dial peers. This is an out-of-band DTMF relay mechanism that registers the DTMF signals using SIP-Info messages. The body of the SIP message consists of signaling information and uses the content-type application/dtmf-relay.

  The method is always enabled for SIP dial peers, and is invoked when a SIP INFO message is received with DTMF relay content.

  This following sample message shows a SIP INFO message received by the gateway with specifics about the DTMF tone to be generated. The combination of the From, To, and Call-ID headers identifies the
call leg. The signal and duration headers specify the digit, in this case 1, and duration, 160 milliseconds in the example, for DTMF tone play.

```plaintext
INFO sip:2143302100@172.17.2.33 SIP/2.0
Via: SIP/2.0/UDP 172.80.2.100:5060

To: <sip:2143302100@172.17.2.33>;tag=9753.0207
Call-ID: 984072_15401962@172.80.2.100
CSeq: 25634 INFO
Supported: 100rel
Supported: timer
Content-Length: 26
Content-Type: application/dtmf-relay
Signal= 1
Duration= 160
```

- **rtp-nte**—Real-Time Transport Protocol (RTP) Named Telephone Events (NTE). This is an in-band DTMF relay mechanism defined by RFC2833. RFC2833 defines formats of NTE-RTP packets used to transport DTMF digits, hook flash, and other telephony events between two peer endpoints. DTMF tones are sent as packet data after call media has been established using the RTP stream and are distinguished from the audio by the RTP payload type field, preventing compression of DTMF-based RTP packets. For example, the audio of a call can be sent on a session with an RTP payload type that identifies it as G.711 data, and the DTMF packets are sent with an RTP payload type that identifies them as NTEs. The consumer of the stream utilizes the G.711 packets and the NTE packets separately.

The SIP NTE DTMF relay feature provides reliable digit relay between Cisco VoIP gateways when a low-bandwidth codec is used.

---

**Note**

Payload type 96 and 97 are used for fax by default in Cisco devices. A third party device may use payload type 96 and 97 for dtmf. In such scenarios, we recommend you to perform one of the following:

- Change the payload type for fax in both incoming and outgoing dial-peers using `rtp payload-type` command
- Use `assymmetric payload dtmf` command

For more information on configuring rtp payload-type and assymmetric payload dtmf, see Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls.

---

Payload types and attributes of this method are negotiated between the two ends at call setup using the Session Description Protocol (SDP) within the body section of the SIP message.

---

**Note**

This method should not be confused with the “Voice in-band audio/G711” transport because the latter is just the audible tones being passed as normal audio without any relay signaling method being “aware” or involved in the process. This is just plain audio passing through end-to-end using the G711Ulaw/Alaw codec.

- **cisco-rtp**—This is an in-band DTMF relay mechanism that is Cisco proprietary, where the DTMF digits are encoded differently from the audio and are identified as payload type 121. The DTMF digits are part
of the RTP data stream and distinguished from the audio by the RTP payload type field. This method is not supported by CUCM and its use has been discontinued.

Note: The `cisco-rtp` operates only between two Cisco 2600 series or Cisco 3600 series devices. Otherwise, the DTMF relay feature does not function, and the gateway sends DTMF tones in-band.

- **G711 audio**—This is an inband DTMF relay mechanism that is enabled by default and requires no configuration. Digits are transmitted within the audio of the phone conversation, that is, it is audible to the conversation partners; therefore, only uncompressed codecs like g711 alaw or ulaw can carry inband DTMF reliably. Female voices are known to, sometimes, trigger the recognition of a DTMF tone. Digits are passed along just like the rest of your voice as normal audio tones with no special coding or markers using the same codec as your voice does and are generated by your phone.

## Configuring DTMF Relays

You can configure DTMF relay using the `dtmf-relay method1 [...[method6]]` command in the VoIP dial peer. DTMF negotiation is performed based on the matching inbound dial-peer configuration.

The `method` variable used here can be any of the following:

- `h245-alphanumeric`
- `h245-signal`
- `sip-notify`
- `sip-kpml`
- `sip-info`
- `rtp-nte [digit-drop]`
- `cisco-rtp`

Multiple DTMF methods may be configured on CUBE simultaneously in order to minimize MTP requirements. If you configure more than one out-of-band DTMF method, preference goes from highest to lowest in the order of configuration. If an endpoint does not support any of the DTMF relay mechanism configured on CUBE, an MTP or transcoder is required.

The following table lists the DTMF relay types supported on a SIP and H.322 gateway.

<table>
<thead>
<tr>
<th>Method</th>
<th>H.323 Gateway</th>
<th>SIP Gateway</th>
</tr>
</thead>
<tbody>
<tr>
<td>In-band</td>
<td><code>cisco-rtp, rtp-nte</code></td>
<td><code>rtp-nte</code></td>
</tr>
<tr>
<td>Out-of-band</td>
<td><code>h245-alphanumeric, h245-signal</code></td>
<td><code>sip-notify, sip-kpml, sip-info</code></td>
</tr>
</tbody>
</table>

### Interoperability and Priority with Multiple DTMF Relay Methods

- CUBE negotiates both `rtp-nte` and `sip-kpml` if both are supported and advertised in the incoming INVITE. However, CUBE relies on the `rtp-nte` DTMF method to receive digits and a SUBSCRIBE if `sip-kpml`
is not initiated. CUBE still accepts SUBSCRIBEs for KPML. This prevents double-digit reporting problems at CUBE.

- CUBE negotiates to one of the following:
  - cisco-rtp
  - rtp-nte
  - rtp-nte and kpml
  - kpml
  - sip-notify

- If you configure rtp-nte, sip-notify, and sip-kpml, the outgoing INVITE contains a SIP Call-Info header, an Allow-Events header with KPML, and an sdpl with rtp-nte payload.

- If you configure more than one out-of-band DTMF method, preference goes from highest to lowest in the order of configuration.

- CUBE selects DTMF relay mechanisms using the following priority:
  - sip-notify or sip-kpml (highest priority)
  - rtp-nte
  - None—Send DTMF in-band

H.323 gateways select DTMF relay mechanisms using the following priority:

- cisco-rtp
- h245-signal
- h245-alphanumeric
- rtp-nte
- None—Send DTMF in-band

### DTMF Interoperability Table

This table provides the DTMF interoperability information between various DTMF relay types in different call flow scenarios. For instance, if you need to configure sip-kpml on an inbound dial peer and h245-signaling on an outbound dial peer in an RTP-RTP Flow through configuration, refer table 1 to see that the combination is supported (as image information is present) and the required image is IOS 12.4(15)T or IOS XE Supported or above. The call scenarios provided are as follows:

- RTP-RTP Flow-Through
- RTP-RTP with transcoder Flow-Through
- RTP-RTP Flow Around
- RTP-RTP with high-density transcoder Flow Through
- SRTP-RTP Flow Through

Cisco Unified Border Element Configuration Guide
For calls sent from an in-band (RTP-NTE) to an out-of-band method, configure the `dtmf-relay rtp-nce digit-drop` command on the inbound dial-peer and the desired out-of-band method on the outgoing dial-peer. Otherwise, same digit is sent in OOB as well as in-band, and gets interpreted as duplicate digits by the receiving end. When the digit-drop option is configured on the inbound leg, CUBE suppresses NTE packets and only relay digits using the OOB method configured on the outbound leg.

### Verifying DTMF Relay

**SUMMARY STEPS**

1. `show sip-ua calls`
2. `show sip-ua calls dtmf-relay sip-info`
3. `show sip-ua history dtmf-relay kpml`
4. `show sip-ua history dtmf-relay sip-notify`

**DETAILED STEPS**

**Step 1** `show sip-ua calls`

The following sample output shows that the DTMF method is SIP-KPML.

**Example:**

```
Device# show sip-ua calls

SIP UAC CALL INFO
Call 1
SIP Call ID : 57633F68-2BE011D6-8013D46B-B4F9B5F60172.18.193.251
  State of the call : STATE_ACTIVE (7)
  Substate of the call : SUBSTATE_NONE (0)
  Calling Number :
  Called Number : 8888
  Bit Flags : 0x0D4018 0x100 0x0
  CC Call ID : 6
  Source IP Address (Sig) : 192.0.2.1
  Destn SIP Req Addr:Port : 192.0.2.2:5060
  Destn SIP Resp Addr:Port: 192.0.2.3:5060
  Destination Name : 192.0.2.4.250
  Number of Media Streams : 1
  Number of Active Streams: 1
  RTP Fork Object : 0x0
  Media Mode : flow-through
  Media Stream 1
    State of the stream : STREAM_ACTIVE
    Stream Call ID : 6
    Stream Type : voice-only (0)
    Negotiated Codec : g711ulaw (160 bytes)
    Codec Payload Type : 0
    Negotiated Dtmf-relay : sip-kpml
    Dtmf-relay Payload Type : 0
    Media Source IP Addr:Port: 192.0.2.5:17468
    Media Dest IP Addr:Port : 192.0.2.6:17468
```
Step 2  show sip-ua calls dtmf-relay sip-info

The following sample output displays active SIP calls with INFO DTMF Relay mode.

Example:

```
Device# show sip-ua calls dtmf-relay sip-info

Total SIP call legs:2, User Agent Client:1, User Agent Server:1

SIP UAC CALL INFO
Call 1
SIP Call ID : 9598A547-5C1311E2-8008F709-2470C996@172.27.161.122
State of the call : STATE_ACTIVE (?)
Calling Number : sipp
Called Number : 3269011111
CC Call ID : 2

Verifying DTMF Relay
Introduction to Codecs

A codec is a device or software capable of encoding or decoding a digital data stream or signal. Audio codecs can code or decode a digital data stream of audio. Video codecs enable compression or decompression of digital video.

CUBE uses codecs to compress digital voice samples to reduce bandwidth usage per call. This chapter describes the basics of encoding digital voice samples using codecs and how to configure them.

- Why CUBE Needs Codecs, on page 45
- Voice Media Transmission, on page 46
- Voice Activity Detection, on page 47
- VoIP Bandwidth Requirements, on page 47
- Supported Audio and Video Codecs, on page 49
- How to Configure Codecs, on page 51
- Configuration Examples for Codecs, on page 56

Why CUBE Needs Codecs

CUBE uses codecs to compress digital voice samples to reduce bandwidth usage per call. Refer to Table 12: Codec and Bandwidth Information, on page 48 to see the relationship between codec and bandwidth utilization.

Configuring codecs on a device (configured as CUBE) allows the device to act as a demarcation point on a VoIP network and allows a dial peer to be established only if the desired codec criteria are satisfied. Additionally, preferences can be used to determine which codecs are selected over others.

If codec filtering is not required, CUBE also supports transparent codec negotiations. This enables negotiations between endpoints with CUBE leaving the codec information untouched.

The illustrations below show how codec negotiation is performed on CUBE. Two VoIP clouds need to be interconnected. In this scenario, both VoIP 1 and VoIP 2 networks have G.711 a-law configured as the preferred codec.
**Voice Media Transmission**

When a VoIP call is established, using the signaling protocols, the digitized voice samples need to be transmitted. These voice samples are often called the voice media. Voice media protocols found in a VoIP environment are the following:

- **Real-Time Transport Protocol (RTP)**—RTP is a Layer 4 protocol that is encapsulated inside UDP segments. RTP carries the actual digitized voice samples in a call.
- **Real-Time Control Protocol (RTCP)**—RTCP is a companion protocol to RTP. Both RTP and RTCP operate at Layer 4 and are encapsulated in UDP. RTP and RTCP typically use UDP ports 16384 to 32767, though these ranges may vary according to hardware platform. However, RTP uses the even port numbers in that range, whereas RTCP uses the odd port numbers. While RTP is responsible for carrying the voice stream, RTCP carries information about the RTP stream such as latency, jitter, packets, and octets sent and received.
- **Compressed RTP (cRTP)**—One of the challenges with RTP is its overhead. Specifically, the combined IP, UDP, and RTP headers are approximately 40 bytes in size, whereas a common voice payload size on a VoIP network is only 20 bytes, which includes 20 ms of voice by default. In that case, the header is twice the size of the payload. cRTP is used for RTP header compression and can reduce the 40-byte header to 2 or 4 bytes in size (depending on whether UDP checksums are in use), as shown in the figure below.
**Figure 12: Compressed RTP**

- Secure RTP (sRTP)—To help prevent an attacker from intercepting and decoding or possibly manipulating voice packets, sRTP supports encryption of RTP packets. In addition, sRTP provides message authentication, integrity checking, and protection against replay attacks.

VPN technology like IP Security (IPSec) may be used to protect traffic between sites. Encrypting sRTP traffic at the source of transmission results in encrypting already encrypted traffic, adding significant overhead and bandwidth needs. So it is recommended that sRTP is used for voice traffic, and that this traffic is excluded from IPSec encapsulation. sRTP uses lesser bandwidth, has the same level of security, and can be used by devices at any location because the payload is originated and terminated at the voice endpoint. Because endpoints can be mobile, the security follows the phone.

**Voice Activity Detection**

Voice Activity Detection (VAD) is a technology that works with the human nature of voice conversations, mainly that one person listens while the other talks. VAD classifies traffic as speech, unknown, and silence. Speech and unknown payloads are transported, but silence is dropped. This accounts for approximately 30 percent savings in bandwidth over time.

VAD can significantly reduce the amount of bandwidth required by a media stream. However, VAD has a few negative attributes that need to be considered. Because no packets are sent during silence, the listener can get the impression that the talker has been disconnected. Another characteristic is that it takes a moment for VAD to recognize the speech as having started again, and as a result, the first part of the sentence can be clipped. This can be annoying to the listening party. Music on Hold (MoH) and fax can also cause VAD to become ineffective because the media stream is constant.

VAD is enabled by default in CUBE dial peers as long as the codec selected supports it. VAD can be disabled at the VoIP dial peer using the `no vad` command. Some codecs, such as G.729b and G.729ab, support Comfort Noise Generation (CNG). When VAD is enabled, white noise is played to the listener during times when no packets are received. This leads the listener to believe that background noise is being heard. Cisco IP Phones and most gateways support CNG.

G.729 Annex-B and G.723.1 Annex-A include an integrated VAD function, but otherwise performs the same as G.729 and G.723.1, respectively.

**VoIP Bandwidth Requirements**

The amount of bandwidth required varies by the codec and the transmission media. Two events require bandwidth. The media stream itself requires bandwidth between 17 to 106 kbps depending on codec, header compression, and Layer 2 and 3 headers. In addition, call signaling must be taken into account. While bandwidth required by call signaling is much smaller, it can cause problems on a network due to irregular requirements.
Table 11: Protocol Header Size Assumptions

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Header size</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP</td>
<td>20 bytes</td>
</tr>
<tr>

Table 13: Explanation of Terms

<table>
<thead>
<tr>
<th>Codec Bit Rate (kbps)</th>
<th>Based on the codec, this is the number of bits per second that need to be transmitted to deliver a voice call. ((\text{codec bit rate} = \text{codec sample size} / \text{codec sample interval})).</th>
</tr>
</thead>
</table>
Size (Bytes) Based on the codec, this is the number of bytes captured by the digital signal processor (DSP) at each codec sample interval. For example, the G.729 coder operates on sample intervals of 10 ms, corresponding to 10 bytes (80 bits) per sample at a bit rate of 8 kbps. (codec bit rate = codec sample size / codec sample interval).

Codec Sample Interval (ms)

This is the sample interval at which the codec operates. For example, the G.729 coder operates on sample intervals of 10 ms, corresponding to 10 bytes (80 bits) per sample at a bit rate of 8 kbps. (codec bit rate = codec sample size / codec sample interval).

MOS

MOS is a system of grading the voice quality of telephone connections. With MOS, a wide range of listeners judge the quality of a voice sample on a scale of one (bad) to five (excellent). The scores are averaged to provide the MOS for the codec.

Voice Payload Size (Bytes)

The voice payload size represents the number of bytes (or bits) that are filled into a packet. The voice payload size must be a multiple of the codec sample size. For example, G.729 packets can use 10, 20, 30, 40, 50, or 60 bytes of voice payload size.

Voice Payload Size (ms)

Payload Size (ms) The voice payload size can also be represented in terms of the codec samples. For example, a G.729 voice payload size of 20 ms (two 10 ms codec samples) represents a voice payload of 20 bytes \[(20 \text{ bytes } \times 8) / (20 \text{ ms}) = 8 \text{ kbps}\].

PPS

PPS represents the number of packets that need to be transmitted every second in order to deliver the codec bit rate. For example, for a G.729 call with voice payload size per packet of 20 bytes (160 bits), 50 packets need to be transmitted every second \[50 \text{ pps} = (8 \text{ kbps}) / (160 \text{ bits per packet})\].

**Supported Audio and Video Codecs**

CUBE is required to support the codec used between endpoints. g729r8 is supported by default. All other codecs have to be configured. The following codecs are supported:

<table>

How to Configure Codecs

Configuring Audio and Video Codecs at the Dial Peer Level

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `dial-peer voice number voip`
4. Enter one of the following to configure an audio codec:
   - `codec codec [bytes payload-size fixed-bytes ]`
   - `codec isac [mode {adaptive | independent} [bit-rate value framesize { 30 | 60 } [fixed] ]`
   - `codec ilbc [mode frame-size [bytes payload-size]]`
   - `codec mp4-latm [profile tag]`
5. Do the following to configure a video codec:
   - `video codec codec`
6. (Optional) Do one of the following to configure RTP payload type:
   - `rtp payload-type cisco-codec-isac value`
   - `rtp payload-type cisco-codec-ilbc value`
   - `rtp payload-type cisco-codec-video-h263+ value`
   - `rtp payload-type cisco-codec-video-h264 value`
7. `end`

### Configuring Audio and Video Codecs at the Dial Peer Level

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device&gt; enable</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

#### Step 2

**configure terminal**  
*Example:*  
`Device> configure terminal`

Enters dial peer configuration mode for the specified VoIP dial peer.

#### Step 3

**dial-peer voice number voip**  
*Example:*  
`Device(config)# dial-peer voice 1 voip`

Configure an audio codec at the dial peer level.

#### Step 4

Enter one of the following to configure an audio codec:

- `codec codec [bytes payload-size fixed-bytes]`
- `codec isac [mode {adaptive | independent} [bit-rate value framesize {30 | 60} [fixed]]]`
- `codec ilbc [mode frame-size [bytes payload-size]]`
- `codec mp4-latm [profile tag]`

*Example:*  
For g711alaw Codec  
`Device(config-dial-peer)# codec g711alaw`

For ISAC Codec  
`Device(config-dial-peer)# codec isac mode independent`

#### Step 5

Do the following to configure a video codec:

- `video codec codec`

*Example:*  
For Video Codec  
`Device(config-dial-peer)# video codec h261`

#### Step 6

(Optional) Do one of the following to configure RTP payload type:

- `rtp payload-type cisco-codec-isac value`
- `rtp payload-type cisco-codec-ilbc value`
- `rtp payload-type cisco-codec-video-h263+ value`
- `rtp payload-type cisco-codec-video-h264 value`

Configures the RTP payload type.

#### Step 7

`end`  
*Example:*  
`Device(config-dial-peer)# end`

Returns to privileged EXEC mode.
Configuring Audio Codecs Using a Codec Voice Class and Preference Lists

Preferences can be used to determine which codecs will be selected over others.

A codec voice class is a construct within which a codec preference order can be defined. A codec voice class can then be applied to a dial peer, which then follows the preference order defined in the codec voice class.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice class codec tag**
4. Do the following for each audio codec you want to configure in the voice class:
   - **codec preference value codec-type[bytes payload-size fixed-bytes ]**
   - **codec preference value isac [mode {adaptive | independent} ] [bit-rate value framesize { 30 | 60 } [fixed] ]**
   - **codec preference value ilbc [mode frame-size [bytes payload-size]]**
   - **codec preference value mp4-latm [profile tag]**
5. **exit**
6. **dial-peer voice number voip**
7. **voice-class codec tag offer-all**
8. **end**

**DETAILED STEPS**

### Verifying an Audio Call

**SUMMARY STEPS**

1. **show call active voice [compact]**

**DETAILED STEPS**

**show call active voice [compact]**

Displays a compact version of call information for voice calls in progress.

Example:

Device# show call active voice compact

```
<callID>  A/O  FAX   T<sec>  Codec   type   Peer Address   IP R<ip>:<udp>
Total call-legs: 2
  23  ANS  T3  mp4a-latm  VOIP   Psipp  9.45.33.11:57210
  24  ORG  T3  mp4a-latm  VOIP   P123   9.45.33.11:57210
```

Example:
Device# show call active voice compact
<callID> A/O FAX T<sec> Codec type Peer Address IP R<ip>:<udp>
Total call-legs: 2
58 ANS  T11  g711ulaw  VOIP  Psipp 2001:....230A:6080
59 ORG  T11  g711ulaw  VOIP  P5000110011 10.13.37.150:6090

Configuration Examples for Codecs

Example: Configuring a Codec at Dial-Peer Level

Device(config)# dial-peer voice 5550199 voip
Device(config-dial-peer)# incoming called-number 5550199
Device(config-dial-peer)# codec g711ulaw
Device(config-dial-peer)# end

Example: Configuring a Codec Preference List and Applying it to a Dial Peer

Device(config)# voice class codec 100
Device(config-dial-peer)# codec preference 1 g711ulaw
Device(config-dial-peer)# exit
Device(config)# dial-peer voice 10 voip
Device(config-dial-peer)# voice-class codec 100
Device(config-dial-peer)# end
CHAPTER 9

Call Admission Control

The call admission control feature enables you to control the audio quality and video quality of calls over a wide-area (IP WAN) link by limiting the number of calls that are allowed on that link at the same time. Audio and video quality can begin to degrade when too many active calls exist on a link and the amount of bandwidth is oversubscribed. Call admission control regulates audio and video quality by limiting the number of calls that can be active on a particular link at the same time.

The Call Admission Control feature controls number of calls based on resources and bandwidth, proactively reserve resources for good quality video calls, ensures that traffic adheres to QoS policies within each network.

CUBE provides different CAC mechanisms that are based on:

• Total Calls, CPU, or Memory
• Call Spike Detection
• Maximum Calls per Destination
• Dial-peer or Interface Bandwidth

• Configuring CAC Based on Total Calls, CPU or Memory, on page 57
• Configuring CAC Based on Call Spike Detection, on page 58
• Configuring CAC Based on Maximum Calls per Destination, on page 60
• Bandwidth-Based Call Admission Control, on page 61

Configuring CAC Based on Total Calls, CPU or Memory

The Call Admission Control (CAC) based on CPU Utilization feature permits the Cisco Voice Gateways to deny incoming calls exceeding a pre-configured threshold, permitting the selection of a system CPU load level value.

The ‘Call Threshold’ command allows you to configure two thresholds, high and low. The ‘Call Treatment’ is triggered when the current value of a resource goes beyond the configured high value. The ‘Call Treatment’ remains in effect until the current resource value falls below the configured low value.

SUMMARY STEPS

1. enable
2. configure terminal
3. **call threshold global** |cpu-5sec| cpu-avg| io-mem| proc-mem| total-calls| total-mem| low
   __low-threshold__ high __high-threshold__

4. **call treatment on**

5. **end**

### Configuring CAC Based on Call Spike Detection

The Call Admission Control (CAC) based on Call Spike Detection feature permits the Cisco Voice Gateways to monitor call arrival rate over a moving window of time. Calls exceeding the configured rate threshold are
rejected. This feature helps in protecting against unexpected high call volumes, and INVITE-based DOS attacks.

You can configure this feature globally or on a per dial-peer level. An error code is sent when a call spike occurs, the error code is configurable globally or on a per dial-peer level.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. call spike threshold \textit{call number} <1-2147483647> \textit{steps} <3-10> \textit{size} <100-250>
4. call treatment on
5. end

</tbody>
</table>
Configuring CAC Based on Maximum Calls per Destination

The Call Admission Control (CAC) based on Maximum Calls per Destination feature permits the Cisco Voice Gateways to restricting the number of concurrent calls that can be active on a VoIP dial peer. Maximum connections work on individual dial-peers and does not provide CAC for the entire gateway.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `dial-peer voice tag voip`
4. `session protocol sipv2`
5. `max-conn`
6. `end`

**DETAILED STEPS**

|      | Example:          |         |
|      | `Device# end`     | |
**Bandwidth-Based Call Admission Control**

The Bandwidth-Based Call Admission Control (CAC) feature provides the functionality to reject SIP calls when the bandwidth accounted by the SIP signaling layer exceeds the aggregate bandwidth threshold for VoIP media traffic—voice, video, and fax. This functionality helps you prevent Quality of Service (QoS) degradation of VoIP media traffic for existing calls when the bandwidth allocated for VoIP traffic is fully utilized. The Bandwidth-Based Call Admission Control feature is supported on Session Initiation Protocol (SIP) trunks of the Time Division Multiplexing (TDM) SIP gateway and the Cisco Unified Border Element (Cisco UBE).

Midcall media renegotiation can also be rejected if the configured maximum bandwidth threshold for the VoIP media traffic is exceeded. The call continues as per the previously negotiated media codecs if midcall media renegotiation is rejected.

The excess subscription of the bandwidth allocated for VoIP traffic results in VoIP media packets being dropped or delayed, irrespective of the VoIP call to which they belong. Under such circumstances, it is better to deny new calls to prevent QoS deterioration for existing VoIP call traffic. The existing traffic congestion resolution mechanisms do not differentiate between media packets of existing calls (admitted) and new calls (oversubscribed). Similarly, existing call signaling is unaware of the media traffic congestion. The Bandwidth-Based Call Admission Control feature fills this gap by rejecting new SIP calls when the bandwidth allocated for VoIP traffic is fully utilized. The actual bandwidth usage is not measured and policed. The lower-level QoS policies control the traffic characteristics for the specified traffic class.

---

**Note**

The Bandwidth-Based Call Admission Control feature is applicable only to VoIP traffic.

---

**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Restrictions for Bandwidth-Based Call Admission Control**

- Cisco UBE, configured with the Bandwidth-Based Call Admission Control feature, will not reject the call if the bandwidth of the SDP answer is greater than the bandwidth of the SDP offer.
- Layer 2 overhead is not included in the bandwidth calculation.
- A midcall delayed-offer (DO) to DO call is disconnected if the bandwidth requested in an offer message (200 OK) exceeds the threshold bandwidth.
- Real Time Transport Control Protocol (RTCP) and RTP Named Telephone Event (RTP-NTE) bandwidth requirement is not computed.
- The Bandwidth-Based Call Admission Control feature does not support:
  - Cisco fax relay.
• Filtering of codecs to accommodate calls within the available bandwidth.
• Media flow-around, Session Description Protocol (SDP) pass-through, out-of-box low-density transcoding, high-density transcoding, video transcoding, and midcall consumption functionalities.
• Non-SIP call legs.
• Subinterfaces for bandwidth-based CAC on an interface.

Information About Bandwidth-Based Call Admission Control

Maximum Bandwidth Calculation

The bandwidth requirement for each SIP call leg is calculated using the codec information available in the SDP. Here, the actual media bandwidth used is not measured.

Bandwidth in Kbps (Kilo bits per second) = [(codec bytes + RTP header (12) + UDP (8) + IP Header (20 or 40)) * Packets per seconds * 8/1000]

Where, codec bytes = Codec payload size, in bytes, for a given packetization interval.
RTP header = Size of the RTP header, in bytes.
UDP = Size of the UDP header, in bytes.
IP Header = Size of the IP header, in bytes. The IPV4 header is 20 bytes and the IPV6 header is 40 bytes.
Packets per second = Number of RTP packets sent or received per second. This value is as per the negotiated packetization interval. The SDP media attribute "ptime" indicates the number of packets per second.

Bandwidth Tables

This section provides the sample maximum bandwidth calculation for audio and fax calls.

How to Configure Bandwidth-Based Call Admission Control

Configuring Bandwidth-Based Call Admission Control at the Interface Level

You can configure the Bandwidth-Based Call Admission Control feature at the interface level to reject SIP calls when the bandwidth required for the call exceeds the aggregate bandwidth threshold.

You can configure the Bandwidth-Based Call Admission Control feature for the following interfaces:

- ATM
- Ethernet (Fast Ethernet, Gigabit Ethernet)
- Loopback
- Serial

Note: Cisco recommends that you configure a bind media to associate a specific interface for SIP calls. Otherwise, the interface used for the calls will be determined based on the best local address that can access the remote media source address (for early offer calls) or the remote signaling source address (for delayed offer calls).

When you use a Loopback interface to configure CAC, you must configure an additional bind-to-bind media with the Loopback interface at the global level or the dial peer level. Configure the `bind media source-interface loopback number` command in service SIP configuration mode to configure a bind media.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `call threshold interface type number int-bandwidth [class-map name [l2-overhead percentage]] low low-threshold high high-threshold] [midcall-exceed]`
4. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Example: Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

| Step 2 | configure terminal |
|        | Enters global configuration mode. |
|        | Example: |
|        | Device# configure terminal |

| Step 3 | call threshold interface type number int-bandwidth (class-map name [l2-overhead percentage] [low low-threshold high high-threshold] [midcall-exceed]) |
|        | Configures the Bandwidth-Based Call Admission Control feature at the interface level to reject SIP calls when the bandwidth required for the calls exceed the aggregate bandwidth threshold. |
|        | • You can configure the `call threshold interface type number low low-threshold high high-threshold [midcall-exceed]` command to apply call admission control to reject SIP calls once the accounted bandwidth reaches the `high-threshold` value and continues to be above the `low-threshold` value. |
|        | • You can configure the `call threshold interface type number int-bandwidth class-map name [l2-overhead percentage] [midcall-exceed]` command to use the bandwidth value provisioned in the QoS policy under the interface for VoIP media traffic for CAC. See the Modular Quality of Service Command-Line Interface Overview document at [http://www.cisco.com/en/US/docs/ios/12_2/qos/configuration/guide/qcfmdcli.html](http://www.cisco.com/en/US/docs/ios/12_2/qos/configuration/guide/qcfmdcli.html) for information on the usage of the QoS policy with Call Admission Control. |
|        | • SIP calls are rejected when the calculated aggregate bandwidth of VoIP media traffic on the specified interface exceeds the configured bandwidth threshold. |

| Step 4 | end |
|        | Exits global configuration mode and enters privileged EXEC mode. |
|        | Example: |
|        | Device(config)# end |

## Configuring Bandwidth-Based Call Admission Control at the Dial Peer Level

You can configure the Bandwidth-Based Call Admission Control feature at the dial peer level to reject SIP calls when the bandwidth required for the calls exceeds the aggregate bandwidth threshold.

### SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice tag voip
4. session protocol sipv2
5. max-bandwidth bandwidth-value [midcall-exceed]

### Configuring the Bandwidth-Based Call Admission Control SIP Error Response Code Mapping

Mapping of the call rejection cause code to a specific SIP error response code is known as error response code mapping. The cause code for the call rejected because of the bandwidth-based CAC can be mapped to a SIP error response code between 400 to 600. The default SIP error response code is 488.

You can configure SIP error response codes for calls rejected by the Bandwidth-Based Call Admission Control feature at the global level, dial peer level, or both.
Configuring Bandwidth-Based Call Admission Control SIP Error Response Code Mapping at the Global Level

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. sip
5. error-code-override cac-bandwidth failure sip-status-code-number
6. end

Verifying Bandwidth-Based Call Admission Control

Perform this task to verify the configuration for the Bandwidth-Based Call Admission Control feature on Cisco UBE. The `show` commands need not be entered in any specific order.

SUMMARY STEPS

1. enable
2. show call threshold config
3. show call threshold status
4. show call threshold stats
5. show dial-peer voice

DETAILLED STEPS

Step 1  enable
Example:
Device>enable
Enables privileged EXEC mode.

Step 2  show call threshold config
Example:
Device# show call threshold config
Some resource polling interval:
  CPU_AVG interval: 60
  Memory interval: 5

<table>
<thead>
<tr>
<th>IF</th>
<th>Type</th>
<th>Value</th>
<th>Low</th>
<th>High</th>
<th>Enable</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet0/0</td>
<td>int-bandwidth</td>
<td>0</td>
<td>100</td>
<td>400</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Displays the current call threshold configuration at the interface level for all resources.

Step 3  show call threshold status
Example:
Device# show call threshold status

<table>
<thead>
<tr>
<th>Status</th>
<th>IF</th>
<th>Type</th>
<th>Value</th>
<th>Low</th>
<th>High</th>
<th>Enable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Avail</td>
<td>GigabitEthernet0/0</td>
<td>int-bandwidth</td>
<td>0</td>
<td>100</td>
<td>400</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Displays the availability status of resources that are configured when the Bandwidth-Based Call Admission Control feature is enabled at an interface level.

Step 4  show call threshold stats
Example:
Device# show call threshold stats

Total resource check: 2
  successful: 1
  failed: 1

1: ------------------------
   Failed resources: int-bandwidth,
   related interface: GigabitEthernet0/0; related option:N/A
   Recorded time: 04:49:39 UTC Wed Dec 8 2010
2: ------------------------
   Successful
All resources are available for this check.
Recorded time: 04:29:39 UTC Wed Dec 8 2010

Displays the statistics of resources that are configured when the Bandwidth-Based Call Admission Control feature is enabled at an interface level.

**Step 5**

**show dial-peer voice**

**Example:**

```
Device# show dial-peer voice
 incoming called-number = `2000', connections/maximum = 0/unlimited, 
bandwidth/maximum = 0/400, 
......
Successful Calls = 0, Failed Calls = 0, Incomplete Calls = 0
Accepted Calls = 3, Refused Calls = 0, 
Bandwidth CAC Accepted Calls = 3, Bandwidth CAC Refused Calls = 0
```

Displays information for the voice dial peer.

---

**Troubleshooting Tips**

The following commands can help troubleshoot the Bandwidth-Based Call Admission Control feature:

- `debug ccsp all`
- `debug voice ccapi all`

**Configuration Examples for Bandwidth-Based Call Admission Control**

**Example: Configuring Bandwidth-Based Call Admission Control at the Interface Level**

The following example shows how to configure Cisco UBE to reject new SIP calls if the accounted VoIP media bandwidth on Gigabit Ethernet interface 0/0 exceeds 400 Kbps of bandwidth and continues to have a bandwidth above 100 Kbps:

```
Device> enable
Device# configure terminal
Device(config)# call threshold interface GigabitEthernet 0/0 int-bandwidth low 100 high 400
```

The following example shows how to configure Cisco UBE to reject new SIP calls if the VoIP media bandwidth on Gigabit Ethernet interface 0/0 exceeds the configured bandwidth for priority traffic in the “voip_traffic” class:

```
Device> enable
Device# configure terminal
Device(config)# class-map match-all voip-traffic
Device(config-cmap)# policy-map voip-policy
Device(config-pmap)# class voip-traffic
Device(config-pmap-c)# priority 440
Device(config-pmap-c)# end
```
Device# enable
Device# configure terminal
Device(config)# call threshold interface GigabitEthernet 0/0 int-bandwidth class-map voip-traffic 12-overhead 10

*Note*

Layer 2 overhead of 10 percent in the `call threshold` command indicates that the IP bandwidth, excluding Layer 2, is 90 percent of the configured priority bandwidth.

**Example: Configuring Bandwidth-Based Call Admission Control at the Dial Peer Level**

The following example shows how to configure Cisco UBE to reject calls once the accounted aggregate bandwidth of active calls exceeds 400 Kbps for a SIP dial peer:

Device> enable
Device# configure terminal
Device(config)# dial-peer voice 2000 voip
Device(config)# session protocol sipv2
Device(config-dial-peer)# max-bandwidth 400

**Example: Configuring the Bandwidth-Based Call Admission Control SIP Error Response Code Mapping at the Global Level**

The following example shows how to configure Cisco UBE for bandwidth-based CAC SIP error response code mapping at the global level:

Device> enable
Device# configure terminal
Device(config)# voice service voip
Device(conf-voi-serv)# sip
Device(conf-serv-sip)# error-code-override cac-bandwidth 500

**Example: Configuring the Bandwidth-Based Call Admission Control SIP Error Response Code Mapping at the Dial Peer Level**

The following example shows how to configure Cisco UBE for bandwidth-based CAC SIP error response code mapping at the dial peer level:

Device> enable
Device# configure terminal
Device(config)# dial-peer voice 88 voip
Device(config-dial-peer)# voice-class sip error-code-override cac-bandwidth failure 500
### Feature Information for Bandwidth-Based Call Admission Control

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

CHAPTER 10

Basic SIP Configuration

This chapter provides basic configuration information for the following features:

- SIP Register Support
- SIP Redirect Processing Enhancement
- SIP 300 Multiple Choice Messages
- SIP implementation enhancements:
  - Interaction with Forking Proxies
  - SIP Intra-Gateway Hairpinning

Finding Support Information for Platforms and Cisco Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

- Prerequisites for Basic SIP Configuration, on page 73
- Restrictions for Basic SIP Configuration, on page 73
- Information About Basic SIP Configuration, on page 74
- How to Perform Basic SIP Configuration, on page 75
- Configuration Examples for Basic SIP Configuration, on page 91
- Toll Fraud Prevention, on page 98

Prerequisites for Basic SIP Configuration

SIP Redirect Processing Enhancement Feature

- Ensure that your SIP gateway supports 300 or 302 Redirect messages.

Restrictions for Basic SIP Configuration

- If Hot Standby Router Protocol (HSRP) is configured on the Cisco IOS Gateway, IP-TDM calls are not supported.
Information About Basic SIP Configuration

SIP Register Support

With H.323, Cisco IOS gateways can register E.164 numbers of a POTS dial peer with a gatekeeper, which informs the gatekeeper of a user’s contact information. Session Initiation Protocol (SIP) gateways allow the same functionality, but with the registration taking place with a SIP proxy or registrar. SIP gateways allow registration of E.164 numbers to a SIP proxy or registrar on behalf of analog telephone voice ports (FXS), IP phone virtual voice ports (EFXS), and local SCCP phones.

When registering dial peers with an external registrar, you can also register with a secondary SIP proxy or registrar to provide redundancy. The secondary registration can be used if the primary registrar fails.

SIP gateways allow registration of E.164 numbers to a SIP proxy or registrar server on behalf of analog telephone voice ports (FXS), IP phone virtual voice ports (EFXS), and local SCCP phones. By default, SIP gateways do not generate SIP Register messages. The following tasks set up the gateway to register E.164 telephone numbers with an external SIP registrar.

Note

There are no commands that allow registration between the H.323 and SIP protocols.

SIP Redirect Processing Enhancement

SIP Redirect Processing allows flexibility in the handling of incoming redirect or 3xx class of responses. Redirect responses can be enabled or disabled through the command-line interface, providing a benefit to service providers who deploy Cisco SIP gateways. Redirect processing is active by default, which means that SIP gateways handle incoming 3xx messages in compliance with RFC 2543. RFC 2543 states that redirect response messages are used by SIP user agents to initiate a new Invite when a user agent learns that a user has moved from a previously known location.

In accordance with RFC 2543-bis-04, the processing of 3xx redirection is as follows:

- The uniform resource identifier (URI) of the redirected INVITE is updated to contain the new contact information provided by the 3xx redirect message.
- The transmitted CSeq number found in the CSeq header is increased by one. The new INVITE includes the updated CSeq.
- The To, From, and Call ID headers that identify the call leg remain the same. The same Call ID gives consistency when capturing billing history.
- The UAC retries the request at the new address given by the 3xx Contact header field.

Redirect handling can be disabled by using the no redirection command in SIP user-agent configuration mode. In this case, the user agent treats incoming 3xx responses as 4xx error class responses. The call is not redirected, and is instead released with the appropriate PSTN cause-code message. The table below shows the mapping of 3xx responses to 4xx responses.
Table 19: Mapping of 3xx Responses to 4xx Responses

<table>
<thead>
<tr>
<th>Redirection (3xx) Response Message</th>
<th>Mapping to 4xx (Client Error) Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>300 Multiple choices</td>
<td>410 Gone</td>
</tr>
<tr>
<td>301 Moved Permanently</td>
<td>410 Gone</td>
</tr>
<tr>
<td>302 Moved Temporarily</td>
<td>480 Temporarily Unavailable</td>
</tr>
<tr>
<td>305 Use Proxy</td>
<td>410 Gone</td>
</tr>
<tr>
<td>380 Alternative Service</td>
<td>410 Gone</td>
</tr>
<tr>
<td>&lt;any other 3xx response&gt;</td>
<td>410 Gone</td>
</tr>
</tbody>
</table>

SIP Redirect Processing generates call history information with appropriate release cause codes that may be used for accounting or statistics purposes. When a 3xx response is mapped to 4xx class of response, the cause code stored in call history is based on the mapped 4xx response code.

Call redirection must be enabled on the gateway for SIP call transfer involving redirect servers to be successful. The Cisco IOS voice gateway can also use call redirection if an incoming VoIP call matches an outbound VoIP dial peer. The gateway sends a 300 or 302 Redirect message to the call originator, allowing the originator to reestablish the call. Two commands allow you to enable the redirect functionality, globally or on a specific inbound dial peer: `redirect ip2ip (dial-peer)` and `redirect ip2ip (voice service)`.

Sending SIP 300 Multiple Choice Messages

Originally, when a call was redirected, the SIP gateway would send a 302 Moved Temporarily message. The first longest match route on a gateway (dial-peer destination pattern) was used in the Contact header of the 302 message. Now, if multiple routes to a destination exist for a redirected number (multiple dial peers are matched), the SIP gateway sends a 300 Multiple Choice message, and the multiple routes in the Contact header are listed.

The `redirect contact order` command gives you the flexibility to choose the order in which routes appear in the Contact header.

How to Perform Basic SIP Configuration

Note

For help with a procedure, see the verification and troubleshooting sections listed above.
Configuring SIP VoIP Services on a Cisco Gateway

Shut Down or Enable VoIP Service on Cisco Gateways

SUMMARY STEPS
1. enable
2. configure terminal
3. voice service voip
4. [no] shutdown [forced]
5. exit

DETAILED STEPS

### Configuring SIP Register Support

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `sip-ua`
4. `registrar {dns: address | ipv4: destination-address} expires seconds [tcp] [secondary]`
5. `retry register number`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enters privileged EXEC mode or any other security level set by a system administrator. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> sip-ua</td>
<td>Enters SIP user-agent configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> registrar {dns: address</td>
<td>ipv4: destination-address} expires seconds [tcp] [secondary]</td>
</tr>

</table>

## Configuring SIP Redirect Processing Enhancement

### Configure Call-Redirect Processing Enhancement

Redirect processing using the `redirection` command is enabled by default. To disable and then reset redirect processing, perform the steps listed in this section:

IP-to-IP call redirection can be enabled globally or on a dial-peer basis. To configure, perform the steps listed in these sections:

### Configuring Call-Redirect Processing Enhancement

#### SUMMARY STEPS

1. enable
2. configure terminal
3. sip-ua
4. no redirection
5. redirection
6. exit

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enters privileged EXEC mode or any other security level set by a system administrator. Enter your password if prompted.</td>

</tr>
</tbody>
</table>
### Configuring Call Redirect to Support Calls Globally

To configure call redirect to support calls globally, perform the following steps.

**Note**
To enable global IP-to-IP call redirection for all VoIP dial peers, use voice-service configuration mode. The default SIP application supports IP-to-IP redirection.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. voice service voip
4. redirect ip2ip
5. exit

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enters privileged EXEC mode or any other security level set by a system administrator. Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
Purpose: Command or Action

**Step 3**
voice service voip  
Example:  
Router(config)# voice service voip

Enables voice-service VoIP configuration mode.

**Step 4**
redirect ip2ip  
Example:  
Router(conf-voi-serv)# redirect ip2ip

Redirects SIP phone calls to SIP phone calls globally on a gateway using the Cisco IOS voice gateway.

**Step 5**
exit  
Example:  
Router(conf-voi-serv)# exit

Exits the current mode.

---

### Configuring Call Redirect to Support Calls on a Specific VoIP Dial Peer

To specify IP-to-IP call redirection for a specific VoIP dial peer, configure it on an inbound dial peer in dial-peer configuration mode. The default application on SIP SRST supports IP-to-IP redirection.

- When IP-to-IP redirection is configured in dial-peer configuration mode, the configuration on the specific inbound dial peer takes precedence over the global configuration entered under voice service configuration.

### SUMMARY STEPS

1. enable  
2. configure terminal  
3. dial-peer voice tag voip  
4. application application-name  
5. redirect ip2ip  
6. exit

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enters privileged EXEC mode or any other security level set by a system administrator. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Step 3**  
dial-peer voice  
**Example:**

Router(config)# dial-peer voice 29 voip

**Purpose**

Use this command to enter dial-peer configuration mode. The argument is as follows:

- *tag* --Digits that define a particular dial peer. Range: 1 to 2,147,483,647 (enter without commas).

**Step 4**  
application application-name  
**Example:**

Router(config-dial-peer)# application session

**Purpose**

Enables a specific application on a dial peer. The argument is as follows:

- *application-name* --Name of the predefined application you wish to enable on the dial peer. For SIP, the default Tel application (from the Cisco IOS image) is session and can be applied to both VoIP and POTS dial peers. The application must support IP-to-IP redirection.

**Step 5**  
redirect ip2ip  
**Example:**

Router(conf-dial-peer)# redirect ip2ip

**Purpose**

Redirects SIP phone calls to SIP phone calls on a specific VoIP dial peer using the Cisco IOS voice gateway.

**Step 6**  
exit  
**Example:**

Router(conf-dial-peer)# exit

**Purpose**

Exits the current mode.

---

### Configuring SIP 300 Multiple Choice Messages

#### Configuring Sending of SIP 300 Multiple Choice Messages

- **Note**

  If multiple routes to a destination exist for a redirected number (multiple dial peers are matched), the SIP gateway sends a 300 Multiple Choice message and the multiple routes in the Contact header are listed. This configuration allows users to choose the order in which the routes appear in the Contact header.

---

### SUMMARY STEPS

1. enable
2. configure terminal
3. voice service voip
4. sip
5. redirect contact order [best-match | longest-match]
6. exit
### DETAILED STEPS

<table>
<thead>

### Configuring SIP Implementation Enhancements

Minor underlying or minimally configurable features are described in the following sections:

For additional information on SIP implementation enhancements, see “Achieving SIP RFC Compliance.”

### Interaction with Forking Proxies

Call forking enables the terminating gateway to handle multiple requests and the originating gateway to handle multiple provisional responses for the same call. Call forking is required for the deployment of the find me/follow me type of services.
Support for call forking enables the terminating gateway to handle multiple requests and the originating gateway to handle multiple provisional responses for the same call. Interaction with forking proxies applies to gateways acting as a UAC, and takes place when a user is registered to several different locations. When the UAC sends an INVITE message to a proxy, the proxy forks the request and sends it to multiple user agents. The SIP gateway processes multiple 18X responses by treating them as independent transactions under the same call ID. When the relevant dial peers are configured for QoS, the gateway maintains state and initiates RSVP reservations for each of these independent transactions. When it receives an acknowledgment, such as a 200 OK, the gateway accepts the successful acknowledgment and destroys state for all other transactions.

The forking feature sets up RSVP for each transaction only if the dial peers are configured for QoS. If not, the calls proceed as best-effort.

Support for interaction with forking proxies applies only to gateways acting as UACs. It does not apply when the gateway acts as a UAS. In that case, the proxy forks multiple INVITES with the same call ID to the same gateway but with different request URLs.

Also, the forking feature sets up RSVP for each transaction only if the dial peers are configured for QoS. If not, the calls proceed as best-effort.

### SIP Intra-Gateway Hairpinning

SIP hairpinning is a call routing capability in which an incoming call on a specific gateway is signaled through the IP network and back out the same gateway. This can be a PSTN call routed into the IP network and back out to the PSTN over the same gateway (see the figure below).

**Figure 13: PSTN Hairpinning Example**

![PSTN Hairpinning Example](image)

Similarly, SIP hairpinning can be a call signaled from a line (for example, a telephone line) to the IP network and back out to a line on the same access gateway (see the figure below).

**Figure 14: Telephone Line Hairpinning Example**

![Telephone Line Hairpinning Example](image)

With SIP hairpinning, unique gateways for ingress and egress are unnecessary.

SIP supports plain old telephone service (POTS)-to-POTS hairpinning (which means that the call comes in one voice port and is routed out another voice port). It also supports POTS-to-IP call legs and IP-to-POTS call legs. However, it does not support IP-to-IP hairpinning. This means that the SIP gateway cannot take an inbound SIP call and reroute it back to another SIP device using the VoIP dial peers.

Only minimal configuration is required for this feature. To enable hairpinning on the SIP gateway, see the following configuration example for dial peers. Note that:

- The POTS dial peer must have preference 2 defined, and the VoIP dial peer must have preference 1 defined. This ensures that the call is sent out over IP, not Plain Old Telephone Service (POTS).
- The session target is the same gateway because the call is being redirected to it.
Verifying SIP Gateway Status

To verify SIP gateway status and configuration, perform the following steps as appropriate (commands are listed in alphabetical order).

**SUMMARY STEPS**

1. show sip service
2. show sip-ua register status
3. show sip-ua statistics
4. show sip-ua status
5. show sip-ua timers

**DETAILED STEPS**

**Step 1**

**show sip service**

Use this command to display the status of SIP call service on a SIP gateway.

The following sample output shows that SIP call service is enabled:

**Example:**

```
Router# show sip service
SIP Service is up
```

The following sample output shows that SIP call service was shut down with the `shutdown` command:

**Example:**

```
```
Verifying SIP Gateway Status

Router# show sip service
SIP service is shut globally
under 'voice service voip'

The following sample output shows that SIP call service was shut down with the call service stop command:

Example:

Router# show sip service
SIP service is shut
under 'voice service voip', 'sip' submode

The following sample output shows that SIP call service was shut down with the shutdown forced command:

Example:

Router# show sip service
SIP service is forced shut globally
under 'voice service voip'

The following sample output shows that SIP call service was shut down with the call service stop forced command:

Example:

Router# show sip service
SIP service is forced shut
under 'voice service voip', 'sip' submode

Step 2  show sip-ua register status

Use this command to display the status of E.164 numbers that a SIP gateway has registered with an external primary SIP registrar.

Example:

Router# show sip-ua register status
Line peer expires(sec) registered
4001 20001 596    no
4002 20002 596    no
5100 1    596    no
9998 2    596    no

Step 3  show sip-ua statistics

Use this command to display response, traffic, and retry SIP statistics, including whether call redirection is disabled.

The following sample shows that four registers were sent:

Example:

Router# show sip-ua statistics
SIP Response Statistics (Inbound/Outbound)
   Informational:
   Trying 0/0, Ringing 0/0,
   Forwarded 0/0, Queued 0/0,
   SessionProgress 0/0
   Success:
   OkInvite 0/0, OkBye 0/0,
   OkCancel 0/0, OkOptions 0/0,
   OkPrack 0/0, OkPreconditionMet 0/0,
   OkSubscribe 0/0, OkNOTIFY 0/0,
   OkInfo 0/0, 202Accepted 0/0
OkRegister 12/49
Redirection (Inbound only except for MovedTemp(Inbound/Outbound)) :
  MultipleChoice 0, MovedPermanently 0,
  MovedTemporarily 0/0, UseProxy 0,
  AlternateService 0
Client Error:
  BadRequest 0/0, Unauthorized 0/0,
  PaymentRequired 0/0, Forbidden 0/0,
  NotFound 0/0, MethodNotAllowed 0/0,
  NotAcceptable 0/0, ProxyAuthReqd 0/0,
  ReqTimeout 0/0, Conflict 0/0, Gone 0/0,
  ReqEntityTooLarge 0/0, RequRITooLarge 0/0,
  UnsupportedMediaType 0/0, BadExtension 0/0,
  TempNotAvailable 0/0, CallLegNonExistent 0/0,
  LoopDetected 0/0, TooManyHops 0/0,
  AddrIncomplete 0/0, Ambiguous 0/0,
  BusyHere 0/0, RequestCancel 0/0,
  NotAcceptableMedia 0/0, BadEvent 0/0,
  SetTooSmall 0/0
Server Error:
  InternalError 0/0, NotImplemented 0/0,
  BadGateway 0/0, ServiceUnavail 0/0,
  GatewayTimeout 0/0, BadSipVer 0/0,
  PreCondFailure 0/0
Global Failure:
  BusyEverywhere 0/0, Decline 0/0,
  NotExistAnywhere 0/0, NotAcceptable 0/0
Miscellaneous counters:
  RedirectRspMappedToClientErr 0
SIP Total Traffic Statistics (Inbound/Outbound)
  Invite 0/0, Ack 0/0, Bye 0/0,
  Cancel 0/0, Options 0/0,
  Prack 0/0, Comet 0/0,
  Subscribe 0/0, NOTIFY 0/0,
  Refer 0/0, Info 0/0
  Register 49/16
Retry Statistics
  Invite 0, Bye 0, Cancel 0, Response 0,
  Prack 0, Comet 0, Reliable1xx 0, NOTIFY 0
  Register 4
SDP application statistics:
  Parses: 0, Builds 0
  Invalid token order: 0, Invalid param: 0
  Not SDP desc: 0, No resource: 0
  Last time SIP Statistics were cleared: <never>

The following sample output shows the RedirectResponseMappedToClientErr status message. An incremented number indicates that 3xx responses are to be treated as 4xx responses. When call redirection is enabled (default), the RedirectResponseMappedToClientErr status message is not incremented.

Example:

Router# show sip-ua statistics
SIP Response Statistics (Inbound/Outbound)
  Informational:
    Trying 0/0, Ringing 0/0,
    Forwarded 0/0, Queued 0/0,
    SessionProgress 0/0
  Success:
    OkInvite 0/0, OkBye 0/0,
    OkCancel 0/0, OkOptions 0/0,
    OkPrack 0/0, OkPreconditionMet 0/0,
    OkSubscribe 0/0, OkNotify 0/0,
    202Accepted 0/0
Redirection (Inbound only):
  MultipleChoice 0, MovedPermanently 0,
  MovedTemporarily 0, UseProxy 0,
  AlternateService 0
Client Error:
  BadRequest 0/0, Unauthorized 0/0,
  PaymentRequired 0/0, Forbidden 0/0,
  NotFound 0/0, MethodNotAllowed 0/0,
  NotAcceptable 0/0, ProxyAuthReqd 0/0,
  ReqTimeout 0/0, Conflict 0/0, Gone 0/0,
  ReqEntityTooLarge 0/0, ReqURITooLarge 0/0,
  UnsupportedMediaType 0/0, BadExtension 0/0,
  TempNotAvailable 0/0, CallLegNonExistent 0/0,
  LoopDetected 0/0, TooManyHops 0/0,
  AddrIncomplete 0/0, Ambiguous 0/0,
  BusyHere 0/0, RequestCancel 0/0
  NotAcceptableMedia 0/0, BadEvent 0/0
Server Error:
  InternalError 0/0, NotImplemented 0/0,
  BadGateway 0/0, ServiceUnavail 0/0,
  GatewayTimeout 0/0, BadSipVer 0/0,
  PreCondFailure 0/0
Global Failure:
  BusyEverywhere 0/0, Decline 0/0,
  NotExistAnywhere 0/0, NotAcceptable 0/0
Miscellaneous counters:
  RedirectResponseMappedToClientError 1,
SIP Total Traffic Statistics (Inbound/Outbound)
  Invite 0/0, Ack 0/0, Bye 0/0,
  Cancel 0/0, Options 0/0,
  Prack 0/0, Comet 0/0,
  Subscribe 0/0, Notify 0/0,
  Refer 0/0
Retry Statistics
  Invite 0, Bye 0, Cancel 0, Response 0,
  Prack 0, Comet 0, Reliable1xx 0, Notify 0
SDP application statistics:
  Parses: 0, Builds 0
  Invalid token order: 0, Invalid param: 0
  Not SDP desc: 0, No resource: 0

**Step 4**  
**show sip-ua status**

Use this command to display status for the SIP user agent (UA), including whether call redirection is enabled or disabled.

**Example:**

```bash
Router# show sip-ua status
SIP User Agent Status
SIP User Agent for UDP : ENABLED
SIP User Agent for TCP : ENABLED
SIP User Agent bind status(signaling) : DISABLED
SIP User Agent bind status(media) : DISABLED
SIP max-forwards : 6
SIP DNS SRV version: 1 (rfc 2052)
Redirection (3xx) message handling: ENABLED
```

**Step 5**  
**show sip-ua timers**

Use this command to display the current settings for the SIP user-agent (UA) timers.

The following sample output shows the waiting time before a register request is sent— that is, the value that is set with the `timers register` command:
Example:

Router# show sip-ua timers
SIP UA Timer Values (milliseconds)
trying 500, expires 180000, connect 500, disconnect 500
comet 500, prack 500, re11xx 500, notify 500
refer 500, register 500

General Troubleshooting Tips

For more information on troubleshooting, see the following references:

• "Cisco IOS Voice Troubleshooting and Monitoring Guide"
• Cisco IOS Debug Command Reference
• Cisco IOS Voice, Video, and Fax Configuration Guide
• Troubleshooting and Debugging VoIP Call Basics
• VoIP Debug Commands

Note

Commands are listed in alphabetical order.

• Make sure that VoIP is working.
• Make sure that you can make a voice call.
• Verify that SIP-supported codecs are used. Support for codecs varies on different platforms; use the `codec ?` command to determine the codecs available on a specific platform.
• Use the `debug aaa authentication` command to display high-level diagnostics related to AAA logins.
• Use the `debug asnl events` command to verify that the SIP subscription server is up. The output displays a pending message if, for example, the client is unsuccessful in communicating with the server.
• Use the debug call fallback family of commands to display details of VoIP call fallback.
• Use the `debug cch323` family of commands to provide debugging output for various components within an H.323 subsystem.
• Use the `debug ccsip` family of commands for general SIP debugging, including viewing direction-attribute settings and port and network address-translation traces. Use any of the following related commands:
  • `debug ccsip all`--Enables all SIP-related debugging
  • `debug ccsip calls`--Enables tracing of all SIP service-provider interface (SPI) calls
  • `debug ccsip error`--Enables tracing of SIP SPI errors
  • `debug ccsip events`--Enables tracing of all SIP SPI events
  • `debug ccsip info`--Enables tracing of general SIP SPI information, including verification that call redirection is disabled
• **debug ccsip media**—Enables tracing of SIP media streams
• **debug ccsip messages**—Enables all SIP message tracing, such as those that are exchanged between the SIP user-agent client (UAC) and the access server
• **debug ccsip preauth**—Enables diagnostic reporting of authentication, authorization, and accounting (AAA) preauthentication for SIP calls
• **debug ccsip states**—Enables tracing of all SIP state tracing
• **debug ccsip transport**—Enables tracing of the SIP transport handler and the TCP or User Datagram Protocol (UDP) process

• Use the **debug isdn q931** command to display information about call setup and teardown of ISDN network connections (layer 3) between the local router (user side) and the network.
• Use the **debug kpml** command to enable debug tracing of KeyPad Markup Language (KPML) parser and builder errors.
• Use the **debug radius** command to enable debug tracing of RADIUS attributes.
• Use the **debug rpms-proc preauth** command to enable debug tracing on the RPMS process for H.323 calls, SIP calls, or both H.323 and SIP calls.
• Use the **debug rtr trace** command to trace the execution of an SAA operation.
• Use the **debug voip** family of commands, including the following:
  • **debug voip ccap protoheaders**—Displays messages sent between the originating and terminating gateways. If no headers are being received by the terminating gateway, verify that the **header-passing** command is enabled on the originating gateway.
  • **debug voip ivr script**—Displays any errors that might occur when the Tcl script is run
  • **debug voip rtp session named-event 101**—Displays information important to DTMF-relay debugging, if you are using codec types g726r16 or g726r24. Be sure to append the argument 101 to the command to prevent the console screen from flooding with messages and all calls from failing.

Sample output for some of these commands follows:

**Sample Output for the debug ccsip events Command**

• The example shows how the Proxy-Authentication header is broken down into a decoded username and password.

```
Router# debug ccsip events
CCSIP SPI: SIP Call Events tracing is enabled
21:03:21: sippmh_parse_proxy_auth: Challenge is 'Basic'.
21:03:21: sippmh_parse_proxy_auth: Base64 user-pass string is 'MTIzNDU2Nzg5MDEyMzQ1Njou'.
21:03:21: sippmh_parse_proxy_auth: Decoded user-pass string is '1234567890123456:.'.
21:03:21: sip_process_proxy_auth: Username is '1234567890123456'.
21:03:21: sip_process_proxy_auth: Pass is '.
```

**Sample Output for the debug ccsip info Command**

This example shows only the portion of the debug output that shows that call redirection is disabled. When call redirection is enabled (default), there are no debug line changes.

```
Router# debug ccsip info
```
00:20:32: HandleUdpSocketReads :Msg enqueued for SPI with IPaddr: 172.18.207.10 :5060
00:20:32: CCSIP-SPI-CONTROL: act_sentinvite_new_message
00:20:32: CCSIP-SPI-CONTROL: sipSPICheckResponse
00:20:32: sip_stats_status_code : !!Call Redirection feature is disabled on the GW
00:20:32: ccsp_get_code_class: !!Mapping 302 response to 480
00:20:32: Roundtrip delay 4 milliseconds for method INVITE

Toll Fraud Prevention

When a Cisco router platform is installed with a voice-capable Cisco IOS software image, appropriate features must be enabled on the platform to prevent potential toll fraud exploitation by unauthorized users. Deploy these features on all Cisco router Unified Communications applications that process voice calls, such as Cisco Unified Communications Manager Express (Cisco Unified CME), Cisco Survivable Remote Site Telephony (SRST), Cisco Unified Border Element (Cisco UBE), Cisco IOS-based router and standalone analog and analog line devices.
digital PBX and public-switched telephone network (PSTN) gateways, and Cisco contact-center VoiceXML gateways. These features include, but are not limited to, the following:

- **Disable secondary dial tone on voice ports--**By default, secondary dial tone is presented on voice ports on Cisco router gateways. Use private line automatic ringdown (PLAR) for foreign exchange office (FXO) ports and direct-inward-dial (DID) for T1/E1 ports to prevent secondary dial tone from being presented to inbound callers.

- **Cisco router access control lists (ACLs)--**Define ACLs to allow only explicitly valid sources of calls to the router or gateway, and therefore to prevent unauthorized SIP or H.323 calls from unknown parties to be processed and connected by the router or gateway.

- **Close unused SIP and H.323 ports--**If either the SIP or H.323 protocol is not used in your deployment, close the associated protocol ports. If a Cisco voice gateway has dial peers configured to route calls outbound to the PSTN using either time division multiplexing (TDM) trunks or IP, close the unused H.323 or SIP ports so that calls from unauthorized endpoints cannot connect calls. If the protocols are used and the ports must remain open, use ACLs to limit access to legitimate sources.

- **Change SIP port 5060--**If SIP is actively used, consider changing the port to something other than well-known port 5060.

- **SIP registration--**If SIP registration is available on SIP trunks, turn on this feature because it provides an extra level of authentication and validation that only legitimate sources can connect calls. If it is not available, ensure that the appropriate ACLs are in place.

- **SIP Digest Authentication--**If the SIP Digest Authentication feature is available for either registrations or invites, turn this feature on because it provides an extra level of authentication and validation that only legitimate sources can connect calls.

- **Explicit incoming and outgoing dial peers--**Use explicit dial peers to control the types and parameters of calls allowed by the router, especially in IP-to-IP connections on Cisco Unified CME, SRST, and Cisco UBE. Incoming dial peers offer additional control on the sources of calls, and outgoing dial peers on the destinations. Incoming dial peers are always used for calls. If a dial peer is not explicitly defined, the implicit dial peer 0 is used to allow all calls.

- **Explicit destination patterns--**Use dial peers with more granularity than .T for destination patterns to block disallowed off-net call destinations. Use class of restriction (COR) on dial peers with specific destination patterns to allow even more granular control of calls to different destinations on the PSTN.

- **Translation rules--**Use translation rules to manipulate dialed digits before calls connect to the PSTN to provide better control over who may dial PSTN destinations. Legitimate users dial an access code and an augmented number for PSTN for certain PSTN (for example, international) locations.

- **Tcl and VoiceXML scripts--**Attach a Tcl/VoiceXML script to dial peers to do database lookups or additional off-router authorization checks to allow or deny call flows based on origination or destination numbers. Tcl/VoiceXML scripts can also be used to add a prefix to inbound DID calls. If the prefix plus DID matches internal extensions, then the call is completed. Otherwise, a prompt can be played to the caller that an invalid number has been dialed.

- **Host name validation--**Use the “permit hostname” feature to validate initial SIP Invites that contain a fully qualified domain name (FQDN) host name in the Request Uniform Resource Identifier (Request URI) against a configured list of legitimate source hostnames.

- **Dynamic Domain Name Service (DNS)--**If you are using DNS as the “session target” on dial peers, the actual IP address destination of call connections can vary from one call to the next. Use voice source
groups and ACLs to restrict the valid address ranges expected in DNS responses (which are used subsequently for call setup destinations).

For more configuration guidance, see the “Cisco IOS Unified Communications Manager Express Toll Fraud Prevention” paper.
CHAPTER 11

SIP Binding

The SIP Binding feature enables you to configure a source IP address for signaling packets and media packets.

- Feature Information for SIP Binding, on page 101
- Information About SIP Binding, on page 102
- Configuring SIP Binding, on page 108
- Verifying SIP Binding, on page 110

Feature Information for SIP Binding

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 20: Feature Information for SIP Binding

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP Gateway Support for the bind Command</td>
<td>Cisco IOS 12.2(2)XB, 12.2(2)XB2, 12.2(8)T, 12.2(11)T, and 12.3(4)T Cisco IOS XE 3.1.0S</td>
<td>The SIP Gateway Support for the bind Command feature allows you to configure the source IP address of signaling packets and media packets. In 12.2(2)XB, this feature was introduced. In 12.3(4)T, this feature was expanded to provide the flexibility to specify different source interfaces for signaling and media, and allow network administrators a finer granularity of control on the network interfaces used for voice traffic. The following commands were introduced or modified: bind, show dial-peer voice, show ip sockets, show sip-ua connections, and show sip-ua status.</td>
</tr>
</tbody>
</table>
### Information About SIP Binding

When you configure SIP on a router, the ports on all its interfaces are open by default. This makes the router vulnerable to malicious attackers who can execute toll fraud across the gateway if the router has a public IP address and a public switched telephone network (PSTN) connection. To eliminate the threat, you should bind an interface to an IP address so that only those ports are open to the outside world. In addition, you should protect any public or untrusted interface by configuring a firewall or an access control list (ACL) to prevent unwanted traffic from traversing the router.

#### Benefits of SIP Binding

- SIP signaling and media paths can advertise the same source IP address on the gateway for certain applications, even if the paths used different addresses to reach the source. This eliminates confusion for firewall applications that may have taken action on source address packets before the use of binding.

- Firewalls filter messages based on variables such as the message source, the target address, and available ports. Normally a firewall opens only certain addresses or port combination to the outside world and those addresses can change dynamically. Because VoIP technology requires the use of more than one address or port combination, the `bind` command adds flexibility by assigning a gateway to a specific interface (and therefore the associated address) for the signaling or media application.

- You can obtain a predefined and separate interface for both signaling and media traffic. After a `bind` command is in effect, the interface it limits is bound solely to that purpose. Administrators can therefore dictate the use of one network to transport the signaling and another network to transport the media. The benefits of administrator control are:
  - Administrators know the traffic that runs on specific networks, thereby making debugging easier.
  - Administrators know the capacity of the network and the target traffic, thereby making engineering and planning easier.
  - Traffic is controlled, allowing Quality of Service (QoS) to be monitored.
• The **bind media** command relaxes the constraints imposed by the **bind control** and **bind all** commands, which cannot be set during an active call. The **bind media** command works with active calls.

## Source Address

In early releases of Cisco IOS software with SIP functionality, the source address of a packet going out of the gateway was never deterministic. That is, the session protocols and VoIP layers always depended on the IP layer to give the *best local address*. The best local address was then used as the source address (the address showing where the SIP request came from) for signaling and media packets. Using this non-deterministic address occasionally caused confusion for firewall applications, because a firewall could not be configured with an exact address and would take action on several different source address packets.

However, the **bind** command enables you to configure the source IP address of signaling and media packets to a specific interface’s IP address. Thus, the address that goes out on the packet is bound to the IP address of the interface specified with the **bind** command. Packets that are not destined to the bound address are discarded.

When you do not want to specify a bind address or if the interface is down, the IP layer still provides the best local address.

The Support Ability to Configure Source IP Address for Signaling and Media per SIP Trunk feature extends the global bind functionality to support the SIP signaling Transport Layer Socket (TLS) with UDP and TCP. The source address at the dial peer is the source address in all the signaling and media packets between the gateway and the remote SIP entity for calls using the dial-peer. Multiple SIP listen sockets with specific source address handle the incoming SIP traffic from each selected SIP entity. The order of preference for retrieving the SIP signalling and media source address for inbound and outbound calls is as follows:

- Bind configuration at dial peer level
- Bind configuration at global level
- Best local IP address to reach the destination

The table below describes the state of the system when the **bind** command is applied in the global or dial peer level:

### Table 21: State of the System for the bind Address

<table>
<thead>
<tr>
<th>Bind State</th>
<th>System Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>No global bind</td>
<td>The best local address is used in all outbound SIP messages. Only one SIP listen socket with a wildcard source address.</td>
</tr>
<tr>
<td>Global bind</td>
<td>Global bind address used in all outbound SIP messages. Only one SIP listen socket with global bind address.</td>
</tr>
<tr>
<td>No global bind Dial peer bind</td>
<td>Dial peer bind address is used in outbound SIP messages of this dial peer. The remaining SIP messages use the best local address. One SIP listen socket with a wildcard source address. Additional SIP listen socket for each different dial peer bind listening on the specific dial peer bind address.</td>
</tr>
</tbody>
</table>
Dial peer bind address is used in outbound SIP messages of this dial peer. The remaining SIP messages use the global bind address.

One SIP listen socket with global bind address.

Additional SIP listen socket for each different dial peer bind command listening on the specific dial peer bind address.

The `bind` command performs different functions based on the state of the interface (see the table below).

**Table 22: State of the Interface for the bind Command**

<table>
<thead>
<tr>
<th>Interface State</th>
<th>Result Using Bind Command</th>
</tr>
</thead>
</table>
| Shut down With or without active calls | TCP, TLS, and User Datagram Protocol (UDP) socket listeners are initially closed. (Socket listeners receive datagrams addressed to the socket.)
Then the sockets are opened to listen to any IP address.
If the outgoing gateway has the `bind` command enabled and has an active call, the call becomes a one-way call with media flowing from the outgoing gateway to the terminating gateway.
The dial peer bind socket listeners of the interface are closed and the configuration turns inactive for all subsequent SIP messages. |
| No shut down No active calls | TCP, TLS, and UDP socket listeners are initially closed. (Socket listeners receive datagrams addressed to the socket.)
Then the sockets are opened and bound to the IP address set by the `bind` command.
The sockets accept packets destined for the bound address only.
The dial peer bind socket listeners of the interface are reopened and the configuration turns active for all subsequent SIP messages. |
| No shut down Active calls   | TCP, TLS, and UDP socket listeners are initially closed.
Then the sockets are opened to listen to any IP address.
The dial peer bind socket listeners of the interface are reopened and the configuration turns active for all subsequent SIP messages. |
<table>
<thead>
<tr>
<th>Interface State</th>
<th>Result Using Bind Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bound-interface IP address is removed.</td>
<td>TCP, TLS, and UDP socket listeners are initially closed. Then the sockets are opened to listen to any address, because the IP address has been removed. This happens even when SIP was never bound to an IP address. A message stating that the IP address has been deleted from the SIP bound interface is printed. If the outgoing gateway has the <code>bind</code> command enabled and has an active call, the call becomes a one-way call with media flowing from the outgoing gateway to the terminating gateway. The dial peer bind socket listeners of the interface are closed and the configuration turns inactive for all subsequent SIP messages.</td>
</tr>
<tr>
<td>The physical cable is pulled on the bound port or the interface layer is down.</td>
<td>TCP, TLS, and UDP socket listeners are initially closed. Then the sockets are opened and bound to listen to any address. When the pulled cable is replaced, the result is as documented for no shutdown interfaces. The dial peer bind socket listeners of the interface are closed and the configuration turns inactive for all subsequent SIP messages.</td>
</tr>
<tr>
<td>A bind interface is shut down or its IP address is changed or the physical cable is pulled while SIP calls are active.</td>
<td>The call becomes a one-way call with media flowing in only one direction. It flows from the gateway where the change or shutdown took place, to the gateway where no change occurred. Thus, the gateway with the status change no longer receives media. The call is then disconnected, but the disconnected message is not understood by the gateway with the status change, and the call is still assumed to be active. If the bind interface is shutdown, the dial peer bind socket listeners of the interface are closed. If the IP address of the interface is changed, the socket listeners representing the bind command is opened with the available IP address of the interface and the configuration turns active for all subsequent SIP messages.</td>
</tr>
</tbody>
</table>

**Note**

If there are active calls, the `bind` command does not take effect if it is issued for the first time or if another `bind` command is in effect. A message reminds you that there are active calls and that the change cannot take effect.
The bind command applied at the dial peer level can be modified only in the following situations:

- Dial peer bind is disabled in the supported IOS configuration options.
- Dial peer bind is removed when the bound interface is removed.
- Dial peer bind is removed when the dial peer is removed.

**Voice Media Stream Processing**

The SIP Gateway Support Enhancements to the bind Command feature extends the capabilities of the bind command by supporting a deterministic network interface for the voice media stream. Before the voice media stream addition, the bind command supported a deterministic network interface for control (signaling) traffic or all traffic. With the SIP Gateway Support Enhancements to the bind Command feature, a finer granularity of control is achieved on the network interfaces used for voice traffic.

If multiple bind commands are issued in sequence—that is, if one bind command is configured and then another bind command is configured—a set interaction happens between the commands. The table below describes the expected command behavior.

**Table 23: Interaction Between Previously Set and New bind Commands**

<table>
<thead>
<tr>
<th>Interface State</th>
<th>bind Command</th>
<th>Result Using bind Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Without active calls</td>
<td>bind all</td>
<td>Generated bind control and bind media commands to override existing bind control and bind media commands.</td>
</tr>
<tr>
<td></td>
<td>bind control</td>
<td>Overrides existing bind control command.</td>
</tr>
<tr>
<td></td>
<td>bind media</td>
<td>Overrides existing bind media command.</td>
</tr>
<tr>
<td>With active calls</td>
<td>bind all or bind control</td>
<td>Blocks the command, and the following messages are displayed:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 00:16:39: There are active calls</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 00:16:39: configure_sip_bind_command: The bind command change will not take effect</td>
</tr>
<tr>
<td></td>
<td>bind media</td>
<td>Succeeds and overrides any existing bind media command.</td>
</tr>
</tbody>
</table>

The bind all and bind control commands perform different functions based on the state of the interface.

**Note**

The bind all command only applies to global level, whereas the bind control and bind media command apply to global and dial peer. The table below applies to bind media only if the media interface is the same as the bind control interface. If the two interfaces are different, media behavior is independent of the interface state.
### Table 24: bind all and bind control Functions, Based on Interface State

<table>
<thead>
<tr>
<th>Interface State</th>
<th>Result Using bind all or bind control Commands</th>

<tr>
<td></td>
<td>The dial peer bind socket listeners of the interface are closed and the configuration turns inactive for all subsequent SIP messages.</td>
</tr>
</tbody>
</table>
### Configuring SIP Binding

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `ip address ip-address mask [secondary]`
5. `exit`
6. Use one of the following commands to configure SIP binding:
   - `bind \{control | all\} source-interface interface-id [ipv6-address ipv6-address]` in SIP configuration mode.
   - `bind media \{source-address ipv4 ipv4-address | source-interface interface-id [ipv6-address ipv6-address]\}` in SIP configuration mode.
   - `voice-class sip bind control source interface interface-id [ipv6-address ipv6-address]` in dial-peer configuration mode.
   - `voice-class sip bind media \{source-address ipv4 ipv4-address | source-interface interface-id [ipv6-address ipv6-address]\}` in dial-peer configuration mode.
7. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| Router# configure terminal | **Step 3** interface  *type number*  
Example:  
Router(config)# interface fastethernet0/0 | Configures an interface type and enters the interface configuration mode.  
- *type number* — Type of interface to be configured and the port, connector, or interface card number. |
| Step 4  
Example:  
Router(config-if)# ip address 192.168.200.33 255.255.255.0 | Configures a primary or secondary IP address for an interface.  
**Note** Secondary IP address on an interface with SIP binding is not supported for CUBE. |
| Step 5  
Example:  
Router(config-if)# exit | Exits the current mode. |
| Step 6  
Example:  
SIP binding in SIP configuration mode:  
Device(config)# voice service voip  
Device(config-voi-serv)# sip  
Device(config-voi-serv)# bind control source-interface FastEthernet0/0  
Device(config-voi-serv)# exit  
Device(config)# voice service voip  
Device(config-voi-serv)# sip  
Device(config-voi-serv)# bind media source-address ipv4 172.18.192.204  
Device(config-voi-serv)# exit | Sets a source interface for signaling and media packets. The binding applies to the specified interfaces only. SIP must be configured globally or at a dial peer level.  
- *control* — Binds signaling packets.  
- *media* — Binds media packets.  
- *all* — Binds signaling and media packets.  
- *source-address* — Binds media packets directly to an IP address.  
- *ipv4 ipv4-address* — Configures the IPv4 address.  
- *source interface interface-id* — Type of interface and its ID.  
- *ipv6-address ipv6-address* — Configures the IPv6 address. Ensure that the IPv6 address has been applied to an interface. |
Verifying SIP Binding

SUMMARY STEPS

1. show ip sockets
2. show sip-ua status
3. show sip-ua connections {tcp [tls] | udp} {brief | detail}
4. show dial-peer voice
5. show running-config

DETAILED STEPS

Step 1 show ip sockets
Use this command to display IP socket information and indicate whether the bind address of the receiving gateway is set.

The following sample output indicates that the bind address of the receiving gateway is set:

Example:

Device# show ip sockets
Proto Remote Port Local Port In Out Stat TTY Output IF
17 0.0.0.0 0--any-- 2517 0 0 9 0
17 --listen-- 172.18.192.204 1698 0 0 1 0
17 0.0.0.0 0 172.18.192.204 67 0 0 489 0
17 0.0.0.0 0 172.18.192.204 5060 0 0 A1 0

Example:

Step 2 show sip-ua status
Use this command to display SIP user-agent status and indicate whether bind is enabled.
The following sample output indicates that signaling is disabled and media on 172.18.192.204 is enabled:

**Example:**

```plaintext
Device# show sip-ua status
SIP User Agent Status
SIP User Agent for UDP : ENABLED
SIP User Agent for TCP : ENABLED
SIP User Agent for TLS over TCP : ENABLED
SIP User Agent bind status(signaling): DISABLED
SIP User Agent bind status(media): ENABLED 172.18.192.204
SIP early-media for 180 responses with SDP: ENABLED
SIP max-forwards : 70
SIP DNS SRV version: 2 (rfc 2782)
NAT Settings for the SIP-UA
Role in SDP: NONE
Check media source packets: DISABLED
Maximum duration for a telephone-event in NOTIFYs: 2000 ms
SIP support for ISDN SUSPEND/RESUME: ENABLED
Redirection (3xx) message handling: ENABLED
Reason Header will override Response/Request Codes: DISABLED
Out-of-dialog Refer: DISABLED
Presence support is DISABLED
protocol mode is ipv4
SDP application configuration:
  Version line (v=) required
  Owner line (o=) required
  Timespec line (t=) required
Media supported: audio video image
Network types supported: IN
Address types supported: IPv4 IPv6
Transport types supported: RTP/AVP udptl

Step 3  show sip-ua connections {tcp [tls] | udp} {brief | detail}

Use this command to display the connection details for the UDP transport protocol. The command output looks identical for TCP and TLS.

**Example:**

```plaintext
Device# show sip-ua connections udp detail

Total active connections : 0
No. of send failures : 0
No. of remote closures : 0
No. of inactive conn. ageouts : 10
---------Printing Detailed Connection Report---------
Note:
  ** Tuples with no matching socket entry
    - Do 'clear sip <tcp[tls]/udp> conn t ipv4:<addr>:<port>'
      to overcome this error condition
  ++ Tuples with mismatched address/port entry
    - Do 'clear sip <tcp[tls]/udp> conn t ipv4:<addr>:<port> id <connid>'
      to overcome this error condition
No Active Connections Found
--------- SIP Transport Layer Listen Sockets ---------
Conn-Id          Local-Address
=============== =============================
2                [9.42.28.29]:5060

Step 4  show dial-peer voice
Use this command, for each dial peer configured, to verify that the dial-peer configuration is correct. The following is sample output from this command for a VoIP dial peer:

**Example:**

Device# show dial-peer voice 101

```
VoiceOverIpPeer1234
peer type = voice, system default peer = FALSE, information type = voice,

Verifying SIP Binding

To verify SIP binding, you can use the following commands:

```
show running-config
```

The output will display the SIP binding configuration set on the router.

### Step 5: show running-config

Although the bind all command is an accepted configuration, it does not appear in `show running-config` command output. Because the `bind all` command is equivalent to issuing the commands `bind control` and `bind media`, those are the commands that appear in the `show running-config` command output.

### Example:

The following sample output shows that bind is enabled on router 172.18.192.204:

```

Verifying SIP Binding
Media Path

The Media Path feature allows you to configure the path taken by media after a call is established. You can configure media path in the following modes:

- Media flow-through
- Media flow-around
- Media anti-trombone

- Feature Information for Media Path, on page 117
- Media Flow-Through, on page 118
- Media Flow-Around, on page 119
- Media Anti-Trombone, on page 120

Feature Information for Media Path

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<td>---------------</td>
</tr>
<tr>
<td>Configuring Media Path</td>
</tr>
</tbody>
</table>
Media Flow-Through

Media Flow-Through is a media path mode where media and signaling packets terminate and originate on CUBE. As CUBE is an active participant of the call, this mode is recommended when connected outside an enterprise (untrusted endpoints).

![Figure 15: Media Flow-Through Mode](image)

Restrictions for Media Flow-Through

- Video codecs are not supported for Media Flow-Through.
- Media flow-around for Delayed-Offer to Early-Offer audio and video calls is not supported.

Configuring Media Flow-Through

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. Use one of the following commands to configure media flow-through:
   - `media flow-through` in dial-peer configuration mode
   - `media flow-through` in global VoIP configuration mode
4. `end`

**DETAILED STEPS**

<table>
<thead>

<tr>
<td>Step 2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
### Media Flow-Around

Media Flow-Around is a media path mode where signaling packets terminate and originate on CUBE. As media bypasses CUBE and flows directly between endpoints, this mode is recommended when connected within an enterprise (trusted endpoints). Media Flow-Around is supported for both audio and video calls.

**Figure 16: Media Flow-Around**

**Configuring Media Flow-Around**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. Use one of the following commands to configure media flow-around:
   - **media flow-around** in dial-peer configuration mode
Media Anti-Trombone

Media Anti-Tromboning is a media path mode that allows CUBE to detect and avoid loops created by call transfers or call forwards. Loops are restricted to the SIP signaling path and removed from the RTP media path.

The user agent may initiate call forwards and call transfers that are sent towards CUBE as a new SIP INVITE dialog. CUBE considers the original call and the forwarded call as separate unrelated calls. Media
anti-tromboning allows CUBE to detect the relation between the calls and resolve the media loop by sending SDP packets back to the sender.

The figure below illustrates how CUBE needlessly loops RTP packets towards the User Agent because it fails to detect the loop.

*Figure 17: Tromboning - Needless looping of Media Packets*

The figure below illustrates how CUBE detects and avoids the loop with the anti-tromboning feature.

*Figure 18: Anti-Tromboning - Avoiding Media Loops*

### Prerequisites

**Cisco Unified Border Element**

- Cisco IOS Release 15.1(3)T or a later release must be installed and running on your Cisco Unified Border Element.

**Cisco Unified Border Element (Enterprise)**

- Cisco IOS XE Release 15.1(3)T or a later release must be installed and running on your Cisco ASR 1000 Series Router.

### Restrictions for Media Anti-Tromboning

- When Media Anti-Tromboning media path mode is activated, CUBE does not perform supplementary services such as handling REFER-based call transfers or media services such as Secure Real-Time Transport Protocol (SRTP) and SNR.

- Anti-Tromboning does not work if one call leg is media flow-through and the other call leg is Media Flow-Around. Similarly, anti-tromboning does not work if one call leg is Session Description Protocol (SDP) passthrough and another call leg is SDP normal.

- H.323 is not supported.
Configuring Media Anti-Tromboning

Before you begin
Configure mode border-element command under voice service voip, global VoIP configuration mode.

SUMMARY STEPS

1. enable
2. configure terminal
3. Enter one of the following commands to configure media anti-tromboning:
   - media anti-trombone in dial-peer configuration mode
   - media anti-trombone in global VoIP configuration mode
4. end

Configuring Media Anti-Tromboning
SIP Profiles

Session Initiation Protocol (SIP) profiles change SIP incoming or outgoing messages so that interoperability between incompatible devices can be ensured.

You can configure SIP profiles with rules to add, remove, copy, or modify the SIP, Session Description Protocol (SDP), and peer headers that enter or leave CUBE. The rules in a SIP profile configuration can be also tagged with a unique number. Tagging the rules allows you to insert or delete rules at any position of the existing SIP profile configuration without deleting and reconfiguring the entire voice-class sip profile.

Figure 19: Incoming and Outgoing Messages Where SIP Profiles Can Be Applied

You can use the following tool to test your SIP profile on an incoming message: https://cway.cisco.com/tools/SipProfileTest/.

• Feature Information for SIP Profiles, on page 125
• Information About SIP Profiles, on page 126
• Restrictions for SIP Profiles, on page 128
• How to Configure SIP Profiles, on page 129

Feature Information for SIP Profiles

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

</tr>
</tbody>
</table>

### Information About SIP Profiles

Protocol translation and repair is a key Cisco Unified Border Element (CUBE) function. CUBE can be deployed between two devices that support the same VoIP protocol (for example, SIP), but do not interwork because
of differences in how the protocol is implemented or interpreted. CUBE can customize the SIP messaging on either side to what the devices in that segment of the network expects to see by normalizing the SIP messaging on the network border, or between two non-interoperable devices within the network.

Service providers may have policies for which SIP messaging fields should be present (or what constitutes valid values for the header fields) before a SIP call enters their network. Similarly, enterprises and small businesses may have policies for the information that can enter or exit their networks for policy or security reasons from a service provider SIP trunk.

**Figure 20: SIP Profile**

In order to customize SIP messaging in both directions, you can place and configure a CUBE with a SIP profile at the boundary of these networks.

In addition to network policy compliance, the CUBE SIP profiles can be used to resolve incompatibilities between SIP devices inside the enterprise network. These are the situations in which incompatibilities can arise:

- A device rejects an unknown header (value or parameter) instead of ignoring it
- A device sends incorrect data in a SIP message
- A device does not implement (or implements incorrectly) protocol procedures
- A device expects an optional header value or parameter, or an optional protocol procedure that can be implemented in multiple ways
- A device sends a value or parameter that must be changed or suppressed before it leaves or enters the network
- Variations in the SIP standards on how to achieve certain functions

The SIP profiles feature on CUBE provides a solution to these incompatibilities and customization issues.

SIP profiles can also be used to change a header name from the long form to the compact form. For example, `From` to `f`. This can be used as a way to reduce the length of a SIP message. By default, the device never sends the compact form of the SIP messages although it receives either the long or the short form.

**Important Characteristics of SIP Profiles**

Given below are a few important notes for SIP Profiles:

- Copy Variables u01 to u99 are shared by inbound and outbound SIP Profiles.
- Session Initiation Protocol (SIP) and Session Description Protocol (SDP) headers are supported. SDP can be either a standalone body or part of a Multipurpose Internet Mail Extensions (MIME) message.
The rules configured for an INVITE message are applied only to the first INVITE of a call. A special REINVITE keyword is used to manipulate subsequent INVITEs of a CALL.

Manipulation of SIP headers by outbound SIP profiles occurs as the last step before the message leaves the CUBE device; that is, after destination dial-peer matching has taken place. Changes to the SIP messages are not remembered or acted on by the CUBE application. The Content-length field is recalculated after the SIP Profiles rules are applied to the outgoing message.

If the ANY keyword is used in place of a header, it indicates that a rule must be applied to any message within the specified category.

SIP header modification can be cryptic. It is easier to remove a header and add it back (with the new value), rather than modifying it.

To include "?" (question-mark) character as part of match-pattern or replace-pattern, you need to press "Ctrl+v" keys and then type ". This is needed to treat ‘?’ as a input character itself instead of usual device help prompt.

For header values used to add, modify or copy a header:

- If a whitespace occurs, the entire value must be included between double quotes. For example, “User-Agent: CISCO CUBE”

- If double quotes occurs, a back slash must prefix the double quotes. For example, “User-Agent: "CISCO" CUBE”

- Regular expressions are supported.

- If an incoming SIP message contains certain proprietary attributes, CUBE can copy these unsupported SDP attributes or lines from incoming leg to outgoing leg using a SIP profile rule.

- The copy variable can be used in outbound profile to add or modify the outgoing message.

**Inbound SIP Profile:**

- If the incoming message contains multiple instances of same header, the header values are stored as a comma separated list, and this needs to be considered while modifying it.

- Modification by an inbound SIP profile takes place before regular SIP call processing happens so that behavior of CUBE would be as if it received the message directly without modification.

  If inbound dial peer matching fails as required information could not be extracted from headers (like Request-URI, Via, From or To) due to issues in them, global dial peers are applied. An example is a request with invalid SIP-Req-URI.

- After modification by inbound SIP Profiles, the parameters in SIP message might change, which might change the inbound dial-peer matched when actual dial-peer lookup is done.

- In the register pass-through feature, there is only one dial-peer for register and response. So both register from phone and response from registrar would go through the same inbound sip profile under the dial-peer if any.

**Restrictions for SIP Profiles**

- Removal or addition of mandatory headers is not supported. You can only modify mandatory headers Mandatory SIP headers include To, From, Via, CSeq, Call-Id, and Max-Forwards. Mandatory SDP headers include v, o, s, t, c, and m.

- Addition or removal of entire Multipurpose Internet Mail Extensions (MIME) or (Session Description Protocol) SDP bodies from SIP messages is not supported.
• Syntax checking is not performed on SIP messages after SIP profile rules have been applied. Changes specified in the SIP profile should result in valid SIP protocol exchanges.

• The header length (including header name) after modification should not exceed 300 characters. Max header length for add value is approximately 220 characters. Max SDP length is 2048 characters. If any header length exceeds this maximum value after applying SIP profiles, then the profile is not applied.

• If a header-name is changed to its compact form, SIP profile rules cannot be applied on that header. Thus a SIP profile rule modifying a header name to its compact form must be the last rule on that header.

• We cannot modify the "image" m-line attributes (m=image 16850 udp t38) using SIP profiles. SIP profiles can be applied only on audio and video m-lines in SDP.

• In a high-availability (HA) scenario, SIP profiles copy variable data is not check-pointed to standby.

• Existing limitations and restrictions of outbound SIP profiles apply to inbound SIP profiles as well.

• You cannot configure more than 99 variables for the SIP profiles copy option.

• Once a SIP profile is configured using rule tag, you cannot add rules without tags in the same profile and vice-versa.

How to Configure SIP Profiles

To configure SIP Profiles, you must first configure the SIP Profile globally, and apply it at either to all dial peers (globally) or to a single dial peer (dial-peer level). After a SIP profile is configured, it can be applied as an inbound or outbound profile.

Configuring a SIP Profile to Manipulate SIP Request or Response Headers

SUMMARY STEPS

1. enable
2. configure terminal
3. voice class sip-profiles profile-id
4. Enter one of the following to add, remove, modify SIP headers:
   - request message [sip-header | sdp-header] header-to-add add header-value-to-add
   - request message [sip-header | sdp-header] header-to-remove remove
   - request message [sip-header | sdp-header] header-to-modify modify header-value-to-match header-value-to-replace
5. Enter one of the following to add, remove, or modify SIP response headers:
   - response message [method method-type] [sip-header | sdp-header] header-to-add add header-value-to-add
   - response message [method method-type] [sip-header | sdp-header] header-to-remove remove
   - response message [method method-type] [sip-header | sdp-header] header-to-modify modify header-value-to-match header-value-to-replace
6. end
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| 2    | configure terminal| Enters global configuration mode. |
| 3    | voice class sip-profiles  
Example: |
Device(config)# voice class sip-profiles 10 | Creates a SIP Profiles and enters voice class configuration mode. |
| 4    | Enter one of the following to add, remove, modify SIP headers:  
• request message {sip-header | sdpp-header}  
  header-to-add add header-value-to-add  
  header-to-remove remove  
  header-to-modify modify header-value-to-match header-value-to-replace | According to your choice, this step does one of the following:  
• Adds a SIP or SDP header to a SIP request.  
• Removes a SIP or SDP header to a SIP request.  
• Modifies a SIP or SDP header to a SIP request.  
• If ANY is used in place of a header, it indicates that a rule must be applied to any message within the specified category.  
• For header-value-to-add used to add a header,  
  header-value-to-match or header-value-to-replace used to modify a header:  
  • If a whitespace occurs, the entire value must be included between double quotes. For example, “User-Agent: CISCO CUBE”  
  • If double quotes occurs, a back slash must prefix the double quotes. For example, “User-Agent: \"CISCO\" CUBE”  
  • Regular expressions are supported. |
| 5    | Enter one of the following to add, remove, or modify SIP response headers:  
• response message [method method-type] [sip-header | sdpp-header]  
  header-to-add add header-value-to-add  
  header-to-remove remove  
  header-to-modify modify header-value-to-match header-value-to-replace | According to your choice, this step does one of the following:  
• Adds a SIP or SDP header to a SIP response.  
• Removes a SIP or SDP header to a SIP response.  
• Modifies a SIP or SDP header to a SIP response.  
• All notes from the previous step are applicable here. |
| 6    | end               | Exits to privileged EXEC mode |
Configuring SIP Profiles for Copying Unsupported SDP Headers

CUBE can pass across SDP attributes by defining SIP profile rules. The following steps are involved:

1. Configure CUBE to pass-through custom SDP on in-leg.
2. Define rule to Copy relevant attributes from peer SDP on out-leg.
3. Define rule to Add or Modify attributes in outbound SDP with copied data.

SUMMARY STEPS

1. enable
2. configure terminal
3. To enable copying of unsupported SDP attribute from incoming leg to outbound leg, you need to enable one of the following commands:
   - In Global VoIP SIP configuration mode
     pass-thru content custom-sdp
   - In dial-peer configuration mode (The configuration is applied on the incoming dial-peer)
     voice-class sip pass-thru content custom-sdp
4. voice class sip-profiles profile-id
5. Enter one of the following to copy an unsupported SDP line or attribute from peer leg's SDP and add, modify, or remove in the outgoing SDP:
   - request/response ANY peer-header sdp mline-index index COPY match-pattern copy-variable
   - request/response ANY sdp-header mline-index index header-name ADD copy-variable
   - request/response ANY sdp-header mline-index index header-name MODIFY copy-variable + replace-pattern
   - request/response ANY sdp-header mline-index index header-name REMOVE
6. end

<tr>
<td> </td>
<td>Device(config-dial-peer)# voice-class sip pass-thru content custom-sdp</td>
</tr>
</tbody>
</table>

**Step 4**

<table>
<thead>
<tr>
<th>voice class sip-profiles</th>
<th>profile-id</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td> </td>
<td>Device(config)# voice class sip-profiles 10</td>
</tr>
</tbody>
</table>

**Step 5**

<table>
<thead>
<tr>
<th>M-line Index values:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0</strong> - A value of zero represents the session level.</td>
</tr>
<tr>
<td><strong>1 to 6</strong> - A value in the range of one to six represents the m-line number in SDP.</td>
</tr>
</tbody>
</table>

Copy: Enables copying of SDP line or attribute from peer leg SDP.

Add: Enables adding the copied SDP line or attribute in the outgoing SDP.

Modify: Enables modifying SDP line or attribute in the outgoing SDP.

Remove: Enables removing SDP line or attribute in the outgoing SDP.

**Step 6**

<table>
<thead>
<tr>
<th>end</th>
</tr>
</thead>
</table>

**Example: Configuring SIP Profile Rules (Attribute Passing)**

```
response ANY peer-header sdp mline-index 4 copy "(a=ixmap:0.*)" u01
response ANY sdp-header mline-index 4 a=ixmap add "\u01"
```
Example: Configuring SIP Profile Rules (Parameter Passing)

response ANY peer-header sdp mline-index 2 copy "a=fmtp:126 .*(max-fps=....)" u04
response ANY sdp-header mline-index 2 a=fmtp:126 modify ";" ";\u04;"

Example: Configuration to Remove an Attribute

response ANY sdp-header mline-index 4 a=test REMOVE

Configuring SIP Profile Using Rule Tag

Configure SIP profile rules using the rule tag, enables you to performing the following tasks:

- Add SIP profile request and response headers with a rule tag.
- Modify the existing SIP profile configurations by inserting a rule at any position of the SIP profile without deleting and reconfiguring the entire SIP profile.
- Remove a rule by specifying only rule tag.

Below are the rule tag behaviors that needs to be considered while using rule tag in SIP profile configurations:

- If a rule is added with the tag of an existing rule, then the existing rule is overwritten with the new rule.
- For inserting a rule at the desired position, the SIP profile configuration should be in rule format. In case the SIP profile is in non-rule format, upgrade the SIP profiles to rule format before inserting a rule.
- If a new rule is inserted, the new rule takes the position specified in before tag. The subsequent rules are incremented sequentially.
- Once the rule is removed, the tag belonging to the removed rule remains vacant. The tags associated with the subsequent rules remain unchanged.
- If a rule is added to a vacant tag, the new rule gets associated with the vacant tag and the subsequent rules remain unchanged.

SUMMARY STEPS

1. enable
2. configure terminal
3. voice class sip-profiles profile-id
4. Enter one of the following to add, copy, modify, or remove a SIP request or response headers to a SIP profile configuration:
   - rule tag request method sdp-header | sip-header header-name add | copy | modify | remove string
   - rule tag response method sdp-header | sip-header header-name add | copy | modify | remove string
5. Enter one of the following to insert a rule in between the existing set of rules to add, remove, or modify SIP request or response headers:
### Configuring SIP Profile Using Rule Tag

**Purpose**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  
|      |                   | • Enter your password if prompted. |
| 2    | configure terminal | Enters global configuration mode. |
| 3    | voice class sip-profiles profile-id  
|      | Example:          | Creates a SIP Profile and enters voice class configuration mode. |
|      | Device(config)# voice class sip-profiles 10 | |
| 4    | Enter one of the following to add, copy, modify, or remove a SIP request or response headers to a SIP profile configuration:  
|      | • rule tag request method sdp-header | sip-header header-name add | copy | modify | remove string  
|      | • rule tag response method sdp-header | sip-header header-name add | copy | modify | remove string | |
| 5    | Enter one of the following to insert a rule in between the existing set of rules to add, remove, or modify SIP request or response headers:  
|      | • rule before tag request method sdp-header | sip-header header-name add | copy | modify | remove string  
|      | • rule before tag response method sdp-header | sip-header header-name add | copy | modify | remove string | |
| 6    | Enter the following to delete a rule:  
|      | • no rule tag | |
| 7    | end | Exits voice class sip-profiles configuration mode. |

---

**DETAILED STEPS**

**Purpose**

- Enables privileged EXEC mode.
- Enters global configuration mode.
- Creates a SIP Profile and enters voice class configuration mode.
- According to your choice, this step tags the SIP request or response header with a unique number.
- According to your choice, this step inserts the rule at the position specified in the `before tag`. The subsequent rules in the existing SIP profile configuration are incremented sequentially.
- According to your choice, this step tags the SIP request or response with a unique number.
- Exits voice class sip-profiles configuration mode.
Configuring a SIP Profile for Non-standard SIP Header

SUMMARY STEPS

1. enable
2. configure terminal
3. voice class sip-profiles profile-id
4. Enter one of the following to add, copy, remove, or modify non-standard SIP request headers:
   • request message {sip-header} non-standard-header-to-add add non-standard-header-value-to-add
   • request message {sip-header} non-standard-header-to-copy copy non-standard-header-value-to-match copy-variable
   • request message {sip-header} non-standard-header-to-remove remove
   • request message {sip-header} non-standard-header-to-modify modify non-standard-header-value-to-match non-standard-header-value-to-replace

5. Enter one of the following to add, copy, remove, or modify non-standard SIP response headers:
   • response message [method method-type] {sip-header} non-standard-header-to-add add non-standard-header-value-to-add
   • response message [method method-type] {sip-header} non-standard-header-to-copy copy non-standard-header-value-to-match copy-variable
   • response message [method method-type] {sip-header} non-standard-header-to-remove remove

6. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>• Enter your password if prompted.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> voice class sip-profiles profile-id</td>
<td>Creates a SIP Profiles and enters voice class configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# voice class sip-profiles 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> Enter one of the following to add, copy, remove, or modify non-standard SIP request headers:</td>
<td>According to your choice, this step does one of the following:</td>
</tr>
<tr>
<td>• request message {sip-header} non-standard-header-to-add add non-standard-header-value-to-add</td>
<td>• Adds a non-standard SIP header to a SIP request.</td>
</tr>
<tr>
<td>• request message {sip-header} non-standard-header-to-copy copy non-standard-header-value-to-match copy-variable</td>
<td>• Copies contents from a non-standard SIP header to a SIP request.</td>

<tr>
<td>• request message {sip-header} non-standard-header-to-remove remove</td>
<td>• Removes a non-standard SIP header to a SIP request.</td>
</tr>
<tr>
<td>• request message {sip-header} non-standard-header-to-modify modify non-standard-header-value-to-match non-standard-header-value-to-replace</td>
<td>• Modifies a non-standard SIP header to a SIP request.</td>
</tr>
</tbody>
</table>
Purpose

Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• request message {sip-header } non-standard-header-to-remove remove</td>
</tr>
<tr>
<td>• request message {sip-header } non-standard-header-to-modify modify non-standard-header-value-to-match non-standard-header-value-to-replace</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

Step 5

Enter one of the following to add, copy, remove, or modify non-standard SIP response headers:

<table>
<thead>
<tr>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>• response message [method method-type] {sip-header } non-standard-header-to-add add non-standard-header-value-to-add</td>
</tr>
<tr>
<td>• response message {sip-header } non-standard-header-to-copy copy non-standard-header-value-to-match copy-variable</td>
</tr>
<tr>
<td>• response message {sip-header } non-standard-header-to-remove remove</td>
</tr>
<tr>
<td>• response message {sip-header } non-standard-header-to-modify modify non-standard-header-value-to-match non-standard-header-value-to-replace</td>
</tr>
</tbody>
</table>

According to your choice, this step does one of the following:

<table>
<thead>
<tr>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Adds a non-standard SIP to a SIP response.</td>
</tr>
<tr>
<td>• Copies contents from a non-standard SIP header to a SIP response.</td>
</tr>
<tr>
<td>• Removes a non-standard header to a SIP response.</td>
</tr>
<tr>
<td>• Modifies a non-standard SIP header to a SIP response.</td>
</tr>
<tr>
<td>• All notes from the previous step are applicable here.</td>
</tr>
</tbody>
</table>

Step 6

End

Exits to privileged EXEC mode

Upgrading or Downgrading SIP Profile Configurations

You can upgrade or downgrade all the SIP Profile configurations to rule-format or non-rule format automatically.

**Note**

We recommend that you downgrade the SIP profiles to non-rule format configuration before migrating to a version below Cisco IOS Release 15.5(2)T or Cisco IOS-XE Release 3.15S. If you migrate without downgrading the SIP profile configurations, then all the SIP profile configurations is lost after migration.
SUMMARY STEPS

1. **enable**
2. Enter the following to upgrade SIP profiles configurations to rule-format:
   - `voice sip sip-profiles upgrade`
3. Enter the following to downgrade SIP profiles configurations to non-rule format:
   - `voice sip sip-profiles downgrade`
4. **end**

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Upgrades all SIP Profiles to rule-format configurations.</td>
</tr>
<tr>
<td>Enter the following to upgrade SIP profiles configurations to rule-format:</td>
<td></td>
</tr>
<tr>
<td>• <code>voice sip sip-profiles upgrade</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>In EXEC(#) mode:</td>
</tr>
<tr>
<td><code>Device#voice sip sip-profiles upgrade</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Downgrades all SIP Profiles from rule-format configurations to non-rule format configurations.</td>
</tr>
<tr>
<td>Enter the following to downgrade SIP profiles configurations to non-rule format:</td>
<td></td>
</tr>
<tr>
<td>• <code>voice sip sip-profiles downgrade</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>In EXEC(#) mode:</td>
</tr>
<tr>
<td><code>Device#voice sip sip-profiles downgrade</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Exits privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**What to do next**

Now apply the SIP Profile as an inbound or outbound SIP profile.

### Configuring a SIP Profile as an Outbound Profile

SUMMARY STEPS

1. **enable**
2. `configure terminal`
3. Apply the SIP profile to a dial peer:
   - `voice-class sip profiles profile-id` in the dial-peer configuration mode.
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable          | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Step 3** Apply the SIP profile to a dial peer:  
  • voice-class sip profiles profile-id in the dial-peer configuration mode.  
  • sip-profiles profile-id in the global VoIP configuration mode |
| **Example:**  
  In dial-peer configuration mode |
| !Applying SIP profiles to one dial peer only  
Device (config)# dial-peer voice 10 voip  
Device (config-dial-peer)# voice-class sip profiles 30  
Device (config-dial-peer)# end |
| **Example:**  
  In global VoIP SIP mode |
| ! Applying SIP profiles globally  
Device (config)# voice service voip  
Device (config-voi-serv)# sip  
Device (config-voi-sip)# sip-profiles 20  
Device (config-voi-sip)# end |
| **Step 4** end | Exits to privileged EXEC mode |

### Configuring a SIP Profile as an Inbound Profile

You can configure a SIP profile as an inbound profile applied globally or to a single inbound dial peer. Inbound SIP profiles feature must be enabled before applying it to dial peers.

### SUMMARY STEPS

1. enable  
2. configure terminal  
3. voice service voip  
4. sip  
5. sip-profiles inbound
6. Apply the SIP profile to a dial peer:
   - `voice-class sip profiles profile-id inbound` in the dial-peer configuration mode.
   - `sip-profiles profile-id inbound` in the global VoIP configuration mode

7. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> voice service voip</td>
<td>Enters global VoIP configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# voice service voip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> sip</td>
<td>Enters global VoIP SIP configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config-voi-serv)# sip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> sip-profiles inbound</td>
<td>Enables inbound SIP profiles feature.</td>
</tr>
<tr>
<td>Example: Device(config-voi-sip)# sip-profiles inbound</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Apply the SIP profile to a dial peer:</td>
</tr>
<tr>
<td></td>
<td>• <code>voice-class sip profiles profile-id inbound</code> in the dial-peer configuration mode.</td>
</tr>
<tr>
<td></td>
<td>• <code>sip-profiles profile-id inbound</code> in the global VoIP configuration mode</td>
</tr>
<tr>
<td>Example: In dial-peer configuration mode</td>
<td></td>
</tr>
<tr>
<td>!Applying SIP profiles to one dial peer only</td>
<td></td>
</tr>
<tr>
<td>Device (config)# dial-peer voice 10 voip</td>
<td></td>
</tr>
<tr>
<td>Device (config-dial-peer)# voice-class sip profiles 30 inbound</td>
<td></td>
</tr>
<tr>
<td>Device (config-dial-peer)# end</td>
<td></td>
</tr>
<tr>
<td>Example: In global VoIP SIP mode</td>
<td></td>
</tr>
<tr>
<td>! Applying SIP profiles globally</td>
<td></td>
</tr>
<tr>
<td>Device(config)# voice service voip</td>
<td></td>
</tr>
<tr>
<td>Device (config-voi-serv)# sip</td>
<td></td>
</tr>
</tbody>
</table>
### Verifying SIP Profiles

**SUMMARY STEPS**

1. `show dial-peer voice id | include profile`

**DETAILED STEPS**

```
show dial-peer voice id | include profile
```
Displays information related to SIP profiles configured on the specified dial peer.

**Example:**
```
Device# show dial-peer voice 10 | include profile
```
Translation profile (Incoming):
Translation profile (Outgoing):
translation-profile = `'
voice class sip profiles = 11
voice class sip profiles inbound = 10
```

### Troubleshooting SIP Profiles

**SUMMARY STEPS**

1. `debug ccsip all`

**DETAILED STEPS**

```
ddebug ccsip all
```
This command displays the applied SIP profiles.

**Example:**
```
Applied SIP profile is highlighted in the example below.
Device# debug ccsip all
```
Oct 12 06:51:53.619: //1/735085DC8F3D/SIP/Info/sipSPIGetShrlPeer:
Try match incoming dialpeer for Calling number:
: sippOct 12 06:51:53.619:
Examples: Adding, Modifying, Removing SIP Profiles

Example: Adding a SIP, SDP, or Peer Header

Example: Adding "b=AS:4000" SDP header to the video-media Header of the INVITE SDP Request Messages

Device(config)# voice class sip-profiles 10
Device(config-class)# request INVITE sdp-header Video-Bandwidth-Info add "b=AS:4000"
Device(config-class)# end

Example: Adding "b=AS:4000" SDP header to the video-media Header of the INVITE SDP Request Messages in rule format

Device(config)# voice class sip-profiles 10
Device(config-class)# rule 1 request INVITE sdp-header Video-Bandwidth-Info add "b=AS:4000"
Device(config-class)# end

Example: Adding the Retry-After Header to the SIP 480 Response Messages

Device(config)# voice class sip-profiles 20
Example: Adding a SIP, SDP, or Peer Header

```
Device(config-class)# response 480 sip-header Retry-After add "Retry-After: 60"
Device(config-class)# end
```

Example: Adding the Retry-After Header to the SIP 480 Response Messages in rule format

```
Device(config)# voice class sip-profiles 20
Device(config-class)# rule 1 response 480 sip-header Retry-After add "Retry-After: 60"
Device(config-class)# end
```

Example: Adding "User-Agent: SIP-GW-UA" to the User-Agent Field of the 200 Response SIP Messages

```
Device(config)# voice class sip-profiles 40
Device(config-class)# response 200 sip-header User-Agent add "User-Agent: SIP-GW-UA"
Device(config-class)# end
```

Example: Adding "User-Agent: SIP-GW-UA" to the User-Agent Field of the 200 Response SIP Messages in rule format

```
Device(config)# voice class sip-profiles 40
Device(config-class)# rule 1 response 200 sip-header User-Agent add "User-Agent: SIP-GW-UA"
Device(config-class)# end
```

Example: Adding "a=ixmap:0 ping" in M-Line number 4 of the INVITE SDP Request Messages

```
Device(config)# voice class sip-profiles 10
Device(config-class)# request INVITE sdp-header mline-index 4 a=ixmap add "a=ixmap:0 ping"
Device(config-class)# end
```

Applying the SIP Profiles

```
! Applying SIP profiles globally
Device(config)# voice service voip
Device(config-voi-serv)# sip
Device(config-voi-sip)# sip-profiles 20
Device(config-voi-sip)# end

! Applying SIP profiles to one dial peer only
Device(config) dial-peer voice 10 voip
Device(config-dial-peer)# voice-class sip profiles 30
Device(config-dial-peer)# end
```
Example: Modifying a SIP, SDP, or Peer Header

Example: Modifying SIP-Req-URI of the Header of the INVITE and RE-INVITE SIP Request Messages to include "user=phone"

Device(config)# voice class sip-profiles 30
Device(config-class)# request INVITE sip-header SIP-Req-URI modify "; SIP/2.0" "user=phone SIP/2.0"
Device(config-class)# request RE-INVITE sip-header SIP-Req-URI modify "; SIP/2.0" "user=phone SIP/2.0"
Device(config-class)# end

Example: Modifying SIP-Req-URI of the Header of the INVITE and RE-INVITE SIP Request Messages to include "user=phone" in rule format

Device(config)# voice class sip-profiles 30
Device(config-class)# rule 1 request INVITE sip-header SIP-Req-URI modify "; SIP/2.0" "user=phone SIP/2.0"
Device(config-class)# rule 2 request RE-INVITE sip-header SIP-Req-URI modify "; SIP/2.0" "user=phone SIP/2.0"
Device(config-class)# end

Modify the From Field of a SIP INVITE Request Messages to “gateway@gw-ip-address” Format

For example, modify 2222000020@10.13.24.7 to gateway@10.13.24.7

Device(config)# voice class sip-profiles 20
Device(config-class)# request INVITE sip-header From modify "(<.*:)(.*@)" "gateway@"

Modify the From Field of a SIP INVITE Request Messages to “gateway@gw-ip-address” Format in rule format

For example, modify 2222000020@10.13.24.7 to gateway@10.13.24.7

Device(config)# voice class sip-profiles 20
Device(config-class)# rule 1 request INVITE sip-header From modify "(<.*:)(.*@)" "gateway@"

Replace “CiscoSystems-SIP-GW-UserAgent” with "-" in the Originator Header of the SDP in INVITE Request Messages

Device(config)# voice class sip-profiles 10
Device(config-class)# request INVITE sdp-header Session-Owner modify "CiscoSystems-SIP-GW-UserAgent" "-"

Replace “CiscoSystems-SIP-GW-UserAgent” with "-" in the Originator Header of the SDP in INVITE Request Messages in rule format

Device(config)# voice class sip-profiles 10
Device(config-class)# rule 1 request INVITE sdp-header Session-Owner modify "CiscoSystems-SIP-GW-UserAgent" "-"
Convert "sip uri" to "tel uri" in Req-URI, From and To Headers of SIP INVITE Request Messages

For example, modify sip:2222000020@9.13.24.6:5060" to “tel:2222000020

```
Device(config)# voice class sip-profiles 40
Device(config-class)# request INVITE sip-header SIP-Req-URI modify "sip:(.*)@[^ ]+" "tel:\1"
Device(config-class)# request INVITE sip-header From modify "<sip:(.*)@.*>" "<tel:\1>"
Device(config-class)# request INVITE sip-header To modify "<sip:(.*)@.*>" "<tel:\1>"
```

Convert "sip uri" to "tel uri" in Req-URI, From and To Headers of SIP INVITE Request Messages in rule format

For example, modify sip:2222000020@9.13.24.6:5060" to “tel:2222000020

```
Device(config)# voice class sip-profiles 40
Device(config-class)# rule 1 request INVITE sip-header SIP-Req-URI modify "sip:(.*)@[^ ]+" "tel:\1"
Device(config-class)# rule 2 request INVITE sip-header From modify "<sip:(.*)@.*>" "<tel:\1>"
Device(config-class)# rule 3 request INVITE sip-header To modify "<sip:(.*)@.*>" "<tel:\1>"
```

Example: Change the Audio Attribute Ptime:20 to Ptime:30

Inbound pttime:
a=ptime:20

Outbound pttime:
a=ptime:30

```
Device(config)# voice class sip-profiles 103
Device(config-class)# request ANY sdp-header Audio-Attribute modify "a=ptime:20" "a=ptime:30"
```

Example: Modify Audio direction "Audio-Attribute"

Some service providers or customer equipment reply to delay offer invites and or re-invites that contain a=inactive with a=inactive, a=recvonly, or a=sendonly. This can create an issue when trying to transfer or retrieve a call from hold. The result is normally one-way audio after hold or resume or transfer or moh is not heard. To resolve this issue changing the audio attribute to Sendrecv prevents the provider from replaying back with a=inactive, a=recvonly, or a=sendonly.

Case 1:

Inbound Audio-Attribute
a=inactive

Outbound Audio-Attribute
a=sendrecv

Case 2:

Inbound Audio-Attribute
a=recvonly
Outbound Audio-Attribute
a=sendrecv

Case 3
Inbound Audio-Attribute
a=sendonly
Outbound Audio-Attribute
a=sendrecv

Device(config)# voice class sip-profiles 104
Device(config-class)# request any sdp-header Audio-Attribute modify "a=inactive" "a=sendrecv"
Device(config-class)# request any sdp-header Audio-Attribute modify "a=recvonly" "a=sendrecv"
Device(config-class)# request any sdp-header Audio-Attribute modify "a=sendonly" "a=sendrecv"
Device(config-class)# response any sdp-header Audio-Attribute modify "a=inactive" "a=sendrecv"
Device(config-class)# response any sdp-header Audio-Attribute modify "a=recvonly" "a=sendrecv"
Device(config-class)# response any sdp-header Audio-Attribute modify "a=sendonly" "a=sendrecv"

Example: Modifying Packetization Mode in a=fmtp line of M-line number 2 of the INVITE SDP Request

Device(config)# voice class sip-profiles 10
Device(config-class)# request INVITE sdp-header mline-index 2 a=fmtp modify "packetization-mode=1" "packetization-mode=0"
Device(config-class)# end

Applying the SIP Profiles to Dial Peers

! Applying SIP Profiles globally
Device(config)# voice service voip
Device(config-voi-serv) sip-profiles 20
Device(config-voi-serv) sip-profiles 10
Device(config-voi-serv) sip-profiles 40
Device(config-voi-serv) sip-profiles 103
Device(config-voi-serv) sip-profiles 104
Device(config-voi-serv) exit

! Applying SIP Profiles to one dial peer only
Device(config) dial-peer voice 90 voip
Device(config-dial-peer) voice-class sip profiles 30

Example: Remove a SIP, SDP, or Peer Header

Remove Cisco-Guid SIP header from all Requests and Responses

Device(config)# voice class sip-profiles 20
Device(config-class)# request ANY sip-header Cisco-Guid remove
Device(config-class)# response ANY sip-header Cisco-Guid remove
Device(config-class)# end

Remove Server Header from 100 and 180 SIP Response Messages

Device(config)# voice class sip-profiles 20
Device(config-class)# response 100 sip-header Server remove
Device(config-class)# response 180 sip-header Server remove
Device(config-class)# end

Removing a SIP Profile rule in rule format configuration

SIP Profile configuration in rule format

Device(config)# voice class sip-profiles 10
Device(config-class)# rule 1 request any sdp-header Audio-Attribute modify "a=inactive"
"a=sendrecv"
Device(config-class)# rule 2 request any sdp-header Audio-Attribute modify "a=recvonly"
"a=sendrecv"
Device(config-class)# end

Removing the rule using rule tag

Device(config)# voice class sip-profiles 10
Device(config-class)# no rule 1
Device(config)# end

Once the rule is removed, the tag belonging to the removed rule remains vacant. The tags associated with the subsequent rules are unchanged.

The SIP Profile configuration after removing the rule

Device(config)# voice class sip-profiles 10
Device(config-class)# rule 2 request any sdp-header Audio-Attribute modify "a=recvonly"
"a=sendrecv"
Device(config-class)# end

Example: Removing “a=ixmap” in M-Line number 4 of the INVITE SDP Request Messages

Device(config)# voice class sip-profiles 10
Device(config-class)# response ANY sdp-header mline-index 4 a=ixmap REMOVE
Device(config-class)# end

Example: Inserting SIP Profile Rules

Example: Inserting a SIP Profile Rule

Inserting a SIP profile rule to a SIP Profile
Device(config)#voice class sip-profiles 1
Device(config-class)#rule 1 request INVITE sip-header Contact Modify "(.*)" \1;\temp=xyz
Device(config-class)#rule 2 request INVITE sip-header Supported Add "Supported: 
Device(config-class)#rule before 2 request INVITE sip-header To Modify "(.*)" \1;\temp=abc

The SIP Profile after inserting the new rule

Device(config)#voice class sip-profiles 1
Device(config-class)#rule 1 request INVITE sip-header Contact Modify "(.*)" \1;\temp=xyz
Device(config-class)#rule 2 request INVITE sip-header To Modify "(.*)" \1;\temp=abc
Device(config-class)#rule 3 request INVITE sip-header Supported Add "Supported: 

Example: Upgrading and Downgrading SIP Profiles automatically

Upgrading SIP Profiles to rule-format

The following is a snippet from `show running-config` command showing the SIP profiles in non-rule format:

Device#show running-config

request INVITE sip-header Contact Modify "(.*)" \1;\temp=xyz
request INVITE sip-header Supported Add "Supported: 

Execute the following command in EXEC (#) mode to upgrade the SIP Profiles to rule-format:

Device#voice sip sip-profiles upgrade

The following is a snippet from `show running-config` command showing the SIP profiles after upgrading to rule-format:

Device#show running-config

rule 1 request INVITE sip-header Contact Modify "(.*)" \1;\temp=xyz
rule 2 request INVITE sip-header Supported Add "Supported: 

Downgrading SIP Profiles to non-rule format

The following is a snippet from `show running-config` command showing SIP profiles in rule-format:

Device#show running-config

rule 1 request INVITE sip-header Contact Modify "(.*)" \1;\temp=xyz
rule 2 request INVITE sip-header Supported Add "Supported: 

Execute the following command in EXEC(#{ mode to downgrade SIP Profiles to non-rule format:

Device# voice sip sip-profiles downgrade

The following is a snippet from `show running-config` command showing SIP profiles after downgrading to non-rule format:
Example: Modifying Diversion Headers

Example: Modify Diversion Headers from Three-Digit Extensions to Ten Digits.

Most service providers require a ten digit diversion header. Prior to Call manager 8.6, Call manager would only send the extension in the diversion header. A SIP profile can be used to make the diversion header ten digits.

Call manager version 8.6 and above has the field “Redirecting Party Transformation CSS” which lets you expand the diversion header on the call manager.

The SIP profile will look for a diversion header containing "<sip:5...", where ... stands for the three-digit extension and then concatenates 9789365 with these three digits.

Original Diversion Header:

Diversion:<sip:5100@161.44.77.193>;privacy=off;reason=unconditional;counter=1;screen=no

Modified Diversion Header:

Diversion: <sip:9789365100@10.86.176.19>;privacy=off;reason=unconditional;counter=1;screen=no

Device(config)# voice class sip-profiles 101
Device(config-class)# request INVITE sip-header Diversion modify "<sip:5(...)@" "<sip:9789365\1@"
Device(config-class)# end

Example: Create a Diversion header depending on the area code in the From field

Most service providers require a redirected call to have a diversion header that contains a full 10 digit number that is associated with a SIP trunk group. Sometimes, a SIP trunk may cover several different area codes, states, and geographic locations. In this scenario, the service provider may require a specific number to be placed in the diversion header depending on the calling party number.

In the below example, if the From field has an area code of 978 "<sip:978", the SIP profile leaves the From field as is and adds a diversion header.

Device(config)# voice class sip-profiles 102
Device(config-class)# request INVITE sip-header From modify "From:(.*)<sip:978(.*)@(.*)" "From:\1<sip:978\2\3\x0ADiversion: <sip:9789365000@10.86.176.19:5060;privacy=off;reason=unconditional;counter=1;screen=no"

The below diversion header is added. There was no diversion header before this was added:

Diversion: <sip:9789365000@10.86.176.19:5060;transport=udp>"
Example: Sample SIP Profile Application on SIP Invite Message

The SIP profile configured is below:

```
voice class sip-profiles 1
  request INVITE sdp-header Audio-Bandwidth-Info add "b=AS:1600"
  request ANY sip-header Cisco-Guid remove
  request INVITE sdp-header Session-Owner modify "CiscoSystems-SIP-GW-UserAgent" "-"
```

The SIP INVITE message before the SIP profile has been applied is show below:

```
INVITE sip:2222000020@9.13.40.250:5060 SIP/2.0
Via: SIP/2.0/UDP 9.13.40.249:5060;branch=z9hG4bK1A203F
From: "sipp " <sip:1111000010@9.13.40.249>;tag=F11AE0-1D8D
To: <sip:2222000020@9.13.40.250>
Date: Mon, 29 Oct 2007 19:02:04 GMT
Call-ID: 4561B116-858811DC-804DEF2E-4CF2D71B@9.13.40.249
Content-Length: 290
v=0
o=CiscoSystemsSIP-GW-UserAgent 6906 8069 IN IP4 9.13.40.249
s= SIP Call
c=IN IP4 9.13.40.249
t=0 0
m=audio 17070 RTP/AVP 0
c=IN IP4 9.13.40.249
a=rtpmap:0 PCMU/8000
a=ptime:20
```

The SIP INVITE message after the SIP profile has been applied is shown below:

- The Cisco-Guid has been removed.
- CiscoSystemsSIP-GW-UserAgent has been replaced with -.
- The Audio-Bandwidth SDP header has been added with the value b=AS:1600.

Example: Sample SIP Profile for Non-Standard SIP Headers

Before Cisco IOS Release 15.5(2)T, there was no method to add, copy, delete, or modify any non-standard SIP headers like 'X-Cisco-Recording-Participant' using SIP profiles. The SIP profile will look for the new option "WORD" that allows the user to change any non-standard SIP header.
Example: Sample SIP Profile for Non-Standard SIP Headers

voice class sip-profiles 1
request INVITE sip-header X-Cisco-Recording-Participant copy "sip:(.*)@" u01
request INVITE sip-header X-Cisco-Recording-Participant modify "sip:sipp@" "sip:1000@"
request INVITE sip-header My-Info add "My-Info: MF Call"
request INVITE sip-header My-Info remove
SIP Out-of-Dialog OPTIONS Ping Group

This feature groups the monitoring of SIP dial-peers endpoints and servers by consolidating dial peers with the same SIP Out-of-Dialog (OOD) OPTIONS ping setup.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About SIP Out-Of-dialog OPTIONS Ping Group

SIP Out-of-Dialog OPTIONS Ping Group Overview

The SIP Out-Of-Dialog OPTIONS (OODO) Ping Group feature is an existing mechanism that is used by CUBE to monitor the status of a single SIP dial-peer destination (keepalive). A generic heartbeat mechanism allows you to monitor the status of SIP servers or endpoints and provide the option of marking a dial peer as inactive (busyout) upon total heartbeat failure.

You can now consolidate the sending of SIP OODO ping packets by grouping dial peers with the same SIP OODO ping setup. A keepalive profile is created and referenced by different SIP dial peers. An OODO Options ping heartbeat keepalive connection is set up for each dial-peer destination of a keepalive profile. If a heartbeat failure occurs for any of the dial peers of the profile, the status of the respective dial peer is changed to inactive (busyout) by CUBE.
Configuring the same OPTIONS KEEPALIVE profile on two or more dial-peers with different bind interfaces configured is not supported. This leads to a scenario wherein the OPTIONS SIP message is not sent from all bind interfaces expect the first configured one. But the dial-peer is always marked as ACTIVE.

You can use the `shutdown` command to suspend monitoring of all dial peers associated with a keepalive profile.

The new command `voice-class sip options-keepalive profile tag` is used to monitor a group of SIP servers or endpoints and the existing `voice-class sip options-keepalive` command is used to monitor a single SIP endpoint or server.

You can configure a server group to be a part of a SIP OODO ping group. A SIP dial peer is updated to BUSY state only if all targets of its server group does not response to the OODO ping.

### How to Configure SIP Out-Of-dialog OPTIONS Ping Group

#### Configuring SIP Out-of-Dial OPTIONS Ping Group

**Before you begin**

Configure SIP profiles and server groups.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `voice class sip-options-keepalive keepalive-group-profile-id`
4. `description` `text`
5. `transport {tcp | tls | udp | system}`
6. `sip-profiles profile-number`
7. `down-interval down-interval`
8. `up-interval up-interval`
9. `retry retry-interval`
10. `exit`
11. `dial-peer voice dial-peer-id voip`
12. `session protocol sipv2`
13. `voice-class sip options-keepalive profile keepalive-group-profile-id`
14. `session server-group server-group-id`
15. `end`
16. `show voice class sip-options-keepalive keepalive-group-profile-id`

Feature Information for SIP Out-of-dialog OPTIONS Ping Group

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

CHAPTER 15

Configure TCL IVR Applications

This chapter shows you how to configure Interactive Voice Response (IVR) using the Tool Command Language (TCL) scripts. The Cisco IOS Release 12.1(3)T release introduces TCL IVR Version 2.0 with several feature enhancements to the Cisco IVR functionality. This chapter contains the following sections:

- Tcl IVR Overview, on page 159
- Tcl IVR Enhancements, on page 160
- MGCP Scripting, on page 160
- RTSP Client Implementation, on page 161
- TCL IVR Prompts Played on IP Call Legs, on page 162
- TCL Verbs, on page 163
- TCL IVR Prerequisite Tasks, on page 166
- TCL IVR Configuration Tasks List, on page 166
- Configuring the Call Application for the Dial Peer, on page 167
- Configuring TCL IVR on the Inbound POTS Dial Peer, on page 169
- Configuring TCL IVR on the Inbound VoIP Dial Peer, on page 171
- Configuring MGCP Scripting, on page 173
- Verifying TCL IVR Configuration, on page 176
- TCL IVR Configuration Examples, on page 177
- TCL IVR for Gateway1 (GW1) Configuration Example, on page 177
- TCL IVR for GW2 Configuration Example, on page 180
- MGCP Scripting Configuration Example, on page 182

Tcl IVR Overview

IVR consists of simple voice prompting and digit collection to gather caller information for authenticating the user and identifying the destination. IVR applications can be assigned to specific ports or invoked on the basis of DNIS. An IP public switched telephone network gateway can have several IVR applications to accommodate many different gateway services, and you can customize the IVR applications to present different interfaces to the various callers.

IVR systems provide information in the form of recorded messages over telephone lines in response to user input in the form of spoken words, or more commonly dual tone multifrequency (DTMF) signalling. For
example, when a user makes a call with a debit card, an IVR application is used to prompt the caller to enter a specific type of information, such as an account number. After playing the voice prompt, the IVR application collects the predetermined number of touch tones and then places the call to the destination phone or system.

IVR uses TCL scripts gather information and to process accounting and billing. For example, a TCL IVR script plays when a caller receives a voice-prompt instruction to enter a specific type of information, such as a personal identification number (PIN). After playing the voice prompt, the TCL IVR application collects the predetermined number of touch tones and sends the collected information to an external server for user authentication and authorization.

---

**Note**

Audio playback is not supported when Secure Real-Time Transport Protocol (SRTP) is used with TCL IVR applications.

---

**Tcl IVR Enhancements**

Since the introduction of the Cisco IVR technology, the software has undergone several enhancements. TCL IVR Version 2.0 is made up of separate components that are described individually in the sections that follow. The enhancements are as follows:

- Media Gateway Control Protocol (MGCP) scripting package implementation
- Real Time Streaming Protocol (RTSP) client implementation
- TCL IVR prompt playout and digit collection on IP call legs
- New TCL verbs to utilize RTSP and MGCP scripting features

The enhancements add scalability and enable the TCL IVR scripting functionality on VoIP legs. In addition, support for RTSP enables VoIP gateways to play messages from RTSP-compliant announcement servers. The addition of these enhancements also reduces the CPU load and saves memory on the gateway because no packetization is involved. Larger prompts can be played, and the use of an external audio server is allowed.

---

**Note**

TCL IVR 2.0 removed the signature locking mechanism requirement.

---

**MGCP Scripting**

TCL IVR Version 2.0 infrastructure is greatly enhanced with the addition of support for MGCP using the application package model. MGCP defines application packages to run scripts on the media gateways. These application packages initiate scripts on the gateways and receive return values after execution completes. MGCP scripting allows external call agents (CAs) to instruct a media gateway to run an TCL IVR script in order to perform a specific task and return the end result. For example, you can request and collect the PIN and account number from a caller.

Two previously released Cisco VoIP features that can be implemented are the Debit Card for Packet Telephony and TCL IVR. Both features use the TCL scripting language. The TCL scripts that run with MGCP are written
in TCL IVR API Version 2.0 and are able to receive calls through hand off. MGCP scripts can run any TCL command.

**Figure 21: MGCP Control of TCL IVR Scripts**, on page 161 displays the CA controlling the TCL IVR scripts. MGCP is the protocol that is running on the CA. The RTSP server is configured to interact with the gateways that have TCL IVR scripts installed and running. The RADIUS server running authentication, authorization, and accounting (AAA) also interacts with the gateways.

**Figure 21: MGCP Control of TCL IVR Scripts**

---

**RTSP Client Implementation**

RTSP is an application-level protocol used for control over the delivery of data that has real-time properties. Using RTSP also enables an external RTSP server to play announcements and interact with voice mail servers. It provides an extensive framework to enable control and to perform on-demand delivery of real-time data. For example, RTSP is used to control the delivery of audio streams from an audio server.

If you use an RTSP server in your network with VoIP gateways, a scripting application, (for example, an MGCP script) can run on the gateway and connect calls with audio streams from an external audio server. Using RTSP also has the following benefits:

- Reduces the CPU load
- Allows large prompts to be played that previously demanded high CPU usage from the gateway
- Saves memory on the gateway because no packetization is involved
- Allows use of an external audio server which removes the limitation on the number of prompts that can be played out and on the size of the prompt
TCL IVR Prompts Played on IP Call Legs

TCL IVR Version 2.0 scripts can be configured for incoming plain old telephone service (POTS) or VoIP call legs to play announcements to the user or collect user input (digits). With TCL IVR Version 2.0 the prompts can be triggered from both the PSTN side of the call leg and the IP side of the call leg. This feature enables the audio files (or prompts) to be played out over the IP network.

TCL IVR scripts played toward a VoIP call leg are subject to the following conditions:

- G.711 mu-law encoding must be used when prompts are played.
- G.711 mu-law encoding must also be used for the duration of these calls, even after prompt playout has completed.
- Digital signaling protocols (DSPs) cannot be on the IP call leg so the script cannot initiate a tone.
- When an TCL IVR script is used to collect digits on a VoIP call leg, one of the following DTMF relay methods must be used.
  - For H.323 protocol configured on the call leg, use one of the following DTMF relay methods: Cisco proprietary RTP, H.245 Alphanumeric IE, or H.245 Signal IE
  - For SIP protocol configured on the call leg, use Cisco proprietary RTP

Note

For additional information about the `dtmf-relay` command, refer to the Cisco IOS Voice Command Reference - D through I.

IVR 2.0 enables the system to accept calls initiated from the IP side of the network using G.711, and terminate calls to the terminating gateway using the same codec. Figure 22: IVR Control of Scripts on an IP Call Leg, on page 163 displays the TCL IVR application on the gateways controlling the scripts. IP phones can also originate a call to a gateway running an TCL IVR script.
TCL IVR Version 2.0 is not backward compatible with the IVR 1.0 scripts. The MGCP scripting package can only be implemented using the new TCL verbs.

TCL IVR Version 2.0 is not backward compatible with the IVR 1.0 scripts. The MGCP scripting package can only be implemented using the new TCL verbs.

For in-depth information about the TCL 2.0 verb set and how to develop scripts, refer to Cisco.com (Related Documentation index).

TCL IVR scripts use the TCL verbs to interact with the gateway during call processing in order to collect the required digits—for example, to request the PIN or account number for the caller. The TCL scripts are the default scripts for all Cisco voice features using IVR. TCL scripts are configured to control calls coming into or going out of the gateway.

Ensure that you have loaded the version of TCL scripts that support IVR Version 2.
The TCL IVR scripts shown below are listed as an example of the types of scripts available to be downloaded from the cisco.com Software Center. For a complete list of scripts, it is recommended that you check the Software Center.

Cisco provides the following IVR scripts:

- **fax_hop_on_1**—Collects digits from the redialer, such as account number and destination number. When a call is placed to an H.323 network, the set of fields (configured in the call information structure) are "entered", "destination", and "account".

- **clid_authen**—Authenticates the call with automatic number identification (ANI) and DNIS numbers, collects the destination data, and makes the call.

- **clid_authen_npw**—Performs as c1id_authen, but uses a null password when authenticating, rather than DNIS numbers.

- **clid_authen_collect**—Authenticates the call with ANI and DNIS numbers and collects the destination data. If authentication fails, it collects the account and password.

- **clid_authen_col_npw**—Performs as c1id_authen_collect, but uses a null password and does not use or collect DNIS numbers.

- **clid_col_npw_3**—Performs as c1id_authen_col_npw except that, if authentication with the digits collected (account and PIN) fails, the c1id_authen_col_npw script just plays a failure message (auth_failed.au) and then hangs up. The c1id_col_npw_3 script allows two failures, then plays the retry audio file (auth_retry.au) and collects the account and PIN again.

- The caller can interrupt the message by entering digits for the account number, triggering the prompt to tell the caller to enter the PIN. If authentication fails the third time, the script plays the audio file auth_fail_final.au, and hangs up.

Table 28: c1id_col_npw_3 Script Prompt Audio Files, on page 164 lists the prompt audio files associated with the c1id_col_npw_3 script.

**Table 28: c1id_col_npw_3 Script Prompt Audio Files**

<table>
<thead>
<tr>
<th>Audio Filename</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>flash:enter_account.au</td>
<td>Asks the caller to enter an account number. Played as the first request.</td>
</tr>
<tr>
<td>flash:auth_fail_retry.au</td>
<td>Asks the caller to reenter the account number. Plays after two failures.</td>
</tr>
<tr>
<td>flash:enter_pin.au</td>
<td>Asks the caller to enter a PIN.</td>
</tr>
<tr>
<td>flash:enter_destination.au</td>
<td>Asks the caller to enter a destination phone number.</td>
</tr>
<tr>
<td>flash:auth_fail_final.au</td>
<td>Informs the caller that the account number authorization has failed three times.</td>
</tr>
</tbody>
</table>

Table 29: Additional c1id_col_npw_3 Script Audio Files, on page 164 lists additional audio files associated with the c1id_col_npw_3 script.

<td>Informs the caller that the account number authorization has failed three times.</td>
</tr>
</tbody>
</table>

• clid_col_npw_npw—Tries to authenticate by using ANI, null as the user ID, user, and user password pair. If that fails, it collects an account number and authenticates with account and null. It allows three tries for the caller to enter the account number before ending the call with the authentication failed audio file. If authentication succeeds, it plays a prompt to enter the destination number.

Table 30: clid_col_npw_npw Script Audio Files, on page 165 lists the audio files associated with the clid_col_npw_npw script.

Table 30: clid_col_npw_npw Script Audio Files

<table>

<td>Informs the caller that the account number authorization has failed three times.</td>
</tr>
</tbody>
</table>

• clid_col_dnis_3.tcl—Authenticates the caller ID three times. First it authenticates the caller ID with DNIS. If that is not successful, it attempts to authenticate with the caller PIN up to three times.

• clid_col_npw_3.tcl—Authenticates with null. If authentication is not successful, it attempts to authenticate by using the caller PIN up to 3 times.

• clid_4digits_npw_3.tcl—Authenticates with null. If the authentication is not successful, it attempts to authenticate with the caller PIN up to 3 times using the 14-digit account number and password entered together.

• clid_4digits_npw_3_cli.tcl— Authenticates the account number and PIN respectively by using ANI and null. The number of digits allowed for the account number and password are configurable through the CLI. If the authentication fails, it allows the caller to retry. The retry number is also configured through the CLI.

• clid_authen_col_npw_cli.tcl—Authenticates the account number and PIN respectively using ANI and null. If the authentication fails, it allows the caller to retry. The retry number is configured through the CLI. The account number and PIN are collected separately.

• clid_authen_collect_cli.tcl—Authenticates the account number and PIN by using ANI and DNIS. If the authentication fails, it allows the caller to retry. The retry number is configured through the CLI. The account number and PIN are collected separately.

• clid_col_npw_3_cli.tcl—Authenticates by using ANI and null for account and PIN respectively. If the authentication fails, it allows the caller to retry. The retry number is configured through the CLI.
• clid_col_npw_npw_colini.tcl—Authenticates by using ANI and null for account and PIN respectively. If authentication fails, it allows the caller to retry. The retry number is configured through the CLI. The account number and PIN are collected together.

---

**Note**
To display the contents of the TCL IVR script, use the show call application voice command.

---

**TCL IVR Prerequisite Tasks**

Before you configure your Cisco gateway to support TCL IVR, you must perform the following prerequisite tasks:

- Configure VoIP to support H.323-compliant gateways—meaning that in addition to the basic configuration tasks, such as configuring dial peers and voice ports, you must configure specific devices in your network to act as gateways.

- Configure a TFTP server to perform storage and retrieval of the audio files, which are required by the Debit Card gateway or other features requiring TCL IVR scripts and audio files.

- Download the appropriate TCL IVR script from the Cisco.com. Use the `copy` command to copy your audio file (.au file) to your Flash memory, and the `audio-prompt load` command to read it into RAM. When you use TCL IVR applications, the gateway needs to know the URL where the TCL script can be found, as well as the URL of any audio file you want to use. Cisco IOS File System (IFS) is used to read the files, so any IFS-supported URLs can be used, which includes TFTP, FTP, or a pointer to a device on the router. During configuration of the application, you specify the URLs for the script and for the audio prompt. See the "Using URLs in IVR Scripts" chapter in the [*TCL IVR API Version 2.0 Programmer's Guide*](#) for more information.

- Make sure that your audio files are in the proper format. The TCL IVR prompts require audio file (.au) format of 8-bit, u-law, and 8-kHz encoding. To encode your own audio files, we recommend that you use one of these two audio tools (or a tool of similar quality):
  - Cool Edit, manufactured by Syntrillium Software Corporation
  - AudioTool, manufactured by Sun Microsystems

- Make sure that your access platform has a minimum of 16 MB Flash and 128 MB of DRAM memory.

- Install and configure the appropriate RADIUS security server in your network. The version of RADIUS that you are using must be able to support IETF-supported vendor specific attributes (VSAs), which are implemented by using IETF RADIUS attribute 26.

---

**TCL IVR Configuration Tasks List**

Before starting the software configuration tasks for the TCL IVR Version 2.0 features, complete the following preinstallation tasks:

- Download the TCL scripts and audio files to be used with this feature from the Cisco.com.
• Store the TCL scripts and audio files on a TFTP server configured to interact with your gateway access server.

• Create the TCL IVR application script to use with the call application voice command when configuring IVR using TCL scripts. You create this application first and store it on a server or location where it can be retrieved by the access server.

• Define the call flow and pass the defined parameter values to the application. Depending on the TCL script you select, these values can include the language of the audio file and the location of the audio file. Table 28: clid_col_npw_3 Script Prompt Audio Files, on page 164 lists the TCL scripts and the parameter values they require.

• Associate the application to the incoming POTS or VoIP dial peer.

---

**Note**

When an IVR script is used to detect a "long #" from a caller connected to the H.323 call leg, the DTMF method used must either be Cisco proprietary RTP or DTMF relay using H.245 signal IE. DTMF relay using H.245 alphanumeric IE does not report the actual duration of the digit, causing long pound (#) detection to fail.

---

### Configuring the Call Application for the Dial Peer

#### Before you begin

You must configure the application that interacts with the dial peer before you configure the dial peer. The dial peer collects digits from the caller and uses the application you have created. Use the call application voice command as shown in the table that follows. Each command line is optional depending on the type of action desired or the digits to be collected.

To configure the application, enter the following commands in global configuration mode:

#### SUMMARY STEPS

1. call application voice name url
2. call application voice name language digit language
3. call application voice name pin-length number
4. call application voice name retry-count number
5. call application voice name uid-length number
6. call application voice name set-location language category location

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> call application voice name url</td>
<td>Defines the name of the application to be used with your TCL IVR script. The url argument specifies the location of the file and the access protocol. An example is as follows: flash:scripts/session.tcl</td>
</tr>
</tbody>
</table>

**Example:**

Router(config)# call application voice name url
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>tftp://dirt/sarvi/scripts/session.tcl  ftp://sarvi-ultra/scripts/session.tcl  slot0:scripts/tcl/session..tcl</td>
<td>You can only configure a url if the application named name has not been configured.</td>
</tr>
</tbody>
</table>

#### Step 2

**call application voice name language digit language**

**Example:**

Router(config)# call application voice name language digit language

Specifies the language used by the audio files. An example is: call application voice test language 1 en. The arguments are as follows:

- **digit**—Specifies zero (0) through 9.
- **language**—Specifies two characters that represent a language. For example, "en" for English, "sp" for Spanish, and "ch" for Mandarin. Enter aa to represent all.

#### Step 3

**call application voice name pin-length number**

**Example:**

Router(config)# call application voice name pin-length number

Defines the number of characters in the PIN for the designated application. Values are from 0 through 10.

#### Step 4

**call application voice name retry-count number**

**Example:**

Router(config)# call application voice name retry-count number

Defines the number of times a caller is permitted to reenter the PIN for the designated application. Values are from 1 through 5.

#### Step 5

**call application voice name uid-length number**

**Example:**

Router(config)# call application voice name uid-length number

Defines the number of characters allowed to be entered for the user ID for the designated application. Values are from 1 through 20.

#### Step 6

**call application voice name set-location language category location**

**Example:**

Router(config)# call application voice nameset-location language category location

Defines the location, language, and category of the audio files for the designated application. An example is: set-location en 1 tftp://server dir/audio filename.

---

**What to do next**

The following table lists TCL script names and the corresponding parameters that are required for each TCL scripts.
Table 31: TCL Scripts and Parameters

<table>
<thead>
<tr>
<th>TCL Script Name</th>
<th>Description—Summary</th>
<th>Commands to Configure</th>
</tr>
</thead>
<tbody>
<tr>
<td>clid_4digits_npw_3_cli.tcl</td>
<td>Authenticates the account number and PIN using ANI and null. The allowed length of digits is configurable through the CLI. If the authentication fails, it allows the caller to retry. The retry number is also configured through the CLI.</td>
<td>call application voice uid-len min = 1, max = 20, default - 10</td>
</tr>
<tr>
<td></td>
<td></td>
<td>call application voice pin-len min = 0, max - 10, default = 4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>call application voice retry-count min = 1, max = 5, default = 3</td>
</tr>
<tr>
<td>clid_authen_col_npw_cli.tcl</td>
<td>Authenticates the account number and PIN using ANI and null. If the authentication fails, it allows the caller to retry. The retry number is configured through the CLI. The account number and PIN are collected separately.</td>
<td>call application voice retry-count min = 1, max = 5, default = 3</td>
</tr>
<tr>
<td>clid_authen_collect_cli.tcl</td>
<td>Authenticates the account number and PIN using ANI and DNIS. If the authentication fails, it allows the caller to retry. The retry number is configured through the CLI. The account number and PIN are collected separately.</td>
<td>call application voice retry-count min = 1, max = 5, default = 3</td>
</tr>
<tr>
<td>clid_col_npw_3_cli.tcl</td>
<td>Authenticates using ANI and null for account and PIN. If the authentication fails, it allows the caller to retry. The retry number is configured through the CLI.</td>
<td>call application voice retry-count min = 1, max = 5, default = 3</td>
</tr>
<tr>
<td>clid_col_npw_npw_cli.tcl</td>
<td>Authenticates using ANI and null for account and PIN. If authentication fails, it allows the caller to retry. The retry number is configured through the CLI. The account number and PIN are collected together.</td>
<td>call application voice retry-count min = 1, max = 5, default = 3</td>
</tr>
</tbody>
</table>

Configuring TCL IVR on the Inbound POTS Dial Peer

Before you begin

Configuring gw-accounting and AAA are not always required for POTS dial peer configuration. It is dependent upon the type of application that is being used with TCL IVR. For example, the Pre-Paid Calling Card feature requires accounting and the authentication caller ID application does not.
To configure the inbound POTS dial peer, use the following commands beginning in global configuration mode:

**SUMMARY STEPS**

1. `aaa new-model`
2. `gw-accounting h323`
3. `aaa authentication login h323 radius`
4. `aaa accounting connection h323 start-stop radius`
5. `radius-server host ip-address auth-port number acct-port number`
6. `radius-server key key`
7. `dial-peer voice number pots`
8. `application name`
9. `destination-pattern string`
10. `session target`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>aaa new-model</code></td>
<td>(Optional) Enables AAA security and accounting services.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# aaa new-model</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# gw-accounting h323</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>aaa authentication login h323 radius</code></td>
<td>(Optional) Defines a method list called H.323 where RADIUS is defined as the only method of login authentication.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# aaa authentication login h323 radius</code></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>aaa accounting connection h323 start-stop radius</code></td>
<td>(Optional) Defines a method list called H.323 where RADIUS is used to perform connection accounting, providing start-stop records.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# aaa accounting connection h323 start-stop radius</code></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>radius-server host ip-address auth-port number acct-port number</code></td>
<td>Identifies the RADIUS server and the ports that will be used for authentication and accounting services.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# radius-server host ip-address auth-port number acct-port number</code></td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>radius-server key key</code></td>
<td>Specifies the password used between the gateway and the RADIUS server.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# radius-server key key</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>dial-peer voice number pots</strong></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router(config)# dial-peer voice number pots</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Enters dial-peer configuration mode to configure the incoming POTS dial peer. The <em>number</em> argument is a tag that uniquely identifies the dial peer.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>application name</strong></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router(dial-peer)# application name</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Associates the TCL IVR application with the incoming POTS dial peer. Enter the selected TCL IVR application name.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>destination-pattern string</strong></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router(config-dial-peer)# destination-pattern string</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Enters the telephone number associated with this dial peer. The <em>pattern</em> argument is a series of digits that specify the E.164 or private dialing plan telephone number. Valid entries are numbers from zero (0) through nine and letters from A through D. The following special characters can be entered in the string:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Plus sign (+) — (Optional) Indicates an E.164 standard number. The plus sign (+) is not supported on the Cisco MC3810 multiservice concentrator.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <em>string</em> — Specifies the E.164 or private dialing plan telephone number. Valid entries are the digits 0 through 9, the letters A through D, and the following special characters:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• – Asterisk (*) and pound sign (#) that appear on standard touch-tone dial pads.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• – Comma (,) inserts a pause between digits.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• – Period (.) matches any entered digit (this character is used as a wildcard).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• T — (Optional) Indicates that the destination-pattern value is a variable length dial-string.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Step 10</strong></td>
<td><strong>session target</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Router(config-dial-peer)# session target</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Specifies the session target IP address.</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring TCL IVR on the Inbound VoIP Dial Peer

**Before you begin**

To configure the inbound VoIP dial peer, use the following commands beginning in global configuration mode:
## SUMMARY STEPS

1. `dial-peer voice 4401 voip`
2. `application application-name`
3. `destination-pattern pattern`
4. `session protocol sipv2`
5. `session target`
6. `dtmf-relay cisco-rtp`
7. `codec g711ulaw`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>dial-peer voice 4401 voip</code></td>
<td>Enters the dial-peer configuration mode and identifies the call leg.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# <code>dial-peer voice 4401 voip</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>application application-name</code></td>
<td>Specifies the name of the application and script to use.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-dial-peer)# <code>application application-name</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>destination-pattern pattern</code></td>
<td>Enters the destination pattern.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-dial-peer)# <code>destination-pattern pattern</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>session protocol sipv2</code></td>
<td>Specifies the session protocol. The default session protocol is H.323. The <code>sipv2</code> argument enables SIP.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-dial-peer)# <code>session protocol sipv2</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>session target</code></td>
<td>Specifies the session target IP address.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-dial-peer)# <code>session target</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>dtmf-relay cisco-rtp</code></td>
<td>Specifies the DTMF relay method. The keyword <code>cisco-rtp</code> specifies H.323 and SIP. Other keywords that are available only for H.323 are <code>h245-alphanumeric</code> and <code>h245-signal</code>.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-dial-peer)# <code>dtmf-relay cisco-rtp</code></td>
<td><strong>Note</strong> If digit collection from this VoIP call leg is required, the command <code>dtmf-relay</code> is required. The default is <code>no dtmf-relay</code>.</td>
</tr>
<tr>
<td><strong>Step 7</strong> <code>codec g711ulaw</code></td>
<td>Specifies the voice codec.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-dial-peer)# <code>codec g711ulaw</code></td>
<td><strong>Note</strong> If the configured application will be playing prompts to the VoIP call leg, the <code>g711ulaw</code> keyword is required.</td>
</tr>
</tbody>
</table>
Configuring MGCP Scripting

Before you begin

To perform MGCP scripting, you must enable the MGCP script package. Enable the script in global configuration mode by entering the `mgcp package-capability script package` command. The example MGCP configuration shown in this section is for DS0s on T1 lines. The configuration tasks are as follows:

- Enabling the MGCP service on the DS0 groups
- Enabling the other MGCP packages
- Configuring the call agent address and other MGCP parameters

To configure MGCP scripting, use the following commands beginning in global configuration mode:

**SUMMARY STEPS**

1. `mgcp`
2. `mgcp request timeout timeout`
3. `mgcp request retries count`
4. `mgcp call-agent {ipaddr hostname} [port]`
5. `mgcp max-waiting-delay value`
6. `mgcp restart-delay value`
7. `mgcp vad`
8. `mgcp package-capability {as-package | dtmf-package | gm-package | rtp-package | trunk-package}`
9. `mgcp default-package {as-package | dtmf-package | gm-package | rtp-package | trunk-package}`
10. `mgcp quality-threshold {hwm-jitter-buffer value | hwm-latency value | hwm-packet-loss value | lwm-jitter-buffer value | lwm-latency value | lwm-packet-loss value}`
11. `mgcp playout {adaptive init-value min-valuemax-value} | {fixed init-value}`
12. `mgcp codec type [packetization-period value]`
13. `mgcp ip-tos {high-reliability | high-throughput | low-cost | low-delay | precedence value}`
14. `controller t1 slot#`
15. `framing`
16. `clock source type`
17. `linecode type`
18. `ds0-group n timeslots range type signaling-type service mgcp`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>mgcp</td>
<td>Example: <code>Router(config)# mgcp</code></td>
<td>Starts the MGCP daemon.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>mgcp request timeout <em>timeout</em>&lt;br&gt;Example: &lt;br&gt;Router(config)# mgcp request timeout <em>timeout</em>&lt;br&gt;Specifies how long the gateway should wait for a response to a request.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>mgcp request retries <em>count</em>&lt;br&gt;Example: &lt;br&gt;Router(config)# mgcp request retries <em>count</em>&lt;br&gt;Specifies the number of times to retry sending the mgcp command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>mgcp call-agent {ipaddr</td>
<td>hostname} [port]&lt;br&gt;Example: &lt;br&gt;Router(config)# mgcp call-agent {ipaddr</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>mgcp max-waiting-delay <em>value</em>&lt;br&gt;Example: &lt;br&gt;Router(config)# mgcp max-waiting-delay <em>value</em>&lt;br&gt;Configures the maximum waiting delay to be used in a restart in progress (RSIP) message as restart instructions for the call agent.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>mgcp restart-delay <em>value</em>&lt;br&gt;Example: &lt;br&gt;Router(config)# mgcp restart-delay <em>value</em>&lt;br&gt;Configures the restart delay value to be used in an RSIP message as graceful teardown instructions for the gateway connection.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>mgcp vad&lt;br&gt;Example: &lt;br&gt;Router(config)# mgcp vad&lt;br&gt;Configure voice activity detection.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>mgcp package-capability {as-package</td>
<td>dtmf-package</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>mgcp default-package { as-package</td>
<td>dtmf-package</td>

Verifying TCL IVR Configuration

Before you begin

You can verify TCL IVR configuration by performing the following tasks:

- To verify TCL IVR configuration parameters, use the show running-config command.
- To display a list of all voice applications, use the show call application summary command.
- To show the contents of the script configured, use the show call application voice command.
- To verify that the operational status of the dial peer, use the show dial-peer voice command.

To verify the TCL IVR configuration, perform the following steps:

Step 1

Enter the show call application voice summary command to verify that the newly created applications are listed. The example output follows.

```
Router# show call application voice summary

<table>
<thead>
<tr>
<th>name</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT</td>
<td>NEW::Basic app to do DID, or supply dialtone.</td>
</tr>
<tr>
<td>fax_hop_on</td>

TCL Script Version 2.0 supported.
TCL Script Version 1.1 supported.

**Note** In the output shown, an asterisk (*) in an application indicates that this application was not loaded successfully. Use the `show call application voice` command with the `name` argument to view information for a particular application.

**Step 2** Enter the `show dial-peer voice` command with the `peer tag` argument and verify that the application associated with the dial peer is correct.

**Step 3** Enter the `show running-config` command to display the entire configuration.

### TCL IVR Configuration Examples

Use the `show running-config` command to display the entire gateway configuration. Figure 23: Example Configuration Topology, on page 177 shows the type of topology used in the configuration for the example.

In this example configuration, GW1 is running TCL IVR for phone A, and GW2 is running TCL IVR for phone B.

This section provides the following configuration examples:

**Figure 23: Example Configuration Topology**

VoIP for IPv6

This document describes VoIP in IPv6 (VoIPv6), a feature that adds IPv6 capability to existing VoIP features. This feature adds dual-stack (IPv4 and IPv6) support on voice gateways and media termination points (MTPs), IPv6 support for Session Initiation Protocol (SIP) trunks, and support for Skinny Client Control Protocol (SCCP)-controlled analog voice gateways. In addition, the Session Border Controller (SBC) functionality of connecting a SIP IPv4 or H.323 IPv4 network to a SIP IPv6 network is implemented on a Cisco UBE to facilitate migration from VoIPv4 to VoIPv6.

- Finding Feature Information, on page 185
- Prerequisites for VoIP for IPv6, on page 185
- Restrictions for Implementing VoIP for IPv6, on page 186
- Information About VoIP for IPv6, on page 187
- How to Configure VoIP for IPv6, on page 193
- Configuration Examples for VoIP over IPv6, on page 217
- Troubleshooting Tips for VoIP for IPv6, on page 217
- Verifying and Troubleshooting Tips, on page 218
- Feature Information for VoIP for IPv6, on page 235

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support.

To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VoIP for IPv6

- Cisco Express Forwarding for IPv6 must be enabled.
- Virtual routing and forwarding (VRF) is not supported in IPv6 calls.

Cisco Unified Border Element

- Cisco IOS Release 12.4(22)T or a later release must be installed and running on your Cisco UBE.
Cisco Unified Border Element (Enterprise)

- Cisco IOS XE Release 3.3S or a later release must be installed and running on your Cisco ASR 1000 Series Router.

Restrictions for Implementing VoIP for IPv6

The following are the restrictions for Cisco UBE features:

**Media Flow–Through**

- Video call flows with Alternative Network Address Types (ANAT) are not supported.
- Webex call flow with ANAT is not supported (Cisco UBE does not support ANAT on Video and Application media types).

**SDP Pass-Through**

- Supports only Early Offer (EO)–Early Offer (EO) and Delayed Offer (DO)–Delayed Offer (DO) call flows.
- Delayed Offer–Early Offer call flow falls back to Delayed Offer–Delayed Offer call flow.
- Supplementary services are not supported on SDP Pass-Through.
- Transcoding and DTMF interworking are not supported.

**Note**

The above SDP Pass–Through restrictions are applicable for both IPv4 and IPv6.

- SDP Pass–Through does not support the dual-stack functionality.
- ANAT call flows do not support IPv4-to-IPv6 and IPv6-to-IPv4 Media interworking.

**UDP Checksum**

- CEF and process options are not supported on ASR1000 series routers.
- None option is partially supported on ISR–G2.

**Media Anti–Trombone**

- Media Anti–Trombone is not enabled if the initial call before tromboning is in Flow–Around (FA) mode.
- Media Anti–Trombone supports only symmetric media address type interworking (IPv4-IPv4 or IPv6-IPv6 media) with or without ANAT.
- Does not provide support for IPv4-IPv6 interworking cases with or without ANAT because Cisco UBE cannot operate in FA mode post tromboning.
IPv6 and IPv4 SRTP Interoperability

- IPv6 and IPv4 SRTP interoperability is not supported.
- When dual stack is configured with preference to IPv4, crypto keys appear only under IPv4. It does not appear under IPv6.
- When dual stack is configured with preference to IPv6, crypto keys appear only under IPv6. It does not appear under IPv4.

Information About VoIP for IPv6

SIP Features Supported on IPv6

The Session Initiation Protocol (SIP) is an alternative protocol developed by the Internet Engineering Task Force (IETF) for multimedia conferencing over IP. The Cisco SIP functionality enables Cisco access platforms to signal the setup of voice and multimedia calls over IP networks. SIP features also provide advantages in the following areas:

- Protocol extensibility
- System scalability
- Personal mobility services
- Interoperability with different vendors

A SIP User Agent (UA) operates in one of the following three modes:

- IPv4-only: Communication with only IPv6 UA is unavailable.
- IPv6-only: Communication with only IPv4 UA is unavailable.
- Dual-stack: Communication with only IPv4, only IPv6 and dual-stack UAs are available.

Dual-stack SIP UAs use Alternative Network Address Transport (ANAT) grouping semantics:

- Includes both IPv4 and IPv6 addresses in the Session Description Protocol (SDP).
- Is automatically enabled in dual-stack mode (can be disabled if required).
- Requires media to be bound to an interface that have both IPv4 and IPv6 addresses.
- Described in RFC 4091 and RFC 4092 (RFC 5888 describes general SDP grouping framework).

SIP UAs use “sdp-anat” option tag in the Required and Supported SIP header fields:

- Early Offer (EO) INVITE using ANAT semantics places “sdp-anat” in the Require header.
- Delayed Offer (DO) INVITE places “sdp-anat” in the Supported header.

SIP Signaling and Media Address Selection:

- Source address for SIP signaling is selected based on the destination signaling address type configured in the session-target of the outbound dial-peer:
If signaling bind is configured, source SIP signaling address is chosen from the bound interface.

If signaling bind is not configured, source SIP signaling address is chosen based on the best address in the UA to reach the destination signaling address.

SDP may or may not use ANAT semantics:

- When ANAT is used, media addresses in SDP are chosen from the interface media that is configured. When ANAT is not used, media addresses in SDP are chosen from the interface media that is configured OR based on the best address to reach the destination signaling address (when no media bind is configured).

**SIP Voice Gateways in VoIPv6**

Session Initiation Protocol (SIP) is a simple, ASCII-based protocol that uses requests and responses to establish communication among the various components in the network and to ultimately establish a conference between two or more endpoints.

In addition to the already existing features that are supported on IPv4 and IPv6, the SIP Voice Gateways support the following features:

- **History–Info**: The SIP History–info Header Support feature provides support for the history-info header in SIP INVITE messages only. The SIP gateway generates history information in the INVITE message for all forwarded and transferred calls. The history-info header records the call or dialog history. The receiving application uses the history-info header information to determine how and why the call has reached it.

  For more information, refer to the “SIP History INFO” section in the Cisco Unified Border Element (Enterprise) SIP Support Configuration Guide.

- **Handling 181/183 Responses with/without SDP**: The Handling 181/183 Responses with/without SDP feature provides support for SIP 181 (Call is Being Forwarded) and SIP 183 (Session Progress) messages either globally or on a specific dial-peer. Also, you can control when the specified SIP message is dropped based on either the absence or presence of SDP information.

  For more information, refer to “SIP–Enhanced 180 Provisional Response Handling” section in the Cisco Unified Border Element Configuration Guide.

- **Limiting the Rate of Incoming SIP Calls per Dial-Peer (Call Spike)**: The call rate-limiting feature for incoming SIP calls starts working after a switch over in a SIP call. The rate-limiting is done for new calls received on the new Active. The IOS timers that track the call rate limits runs on active and standby mode and does not require any checkpoint. However, some statistics for calls rejected requires to be checked for the show commands to be consistent before and after the switchover.

- **PPI/PAI/Privacy and RPID Passing**: For incoming SIP requests or response messages, when the PAI or PPI privacy header is set, the SIP gateway builds the PAI or PPI header into the common SIP stack, thereby providing support to handle the call data present in the PAI or PPI header. For outgoing SIP requests or response messages, when the PAI or PPI privacy header is set, privacy information is sent using the PAI or PPI header.

  For more information, refer to the “Support for PAID PPID Privacy PCPID and PAURI Headers on Cisco UBE” section in the Cisco Unified Border Element SIP Support Configuration Guide.

- **SIP VMWI for FXS phones**: SIP provides visible message waiting indication (VMWI) on FXS phones. This feature provides users with the option to enable one message waiting indication (MWI): audible,
visible, or both. The VMWI mechanism uses SIP Subscribe or Notify to get MWI updates from a virtual machine (VM) system, and then forwards updates to the FXS phone on the port.

For more information, refer to the “Configuring SIP MWI Features” section in the SIP Configuration Guide.

- **SIP Session timer (RFC 4028):** This feature allows for a periodic refresh of SIP sessions through a re-INVITE or UPDATE request. The refresh allows both user agents and proxies to determine whether the SIP session is still active. Two header fields can be defined: Session-Expires, which conveys the lifetime of the session, and Min-SE, which conveys the minimum allowed value for the session timer.

  For more information, refer to the “SIP Session Timer Support” section in the Cisco Unified Border Element SIP Support Configuration Guide.

- **SIP Media Inactivity Detection:** The SIP Media Inactivity Detection Timer feature enables Cisco gateways to monitor and disconnect VoIP calls if no Real-Time Control Protocol (RTCP) packets are received within a configurable time period.

  For more information, refer to the SIP Media Inactivity Timer section.

The SIP Voice Gateways feature is supported for analog endpoints that are connected to Foreign Exchange Station (FXS) ports or a Cisco VG224 Analog Phone Gateway and controlled by a Cisco call-control system, such as a Cisco Unified Communications Manager (Cisco Unified CM) or a Cisco Unified Communications Manager Express (Cisco Unified CME).

For more information on SIP Gateway features and information about configuring the SIP voice gateway for VoIPv6, see the Configuring VoIP for IPv6.

## VoIPv6 Support on Cisco UBE

Cisco UBE in VoIPv6 adds IPv6 capability to VoIP features. This feature adds dual-stack support on voice gateways, IPv6 support for SIP trunks, support for SCCP-controlled analog voice gateways, support for real-time control protocol (RTCP) pass-through, and support for T.38 fax over IPv6.

For more information on these features, refer to the following:

- “Configuring Cisco IOS Gateways” section in the Deploying IPv6 in Unified Communications Networks with Cisco Unified Communications Manager

- “Trunks” section in Deploying IPv6 in Unified Communications Networks with Cisco Unified Communications Manager

- “SCCP-controlled analog voice gateways” section in the SCCP Controlled Analog (FXS) Ports with Supplementary Features in Cisco IOS Gateways

- “RTCP Pass-Through” section in Cisco UBE RTCP Voice Pass-Through for IPv6

- “T.38 fax over IPv6” section in Fax, Modem, and Text Support over IP Configuration Guide

Support has been added for audio calls in media Flow–Through (FT) and Flow–Around (FA) modes, High Density (HD) transcoding, Local Transcoding Interface (LTI), along with Voice Class Codec (VCC) support, support for Hold/Resume, REFER, re-INVITE, 302 based services, and support for media anti-trombone have been added to Cisco UBE.
Cisco UBE being a signaling proxy processes all signaling messages for setting up media channels. This enables Cisco UBE to affect the flow of media packets using the media flow-through and the media flow-around modes.

- **Media FT and Media FA modes** support the following call flows:
  - EO–to–EO
  - DO–to–DO
  - DO–to–EO

- **Media Flow-Through (FT)**: In a media flow–through mode, between two endpoints, both signaling and media flows through the IP-to-IP Gateway (IPIP GW). The IPIP GW performs both signaling and media interworking between H.323/SIP IPv4 and SIP IPv6 networks.

  ![Image](Figure 24: H.323/SIP IPv4 – SIP IPv6 interworking in media flow-through mode)

- **Media Flow-Around (FA)**: Media flow–around provides the ability to have a SIP video call whereby signaling passes through Cisco UBE and media pass directly between endpoints bypassing the Cisco UBE.

  ![Image](Figure 25: H.323/SIP IPv4 - SIP IPv6 interworking in media flow-around mode)

- **Assisted RTCP (RTCP Keepalive)**: Assisted Real-time Transport Control Protocol (RTCP) enables Cisco UBE to generate RTCP keepalive reports on behalf of endpoints; however, endpoints, such as second generation Cisco IP phones (7940/7960) and Nortel Media Gateways (MG 1000T) do not generate any RTCP keepalive reports. Assisted RTCPs enable customers to use Cisco UBE to interoperate between endpoints and call control agents, such as Microsoft OCS/Lync so that RTCP reports are generated to indicate session liveness during periods of prolonged silence, such as call hold or call on mute.

  The assisted RTCP feature helps Cisco UBE to generate standard RTCP keepalive reports on behalf of endpoints. RTCP reports determine the liveness of a media session during prolonged periods of silence, such as a call on hold or a call on mute.
• **SDP Pass-Through**: SDP is configured to pass through transparently at the Cisco UBE, so that both the remote ends can negotiate media independently of the Cisco UBE.

SDP pass-through is addressed in two modes:

- **Flow-through**—Cisco UBE plays no role in the media negotiation, it blindly terminates and re-originate the RTP packets irrespective of the content type negotiated by both the ends. This supports address hiding and NAT traversal.

- **Flow-around**—Cisco UBE neither plays a part in media negotiation, nor does it terminate and re-originate media. Media negotiation and media exchange is completely end-to-end.

For more information, refer to the “Configurable Pass-through of SIP INVITE Parameters” section in the Cisco Unified Border Element SIP Support Configuration Guide.

• **UDP Checksum for IPv6**: User Datagram Protocol (UDP) checksums provide data integrity for addressing different functions at the source and destination of the datagram, when a UDP packet originates from an IPv6 node.

• **IP Toll Fraud**: The IP Toll Fraud feature checks the source IP address of the call setup before routing the call. If the source IP address does not match an explicit entry in the configuration as a trusted VoIP source, the call is rejected.

For more information, refer to the “Configuring Toll Fraud Prevention” section in the Cisco Unified Communications Manager Express System Administrator Guide.

• **RTP Port Range**: Provides the capability where the port range is managed per IP address range. This features solves the problem of limited number of rtp ports for more than 4000 calls. It enables combination of an IP address and a port as a unique identification for each call.

• **Hold/Resume**: Cisco UBE supports supplementary services such as Call Hold and Resume. An active call can be put in held state and later the call can be resumed.

For more information, refer to the “Configuring Call Hold/Resume for Shared Lines for Analog Ports” section in Supplementary Services Features for FXS Ports on Cisco IOS Voice Gateways Configuration Guide.

• **Call Transfer (re-INVITE, REFER)**: Call transfer is used for conference calling, where calls can transition smoothly between multiple point-to-point links and IP level multicasting.

For more information, refer to the “Configurable Pass-through of SIP INVITE Parameters” section in the Cisco Unified Border Element SIP Support Configuration Guide.

• **Call Forward (302 based)**: SIP provides a mechanism for forwarding or redirecting incoming calls. A Universal Access Servers (UAS) can redirect an incoming INVITE by responding with a 302 message (moved temporarily).

- Consumption of 302 at stack level is supported for EO-EO, DO-DO and DO-EO calls for all combination of IPv4/IPv6/ANAT.

- Consumption of 302 at stack level is supported for both FT and FA calls.

For more information, refer to the “Configuring Call Transfer and Forwarding” section in Cisco Unified Communications Manager Express System Administrator Guide.

• **Media Antitrombone**: Antitromboning is a media signaling service in SIP entity to overcome the media loops. Media Trombones are media loops in a SIP entity due to call transfer or call forward. Media loops
in Cisco UBE are not detected because Cisco UBE looks at both call types as individual calls and not calls related to each other.

Antitrombone service has to be enabled only when no media interworking is required in both legs. Media antitrombone is supported only when the initial call is in IPv4 to IPv4 or IPv6 to IPv6 mode only.

For more information, refer to the “Configuring Media Antitrombone” section in the Cisco Unified Border Element Protocol-Independent Features and Setup Configuration Guide.

• **RE-INVITE Consumption**: The Re-INVITE/UPDATE consumption feature helps to avoid interoperability issues by consuming the mid-call Re-INVITEs/UPDATEs from Cisco UBE. As Cisco UBE blocks RE-INVITE / mid-call UPDATE, remote participant is not made aware of the SDP changes, such as Call Hold, Call Resume, and Call transfer.

For more information, refer to the “Cisco UBE Mid-call Re-INVITE/UPDATE Consumption” section in the Cisco Unified Border Element Protocol-Independent Features and Setup Configuration Guide.

• **Address Hiding**: The address hiding feature ensures that the Cisco UBE is the only point of signaling and media entry/exit in all scenarios. When you configure address-hiding, signaling and media peer addresses are also hidden from the endpoints, especially for supplementary services when the Cisco UBE passes REFER/3xx messages from one leg to the other.

For more information, refer to the “Configuring Address Hiding” section in the SIP-to-SIP Connections on a Cisco Unified Border Element.

• **Header Passing**: Header Pass through enables header passing for SIP INVITE, SUBSCRIBE and NOTIFY messages; disabling header passing affects only incoming INVITE messages. Enabling header passing results in a slight increase in memory and CPU utilization.

For more information, refer to the “SIP-to-SIP Connections on a Cisco Unified Border Element” section in the SIP-to-SIPConnections on Cisco Unified Border Element.

• **Refer–To Passing**: The Refer-to Passing feature is enabled when you configure refer-to-passing in Refer Pass through mode and the supplementary service SIP Refer is already configured. This enables the received refer-to header in Refer Pass through mode to move to the outbound leg without any modification. However, when refer-to-passing is configured in Refer Consumption mode without configuring the supplementary-service SIP Refer, the received Refer-to URI is used in the request-URI of the triggered invite.

For more information, refer to the “Configuring Support for Dynamic REFER Handling on Cisco UBE” section in the Cisco Unified Border Element SIP Configuration Guide.

• **Error Pass-through**: The SIP error message pass through feature allows a received error response from one SIP leg to pass transparently over to another SIP leg. This functionality will pass SIP error responses that are not yet supported on the Cisco UBE or will preserve the Q.850 cause code across two sip call-legs.

For more information, refer to the “Configuring SIP Error Message Passthrough” section in the Cisco Unified Border Element SIP Support Configuration Guide.

• **SIP UPDATE Interworking**: The SIP UPDATE feature allows a client to update parameters of a session (such as, a set of media streams and their codecs) but has no impact on the state of a dialog. UPDATE with SDP will support SDP Pass through, media flow around and media flow through. UPDATE with SDP support for SIP to SIP call flows is supported in the following scenarios:
  - Early Dialog SIP to SIP media changes.
  - Mid Dialog SIP to SIP media changes.
For more information, refer to the “SIP UPDATE Message per RFC 3311” section in the Cisco Unified Border Element SIP Support Configuration Guide.

- **SIP OPTIONS Ping**: The OPTIONS ping mechanism monitors the status of a remote Session Initiation Protocol (SIP) server, proxy or endpoints. Cisco UBE monitors these endpoints periodically.

  For more information, refer to the “Cisco UBE Out-of-dialog OPTIONS Ping for Specified SIP Servers or Endpoints” section in the Configuration of SIP Trunking for PSTN Access (SIP-to-SIP) Configuration Guide.

- **Configurable Error Response Code in OPTIONS Ping**: Cisco UBE provides an option to configure the error response code when a dial peer is busied out because of an Out-of-Dial OPTIONS ping failure.

  For more information, refer to the “Configuring an Error Response Code upon an Out-of-Dial OPTIONS Ping Failure” section in the Cisco Unified Border Element SIP Support Configuration Guide.

- **SIP Profiles**: SIP profiles create a set of provisioning properties that you can apply to SIP trunk.

- **Dynamic Payload Type Interworking (DTMF and Codec Packets)**: The Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls feature provides dynamic payload type interworking for dual tone multifrequency (DTMF) and codec packets for Session Initiation Protocol (SIP) to SIP calls. The Cisco UBE interworks between different dynamic payload type values across the call legs for the same codec. Also, Cisco UBE supports any payload type value for audio, video, named signaling events (NSEs), and named telephone events (NTEs) in the dynamic payload type range 96 to 127.

  For more information, refer to the “Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls” section in the Cisco Unified Border Element (Enterprise) Protocol-Independent Features and Setup Configuration Guide.

- **Audio Transcoding using Local Transcoding Interface (LTI)**: Local Transcoding Interface (LTI) is an interface created to remove the requirement of SCCP client for Cisco UBE transcoding.

  For information, refer to Cisco Unified Border Element 9.0 Local Transcoding Interface (LTI).

- **Voice Class Codec (VCC) with or without Transcoding**: The Voice Class Codec feature supports basic and all Re-Invite based supplementary services like call-hold/resume, call forward, call transfer, where if any mid-call codec changes, Cisco UBE inserts/removes/modifies the transcoder as needed.

  Support for negotiation of an Audio Codec on each leg of a SIP–SIP call on the Cisco UBE feature supports negotiation of an audio codec using the Voice Class Codec (VCC) infrastructure on Cisco UBE.

  VCC supports SIP-SIP calls on Cisco UBE and allows mid-call codec change for supplementary services.

---

**How to Configure VoIP for IPv6**

**Configuring VoIP for IPv6**

SIP is a simple, ASCII-based protocol that uses requests and responses to establish communication among the various components in the network and to ultimately establish a conference between two or more endpoints.
Users in a SIP network are identified by unique SIP addresses. A SIP address is similar to an e-mail address and is in the format of sip:userID@gateway.com. The user ID can be either a username or an E.164 address. The gateway can be either a domain (with or without a hostname) or a specific Internet IPv4 or IPv6 address.

A SIP trunk can operate in one of three modes: SIP trunk in IPv4-only mode, SIP trunk in IPv6-only mode, and SIP trunk in dual-stack mode, which supports both IPv4 and IPv6.

A SIP trunk uses the Alternative Network Address Transport (ANAT) mechanism to exchange multiple IPv4 and IPv6 media addresses for the endpoints in a session. ANAT is automatically enabled on SIP trunks in dual-stack mode. The ANAT Session Description Protocol (SDP) grouping framework allows user agents (UAs) to include both IPv4 and IPv6 addresses in their SDP session descriptions. The UA is then able to use any of its media addresses to establish a media session with a remote UA.

A Cisco Unified Border Element can interoperate between H.323/SIP IPv4 and SIP IPv6 networks in media flow-through mode. In media flow-through mode, both signaling and media flows through the Cisco Unified Border Element, and the Cisco Unified Border Element performs both signaling and media interoperation between H.323/SIP IPv4 and SIP IPv6 networks (see the figure below).

Figure 26: H.323/SIP IPv4--SIP IPv6 Interoperating in Media Flow-Through Mode

---

### Shutting Down or Enabling VoIPv6 Service on Cisco Gateways

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **voice service voip**
4. **shutdown [ forced]**

**DETAILED STEPS**

<table>
<thead>
<tr>

| 5.   | call service stop [forced] | Shuts down or enables VoIPv6 for the selected submode. |
|      | Example:         |         |
|      |                  |         |
Configuring the Protocol Mode of the SIP Stack

Before you begin
SIP service should be shut down before configuring the protocol mode. After configuring the protocol mode as IPv6, IPv4, or dual-stack, SIP service should be reenabled.

SUMMARY STEPS

1. enable
2. configure terminal
3. sip-ua
4. protocol mode  ipv4 | ipv6 | dual-stack [preference {ipv4 | ipv6}]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>sip-ua</td>
<td>Enters SIP user agent configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# sip-ua</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>protocol mode  ipv4</td>
<td>ipv6</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-sip-ua)# protocol mode dual-stack</td>
<td></td>
</tr>
</tbody>
</table>

Example: Configuring the SIP Trunk

This example shows how to configure the SIP trunk to use dual-stack mode, with IPv6 as the preferred mode. The SIP service must be shut down before any changes are made to protocol mode configuration.
Device(config)# sip-ua
Device(config-sip-ua)# protocol mode dual-stack preference ipv6

Disabling ANAT Mode

ANAT is automatically enabled on SIP trunks in dual-stack mode. Perform this task to disable ANAT in order to use a single-stack mode.

SUMMARY STEPS

1. enable
2. configure terminal
3. voice service voip
4. sip
5. no anat

Verifying SIP Gateway Status

Before you begin

To verify the status of SIP Gateway, use the following commands

SUMMARY STEPS

1. show sip-ua calls
2. show sip-ua connections
3. show sip-ua status

DETAILED STEPS

Step 1  show sip-ua calls

The `show sip-ua calls` command displays active user agent client (UAC) and user agent server (UAS) information on SIP calls:

```
Device# show sip-ua calls
SIP UAC CALL INFO
Call 1
  SIP Call ID : 8368E08-127A11DD-890798908-BA2972D0@2001::21B:D4FF:FED7:B000
  State of the call : STATE_ACTIVE (7)
  Substate of the call : SUBSTATE_NONE (0)
  Calling Number : 2000
  Called Number : 1000
  Bit Flags : 0xC04018 0x100 0x0
  CC Call ID : 2
  Source IP Address (Sig ) : 2001:DB8:0:ABCD::1
  Destn SIP Req Addr:Port : 2001:DB8:0:0:FFFF:5060
  Destn SIP Resp Addr:Port : 2001:DB8:0:1:FFFF:5060
  Destination Name : 2001::21B:D5FF:FE1D:6C00
  Number of Media Streams : 1
  Number of Active Streams: 1
  RTP Fork Object : 0x0
  Media Mode : flow-through
  Media Stream 1
    State of the stream : STREAM_ACTIVE
    Stream Call ID : 2
    Stream Type : voice-only (0)
    Stream Media Addr Type : 1709707780
    Negotiated Codec : (20 bytes)
    Codec Payload Type : 18
    Negotiated Dtmf-relay : inband-voice
    Dtmf-relay Payload Type : 0
    Media Source IP Addr:Port : [2001::21B:D4FF:FED7:B000]:16504
    Media Dest IP Addr:Port : [2001::21B:D5FF:FE1D:6C00]:19548
  Options-Ping : ENABLED:NO ACTIVE:NO
  Number of SIP User Agent Client(UAC) calls: 1
  SIP UAS CALL INFO
    Number of SIP User Agent Server(UAS) calls: 0
```

Step 2  show sip-ua connections

Use the `show sip-ua connections` command to display SIP UA transport connection tables:

Example:
Device# show sip-ua connections udp brief
Total active connections : 1
No. of send failures    : 0
No. of remote closures  : 0
No. of conn. failures   : 0
No. of inactive conn. ageouts : 0

Router# show sip-ua connections udp detail

Total active connections : 1
No. of send failures    : 0
No. of remote closures  : 0
No. of conn. failures   : 0
No. of inactive conn. ageouts : 0
---------Printing Detailed Connection Report---------
Note:
** Tuples with no matching socket entry
- Do 'clear sip <tcp[tls]/udp> conn t ipv4:<addr>:<port>'
  to overcome this error condition
++ Tuples with mismatched address/port entry
- Do 'clear sip <tcp[tls]/udp> conn t ipv4:<addr>:<port> id <connid>'
  to overcome this error condition
Remote-Agent:2001::21B:D5FF:FE1D:6C00, Connections-Count:1
Remote-Port Conn-Id Conn-State WriteQ-Size
==========================================
5060 2 Established 0

Step 3 show sip-ua status

Use the show sip-ua status command to display the status of the SIP UA:

Example:

Device# show sip-ua status
SIP User Agent Status
SIP User Agent for UDP : ENABLED
SIP User Agent for TCP : ENABLED
SIP User Agent for TLS over TCP : ENABLED
SIP User Agent bind status(signaling): DISABLED
SIP User Agent bind status(media): DISABLED
SIP early-media for 180 responses with SDP: ENABLED
SIP max-forwards : 70
SIP DNS SRV version: 2 (rfc 2782)
NAT Settings for the SIP-UA
Role in SDP: NONE
Check media source packets: DISABLED
Maximum duration for a telephone-event in NOTIFYs: 2000 ms
SIP support for ISDN SUSPEND/RESUME: ENABLED
Redirection (3xx) message handling: ENABLED
Reason Header will override Response/Request Codes: DISABLED
Out-of-dialog Refer: DISABLED
Presence support is DISABLED

protocol mode is ipv6
SDP application configuration:
  Version line (v=) required
  Owner line (o=) required
  Timespec line (t=) required
  Media supported: audio video image
  Network types supported: IN
  Address types supported: IP4 IP6
  Transport types supported: RTP/AVP udptl
**RTCP Pass-Through**

IPv4 and IPv6 addresses embedded within RTCP packets (for example, RTCP CNAME) are passed on to Cisco UBE without being masked. These addresses are masked on the Cisco UBE ASR 1000.

The Cisco UBE ASR 1000 does not support printing of RTCP debugs.

---

**Note**

RTCP is passed through by default. No configuration is required for RTCP pass-through.

---

**Configuring IPv6 Support for Cisco UBE**

In Cisco UBE, IPv4-only and IPv6-only modes are not supported when endpoints are dual-stack. In this case, Cisco UBE must also be configured in dual-stack mode.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **sip-ua**
4. **protocol mode {ipv4 | ipv6 | dual-stack {preference {ipv4 | ipv6}}}**
5. **end**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> sip-ua</td>
<td>Enters SIP user-agent configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# sip-ua</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> protocol mode {ipv4</td>
<td>ipv6</td>
</tr>
<tr>
<td>Example: Device(config-sip-ua)# protocol mode ipv6</td>
<td>• **protocol mode dual-stack preference {ipv4</td>
</tr>
<tr>
<td></td>
<td>• **protocol mode {ipv4</td>
</tr>
</tbody>
</table>
**Verifying RTP Pass-Through**

To enable RTCP packet-related debugging, use the following command:

**SUMMARY STEPS**

1. `debug voip rtcp packets`

**DETAILED STEPS**

```bash
debug voip rtcp packets

Example:
Device# debug voip rtcp packets
```

*Feb 14 06:24:58.799: //1/xxxxxxxxxxx/RTP//Packet/voip_remote_rtcp_packet: Received RTCP packet
*Feb 14 06:24:58.799: SR: ssrc=0x1F7A35F0 sr_ntp_h=0xD10346B4 sr_ntp_l=0x13173D8F sr_timestamp=0x00 sr_npackets=381 sr_nbytes=62176

**Configuring the Source IPv6 Address of Signaling and Media Packets**

Users can configure the source IPv4 or IPv6 address of signaling and media packets to a specific interface’s IPv4 or IPv6 address. Thus, the address that goes out on the packet is bound to the IPv4 or IPv6 address of the interface specified with the `bind` command.
The `bind` command also can be configured with one IPv6 address to force the gateway to use the configured address when the bind interface has multiple IPv6 addresses. The bind interface should have both IPv4 and IPv6 addresses to send out ANAT.

When you do not specify a bind address or if the interface is down, the IP layer still provides the best local address.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. sip
5. bind {control | media | all} source interface interface-id [ipv6-address ipv6-address]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>

## Configuring the Session Target

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `dial-peer voice tag {mmioip | pots | vofr | voip}`
4. `destination pattern [+ string T]
5. `session target {ipv4: destination-address} ipv6: [destination-address] | dns: $s$ | $d$ | $e$ | $u$ | host-name | enum:table -num | loopback:rtp | ras| sip-server} [: port]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable` | Enables privileged EXEC mode.  
* Enter your password if prompted.  
  
  **Example:**  
  `Device>` `enable` |
| **Step 2** | `configure terminal` | Enters global configuration mode.  
  
  **Example:**  
  `Device#` `configure terminal` |
| **Step 3** | `dial-peer voice tag {mmioip | pots | vofr | voip}` | Defines a particular dial peer, specifies the method of voice encapsulation, and enters dial peer configuration mode.  
  
  **Example:**  
  `Device(config)#` `dial-peer voice 29 voip` |
| **Step 4** | `destination pattern [+ string T]` | Specifies either the prefix or the full E.164 telephone number to be used for a dial peer.  
  
  **Example:**  
  `Device(config-dial-peer)#` `destination-pattern 7777` |
| **Step 5** | `session target {ipv4: destination-address} ipv6: [destination-address] | dns: $s$ | $d$ | $e$ | $u$ | host-name | enum:table -num | loopback:rtp | ras| sip-server} [: port]` | Designates a network-specific address to receive calls from a VoIP or VoIPv6 dial peer.  
  
  **Example:**  
  `Device(config-sip-ua)#` `sip-server ipv6: 2001:DB8:0:0:8:800:200C:417A` |
## Configuring SIP Register Support

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `sip-ua`
4. `registrar [dns: address | ipv4: destination-address [; port] | ipv6: destination-address : port] { aor-domain expires seconds [tcp tls] | type [secondary] [scheme string]}
5. `retry register retries`
6. `timers register milliseconds`

# Configuring Cisco UBE Mid-call Re-INVITE Consumption

## Configuring Passthrough of Mid-call Signalling

Perform this task to configure passthrough of mid-call signaling (as Re-invites) only when bidirectional media is added.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. Configure passthrough of mid-call signaling changes only when bidirectional media is added.
   - In Global VoIP SIP configuration mode
     - `midcall-signaling passthru media-change`
   - In dial-peer configuration mode
     - `voice-class sip mid-call signaling passthru media-change`
4. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Enters global configuration mode. |
| `configure terminal` |
| **Example:** |
| `Device# configure terminal` |

| **Step 3** | Re-Invites are passed through only when bidirectional media is added. |
| Configure passthrough of mid-call signaling changes only when bidirectional media is added. |
| • In Global VoIP SIP configuration mode |
| `midcall-signaling passthru media-change` |
| • In dial-peer configuration mode |
| `voice-class sip mid-call signaling passthru media-change` |
| **Example:** |
| In Global VoIP SIP configuration mode: |
| `Device(config)# voice service voip` |
| `Device(conf-voi-serv)# sip` |
| `Device(conf-serv-sip)# midcall-signaling passthru media-change` |
| **Example:** |
| In Dial-peer configuration mode: |
Step 4

**Command or Action**

- Device(config)# dial-peer voice 2 voip
- Device(config-dial-peer)# voice-class sip mid-call signaling passthru media-change

**Purpose**

Exits to privileged EXEC mode.

### Configuring Passthrough SIP Messages at Dial Peer Level

Perform this task to configure passthrough SIP messages at the dial-peer level. You need to perform this task at the dial-peer level to consume all media-related mid-call Re-INVITEs/UPDATEs.

#### Note

If the Cisco UBE Mid-call Re-INVITE/UPDATE consumption feature is configured on global and dial-peer level, dial-peer level takes precedence.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice dial-peer tag voip**
4. **voice-class sip mid-call signaling passthru media-change**
5. **exit**

Configuring H.323 IPv4-to-SIPv6 Connections in a Cisco UBE

An organization with an IPv4 network can deploy a Cisco UBE on the boundary to connect with the service provider’s IPv6 network (see the figure below).

Figure 27: Cisco UBE Interoperating IPv4 Networks with IPv6 Service Provider

A Cisco UBE can interoperate between H.323/SIP IPv4 and SIP IPv6 networks in media flow-through mode. In media flow-through mode, both signaling and media flows through the Cisco UBE, and the Cisco UBE performs both signaling and media interoperation between H.323/SIP IPv4 and SIP IPv6 networks (see the figure below).

Figure 28: IPv4 to IPv6 Media Interoperating Through Cisco IOS MTP

The Cisco UBE feature adds IPv6 capability to existing VoIP features. This feature adds dual-stack support on voice gateways and MTP, IPv6 support for SIP trunks, and SCCP-controlled analog voice gateways. In addition, the SBC functionality of connecting SIP IPv4 or H.323 IPv4 network to a SIP IPv6 network is implemented on an Cisco UBE to facilitate migration from VoIPv4 to VoIPv6.
Before you begin

Cisco UBE must be configured in IPv6-only or dual-stack mode to support IPv6 calls.

---

Note

A Cisco UBE interoperates between H.323/SIP IPv4 and SIP IPv6 networks only in media flow-through mode.

---

SUMMARY STEPS

1. enable
2. configure terminal
3. voice service voip
4. allow-connections from type to to type

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>voice service voip</td>
<td>Enters voice service VoIP configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# voice service voip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>allow-connections from type to to type</td>
<td>Allows connections between specific types of endpoints in a VoIPv6 network.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-voi-serv)# allow-connections h323 to sip</td>
<td></td>
</tr>
</tbody>
</table>

Arguments are as follows:

- *from-type* -- Type of connection. Valid values: h323, sip.
- *to-type* -- Type of connection. Valid values: h323, sip.

---

Example: Configuring H.323 IPv4-to-SIPv6 Connections in a Cisco UBE

Device(config)# voice service voip
Device(config-voi-serv)# allow-connections h323 to sip
Configuration Examples for VoIP over IPv6

Example: Configuring the SIP Trunk

This example shows how to configure the SIP trunk to use dual-stack mode, with IPv6 as the preferred mode. The SIP service must be shut down before any changes are made to protocol mode configuration.

Device(config)# sip-ua
Device(config-sip-ua)# protocol mode dual-stack preference ipv6

Troubleshooting Tips for VoIP for IPv6

Media Flow-Through
To enable all Session Initiation Protocol (SIP)-related debugging, use the `debug ccsip all` command in privileged EXEC mode.

To trace the execution path through the call control application programming interface (CCAPI), use the `debug voip ccapi inout` command.

Media Flow-Around
To enable all Session Initiation Protocol (SIP)-related debugging, use the `debug ccsip all` command.

To trace the execution path through the call control application programming interface (CCAPI), use the `debug voip ccapi inout` command.

SDP Pass-Through
To enable all Session Initiation Protocol (SIP)-related debugging (when the call is active in Pass through mode), use the `debug ccsip all` command.

RTP Port Range
To enable all Session Initiation Protocol (SIP)-related debugging, use the `debug ccsip all` command.

To enable debugging for Real-Time Transport Protocol (RTP) named event packets, use the `debug voip rtp` command.

VMWI SIP
To collect debug information only for signaling events, use the `debug vpm signal` command.

To show all Session Initiation Protocol (SIP) Service Provider Interface (SPI) message tracing, use the `debug ccsip messages` command.
Verifying and Troubleshooting Tips

Verifying Cisco UBE ANAT Call Flows

To verify that media settings are enabled in the media flowthrough and media flow-around feature, use the following commands:

**SUMMARY STEPS**

1. `show call active voice brief`
2. `show call active voice compact`
3. `show voip rtp connections`

**DETAILED STEPS**

### Step 1: show call active voice brief

**Example:**

```
Device# show call active voice brief

SIP/2.0 100 Trying
```
In the example shown, a call is initiated with the following headers:

- **Via:** SIP/2.0/UDP [2001:DB8:C18:2:219:2FFF:FE89:7928]:5060;branch=z9hG4bK1CA8CD
- **From:** <sip:1001@[2001:DB8:C18:2:219:2FFF:FE89:7928]>;tag=6EDAC1D0-F25
- **To:** <sip:6000@[2001:DB8:C18:2:223:4FF:FEAC:4540]>
- **Date:** Thu, 07 Jun 2012 09:17:41 GMT
- **Call-ID:** FC36AC29-1FC2011E-8725FA39-34B6D876@2001:DB8:C18:2:219:2FFF:FE89:7928
- **Timestamp:** 1339066037
- **CSeq:** 101 INVITE
- **Allow-Events:** telephone-event
- **Server:** Cisco-SIPGateway/IOS-15.2.20120528.102328.
- **Content-Length:** 0

The call is then accepted with the following headers:

- **Date:** Thu, 07 Jun 2012 09:17:41 GMT
- **Call-ID:** 7780227E-AFB811E1-8060F4DD-5665AA1B@9.44.30.14
- **Supported:** timer,resource-priority, replaces
- **Require:** sdp-anat
- **Min-SE:** 1800
- **Cisco-Guid:** 4231321369-2948862433-2168455193-0797538600
- **User-Agent:** Cisco-SIPGateway/IOS-15.2.20120528.102328.
- **Content-Type:** application/sdp
- **Content-Disposition:** session;handling=required Phone is offhook
- **Content-Length:** 437

The SDP portion of the message includes audio streams:

```

<td>101</td>
<td>0</td>
</tr>
</tbody>
</table>
```

No active connections found

---

**Verifying VMWI SIP**

**SUMMARY STEPS**

1. **show sip-ua mwi**
2. **debug vpm signal**
3. **debug ccsip messages**
DETAILED STEPS

Step 1  
show sip-ua mwi

Example:
Device# show sip-ua mwi
MWI type: 2
MWI server: 2001:10:12:1::2006 //IPv6 MWI Server Address/
MWI expires: 3600
MWI port: 5060
MWI dial peer tag: 0 //Shows the MWI-Server binding dial-peer tag. Tag "0" is default.//
MWI solicited //MWI type is solicited by default. Subscription of voice-port is required in this case only.//
MWI ipaddr cnt 1:
MWI ipaddr idx 0:
MWI server: 2001:10:12:1::2006, port 5060, transport 1 //IPv6 MWI Server Address/
MWI server dns lookup retry cnt: 0

Step 2  
d debug vpm signal

Example:
Device# debug vpm signal
Process vmwi. vmwi state: OFF
The phone is not on hook (1). Delay the vmwi processing. //Phone is offhook//
Process dc-voltage vmwi. State: OFF //VMWI state is off://
*Mar 2 02:33:34.841: [2/0] c2400_dc_volt_mwi: on=0
The phone is not onhook (1). Delay the vmwi processing. Process vmwi. vmwi state: ON //VMWI state is on//
Voice port 0/2/1 subscribed MWI //Subscription of port for MWI (Solicited)//

Step 3  
d debug ccsip messages

Example:
Device# debug ccsip messages
Note  The debug ccsip messages command shows the SIP Messages, such as Subscribe and Notify.

Verifying SDP Passthrough Configuration

SUMMARY STEPS

1. debug ccsip all
2. show voip rtp connection

DETAILED STEPS

Step 1  
d debug ccsip all

Example:
Device# show logging

**Feature Information for VoIP for IPv6**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

| Cisco UBE support for IPv6   | 12.4(22)T | Cisco Unified Border Element (Cisco UBE) support for SIP IPv4-IPv6 dual stack and IPv4 and IPv6 capability provides the following functionality:  
  • Translation of SIP IPv4 to IPv6 addresses  
  • Administration and enforcement of policies for the IPv4/IPv6 mode of operation of each component.  
  • Supports the following scenarios: H.323 IPv4 to SIP IPv6; SIP IPv4 to SIP IPv6, SIP IPv6 to SIP IPv6  
  • DTMF: Interworking capability on Cisco UBE (H.245 Signal, RFC 2833, SIP Notify, Key Press Markup Language, H.323 to SIP, RFC 2833 to G.711 Inband)  
  • IPv6 topology hiding and demarcation  
  • SIP Options-ping  
  
The VoIP for IPv6 feature describes the Session Border Controller (SBC) functionality of connecting a SIP IPv4 or H.323 IPv4 network to a SIP IPv6 network that is implemented on a Cisco UBE to facilitate migration from VoIPv4 to VoIPv6.

CHAPTER 17

Configurable SIP Parameters via DHCP

The Configurable SIP Parameters via DHCP feature allows a Dynamic Host Configuration Protocol (DHCP) server to provide Session Initiation Protocol (SIP) parameters via a DHCP client. These parameters are used for user registration and call routing.

The DHCP server returns the SIP Parameters via DHCP options 120 and 125. These options are used to specify the SIP user registration and call routing information. The SIP parameters returned are the SIP server address via Option 120, and vendor-specific information such as the pilot, contract or primary number, an additional range of secondary numbers, and the SIP domain name via Option 125.

In the event of changes to the SIP parameter values, this feature also allows a DHCP message called DHCPFORCERENEW to reset or apply a new set of values.

The SIP parameters provisioned by DHCP are stored, so that on reboot they can be reused.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configurable SIP Parameters via DHCP

• A DHCP interface has to be associated with SIP before configurable SIP parameters via DHCP can be enabled.
Cisco Unified Border Element

- Cisco IOS Release 12.4(22)YB or a later release must be installed and running on your Cisco Unified Border Element.

Cisco Unified Border Element (Enterprise)

- Cisco IOS XE Release 3.17S or a later release must be installed and running on your Cisco ASR 1000 Series Router.

Restrictions for Configurable SIP Parameters via DHCP

- DHCP Option 120 is the standard DHCP option (RFC3361) to get a SIP server address, and this can be used by any vendor DHCP server. Only one address is supported, which is in the IPv4 address format. Multiple IPv4 address entries are not supported. Also, there is no support for a DNS name in this or for any port number given behind the IPv4 address.

- DHCP Option 125 (RFC 3925) provides vendor-specific information and its interpretation is associated with the enterprise identity. The primary and secondary phone numbers and domain are obtained using Option 125, which is vendor-specific. As long as other customers use the same format as in the Next Generation Network (NGN) DHCP specification, they can use this feature.

- A primary or contract number is required in suboption 202 of DHCP Option 125. There can be only one instance of the primary number and not multiple instances.

- Multiple secondary or numbers in suboption 203 of DHCP Option 125 are supported. Up to five numbers are accepted and the rest ignored. Also, they have to follow the contract number in the DHCP packet data.

- Authentication is not supported for REGISTER and INVITE messages sent from a Cisco Unified Border Element that uses DHCP provisioning.

- The DHCP provisioning of SIP Parameters is supported only over one DHCP interface.

- The DHCP option is available only to be configured for the primary registrar. It will not be available for a secondary registrar.

Information About Configurable SIP Parameters via DHCP

To perform basic Configurable SIP Parameters via DHCP configuration tasks, you should understand the following concepts:

Cisco Unified Border Element Support for Configurable SIP Parameters via DHCP

The Cisco Unified Border Element provides the support for the DHCP provisioning of the SIP parameters. The NGN is modeled using SIP as a VoIP protocol. In order to connect to NGN, the User to Network Interface (UNI) specification is used. Cisco TelePresence Systems (CTS), consisting of an IP Phone, a codec, and Cisco Unified Communications Manager, are required to internetwork over the NGN for point-to-point and point-to-multipoint video calls. Because Cisco Unified Communications Manager does not provide a UNI
interface, there has to be an entity to provide the UNI interface. The Cisco Unified Border Element provides
the UNI interface and has several advantages such as demarcation, delayed offer to early offer, and registration.
The figure below shows the Cisco Unified Border Element providing the UNI interface for the NGN.

Figure 29: Cisco NGN with Cisco Unified Border Element providing UNI interface

DHCP to Provision SIP Server, Domain Name, and Phone Number

NGN requires Cisco Unified Border Element to support DHCP (RFC 2131 and RFC 2132) to provision the
following:

- IP address for Cisco Unified Border Element’s UNI interface facing NGN
- SIP server address using option 120
- Option 125 vendor specific information to get:
  - Pilot number (also called primary or contract number), there is only one pilot number in DHCPACK,
    and REGISTER is done only for the pilot number
  - Additional numbers, or secondary numbers, are in DHCPACK; there is no REGISTER for additional
    numbers
  - SIP domain name
- DHCPFORCERENEW to reset or apply a new set of SIP parameters (RFC 3203)

DHCP-SIP Call Flow

The following scenario shows the DHCP messages involved in provisioning information such as the IP address
for UNI interface, and SIP parameters including the SIP server address, phone number, and domain name,
along with how SIP messages use the provisioned information.

The figure below shows the DHCP and SIP messages involved in obtaining the SIP parameters and using
them for REGISTER and INVITE.
DHCP Message Details

The DHCP call flow involved in obtaining Cisco Unified Border Element provision information, including the IP address for UNI interface and SIP information such as phone number, domain, and SIP server, is shown in the figure below.
The DHCP messages involved in provisioning the SIP parameters are described in Steps 1 to 6.

1. F1: The Cisco Unified Border Element DHCP client sends a DHCPDISCOVER message to find the available NGN DHCP servers on the network and obtain a valid IPv4 address. The Cisco Unified Border Element DHCP client identity (computer name) and MAC address are included in this message.

2. F2: The Cisco Unified Border Element DHCP client receives a DHCPOFFER message from each available NGN DHCP server. The DHCPOFFER message includes the offered DHCP server’s IPv4 address, the DHCP client’s MAC address, and other configuration parameters.

3. F3: The Cisco Unified Border Element DHCP client selects an NGN DHCP server and its IPv4 address configuration from the DHCPOFFER messages it receives, and sends a DHCPREQUEST message requesting its usage. Note that this is where Cisco Unified Border Element requests SIP server information via DHCP Option 120 and vendor-identifying information via DHCP Option 125.

4. F4: The chosen NGN DHCP server assigns its IPv4 address configuration to the Cisco Unified Border Element DHCP client by sending a DHCPACK message to it. The Cisco Unified Border Element DHCP client receives the DHCPACK message. This is where the SIP server address, phone number and domain name information are received via DHCP options 120 and 125. The Cisco Unified Border Element will use the information for registering the phone number and routing INVITE messages to the given SIP server.
5. F5: When NGN has a change of information or additional information (such as changing SIP server address from 1.1.1.1 to 2.2.2.2) for assigning to Cisco Unified Border Element, the DHCP server initiates DHCPFORCE RENEW to the Cisco Unified Border Element. If the authentication is successful, the Cisco Unified Border Element DHCP client accepts the DHCP FORCE RENEW and moves to the next stage of sending DHCPREQUEST. Otherwise DHCPFORCE RENEW is ignored and the current information is retained and used.

6. F6 and F7: In response to DHCPFORCE RENEW, similar to steps F3 and F4, the Cisco Unified Border Element requests DHCP Options 120 and 125. Upon getting the response, SIP will apply these parameters if they are different by sending an UN-REGISTER message for the previous phone number and a REGISTER message for the new number. Similarly, a new domain and SIP server address will be used. If the returned information is the same as the current set, it is ignored and hence registration and call routing remains the same.

How to Configure SIP Parameters via DHCP

Configuring the DHCP Client

To receive the SIP configuration parameters the Cisco Unified Border Element has to act as a DHCP client. This is because in the NGN network, a DHCP server pushes the configuration to a DHCP client. Thus the Cisco Unified Border Element must be configured as a DHCP client.

Perform this task to configure the DHCP client.

Before you begin

You must configure the `ip dhcp client` commands before entering the `ip address dhcp` command on an interface to ensure that the DHCPDISCOVER messages that are generated contain the correct option values. The `ip dhcp client` commands are checked only when an IP address is acquired from DHCP. If any of the `ip dhcp client` commands are entered after an IP address has been acquired from DHCP, the DHCPDISCOVER messages’ correct options will not be present or take effect until the next time the router acquires an IP address from DHCP. This means that the new configuration will only take effect after either the `ip address dhcp` command or the `release dhcp` and `renew dhcp` EXEC commands have been configured.

</tr>
</tbody>
</table>

### Configuring the DHCP Client Example

The following is an example of how to enable the DHCP client:

```
Router> enable
Router# configure terminal
Router(config)# interface gigabitethernet 1/1
Router(config-if)# ip dhcp client request sip-server-address
Router(config-if)# ip dhcp client request vendor-identifying-specific
Router(config-if)# ip address dhcp
Router(config-if)# exit
```
Enabling the SIP Configuration

Enabling the SIP configuration allows the Cisco Unified Border Element to use the SIP parameters received via DHCP for user registration and call routing. Perform this task to enable the SIP configuration.

Before you begin

The dhcp interface command has to be entered to declare the interface before the registrar and credential commands are entered.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. sip-ua
5. dhcp interface type number
6. registrar dhcp expires seconds random-contact refresh-ratio seconds
7. credentials dhcp password [0|7] password realm domain-name
8. exit

### Enabling the SIP Configuration Example

The following is an example of how to enable the SIP configuration:

```plaintext
Router> enable
Router# configure terminal
Router(config)# interface gigabitethernet 1/0
Router(config-if)# sip-ua
Router(sip-ua)# dhcp interface gigabitethernet 1/0
Router(sip-ua)# registrar dhcp expires 90 random-contact refresh-ratio 90
Router(sip-ua)# credentials dhcp password cisco realm cisco.com
Router(sip-ua)# exit
```

### Troubleshooting Tips

To display information on DHCP and SIP interaction when SIP parameters are provisioned by DHCP, use the `debug ccsip dhcp` command in privileged EXEC mode.
Configuring a SIP Outbound Proxy Server

An outbound-proxy configuration sets the Layer 3 address (IP address) for any outbound REGISTER and INVITE SIP messages. The SIP server can be configured as an outbound proxy server in voice service SIP configuration mode or dial peer configuration mode. When enabled in voice service SIP configuration mode, all the REGISTER and INVITE messages are forwarded to the configured outbound proxy server. When enabled in dial-peer configuration mode, only the messages hitting the defined dial-peer will be forwarded to the configured outbound proxy server.

The configuration tasks in each mode are presented in the following sections:

Perform either of these tasks to configure the SIP server as a SIP outbound proxy server.

Configuring a SIP Outbound Proxy Server in Voice Service VoIP Configuration Mode

Perform this task to configure the SIP server as a SIP outbound proxy server in voice service SIP configuration mode.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. sip
5. outbound-proxy dhcp
6. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 voice service voip</td>
<td>Enters voice service VoIP configuration mode and specifies VoIP as the</td>
</tr>
<tr>
<td>Example:</td>
<td>voice-encapsulation type.</td>
</tr>
<tr>
<td>Router(config)# voice service voip</td>
<td></td>
</tr>
<tr>
<td>Step 4 sip</td>
<td>Enters voice service SIP configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><code>Router(config-voi-srv)# sip</code></td>
<td>Configures the DHCP client to request a SIP server address from a DHCP server.</td>
</tr>
</tbody>
</table>

**Step 5**

**Example:**

```
Router(config-serv-sip)# outbound-proxy dhcp
```

**Step 6**

**Example:**

```
Router(config-serv-sip)# exit
```

### Configuring a SIP Outbound Proxy Server in Voice Service VoIP Configuration Mode Example

The following is an example of how to configure a SIP outbound proxy in voice service SIP configuration mode:

```
Router> enable
Router# configure terminal
Router(config)# voice service voip
Router(config-voi-srv)# sip
Router(config-serv-sip)# outbound-proxy dhcp
Router(config-serv-if)# exit
```

### Configuring a SIP Outbound Proxy Server and Session Target in Dial Peer Configuration Mode

Perform this task to configure the SIP server as a SIP outbound proxy server in dial peer configuration mode.

> **Note**

SIP must be configured on the dial pier before DHCP is configured. Therefore the `session protocol sipv2` command must be executed before the `session target dhcp` command. DHCP is supported only with SIP configured on the dial peer.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dial-peer voice number voip
4. session protocol sipv2
5. voice-class sip outbound-proxy dhcp

CHAPTER 18

Matching Inbound Dial Peers by URI

The Matching Inbound Dial Peers by URI feature allows you to configure the selection of inbound dial peers by matching parts of the URI sent by a remote (neighboring) SIP entity. The match can be done on different parts of the URI like hostname, IP address, DNS name. This feature can be used to configure configuration policies, enforce specific call-treatment, security, and routing policies on each SIP trunk by originating SIP entity.

In a scenario where multiple SIP hops are involved in a call, there would be multiple via headers involved, and the topmost via header of an incoming SIP invite represents the last hop that forwarded the SIP request, and the bottom-most via header would represent the originator of the SIP request. This feature supports matching by the last hop that forwarded the request (neighboring SIP entity), which is the topmost via header.

For incoming dial-peer match based on URI, if there are multiple dial-peer matches, then the longest matching dial-peer is chosen (similar to multiple dial-peer match based on incoming called number). However for URI pattern match, there is no match length and hence this is the least preferred.

---

**Note**

For incoming dial-peer match based on URI, if there are multiple dial-peer matches, then the longest matching dial-peer is chosen (similar to multiple dial-peer match based on incoming called number). However for URI pattern match, there is no match length and hence this is the least preferred.

---

**Feature Information for Matching Inbound Dial Peers by URI**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.
Configuring an Inbound Dial Peer to Match on URI

SUMMARY STEPS

1. enable
2. configure terminal
3. voice class uri voice-class-uri-tag
4. Specify a URI field for the voice class:
   - host hostname-pattern
   - host ipv4: ipv4-address
   - host ipv6: ipv6-address
   - host dns: dns-address
   - pattern uri-pattern
   - user-id username-pattern
5. exit
6. dial-peer voice tag voip
7. session protocol sipv2
8. incoming uri { from | request | to | via} voice-class-uri-tag
9. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Enter your password if prompted.</td>
<td>Device&gt; enable</td>
</tr>
</tbody>
</table>

**Step 2**

**configure terminal**

**Example:**

Device> configure terminal

**Step 3**

**voice class uri voice-class-uri-tag**

**Example:**

Device(config)# voice class uri 200

**Step 4**

Specify a URI field for the voice class:

- `host hostname-pattern`
- `host ipv4: ipv4-address`
- `host ipv6: ipv6-address`
- `host dns: dns-address`
- `pattern uri-pattern`
- `user-id username-pattern`

**Example:**

Device(config-voice-uri-class)# host server1

**Step 5**

**exit**

**Example:**

Device(config-voice-uri-class)# exit

**Step 6**

**dial-peer voice tag voip**

**Example:**

Device(config)# dial-peer voice 6000 voip

**Step 7**

**session protocol sipv2**

**Example:**

Device(config-dial-peer)# session protocol sipv2
Examples for Configuring an Inbound Dial Peer to Match on a URI

<td></td>
</tr>
<tr>
<td>Device(config-dial-peer)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Examples for Configuring an Inbound Dial Peer to Match on a URI**

**Matching Against IPv4 Address and VIA**

CUBE is configured to use incoming dial-peer 101 for incoming SIP calls from remote SIP endpoint having an IP address of 10.10.10.1

```
voice class uri 201 sip
host ipv4:10.10.10.1

dial-peer voice 101 voip
session protocol sipv2
incoming uri via 201
```

Incoming INVITE that can be matched against this dial peer.

```
INVITE sip:123@1.2.3.4:5060 SIP/2.0
Via: SIP/2.0/TCP 10.10.10.1:5093;branch=z9hG4bK-17716-1-0
Via: SIP/2.0/TCP 10.10.14.20:5093;branch=z9hG4bK-28280-1-0
```

**Matching Against DNS Name and VIA**

CUBE is configured to use incoming dial-peer 102 for incoming SIP calls from sample.com or an IP address that represents one of the resolved IP address of sample.com.

```
voice class uri 202 sip
host dns:sample.com

dial-peer voice 101 voip
session protocol sipv2
incoming uri via 202
```

Incoming INVITE that can be matched against this dial peer.

```
INVITE sip:123@1.2.3.4:5060 SIP/2.0
Via: SIP/2.0/TCP sample.com;branch=z9hG4bK-17716-1-0
```

```
INVITE sip:123@1.2.3.4:5060 SIP/2.0
Via: SIP/2.0/TCP 10.10.10.25:5093;branch=z9hG4bK-17716-1-0
```

10.10.10.25 is a resolved IP address of sample.com.
Matching Against Multiple Attributes and VIA

CUBE is configured to use incoming dial-peer 103 for incoming SIP calls from xxx.yyy.com, abc.def.com and IP addresses 10.10.10.10, 10.9.10.11 and 10.10.10.10.

```
voice class uri 203 sip
host dns:xxx.yyy.com
host dns:abc.def.com
host ipv4:10.10.10.10
host ipv4:10.9.10.11
host ipv4:10.10.10.10

dial-peer voice 103 voip
session protocol sipv2
incoming uri via 203
```

Incoming INVITE that can be matched against this dial peer.

```
INVITE sip:123@1.2.3.4:5060 SIP/2.0
Via: SIP/2.0/TCP 10.10.10.10:5093;branch=z9hG4bK-17716-1-0
Via: SIP/2.0/TCP 10.10.14.20:5093;branch=z9hG4bK-28280-1-0

10.10.10.25 is a resolved IP address of sample.com.
```
Examples for Configuring an Inbound Dial Peer to Match on a URI
CHAPTER 19

URI-Based Dialing Enhancements

The URI-Based Dialing Enhancements feature describes the enhancements made to Uniform Resource Identifier (URI)-based dialing on Cisco Unified Border Element (CUBE) for Session Initiation Protocol (SIP) calls. The URI-Based Dialing Enhancements feature includes support for call routing on Cisco UBE when the user part of the incoming Request-URI is non-E164 (for example, INVITE sip:user@abc.com).

- Finding Feature Information, on page 263
- Feature Information for URI-Based Dialing Enhancements, on page 263
- Information About URI-Based Dialing Enhancements, on page 264
- How to Configure URI-Based Dialing Enhancements, on page 267
- Configuration Examples for URI-Based Dialing Enhancements, on page 274
- Additional References for URI-Based Dialing Enhancements, on page 276

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Feature Information for URI-Based Dialing Enhancements

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 35: Feature Information for URI-Based Dialing Enhancements

<td>The URI-Based Dialing Enhancements feature includes support for call routing on Cisco UBE when the user-part of the incoming Request-URI is non-E164 (for example, INVITE sip:<a href="mailto:user@abc.com">user@abc.com</a>). The following commands were introduced or modified: contact-passing, requiri-passing, session target sip-uri and voice-class sip requiri-passing</td>
</tr>
</tbody>
</table>

Information About URI-Based Dialing Enhancements

Cisco Unified Communications Manager (CUCM) supports dialing using directory Uniform Resource Identifiers (URIs) for call addressing. Directory URIs follow the username@host format where the host portion is an IPv4 address or a fully qualified domain name. A directory URI is a string of characters that can be used to identify a directory number. If that directory number is assigned to a phone, CUCM can route calls to that phone using the directory URI. URI dialing is available for Session Initiation Protocol (SIP) and Signaling Connection Control Part (SCCP) endpoints that support directory URIs.

The minimum supported release of Cisco IOS required for URI based call routing on dial-peers is Cisco IOS XE Gibraltar Release 16.12. You must configure the 'call-route-url' on the outgoing dial-peers to properly route the refer-to headers based on the URI matching.

The primary use of URI-based dialing is peer-to-peer calling between enterprises using complete URI addresses (that is, 'username@host'). The host part of the URI identifies the destination to which the call should be routed. In earlier Cisco Unified Border Element (Cisco UBE) URI routing, the URI was replaced in the SIP header with the destination server IP address. Then routing of calls was based on the following restrictions:

- The user part of the incoming Request-URI must be an E164 number.
- The outgoing Request-URI is always set to the session target information of the outbound dial peer.

The URI-Based Dialing Enhancements feature extends support for Cisco UBE URI-based routing of calls. With these enhancements Cisco UBE supports:

- URI-based routing when the user part of the incoming Request-URI is non-E164 (for example, INVITE sip:user@abc.com).
- URI-based routing when the user part is not present. The user part is an optional parameter in the URI (for example, INVITE sip:abc.com).
- Copying the outgoing Request-URI and To header from the inbound Request-URI and To header respectively.
- Deriving (optionally) the session target for the outbound dial peer from the host portion of the inbound URI.
• URI-based routing for 302, Refer, and Bye Also scenarios.
• Call hunting where the subsequent dial peer is selected based on URI.
• Pass through of 302, with the host part of Contact: unmodified.

Call Flows for URI-Based Dialing Enhancements

Case 1: URI dialing with username being E164 or non-E164 number and Request-URI host copied from the inbound leg.

Case 2: Incoming Request-URI does not contain user part. The To: header information is also copied from the peer leg when the requiri-passing command is enabled.

Case 3: The old behavior of setting the outbound Request-URI to session target is retained when the requiri-passing command is not enabled.

Case 4: The session target derived from the host part of the URI. The outgoing INVITE is sent to resolved IP address of the host part of the URI.
Case 5: Pass through of contact URI to request URI.

Case 6: In 302 pass-through, contact header can be passed through from one leg to another by using the contact-passing command.

Case 7: Pass through of refer-to URI to request URI.
How to Configure URI-Based Dialing Enhancements

Configuring Pass Through of SIP URI Headers

Perform these tasks to configure the pass through of the host part of the Request-Uniform Resource Identifier (URI) and To Session Initiation Protocol (SIP) headers. By default, Cisco Unified Border Element (Cisco UBE) sets the host part of the URI to the value configured under the session target of the outbound dial peer. For more information, see Case 1 in the “Call Flows for URI-based Dialing Enhancements” section.

Case 8: URI routing based on BYE Also header.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. sip
5. requri-passing
6. end

Configuring Pass Though of Request URI and To Header URI (Dial Peer Level)

SUMMARY STEPS

1. enable
2. configure terminal
3. voice class uri tag sip
4. host hostname-pattern
5. exit
6. dial-peer voice tag voip
7. session protocol sipv2
8. destination uri tag
9. session target ipv4:ip-address
10. voice-class sip requiri-passing [system]
11. end
### Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `enable`          | Enables privileged EXEC mode.  
  *Example:*  
  `Device> enable`  
  - Enter your password if prompted. |
| 2    | `configure terminal` | Enters global configuration mode.  
  *Example:*  
  `Device# configure terminal` |
| 3    | `voice class uri tag sip` | Creates a voice class for matching dial peers to a Session Initiation Protocol (SIP) and enters voice URI class configuration mode.  
  *Example:*  
  `Device(config)# voice class uri mydesturi sip` |
| 4    | `host hostname-pattern` | Matches a call based on the host field in a SIP Uniform Resource Identifier (URI).  
  *Example:*  
  `Device(config-voice-uri-class)# host example.com` |
| 5    | `exit` | Exits voice URI class configuration mode.  
  *Example:*  
  `Device(config-voice-uri-class)# exit` |
| 6    | `dial-peer voice tag voip` | Defines a VoIP dial peer and enters dial peer configuration mode.  
  *Example:*  
  `Device(config)# dial-peer voice 22 voip` |
| 7    | `session protocol sipv2` | Specifies a session protocol for calls between local and remote routers using the Internet Engineering Task Force (IETF) SIP.  
  *Example:*  
  `Device(config-dial-peer)# session protocol sipv2` |
| 8    | `destination uri tag` | Specifies the voice class used to match a dial peer to the destination URI of an outgoing call.  
  *Example:*  
  `Device(config)# destination uri mydesturi` |
| 9    | `session target ipv4:ip-address` | Designates a network-specific address to receive calls from a VoIP.  
  *Example:*  
  `Device(config-dial-peer)# session target ipv4:10.1.1.2` |
| 10   | `voice-class sip requiri-passing [system]` | Enables the pass through of SIP URI headers.  
  *Example:*  
  `Device(config-dial-peer)# voice-class sip requiri-passing system` |
### Configuring Pass Through of 302 Contact Header

#### Configuring Pass Through of 302 Contact Header (Global Level)

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`

</thead>
<tbody>
<tr>
<td>Device(conf-voi-serv)# allow-connections sip to sip</td>
<td>Defines a VoIP dial peer and enters dial peer configuration mode.</td>
</tr>
</tbody>
</table>

**Step 8**

dial-peer voice tag voip  
**Example:**  
Device(config)# dial-peer voice 200 voip

**Step 9**

session protocol sipv2  
**Example:**  
Device(config-dial-peer)# session protocol sipv2

**Step 10**

destination uri destination-tag  
**Example:**  
Device(config-dial-peer)# destination uri mydesturi

**Step 11**

voice-class sip contact-passing  
**Example:**  
Device(config-dial-peer)# voice-class sip contact-passing

**Step 12**

end  
**Example:**  
Device(config-dial-peer)# end

### Deriving of Session Target from URI

Perform this task to derive the session target from the host part of the Uniform Resource Identifier (URI). The outgoing INVITE is sent to the resolved IP address of the host part of the URI. For more information, see Case 4 in the "Call Flows for URI-Based Dialing Enhancements" section.

### SUMMARY STEPS

1. enable  
2. configure terminal  
3. voice class uri destination-tag sip  
4. host hostname-pattern  
5. exit  
6. dial-peer voice tag voip  
7. session protocol sipv2  
8. destination uri destination-tag  
9. session target sip-uri  
10. exit  
11. voice class uri source-tag sip  
12. host hostname-pattern
13. end

### Configuration Examples for URI-Based Dialing Enhancements

#### Example: Configuring Pass Though of Request URI and To Header URI

#### Example: Configuring Pass Though of Request URI and To Header URI (Global Level)

```
Device> enable
Device# configure terminal
Device(config)# voice service voip
Device(conf-voi-serv)# sip
Device(conf-serv-sip)# requiri-passing
Device(conf-serv-sip)# end
```

#### Example: Configuring Pass Though of Request URI and To Header URI (Dial Peer Level)

```
! Configuring URI voice class destination
Device(config)# voice class uri mydesturi sip
Device(config-voice-uri-class)# host xyz.com
Device(config-voice-uri-class)# exit

! Configuring outbound dial peer
Device(config)# dial-peer voice 13 voip
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# destination uri mydesturi
Device(config-dial-peer)# session target ipv4:10.1.1.1
Device(config-dial-peer)# voice-class sip requiri-passing system
Device(config-dial-peer)# end
```
Example: Configuring Pass Through of 302 Contact Header

Example: Configuring Pass Through of 302 Contact Header (Global Level)

```
Device> enable
Device# configure terminal
Device(config)# voice service voip
Device(config-voip)# sip
Device(config-serv-sip)# contact-passing
Device(config-serv-sip)# end
```

Example: Configuring Pass Through of 302 Contact Header (Dial Peer Level)

```
! Configuring URI voice class destination
Device> enable
Device# configure terminal
Device(config)# voice class uri mydesturi sip
Device(config-voice-uri-class)# user-id 5678
Device(config-voice-uri-class)# exit

! Configuring outbound dial peer
Device(config)# voice service voip
Device(config-voip)# allow-connections sip to sip
Device(config-voip)# dial-peer voice 200 voip
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# destination uri mydesturi
Device(config-dial-peer)# voice-class sip contact-passing
Device(config-dial-peer)# end
```

Example: Deriving Session Target from URI

```
Device> enable
Device# configure terminal
Device(config)# voice class uri mydesturi sip
Device(config-voice-uri-class)# host destination.com
Device(config-voice-uri-class)# exit

Device(config)# dial-peer voice 25 voip
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# destination uri mydesturi
Device(config-dial-peer)# session target sip-uri
Device(config-dial-peer)# exit

Device(config)# voice class uri mysourceuri sip
Device(config-voice-uri-class)# host abc.com
Device(config-voice-uri-class)# end
```

Multiple Pattern Support on a Voice Dial Peer

The Multiple Pattern Support on a Voice Dial Peer feature enables you to configure multiple patterns on a VoIP dial peer using an E.164 pattern map. A dial peer can be configured to match multiple patterns to an incoming calling or called number or an outgoing destination number.

- Feature Information for Multiple Pattern Support on a Voice Dial Peer, on page 277
- Restrictions for Multiple Pattern Support on a Voice Dial Peer, on page 278
- Information About Multiple Pattern Support on a Voice Dial Peer, on page 278
- Configuring Multiple Pattern Support on a Voice Dial Peer, on page 278

Feature Information for Multiple Pattern Support on a Voice Dial Peer

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<tr>
<td>Configuring Multiple Pattern Support on a Voice Dial Peer (Outbound Calls)</td>
<td>Cisco IOS 15.2(4)M Cisco IOS XE 3.7S</td>
<td>This feature allows you to add more than one E.164 destination pattern inside a pattern map and configure that pattern map for one or more VoIP dial peers. This feature is supported for outbound peers only. The following commands were introduced or modified: <code>destination e164-pattern-map</code>, <code>e164</code>, <code>show voice class e164-pattern-map</code>, <code>url</code>, <code>voice class e164-pattern-map</code>, <code>load</code>, <code>voice class e164-pattern-map</code>.</td>
</tr>
</tbody>
</table>

**Restrictions for Multiple Pattern Support on a Voice Dial Peer**

- This feature is supported only on a VoIP dial peer.
- Duplicate patterns cannot be added to a pattern map.

**Information About Multiple Pattern Support on a Voice Dial Peer**

Matching an incoming or outgoing call using a pattern defined in a VoIP dial peer is an existing feature on the Cisco Unified Border Element (Enterprise) and Session Initiation Protocol (SIP) Gateway. You can now support multiple patterns on a VoIP dial peer using an E.164 pattern map. You can create a E.164 pattern map and then link it to one or more VoIP dial peers.

When a pattern is the only source to enable a dial peer, a valid E.164 pattern map enables the linked dial peers, whereas an invalid E.164 pattern map disables the linked dial peers. Additionally, whenever an E.164 pattern map is created or reloaded, one or more dial peers linked with an E.164 pattern map is enabled or disabled based on the validation of a pattern map.

You can match a pattern map to an incoming calling or called number or an outgoing destination number. When a dial peer has multiple patterns, the pattern with the longest prefix is considered as the matching criteria.

**Configuring Multiple Pattern Support on a Voice Dial Peer**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice class e164-pattern-map  pattern-map-id
4. Do one of the following:
   • e164  pattern-map-tag
   • url url
5. (Optional) description string
6. exit
7. dial-peer voice  dial-peer-id  voip
8. {destination | incoming called | incoming calling}  e164-pattern-map  pattern-map-group-id
9. end
10. (Optional) voice class e164-pattern-map load  pattern-map-group-id
11. show dial-peer voice  [summary |  dial-peer-id]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td>Enters privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>• Enter your password if prompted.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td>Enters global configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>voice class e164-pattern-map  pattern-map-id</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# voice class e164-pattern-map 1111</td>
</tr>
<tr>
<td>Creates a pattern map for configuring one or multiple E.164 patterns on a dial peer and enters voice class configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Do one of the following:</td>
</tr>
<tr>
<td>• e164  pattern-map-tag</td>
<td></td>
</tr>
<tr>
<td>• url url</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Using URL text file:</td>
</tr>
<tr>
<td></td>
<td>Device(voice-class)# url <a href="http://http-host/config-files/pattern-map.cfg">http://http-host/config-files/pattern-map.cfg</a></td>
</tr>
<tr>
<td>Directly specifying match patterns:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(voice-class)# e164 5557123</td>
</tr>
<tr>
<td>Configure one or more E.164 telephone number prefix match patterns for the pattern map.</td>
<td></td>
</tr>
<tr>
<td>• Repeat this step for each pattern if you are using the e164 command.</td>
<td></td>
</tr>
<tr>
<td>• You can specify a file URL containing the patterns for this dial peer using the url url command. You must then load the E.164 telephone prefixes using Step 10. The file can be internal (on the device) or external.</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 5** | (Optional) **description** *string*  
Example:  
Device(voice-class)# *description* It has 1 entry |
| | Provides a description for the pattern map. |
| **Step 6** | **exit**  
Example:  
Device(voice-class)# *exit* |
| | Exits voice class configuration mode and enters global configuration mode. |
| **Step 7** | **dial-peer voice** *dial-peer-id* *voip*  
Example:  
Device(config)# *dial-peer voice 2222 voip* |
| | Defines a VoIP dial peer and enters dial peer configuration mode. |
| **Step 8** | {*destination | incoming called | incoming calling}*  
*e164-pattern-map* *pattern-map-group-id*  
Example:  
Device(config-dial-peer)# *incoming calling e164-pattern-map 1111* |
| | Links a pattern-map group with a dial peer.  
- Use the *destination* keyword for outbound dial peers.  
- Use the *incoming called* or *incoming calling* keywords for inbound dial peers using called or calling numbers. |
| **Step 9** | **end**  
Example:  
Device(config-dial-peer)# *end* |
| | Exits dial peer configuration mode and enters privileged EXEC mode. |
| **Step 10** | (Optional) **voice class** *e164-pattern-map load*  
*pattern-map-group-id*  
Example:  
Device# *voice class e164-pattern-map load 1111* |
| | Loads the specified pattern map with E.164 match patterns from a text file configured in the pattern map.  
- This step is required only if patterns have been defined for the specified pattern map using a file URL in Step 4. |
| **Step 11** | **show dial-peer voice** [*summary* | *dial-peer-id*]  
Example:  
Device# *show dial-peer voice 1111* |
| | Displays the status of a pattern map when the pattern map is associated with a dial peer. |

**Verifying Multiple Pattern Support on a Voice Dial Peer**

**SUMMARY STEPS**

1. **show voice class e164-pattern-map** [*summary* | *pattern-map-id*]  
2. **show dial-peer voice** [*summary* | *dial-peer-id*]
3.  show dialplan incall {sip | h323} {calling | called} e164-pattern

**DETAILED STEPS**

**Step 1**  
show voice class e164-pattern-map [summary | pattern-map-id]  
Displays the status and contents of a specified pattern map or a status summary of all pattern maps.

**Example:**
Device# show voice class e164-pattern-map 200

```
e164-pattern-map 200
-----------------------
It has 1 entries
It is not populated from a file.
Map is valid.
E164 pattern
-----------
200
```

**Step 2**  
show dial-peer voice [summary | dial-peer-id]  
Displays the status of pattern maps associated with all or a specified dial peer.

**Example:**
Device# show dial-peer voice | include e164-pattern-map

```
ingoing calling e164-pattern-map tag = `200' status = valid,
destination e164-pattern-map tag = 3000 status = valid,
```

Device# show dial-peer voice 2222 | include e164-pattern-map

```
ingoing calling e164-pattern-map tag = `200' status = valid,
```

**Step 3**  
show dialplan incall {sip | h323} {calling | called} e164-pattern  
Displays inbound dial peer details and associated pattern maps based on an incoming calling or called number.

**Example:**
Device# show dialplan incall voip calling 23456

```
VoiceOverIpPeer1234567  
peer type = voice, system default peer = FALSE, information type = voice,  
description = '',  
tag = 1234567, destination-pattern = '',  
destination e164-pattern-map tag = 200 status = valid,  
destination dpg tag = 200 status = valid,  
voice reg type = 0, corresponding tag = 0,  
allow watch = FALSE  
answer-address = '', preference=0,  
ingoing calling e164-pattern-map tag = `200' status = valid,  
CLID Restriction = None
```

Configuration Examples for Multiple Pattern Support on a Voice Dial Peer

**Example: Configuring Multiple Patterns for Outbound Dial Peers Using a File URL**

```
Device# voice class e164-pattern-map 1111
Device(voice-class)# url http://http-host/config-files/pattern-map.cfg
Device(voice-class)# description For Outbound Dial Peer
Device(voice-class)# exit
Device(config)# dial-peer voice 2222 voip
Device(voice-dial-peer)# destination e164-pattern-map 1111
Device(voice-dial-peer)# exit
Device(config)# voice class e164-pattern-map load 1111
Device(config)# end
```

**Example: Configuring Multiple Patterns for Outbound Dial Peers by Specifying Each E164 Pattern**

```
Device# voice class e164-pattern-map 1112
Device(voice-class)# e164 5557456
Device(voice-class)# e164 5557455
Device(voice-class)# e164 5557454
Device(voice-class)# e164 5557453
Device(voice-class)# e164 5557452
Device(voice-class)# description For Outbound Dial Peer
Device(voice-class)# exit
Device(config)# dial-peer voice 2222 voip
Device(config)# destination e164-pattern-map 1112
Device(config)# end
```

**Example: Configuring Multiple Patterns for Inbound Dial Peer**

```
Device# voice class e164-pattern-map 1113
Device(voice-class)# url http://http-host/config-files/pattern-map.cfg
Device(voice-class)# description For Inbound Dial Peer
Device(voice-class)# exit
Device(config)# dial-peer voice 2222 voip
Device(config)# incoming calling e164-pattern-map 1113
Device(config)# exit
Device(config)# voice class e164-pattern-map load 1113
Device(config)# end
```
CHAPTER 21

Outbound Dial-Peer Group as an Inbound Dial-Peer Destination

This feature can group multiple outbound dial peers into a dial-peer group and configure this dial-peer group as the destination of an inbound dial peer.

- Feature Information for Outbound Dial-Peer Group as an Inbound Dial-Peer Destination, on page 283
- Restrictions, on page 284
- Information About Outbound Dial-Peer Group as an Inbound Dial-Peer Destination, on page 284
- Configuring Outbound Dial-Peer Group as an Inbound Dial-Peer Destination, on page 285
- Verifying Outbound Dial-Peer Groups as an Inbound Dial-Peer Destination, on page 287
- Troubleshooting Tips, on page 288
- Configuration Examples for Outbound Dial Peer Group as an Inbound Dial-Peer Destination, on page 289

Feature Information for Outbound Dial-Peer Group as an Inbound Dial-Peer Destination

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 37: Feature Information for Outbound Dial-Peer Group as an Inbound Dial-Peer Destination

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support for POTS dial-peer</td>
<td>Cisco IOS 15.5(1)T</td>
<td>An outgoing POTS dial peer can be part of a dial-peer group. An inbound POTS dial peer can have a dial-peer group as the destination.</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS XE 3.14S</td>
<td></td>
</tr>
</tbody>
</table>
### Feature Information

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outbound Dial-Peer Group as an Inbound Dial-Peer Destination</td>
<td>Cisco IOS 15.4(1)T</td>
<td>This feature groups multiple outbound dial-peers into a dial-peer group and configures this dial-peer group as a destination of an inbound dial peer.</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS XE 3.11S</td>
<td>The following commands were introduced or modified: voice class dpg, description, dial-peer preference, destination dpg, show voice class dpg.</td>
</tr>
</tbody>
</table>

### Restrictions

- If a dial-peer group is in the shutdown state, regular dial-peer search occurs.
- If all dial peers in an active dial-peer group are unavailable, call is disconnected.
- The number of matched digits is zero.
- The **destination-pattern** command is required on the outbound dial peer even matching is not done based on this command.
- The outgoing call setup is deferred until inter-digit timer expires or a terminator is entered.

For POTS dial peers:

- Two-stage dialing is not supported.
- Overlapping dialing is not supported.
- TCL and VXML routing changes are not supported.
- Digit-stripping is not supported.

### Information About Outbound Dial-Peer Group as an Inbound Dial-Peer Destination

You can group up to 20 outbound (H.323, SIP or POTS) dial peers into a dial-peer group and configure this dial-peer group as the destination of an inbound dial peer. Once an incoming call is matched by an inbound dial peer with an active destination dial-peer group, dial peers from this group are used to route the incoming call. No other outbound dial-peer provisioning to select outbound dial peers is used.

A preference can be defined for each dial peer in a dial-peer group. This preference is used to decide the order of selection of dial peers from the group for the setup of an outgoing call.

You can also specify various dial-peer hunt mechanism using the existing **dial-peer hunt** command.
Configuring Outbound Dial-Peer Group as an Inbound Dial-Peer Destination

Perform this task to configure a dial-peer group with multiple outbound peers and an inbound dial peer referencing this dial-peer group as a destination.

Before you begin

- Configure SIP, H.323 or POTS outbound dial peers to be associated with a dial-peer group.
- For an outbound POTS dial peer, ensure that destination-pattern .T and no digit-strip are configured to avoid unexpected dialed digit strip.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dial-peer voice outbound-dial-peer-id [voip | pots]
4. destination-pattern pattern
5. no digit-strip for POTS dial peers.
6. exit
7. (Optional) dial-peer hunt hunt-order-number
8. voice class dpg dial-peer-group-id
9. dial-peer outbound-dial-peer-id [preference preference-order]
10. (Optional) description string
11. exit
12. dial-peer voice inbound-dial-peer-id [voip | pots]
13. destination dpg dial-peer-group-id
14. end

</table>
| For VoIP dial peer:  
Device(config)# dial-peer voice 123 voip |  |
| **Example:**  
For POTS dial peer:  
Device(config)# dial-peer voice 345 pots |  |
| **Step 4**  
**destination-pattern** `pattern` | Configures a destination pattern. This step is required even though the value is not used for dial-peer matching.  
**Example:**  
For VoIP Dial Peers  
Device(config-dial-peer)# destination-pattern 1004  
For POTS Dial Peers  
Device(config-dial-peer)# destination-pattern .T |
| **Step 5**  
**no digit-strip** for POTS dial peers.  
**Example:**  
Device(config-dial-peer)# no digit-strip | Disable unexpected dialed digit strip. |
| **Step 6**  
**exit**  
**Example:**  
Device(config-dial-peer)# exit | Exits to global configuration mode. |
| **Step 7**  
(Optional) **dial-peer hunt** `hunt-order-number`  
**Example:**  
Device(config)# dial-peer hunt 0 | Specifies a hunt selection mechanism for dial peers.  
• The default mechanism is random selection. |
| **Step 8**  
**voice class dpg** `dial-peer-group-id`  
**Example:**  
Device(config)# voice class dpg 181 | Creates a dial-peer group for grouping multiple outbound dial peers and enters voice class configuration mode.  
• You can use the **shutdown** command to resume regular outbound dial-peer provisioning in dial-peers with this dial-peer group as destination. |
| **Step 9**  
**dial-peer outbound-dial-peer-id** `[preference`  
`preference-order]`  
**Example:**  
Device(config-class)# dial-peer 123 preference 1 | Associates a configured outbound dial peer with this dial-peer group and configures a preference value.  
• Repeat this step for all outbound dial-peers that need to be added to this dial-peer group. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• If preference is not specified, the order of selection is random or as specified by the <strong>dial-peer hunt</strong> command.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 10** (Optional) **description** *string*

**Example:**
```
Device(config-class)# description Boston Destination
```

Provides a description for the dial-peer group.

**Step 11** **exit**

**Example:**
```
Device(config-class)# exit
```

Exits voice class configuration mode and enters global configuration mode.

**Step 12** **dial-peer voice** *inbound-dial-peer-id* [voip | pots]

**Example:**
For VoIP dial peer:
```
Device(config)# dial-peer voice 789 voip
```

For POTS dial peer:
```
Device(config)# dial-peer voice 678 pots
```

Defines a dial peer and enters dial peer configuration mode.

**Step 13** **destination dpg** *dial-peer-group-id*

**Example:**
```
Device(config-dial-peer)# destination dpg 181
```

Specifies a dial peer group from which an outbound dial peer can be chosen.

**Step 14** **end**

**Example:**
```
Device(config-dial-peer)# end
```

Exits dial peer configuration mode and enters privileged EXEC mode.

---

**Verifying Outbound Dial-Peer Groups as an Inbound Dial-Peer Destination**

**SUMMARY STEPS**

1. **show voice class dpg** *dial-peer-group-id*
2. **show dial-peer voice** *inbound-dial-peer-id*
DETAILED STEPS

Step 1  
**show voice class dpg dial-peer-group-id**  
Displays the configuration of an outbound dial-peer group.  
**Example:**  
Device# show voice class dpg 200

Voice class dpg: 200  
AdminStatus: Up  
Description: Boston Destination  
Total dial-peer entries: 4

<table>
<thead>
<tr>
<th>Peer Tag</th>
<th>Pref</th>
</tr>
</thead>
<tbody>
<tr>
<td>1001</td>
<td>1</td>
</tr>
<tr>
<td>1002</td>
<td>2</td>
</tr>
<tr>
<td>1004</td>
<td>0</td>
</tr>
<tr>
<td>1003</td>
<td>1</td>
</tr>
</tbody>
</table>

-------------------------------------

Step 2  
**show dial-peer voice inbound-dial-peer-id**  
Displays the referencing of destination dial-peer group from an inbound dial peer.  
**Example:**  
Device# show dial-peer voice 100 | include destination dpg

destination dpg tag = 200 status = valid,

Troubleshooting Tips

SUMMARY STEPS

1. Enter the following:  
   - debug voip dialpeer inout  
   - debug voip ccapi inout

DETAILED STEPS

Enter the following:  
   - debug voip dialpeer inout  
   - debug voip ccapi inout

Displays the configuration of an outbound dial-peer group.  
**Example:**
Incoming dial peer is first matched:

```
Jul 19 10:15:53.310 IST: //-/ED647BD1B0F9/DPM/dpMatchPeertype:exit@6602

Verifying Inbound Dial-Peer Referencing Outbound Dial-Peer Group

Device# `show dial-peer voice 100 | include destination dpg`

    destination dpg tag = 200 status = valid,

Device# `show dial-peer voice 600 | include destination dpg`

    destination dpg tag = 200 status = valid,
Configuration Examples for Outbound Dial Peer Group as an Inbound Dial-Peer Destination
CHAPTER 22

Inbound Leg Headers for Outbound Dial-Peer Matching

The Inbound Leg Headers for Outbound Dial-Peer Matching feature allows you to match and provision an outbound dial peer for an outbound call leg using the headers from an inbound call leg. The following headers of an incoming call leg can be used for outbound dial-peer matching:

- VIA (SIP Header)
- FROM (SIP Header)
- TO (SIP Header)
- DIVERSION (SIP Header)
- REFERRED BY (SIP Header)
- Called Number
- Calling Number
- Carrier ID

- Feature Information for Inbound Leg Headers for Outbound Dial-Peer Matching, on page 293
- Prerequisites for Inbound Leg Headers for Outbound Dial-Peer Matching, on page 294
- Restrictions for Inbound Leg Headers for Outbound Dial-Peer Matching, on page 294
- Information About Inbound Leg Headers for Outbound Dial-Peer Matching, on page 294
- Configuring Inbound Leg Headers for Outbound Dial-Peer Matching, on page 295
- Verifying Inbound Leg Headers for Outbound Dial-Peer Matching, on page 298
- Configuration Example: Inbound Leg Headers for Outbound Dial-Peer Matching, on page 300

Feature Information for Inbound Leg Headers for Outbound Dial-Peer Matching

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
### Prerequisites for Inbound Leg Headers for Outbound Dial-Peer Matching

- CUBE or Voice Gateway must be configured.

### Restrictions for Inbound Leg Headers for Outbound Dial-Peer Matching

- The existing **header-passing** command supports modification of SIP headers of INVITE message by the Tool Command Language (TCL) application. If the above SIP headers are modified by the TCL application, they cannot be used for outbound dial-peer provisioning.

- If multiple SIP via headers and diversion headers are found in an incoming INVITE or REFER message, only the top-most via header and top-most diversion header of an incoming INVITE or REFER message are used for outbound dial-peer provisioning.

- When an incoming call is matched to an inbound dial peer with an associated provision profile without rules, outbound dial-peer provisioning is disabled and the incoming call is disconnected by CUBE or voice gateway with cause code "unassigned number (1)".

### Information About Inbound Leg Headers for Outbound Dial-Peer Matching

This feature allows you to match headers of an inbound call leg and provision an outbound dial peer for an outbound call leg. The following SIP headers of an incoming call leg can be used for outbound dial-peer matching

- VIA (SIP Header)

---

**Table 38: Feature Information for Inbound Leg Headers for Outbound Dial-Peer Matching**

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inbound Leg Headers for Outbound Dial-Peer Matching</td>
<td>15.4(2)T, Cisco IOS XE Release 3.12S</td>
<td>The Inbound Leg Headers for Outbound Dial-Peer Matching feature allows you to match and provision an outbound call leg using the headers of an inbound call leg. The following commands were introduced by this feature: destination provision-policy, destination uri-via, destination uri-to, destination uri-from, destination uri-diversion, destination uri-referred-by. show voice class dial-peer provision-policy. The following commands were modified. show command incall, show dialplan dialpeer.</td>
</tr>
</tbody>
</table>
The above headers are retrieved from an incoming INVITE or REFER message and used for outbound dial-peer provisioning.

SIP headers of an INVITE message are saved to an associated call leg. For example, an INVITE message is received for a new call leg A. Then, SIP headers are saved to call leg A itself for outbound dial-peer lookup.

On the other hand, SIP headers of a REFER message are saved to the peer call leg of the associated call leg. For example, call leg A and call leg B are connected in CUBE. The party at Call Leg B makes a blind transfer to the party at Call Leg C. A REFER message is received in CUBE for call leg B (transferor). But, SIP headers of the REFER message are saved under call leg A (transferee) for an outbound dial-peer lookup for Party C.

### Configuring Inbound Leg Headers for Outbound Dial-Peer Matching

#### Before you begin

Necessary pattern maps have been configured.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. voice class dial-peer provision-policy `tag`
4. (Optional) description `string`
5. preference `preference-order first-attribute second-attribute`
6. exit
7. dial-peer voice `inbound-dial-peer-tag voip`
8. destination provision-policy `tag`
9. exit
10. dial-peer voice `outbound-dial-peer-tag voip`
11. Configure a match command for an outbound dial peer according to the provision policy rule attribute configured.
12. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enters privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Device&gt; enable</strong></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Step 2**

**configure terminal**  
Example:

```
Device# configure terminal
```

**Step 3**

**voice class dial-peer provision-policy tag**  
Example:

```
Device(config)# voice class dial-peer provision-policy 200
```

Creates a provision policy profile in which a set of attributes for dial-peer matching can be defined.  
- You can use the `shutdown` command to deactivate the provision policy and allow normal outbound dial-peer provisioning.

**Step 4**

(Optional) **description string**  
Example:

```
Device(voice-class)# description match both calling and called
```

Provides a description for the provision policy profile.

**Step 5**

**preference preference-order first-attribute second-attribute**  

<table>
<thead>
<tr>
<th>First Attribute</th>
<th>Second Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>diversion</td>
<td>from, referred-by, to, uri, via</td>
</tr>
<tr>
<td>from</td>
<td>diversion, referred-by, to, uri, via</td>
</tr>
<tr>
<td>referred-by</td>
<td>diversion, from, to, uri, via</td>
</tr>
<tr>
<td>to</td>
<td>diversion, referred-by, from, uri, via</td>
</tr>
<tr>
<td>uri</td>
<td>diversion, referred-by, to, from, via, carrier-id</td>
</tr>
<tr>
<td>via</td>
<td>diversion, referred-by, to, uri, via</td>
</tr>
<tr>
<td>called</td>
<td>calling, carrier-id</td>
</tr>
<tr>
<td>calling</td>
<td>called</td>
</tr>
<tr>
<td>carrier-id</td>
<td>called, uri</td>
</tr>
</tbody>
</table>

Example:

```
Device(voice-class)# preference 2 calling called
```

Configures a provision policy rule.  
- You can configure up to two rules. This means up to four attributes can be configured for matching outbound dial peers.  
- If rules are not configured, outbound dial-peer provisioning is disabled, and an incoming call matched to an inbound dial peer associated with this profile is disconnected by CUBE or voice gateway with cause code “unassigned number (1)”.

**Step 6**

**exit**  
Example:

```
Device(voice-class)# exit
```

Exits voice class configuration mode and enters global configuration mode.
### Purpose

**Command or Action**

**Step 7**

`dial-peer voice inbound-dial-peer-tag voip`

Enters dial peer configuration mode for an inbound dial peer.

**Step 8**

`destination provision-policy tag`

Example:

```
Device(config)# dial-peer voice 100 voip
Device(config-dial-peer)# destination provision-policy 200
Device(config)# exit
```

Associates a provision policy profile with an inbound dial peer.

**Step 9**

`exit`

Exits dial peer configuration mode.

**Step 10**

`dial-peer voice outbound-dial-peer-tag voip`

Enters dial peer configuration mode for an outbound dial peer.

**Step 11**

Configure a match command for an outbound dial peer according to the provision policy rule attribute configured.

Configure a match command based on any of the four attributes defined in the provision policy rule.

### Provision Policy Rule Attribute

<table>
<thead>
<tr>
<th>Provision Policy Rule Attribute</th>
<th>Dial-peer Match command</th>
</tr>
</thead>
<tbody>
<tr>
<td>called</td>
<td>destination-pattern pattern</td>
</tr>
<tr>
<td></td>
<td>destination e164-pattern-map pattern-map-class-id</td>
</tr>
<tr>
<td>calling</td>
<td>destination calling e164-pattern-map pattern-map-class-id</td>
</tr>
<tr>
<td>carrier-id</td>
<td>carrier-id target</td>
</tr>
<tr>
<td>uri</td>
<td>destination uri uri-class-tag</td>
</tr>
<tr>
<td>via</td>
<td>destination uri-via uri-class-tag</td>
</tr>
<tr>
<td>to</td>
<td>destination uri-to uri-class-tag</td>
</tr>
<tr>
<td>from</td>
<td>destination uri-from uri-class-tag</td>
</tr>
<tr>
<td>diversion</td>
<td>destination uri-diversion uri-class-tag</td>
</tr>
<tr>
<td>referred-by</td>
<td>destination uri-referred-by uri-class-tag</td>
</tr>
</tbody>
</table>

Example:

```
Device(config)# dial-peer voice 300 voip
Device(config-dial-peer)# destination uri-from 200
Device(config)# exit
```

**Step 12**

`end`

Example:

Exits dial peer configuration mode and enters privileged EXEC mode.
Verifying Inbound Leg Headers for Outbound Dial-Peer Matching

SUMMARY STEPS

1. `show dialplan incall {sip | h323} {calling | called} e164-pattern | include voice`
2. `show dialplan dialpeer inbound-dial-peer-id number e164-pattern | timeout | include Voice`
3. `show voice class dial-peer provision-policy`

DETAILED STEPS

Step 1

`show dialplan incall {sip | h323} {calling | called} e164-pattern | include voice`

Displays inbound dial peers based on an incoming calling or called number. Once you have the dial peer number, you can use it to search for the complete dial-peer details in the running-config.

Example:

Device# `show dialplan incall sip calling 3333 | include Voice`
VoiceOverIpPeer1

Device# `show dialplan incall sip calling 4444 | include Voice`
VoiceOverIpPeer1

Device# `show running-config | section dial-peer voice 1 voip`

dial-peer voice 1 voip
destination dpg 10000
incoming calling e164-pattern-map 100
dtmf-relay rtp-nte
codec g711ulaw

Device# `show dialplan incall sip called 6000 timeout | include Voice`
VoiceOverIpPeer100

Device# `show running-config | section dial-peer voice 100 voip`

dial-peer voice 100 voip
incoming called e164-pattern-map 1
incoming calling e164-pattern-map 1
dtmf-relay rtp-nte
codec g711ulaw

Device# `show dialplan incall voip calling 23456`
VoiceOverIpPeer1234567
peer type = voice, system default peer = FALSE, information type = voice,
description = '',
tag = 1234567, destination-pattern = '',
destination e164-pattern-map tag = 200 status = valid,
Step 2  

show dialplan dialpeer inbound-dial-peer-id number e164-pattern [timeout] | include Voice

Displays a list of outbound dial peers based on a specified inbound dial peer. This command line will be helpful find a list of outbound dial peer of a destination dial-peer group.

Example:

Device# show dialplan dialpeer 1 number 23457 timeout | include Voice

VoiceOverIpPeer100013
VoiceOverIpPeer100012

Example:

voice class dial-peer provision-policy 2000
  preference 2 diversion to
  
  ...  
  
  dial-peer voice 32555 voip
  session protocol sipv2
  session target ipv4:1.5.14.9
  destination uri-diversion 1
  destination uri-to test2
  
  dial-peer voice 32991 voip
  destination provision-policy 2000
  incoming called-number 1234
  
Device# show dialplan dialpeer 32991 number 2234 timeout

Macro Exp.: 2234
Enter Diversion header:sip:1234@cisco.com
Enter To header:sip:2234@10.0.0.0
VoiceOverIpPeer32134
  peer type = voice, system default peer = FALSE, information type = voice,
  description = "",

Step 3  

show voice class dial-peer provision-policy

Displays a list of configured provision policies and associated rules.

Example:

Device# show voice class dial-peer provision-policy

Voice class dial-peer provision-policy: 100  AdminStatus: Up
Description: match only called

  Pref  Policy Rule
  ----  ----------
  1  called

Voice class dial-peer provision-policy: 101  AdminStatus: Up
Description: match both calling and called

  Pref  Policy Rule
Configuration Example: Inbound Leg Headers for Outbound Dial-Peer Matching

Example: Configuring Inbound Called or Calling Numbers Used for Outbound Dial-Peer Matching

Device> enable
Device# configure terminal

Device(config)# voice class dial-peer provision-policy 200
Device(voice-class)# description match both calling and called
Device(voice-class)# preference 2 calling called
Device(voice-class)# exit

Device(config)# voice class e164-pattern-map 300
Device(voice-class)# description patterns
Device(voice-class)# e164 5557123
Device(voice-class)# e164 5558123
Device(voice-class)# e164 5559123
Device(voice-class)# exit

!Associating the Provision Policy with an Inbound Dial Peer
Device(config)# dial-peer voice 100 voip
Device(config-dial-peer)# destination provision-policy 200
Device(config-dial-peer)# end

!Associates a Pattern Map with an Outbound Dial Peer.
! The called number in the SIP headers of the inbound leg is matched to select the below
outbound dial peer.
Device(config)# dial-peer voice 200 voip
Device(config-dial-peer)# destination e164-pattern-map 300
Device(config-dial-peer)# end

Example: Configuring Inbound SIP Headers for Outbound Dial-Peer Matching

Device> enable
Device# configure terminal

Device(config)# voice class dial-peer provision-policy 200
Device(voice-class)# description match both calling and called
Device(voice-class)# preference 2 via from
Device(voice-class)# exit

!Associating the Provision Policy with an Inbound Dial Peer
Device(config)# dial-peer voice 100 voip
Device(config-dial-peer)# destination provision-policy 200
Device(config-dial-peer)# end

Device(config)# voice class uri 200 sip
Device(config-voice-uri-clas)# pattern 25054..

!Associates a Provision Policy with an Outbound Dial Peer.
The FROM SIP headers of the inbound leg is matched to select the below outbound dial peer.
Device(config)# dial-peer voice 200 voip
Device(config-dial-peer)# destination uri-from 200
Device(config-dial-peer)# end
Configuration Example: Inbound Leg Headers for Outbound Dial-Peer Matching
CHAPTER 23

Server Groups in Outbound Dial Peers

This feature configures a server group (group of server addresses) that can be referenced from an outbound dial peer.

- Feature Information for Configuring Server Groups in Outbound Dial Peers, on page 303
- Information About Server Groups in Outbound Dial Peers, on page 304
- How to Configure Server Groups in Outbound Dial Peers, on page 304
- Configuration Examples for Server Groups in Outbound Dial Peers, on page 307

Feature Information for Configuring Server Groups in Outbound Dial Peers

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

<tbody>
<tr>
<td>Configuring Server Groups in Outbound Dial Peers</td>
<td>Cisco IOS XE Release 3.11S</td>
<td>This feature configures server groups (groups of IPv4 and IPv6 addresses) which can be referenced from an outbound SIP dial peer. The following commands were introduced or modified: <strong>voice class server-group</strong>, <strong>description</strong>, <strong>ipv4 port preference</strong>, <strong>ipv6 port preference</strong>, <strong>hunt-scheme</strong>, <strong>show voice class server-group</strong>, <strong>shutdown (Server Group)</strong>.</td>
</tr>
<tr>
<td></td>
<td>15.4(1)T</td>
<td></td>
</tr>
</tbody>
</table>
Information About Server Groups in Outbound Dial Peers

You can now group IPv4 and IPv6 addresses of servers and configure it as in an outbound SIP dial-peer destination. A server group is first created and associated with a SIP outbound dial peer. When a call matches an outbound dial peer, a connection is made to one of the servers of the group, which can then route the call to the destination.

You can associate a preference with each of the servers in the group, which decides the order of selection for outgoing call setup.

You can also configure the round-robin selection of servers in the group.

You can configure up to five servers per server group.

If neither round robin nor preference order is configured, the selection of servers is random.

If the specified server-group is in shutdown mode, the referenced dial peers are not selected to route outgoing calls.

---

**Note**

If the configured IP address in a server group is unreachable, you receive an error message. If you receive an error message with code 404, 500, or 503, hunting for the next destination IP address is supported in destination server groups. However, for a destination server group that is configured in a dial-peer, hunting for the next destination IP address is not supported if you receive an error message with code 480, 486, or 600. As a workaround, it is recommended that you configure dial-peer with preference (Hunt Groups) instead of server groups.

---

How to Configure Server Groups in Outbound Dial Peers

Configuring Server Groups in Outbound Dial Peers

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `voice class server-group  server-group-id`
4. `{ipv4 | ipv6} address [port] [preference preference-order]`
5. (Optional) `hunt-scheme round-robin`
6. (Optional) `description string`
7. `exit`
8. `dial-peer voice  dial-peer-id  voip`
9. `session protocol sipv2`
10. `destination-pattern  [+] string [T]`
11. `session server-group  server-group-id`
12. `end`
13. `show voice class server-group  server-group-id`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Example: Device&gt; <code>enable</code></td>
<td>Enters privileged EXEC mode. • Enter your password if prompted.</td>
</tr>
</tbody>

### Verifying Server Groups in Outbound Dial Peers

**SUMMARY STEPS**

1. `show voice class server-group [server-group-id]`
2. `show voice class server-group dialpeer dial-peer-id`

**DETAILED STEPS**

**Step 1**

`show voice class server-group [server-group-id]`

Displays the configurations for all configured server groups or a specified server group.

**Example:**

```plaintext
Device# show voice class server-group 171
```
Device# show voice class server-group 171

Voice class server-group: 171
AdminStatus: Up  OperStatus: Up
Hunt-Scheme: preference  Last returned server: 10.1.1.1
Description:
Total server entries: 3

<table>
<thead>
<tr>
<th>Pref</th>
<th>Type</th>
<th>IP Address</th>
<th>IP Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ipv4</td>
<td>10.1.1.1</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>ipv4</td>
<td>10.1.1.2</td>
<td>34515</td>
</tr>
<tr>
<td>3</td>
<td>ipv4</td>
<td>2001:DB8:12:1::26</td>
<td></td>
</tr>
</tbody>
</table>

-------------------------------------

Step 2  
show voice class server-group dialpeer dial-peer-id

Displays the configurations for dial peers associated with server groups.

Example:
Device# show voice class server-group dialpeer 181

Voice class server-group: 171  AdminStatus: Up
Hunt-Scheme: round-robin
Total Remote Targets: 3

<table>
<thead>
<tr>
<th>Pref</th>
<th>Type</th>
<th>IP Address</th>
<th>IP Port</th>

Configuration Examples for Server Groups in Outbound Dial Peers
CHAPTER 24

Domain-Based Routing Support on the Cisco UBE

First Published: June 15, 2011
Last Updated: July 22, 2011

The Domain-based routing feature provides support for matching an outbound dial peer based on the domain name or IP address provided in the request URI of the incoming SIP message or an inbound dial peer.

Domain-based routing enables for calls to be routed on the outbound dialpeer based on the domain name or IP address provided in the request Uniform Resource Identifier (URI) of incoming Session IP message.

- Feature Information for Domain-Based Routing Support on the Cisco UBE, on page 311
- Restrictions for Domain-Based Routing Support on the Cisco UBE, on page 312
- Information About Domain-Based Routing Support on the Cisco UBE, on page 312
- How to Configure Domain-Based Routing Support on the Cisco UBE, on page 313
- Configuration Examples for Domain-Based Routing Support on the Cisco UBE, on page 318

Feature Information for Domain-Based Routing Support on the Cisco UBE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn . An account on Cisco.com is not required.

Restrictions for Domain-Based Routing Support on the Cisco UBE

Domain-based routing support is available only for SIP-SIP call flows.

Information About Domain-Based Routing Support on the Cisco UBE

When a dial peer has an application configured as a session application, then only the user parameter of the request URI is used and is sent from the inbound SIP SPI to the application. The session application performs a match on an outbound dial peer based on the user parameter of the request URI sent from the inbound dial peer. In the figure below, 567 is the user portion of the request-URI that is passed from the inbound dial peer to the application and the matching outbound dial-peer found is 1000.
With the introduction of the domain-based routing feature, all parameters including the domain name of the request URI will be sent to the application and the outbound dial peer can be matched with any parameter. In Figure 1, when the domain name example.com is used to match an outbound dial peer the resulting dial peer is 2000. The `call route url` command is used for configuring domain-based routing.

**Note**
Whenever using the `call route url` command, apply translation rule at outbound dial-peer not in to call-route url.

### How to Configure Domain-Based Routing Support on the Cisco UBE

#### Configuring Domain-Based Routing at Global Level

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. sip
5. call-route url
6. exit
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>

</thead>
</table>
| **Step 2** | configure terminal | Enters global configuration mode.  
*Example:*  
Device# configure terminal  
| **Step 3** | dial-peer voice dial-peer tag voip | Enter dial peer voice configuration mode.  
*Example:*  
Device(config)# dial-peer voice 2 voip  
| **Step 4** | voice-class sip call-route url |  
*Example:*  
Device(config-dial-peer)#  
*Example:*  
Routes calls based on the URL  
| **Step 5** | exit | Exits the current mode.  
*Example:*  
Device(config-dial-peer)# exit  

---

### Verifying and Troubleshooting Domain-Based Routing Support on the Cisco UBE

#### SUMMARY STEPS

1. enable  
2. debug ccsip all  
3. debug voip dialpeer inout

#### DETAILED STEPS

##### Step 1

**enable**  
Enables privileged EXEC mode.  
*Example:*  
Device> enable

##### Step 2

**debug ccsip all**  
Enables all SIP-related debugging.  
*Example:*  
Device# debug ccsip all  
Received:  
Via: SIP/2.0/UDP [2208:1:1:1:1:1:1:1115]:5060;branch=z9hG4bK83AE3  
SIP Call
\[s=SIP\text{ Call}\]
\[c=IN\text{ IP6 2208:1:1:1:1:1:1:1116}\]
\[t=0\]
\[m=image 17278 udptl t38\]
\[c=IN\text{ IP6 2208:1:1:1:1:1:1:1116}\]
\[a=T38FaxVersion:0\]
\[a=T38MaxBitRate:14400\]
\[a=T38FaxFillBitRemoval:0\]
\[a=T38FaxTranscodingMMR:0\]
\[a=T38FaxTranscodingJBIG:0\]
\[a=T38FaxRateManagement:transferredTCF\]
\[a=T38FaxMaxBuffer:200\]
\[a=T38FaxMaxDatagram:320\]
\[a=T38FaxUdpEc: t38UDPRedundancy”\]

Step 3  debug voip dialpeer inout

The debug ccsip all and debug voip dialpeer inout commands can be entered in any order and any of the commands can be used for debugging depending on the requirement.

Example:

Displays information about the voice dial peers

Device# debug voip dialpeer inout

voip dialpeer inout debugging is on

The following event shows the calling and called numbers:

Example:

*May 1 19:32:11.731: /-1/6372E2598012/DPM/dpAssociateIncomingPeerCore:  
Calling Number=4085550111, Called Number=3600, Voice-Interface=0x0,  
Timeout=TRUE, Peer Encap Type=ENCAP_VOIP, Peer Search Type=PEER_TYPE_VOICE,  
Peer Info Type=DIALPEER_INFO_SPEECH

The following event shows the incoming dial peer:

Example:

*May 1 19:32:11.731: /-1/6372E2598012/DPM/dpAssociateIncomingPeerCore:  
Result=Success(0) after DP_MATCH_INCOMING_DNIS; Incoming Dial-peer=100
*May 1 19:32:11.731: /-1/6372E2598012/DPM/dpAssociateIncomingPeerCore:  
Calling Number=4085550111, Called Number=3600, Voice-Interface=0x0,  
Timeout=TRUE, Peer Encap Type=ENCAP_VOIP, Peer Search Type=PEER_TYPE_VOICE,  
Peer Info Type=DIALPEER_INFO_SPEECH
*May 1 19:32:11.731: /-1/6372E2598012/DPM/dpAssociateIncomingPeerCore:  
Result=Success(0) after DP_MATCH_INCOMING_DNIS; Incoming Dial-peer=100
*May 1 19:32:11.735: /-1/6372E2598012/DPM/dpMatchPeersCore:  
Calling Number-, Called Number=3600, Peer Info Type=DIALPEER_INFO_SPEECH
*May 1 19:32:11.735: /-1/6372E2598012/DPM/dpMatchPeersCore:  
Match Rule=DP_MATCH_DEST; Called Number=3600
*May 1 19:32:11.735: /-1/6372E2598012/DPM/dpMatchPeersCore:  
Result=Success(0) after DP_MATCH_DEST
*May 1 19:32:11.735: /-1/6372E2598012/DPM/dpMatchPeersMoreArg:  
Result=SUCCESS(0)

The following event shows the matched dial peers in the order of priority:

Example:

List of Matched Outgoing Dial-peer(s):
Configuration Examples for Domain-Based Routing Support on the Cisco UBE

Example Configuring Domain-Based Routing Support on the Cisco UBE

The following example shows how to enable domain-based routing support on the Cisco UBE:

```
Device> enable
Device# configure terminal
Device(config)# voice service voip
Device(conf-voi-serv)# sip
Device(conf-serv-sip)# call-route url
Device(conf-serv-sip)# exit
Device(config)# dial-peer voice 2 voip
Device(config-dial-peer)# voice-class sip call-route url
Device(config-dial-peer)# exit
```
Chapter 25

ENUM Enhancement per Kaplan Draft RFC

The Cisco Unified Border Element (CUBE) facilitates the mapping of E.164 called numbers to Session Initiation Protocol (SIP) Uniform Resource Identifiers (URIs). The SIP ENUM technology allows the traditional telephony part of the network (using E.164 numbering to address destinations) to interwork with the SIP telephony part of the network, generally using SIP URLs. From the Public Switched Telephone Network (PSTN) network, if an end user dials an E.164 called party, the number can be translated by an ENUM gateway into the corresponding SIP URI. This SIP URI is then used to look up the Domain Name System (DNS) Naming Authority Pointer (NAPTR) Resource Records (RR). The NAPTR RR (as defined in RFC 2915) describes how the call should be forwarded or terminated and records information, such as email addresses, a fax number, a personal website, a VoIP number, mobile telephone numbers, voice mail systems, IP-telephony addresses, and web pages. Alternately, when the calling party is a VoIP endpoint and dials an E.164 number, then the originator’s SIP user agent (UA) converts it into a SIP URI to be used to look up at the ENUM gateway DNS and fetch the NAPTR RR.

The ENUM enhancement per Kaplan draft RFC provides source-based routing, that is, SIP-to-SIP calls can be routed based on the source SIP requests. To provide source-based routing and to interact with the Policy Server, an EDNS0 OPT pseudo resource record with source URI, incoming SIP call ID, outbound SIP call ID, and Call Session Identification are added to the ENUM DNS query, according to draft-kaplan-enum-sip-routing-04. The incoming SIP call ID, outbound SIP call ID, and Call Session Identification are automatically included with an EDNS0 OPT pseudo resource record in the ENUM DNS query only if “source-uri no-cache” is enabled and XCC service is registered. This feature also provides the flexibility to disable route caching.

- Feature Information for ENUM Enhancement per Kaplan Draft RFC, on page 319
- Restrictions for ENUM Enhancement per Kaplan Draft RFC, on page 320
- Information About ENUM Enhancement per Kaplan Draft RFC, on page 321
- How to Configure ENUM Enhancement per Kaplan Draft RFC, on page 321
- Troubleshooting Tips, on page 324
- Configuration Examples for ENUM Enhancement per Kaplan Draft RFC, on page 324

Feature Information for ENUM Enhancement per Kaplan Draft RFC

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
Restrictions for ENUM Enhancement per Kaplan Draft RFC

- Supported only for SIP-to-SIP calls.
- The full command of `voice enum-match-table`, including the options, needs to be specified whenever being referenced by its subcommand. If not, the defaults, `no source-uri` and `no no-cached` (or caching) will take effect.
- As the maximum number of characters of the host shown in the `show host` command is 25, the source URI may not be displayed completely.
- The source URI is displayed in a separate line below, starting with “source-uri="”. Refer to the `show` command outputs in this chapter.
- If `no-cache` is configured in the `voice enum-match-table`, no cache table look-up would be made and hence an ENUM query would be made regardless of what is in the cache table.
- Both the target and source, where the source can be null/undefined or defined, need to be matched when looking up the cache table.
- The OPT RR will be added to the query for a SIP-to-SIP call only if the `source-uri` is configured for the outbound `enum-match-table`.
- The route will not be cached if the server does not support the OPT RR (it is recommended to remove the `source-uri` for this scenario if caching is preferred).
- The source URL can be prefixed with a host/target in the host name field in a double quote in the `show host host` command to display routes for the host specific with this source.
- A wildcard, “*”, can be used to denote “all” hosts in the `show host` command. It can be by itself or any host matched with its prefix. The prefix can be a host name, partial or complete, or a domain name with partial or complete source URL.
Information About ENUM Enhancement per Kaplan Draft RFC

SIP-to-SIP calls can be routed based on the source SIP requests, using the ENUM enhancement feature. To provide source-based routing and to interact with Policy Server, an EDNS0 OPT pseudo resource record with source URI, incoming SIP call ID, outbound SIP call ID, and Call session Identification are added to the ENUM DNS query. The DNS server filters its response based on the source URI and call ID information and returns the appropriate NAPTR entries. To enable this feature, you must use the `source-uri` option in the `voice enum-match-table <table-number>` command. In addition, you can use the `no-cache` option to disable caching.

Refer to RFC 3761 and `draft-kaplan-enum-sip-routing-04` for more information about routing SIP requests with ENUM.

How to Configure ENUM Enhancement per Kaplan Draft RFC

Enabling Source-Based Routing

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice enum-match-table match-table-index [source-uri] [no-cache]
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>

</table>

Verifying the ENUM Request

The following **show** commands can be used to verify the operation of the test command. If the **no-cache** option is enabled, the **show host** command does not display the enum entry. Some sample outputs of the **show** command are shown below. The **show** commands can be entered in any order.

**SUMMARY STEPS**

1. **show host** `*`                                                                                                                                                       
2. **show host** `1.0.9.3.e164-test*`                                                                                                                                 
3. **show host** `1*`

_Dial Peer Enhancements_ | _Cisco Unified Border Element Configuration Guide_
4. show host "1.0.9.3.e164-test sip*"

**DETAILED STEPS**

**Step 1**
show host *

Example:

```
Device# show host *

<table>
<thead>
<tr>
<th>Host</th>
<th>Port</th>
<th>Flags</th>
<th>Age</th>
<th>Type</th>
<th>Address(es)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ns.el64-test</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1.0.9.3.e164-test sip:540 NA</td>
<td>(temp, OK)</td>
<td>0</td>
<td>IP</td>
<td>127.0.0.1</td>
<td></td>
</tr>
<tr>
<td>Source-uri</td>
<td>&quot;sip:5403@1.4.65.5&quot;</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```

**Step 2**
show host 1.0.9.3.e164-test*

Example:

```
Device# show host 1.0.9.3.e164-test* 

<table>
<thead>
<tr>
<th>Host</th>
<th>Port</th>
<th>Flags</th>
<th>Age</th>
<th>Type</th>
<th>Address(es)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0.9.3.e164-test sip:540 NA</td>
<td>(temp, OK)</td>
<td>0</td>
<td>NAPTR</td>
<td>0 0 U sip+E2U /*$/sip:3901@10.1.18.28/</td>
<td></td>
</tr>
<tr>
<td>Source-uri</td>
<td>&quot;sip:5403@1.4.65.5&quot;</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```

**Step 3**
show host 1*

Example:

```
Device# show host 1* 

<table>
<thead>
<tr>
<th>Host</th>
<th>Port</th>
<th>Flags</th>
<th>Age</th>
<th>Type</th>
<th>Address(es)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0.9.3.e164-test sip:540 NA</td>
<td>(temp, OK)</td>
<td>0</td>
<td>NAPTR</td>
<td>0 0 U sip+E2U /*$/sip:3901@10.1.18.28/</td>
<td></td>
</tr>
<tr>
<td>Source-uri</td>
<td>&quot;sip:5403@1.4.65.5&quot;</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```

**Step 4**
show host "1.0.9.3.e164-test sip*"

Example:

```
Device# show host "1.0.9.3.e164-test sip*" 

<table>
<thead>
<tr>
<th>Host</th>
<th>Port</th>
<th>Flags</th>
<th>Age</th>
<th>Type</th>
<th>Address(es)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ns.el64-test</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1.0.9.3.e164-test sip:540 NA</td>
<td>(temp, OK)</td>
<td>0</td>
<td>NAPTR</td>
<td>0 0 U sip+E2U /*$/sip:3901@10.1.18.28/</td>
<td></td>
</tr>
<tr>
<td>Source-uri</td>
<td>&quot;sip:5403@1.4.65.5&quot;</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```

Cisco Unified Border Element Configuration Guide
Troubleshooting Tips

Use the following commands for debugging information:

- `debug voip enum detail`
- `debug ip domain`
- `debug ccsip message`
- `debug voip ccapi inout`
- `clear voip fpi session correlator-id`—This command is used to clear the hung FPI sessions. After the hung session is identified using the existing `show` commands and its correlator is obtained, the `clear voip fpi session correlator-id` command can be used to clear the session.

Use the following `show` command that is helpful for debugging:

- `show host [all | * | host-name | partial-host-name]`

Below is an extract of a sample ENUM DNS query containing the EDNS0 OPT pseudo resource record fields as per Kaplan Draft that is helpful in debugging. In the below query the values corresponding to ibcall-id, obcall-id, and sbc-id represent the incoming SIP call ID, outbound SIP call ID and Call Session Identification respectively.

```
7.7.7.7.1.1.e164.arpa sip:1116666@10.1.50.16enum_dns_query: name = 7.7.7.7.1.1.e164.arpa sip:1116666@10.1.50.16 type = 35, ns_server = 0x0 no_cache 1 more_data; ibcall-id=1-23735@10.1.50.16; obcall-id=7190DF-39DD11E4-8008EDAD-F1AA3CF1010.1.110.222; sbc-id=1
```

Configuration Examples for ENUM Enhancement per Kaplan Draft RFC

```
voice enum-match-table 1 source-uri //The source URI is sent to the DNS server to filter the route. //
  description enable source-uri
  rule 2 1 /\(^\(.*\)\)$/ /\1/ e164.arpa

voice enum-match-table 2 source-uri no-cache
rule 1 1 /\(^\(.*\)\)$/ /\1/ e164-test

voice enum-match-table 3 no-cache //The cache table is not looked up and the route is not cached. //
  rule 1 1 /\(^\(.*\)\)$/ /\1/ e164-test

The following is a sample configuration for the ENUM enhancement feature:

dial-peer voice 1 voip
description ENUM Inbound dialpeer
session protocol sipv2
  incoming called-number 1116666

dial-peer voice 2 voip
```
description ENUM Outbound dialpeer
destination-pattern 1117777
session protocol sipv2
session target enum:1 //Session target configured to look up ENUM table 1.//
PART III

Multi-Tenancy

- Support for Multi-VRF, on page 329
- Configuring Multi-Tenants on SIP Trunks, on page 369
Support for Multi-VRF

The Virtual Routing and Forwarding (VRF) feature allows Cisco Unified Border Element (CUBE) to have multiple instances of routing and forwarding table to co-exist on the same device at the same time.

With Multi-VRF feature, each interface or subinterface can be associated with a unique VRF.

Note

The information in this chapter is specific to Multi-VRF feature beginning in Cisco IOS Release 15.6(2)T. However, there is some information on Voice-VRF feature for the reference purpose only. For detailed information on the Voice-VRF feature, see http://www.cisco.com/c/en/us/td/docs/ios/12_4t/12_4t15/vrfawvgw.html.

Feature Information for VRF

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

**Table 42: Feature Information for VRF**

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support for Voice-VRF (VRF-Aware)</td>
<td>Cisco IOS 12.4(11)XJ</td>
<td>This feature provides support to configure a VRF specific to voice traffic.</td>
</tr>
<tr>
<td>Support for Multi-VRF</td>
<td>Cisco IOS 15.6(2)T</td>
<td>This feature allows CUBE to have multiple instances of VRF to co-exist on the same device at the same time. The following commands are introduced: <code>media-address voice-vrf name port-range min-max, show voice vrf</code></td>
</tr>
<tr>
<td>Enhancement to support up to 54 VRF instances</td>
<td>Cisco IOS 15.6(3)M Cisco IOS XE Denali 16.3.1</td>
<td>This feature enhancement provides support for up to 54 VRFs. Each of the VRFs supports up to 10 different RTP port ranges.</td>
</tr>
<tr>
<td>Support for Inbound Dial-peer Matching using VRF-ID</td>

### Feature Information

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Support for media flow-around using Multi-VRF | Cisco IOS XE Gibraltar 16.12.2 | This feature adds media flow-around support for the following intra-VRF call flows in standalone and high availability scenarios:  
  - Basic Audio Call  
  - Call Hold and Resume  
  - Re-INVITE based Call Transfer  
  - 302 based Call Forward  
  - Fax Pass Through Calls  
  - T.38 Fax Calls  
  
  With media flow-around using Multi-VRF, only signalling is routed using VRFs and Cisco UBE passes across the media IP and ports which it receives. For detailed information on media flow-around, see Media Path. |

### Information About Voice-VRF

Support for Voice-VRF (also known as VRF-Aware) was introduced in Cisco IOS Release 12.4(11)XJ to provide support for configuring a VRF specific to voice traffic. Voice-VRF can be configured using `voice vrf vrf-name` command. For more information on voice-VRF, see [http://www.cisco.com/c/en/us/td/docs/ios/12_4t/12_4t15/vrfawvgw.html](http://www.cisco.com/c/en/us/td/docs/ios/12_4t/12_4t15/vrfawvgw.html).

### Information About Multi-VRF

The Multi-VRF feature allows you to configure and maintain more than one instance of routing and forwarding tables within the same CUBE device and segregate voice traffic based on the VRF.

Multi-VRF uses input interfaces to distinguish calls for different VRFs and forms VRF tables by associating with one or more Layer 3 interfaces. Interface can be physical interface (such as FastEthernet ports, Gigabit Ethernet ports) or sub-interface. CUBE supports bridging calls on both intra-VRF and inter-VRF.

---

**Note**

One physical interface or sub-interface can be associated with one VRF only. One VRF can be associated with multiple interfaces.
As per the Multi-VRF feature, the dial-peer configuration must include the use of the interface bind functionality. This is mandatory. It allows dial-peers to be mapped to a VRF via the interface bind.

The calls received on a dial-peer are processed based on the interface to which it is associated with. The interface is in turn associated with the VRF. So, the calls are processed based on the VRF table associated with that particular interface.

VRF Preference Order

Voice-VRF and Multi-VRF configurations can co-exist. The following is the binding preference order for call processing:

Table 43: VRF Preference Order and Recommendations

<table>
<thead>
<tr>
<th>Preference Order</th>
<th>Bind</th>
<th>Recommendations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Dial-peer Bind</td>
<td>—</td>
</tr>
<tr>
<td>2</td>
<td>Tenant Bind</td>
<td>Recommended for SIP trunk, especially when Cisco UBE is collocated with Cisco Unified Survivability Remote Site Telephony. If Tenant bind is not configured, Voice-VRF is preferred for SIP trunk.</td>
</tr>
<tr>
<td>3</td>
<td>Global Bind</td>
<td>Not recommended.</td>
</tr>
<tr>
<td>4</td>
<td>Voice-VRF</td>
<td>Recommended for hosted and cloud services configurations when Cisco UBE is collocated with Cisco Unified Survivability Remote Site Telephony.</td>
</tr>
</tbody>
</table>

Note: Voice-VRF is not supported if Cisco Unified Survivability Remote Site Telephony is running on Cisco 4000 Series Integrated Services Router.

Restrictions

- Supports only SIP-SIP calls.
- Cisco Unified Communications Manager Express (Unified CME) and CUBE co-located with VRF is not supported.
- Cisco Unified Survivability Remote Site Telephony (Unified SRST) and CUBE co-location is not supported on releases before Cisco IOS XE Fuji 16.7.1.
- IPv6 on VRF is not supported.
- SDP pass-through is not supported on releases before Cisco IOS Release 15.6(3)M and Cisco IOS XE Denali 16.3.1.
• Calls are not supported when incoming dial-peer matched is default dial-peer (dial-peer 0).
• Media Anti-trombone is not supported with VRF.
• Cisco UC Services API with VRF is not supported.
• Multi-VRF is not supported on TDM-SIP gateway.
• VRF aware matching is applicable only for inbound dial-peer matching and not for outbound dial-peer matching.
• Invoking TCL scripts through a dial-peer is not supported with the Multi-VRF.
• Multi-VRF using global routing table or default routing table (VRF 0) with virtual interfaces is not supported on ISR-G2 (2900 and 3900 series) routers.
• SCCP-based media resources are not supported with VRF.
• Multi-VRF configured in media flow-around mode is supported only for intra-VRF calls. The following are not supported with Multi-VRF configured in media flow-around mode:
  • Supplementary services with REFER Consume, Mid-call (or Early Dialogue) block
  • Session Description Protocol (SDP) Passthrough
  • Media Recording
  • DSP flows (DTMF, transcoding)

Recommendations

• For new deployments, we recommend a reboot of the router once all VRFs are configured under interfaces.
• No VRF Route leaks are required on CUBE to bridge VoIP calls across different VRFs.
• High Availability (HA) with VRF is supported where VRF IDs are check-pointed in the event of fail-over. Ensure that same VRF configuration exists in both the HA boxes.
• Whenever destination server group is used with VRF, ensure that the server group should have the session targets, belonging to the same network as that of sip bind on the dial-peer, where the server-group is configured. This is because, dial-peer bind is mandatory with VRF and only one sip bind can be configured on any given dial-peer.
• If there are no VRF configuration changes at interface level, then reload of the router is not required.

Configuring VRF

Note We recommend you NOT to modify VRF settings on the interfaces in a live network as it requires CUBE reload to resume VRF functionality.
This section provides the generic configuration steps for creating a VRF. For detailed configuration steps specific to your network scenario (Multi-VRF and Multi-VRF with HA), refer to Configuration Examples section.

You can also use the latest configuration option, which allows creation of multiprotocol VRFs that support both IPv4 and IPv6. Entering the command `vrf definition vrf-name` creates the multiprotocol VRF. Under VRF definition submode, you can use the command `address-family {ipv4 | ipv6}` to specify appropriate address family. To associate the VRF with an interface, use the command `vrf forwarding vrf-name` under the interface configuration submode.

For more information about the `vrf definition` and `vrf forwarding` commands, refer to the Cisco IOS Easy Virtual Network Command Reference Guide.

---

### Create a VRF

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip vrf vrf-name
4. rd route-distinguisher
5. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode  
  * Enter your password if prompted. |
| Example: Device> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example: Device(config)# configure terminal | |
| **Step 3** ip vrf vrf-name | Creates a VRF with the specified name. In the example, VRF name is VRF1.  
  **Note** Space is not allowed in VRF name. |
| Example: Device(config)# ip vrf VRF1 | |
| **Step 4** rd route-distinguisher | Creates a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y) |
| Example: Device(config)# rd 1:1 | |
| **Step 5** exit | Exits present mode. |
| Example: Device(config)# exit | |
Assign Interface to VRF

If an IP address is already assigned to an interface, then associating a VRF with interface will disable the interface and remove the existing IP address. An error message (sample error message shown below) is displayed on the console. Assign the IP address to proceed further.

% Interface GigabitEthernet0/1 IPv4 disabled and address(es) removed due to enabling VRF VRF1

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-name
4. ip vrf forwarding vrf-name
5. ip address ip address subnet mask
6. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<tr>
<td>Device(config)# interface GigabitEthernet 0/1</td>
<td></td>
</tr>
<tr>
<td>Step 4 ip vrf forwarding vrf-name</td>
<td>Associates VRF with the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# ip vrf forwarding VRF1</td>
<td></td>
</tr>
<tr>
<td>Step 5 ip address ip address subnet mask</td>
<td>IP address is assigned to the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# ip address 10.0.0.1 255.255.255.0</td>
<td></td>
</tr>
<tr>
<td>Step 6 exit</td>
<td>Exits present mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Create Dial-peers

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice number voip
4. session protocol protocol
5. Create dial-peer:
   • To create inbound dial-peer:
     incoming called number number
   • To create outbound dial-peer:
     destination pattern number
6. codec codec-name
7. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 dial-peer voice number voip</td>
<td>Creates the dial-peer with the specified number.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# dial-peer voice 1111</td>
<td></td>
</tr>
<tr>
<td>voip</td>
<td></td>
</tr>
<tr>
<td>Step 4 session protocol protocol</td>
<td>Specifies the protocol associated with the dial-peer.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-dial-peer)# session protocol sipv2</td>
<td></td>
</tr>
<tr>
<td>Step 5 Create dial-peer:</td>
<td>Creates inbound and outbound dial-peer.</td>
</tr>
<tr>
<td>• To create inbound dial-peer:</td>
<td></td>
</tr>
<tr>
<td>incoming called number number</td>
<td></td>
</tr>
</tbody>
</table>
## Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>To create outbound dial-peer:</td>
</tr>
<tr>
<td><strong>destination pattern number</strong></td>
</tr>
</tbody>
</table>

**Example:**
Inbound dial-peer:
Device(config-dial-peer)# **incoming called-number 1111**

**Example:**
Outbound dial-peer:
Device(config-dial-peer)# **destination pattern 3333**

**Step 6**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>codec codec-name</strong></td>
<td>Specifies the codec associated with this dial-peer.</td>
</tr>
</tbody>
</table>

**Example:**
Device(config-dial-peer)# **codec g711ulaw**

**Step 7**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>exit</strong></td>
<td>Exits present mode.</td>
</tr>
</tbody>
</table>

**Example:**
Device(config-dial-peer)# **exit**

## Bind Dial-peers

You can configure SIP binding at global level as well as at dial-peer level.

- Control and Media on a dial-peer have to bind with same VRF. Else, while configuring, the CLI parser will display an error

- Whenever global sip bind interface associated with a VRF is added, modified, or removed, you should restart the sip services under 'voice service voip > sip' mode so that the change in global sip bind comes into effect with associated VRF ID.

```
CUBE(config)# voice service voip
CUBE(conf-voi-serv)# sip
CUBE(conf-serv-sip)# call service stop
CUBE(conf-serv-sip)# no call service stop
CUBE(conf-serv-sip)# end
```

## SUMMARY STEPS

1. enable
2. configure terminal
3. Bind control and media to the interface
   - At dial-peer level:
     **dial-peer voice number voip**
voice-class sip bind control source-interface interface-name
voice-class sip bind media source-interface interface-name
• At global configuration level
voice service voip
sip
bind control source-interface interface-name
bind media source-interface interface-name

4. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>

<tr>
<td>bind control source-interface interface-name</td>
<td></td>
<td></td>
</tr>
<tr>
<td>bind media source-interface interface-name</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example:

At dial-peer level:

Device(config)#dial-peer voice 1111 voip
Device(config-dial-peer)# voice-class sip bind control source-interface GigabitEthernet0/1
Device(config-dial-peer)# voice-class sip bind
Configure VRF Specific RTP Port Ranges

You can configure each VRF to have its own set of RTP port range for VoIP RTP connections under voice service voip. A maximum of ten VRF port ranges are supported. Different VRFs can have overlapping RTP port range. VRF based RTP port range limits (min, max port numbers) are same as global RTP port range. All three port ranges (global, media-address, VRF based) can coexist on CUBE and the preference order of RTP port allocation is as follows:

- VRF based port range
- Media-address based port range
- Global RTP port range

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. media-address voice-vrf vrf-name port-range min max
5. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

Example:

```markdown
Device> enable
```

---

**Configure VRF Specific RTP Port Ranges**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>media</td>
<td></td>
</tr>
<tr>
<td>source-interface</td>
<td></td>
</tr>
<tr>
<td>GigabitEthernet0/1</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

At global configuration level:

```markdown
Device(config)# voice service voip
Device(conf-voi-serv)# sip
Device(conf-voi-sip)# bind control source-interface GigabitEthernet0/1
Device(conf-voi-sip)# bind media source-interface GigabitEthernet0/1
```

**Step 4 exit**

**Example:**

```markdown
Device(config-dial-peer)# exit
```

Exits present mode.

Example: VRF with overlapping and non-overlapping RTP Port Range

Example 1 - Non-overlapping Port Range

The following is example shows two VRFs with non-overlapping RTP port range:

```
Device (conf) # voice service voip
Device (conf-voi-serv) # no ip address trusted authenticate
Device (conf-voi-serv) # media bulk-stats
Device (conf-voi-serv) # media-address voice-vrf vrf1 port-range 25000 28000
Device (conf-voi-serv) # media-address voice-vrf vrf2 port-range 29000 32000
Device (conf-voi-serv) # allow-connections sip to sip
Device (conf-voi-serv) # redundancy-group 1
Device (conf-voi-serv) # sip
```

The output for command `show voip rtp connections` shows as follows:

```
Device# show voip rtp connections
VoIP RTP Port Usage Information:
Max Ports Available: 23001, Ports Reserved: 101, Ports in Use: 2

<table>
<thead>
<tr>
<th>Ports</th>
<th>Min</th>
<th>Max</th>
<th>Media-Address Range</th>
<th>Available</th>
<th>Reserved</th>
<th>In-use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Media Pool</td>
<td>8000</td>
<td>48198 19999</td>
<td>101</td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>VRF ID Based Media Pool</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>vrf1</td>
<td>25000</td>
<td>28000</td>
<td>1501</td>
<td>0</td>
<td>1</td>

<td>11.0.0.1</td>
<td>11.0.0.2</td>
<td>NO</td>
<td>vrf2</td>
</tr>
</tbody>
</table>

Found 2 active RTP connections
```

In the above output, you can observe that for both the VRF's having non-overlapping rtp port ranges, the local RTP port allocated for vrf1 and vrf2 are different.

Example 2 - Overlapping Port Range

The following is example shows two VRFs with overlapping RTP port range:
Device(conf)# voice service voip
Device(conf-voi-serv)# no ip address trusted authenticate
Device(conf-voi-serv)# media bulk-stats
Device(conf-voi-serv)# media-address voice-vrf vrf1 port-range 25000 28000
Device(conf-voi-serv)# media-address voice-vrf vrf2 port-range 25000 28000
Device(conf-voi-serv)# allow-connections sip to sip
Device(conf-voi-serv)# redundancy-group 1
Device(conf-voi-serv)# sip

The output for command show voip rtp connections shows as follows:

Device# show voip rtp connections

VoIP RTP Port Usage Information:

<td>vrf2</td>
</tr>
</tbody>
</table>

Found 2 active RTP connections

In the above output, you can observe that for both the VRF’s having overlapping rtp port ranges, the local RTP port allocated for vrf1 and vrf2 is same.

Directory Number (DN) Overlap across Multiple-VRFs

CUBE has the capability to bridge calls across VRFs without the need for route leaks to be configured.

If multiple dial-peers on two different VRFs have the same destination-pattern and preference, CUBE will randomly choose a dial-peer and route the call using the session target of the selected dial-peer. Due to this, the call intended for one VRF may be routed to another VRF.

Dial-peer group feature allows you to route calls within the same VRF and not across VRFs. Configuring dial-peer group, routes the call to a specific VRF even if multiple dial-peers on two different VRFs have the same destination-pattern and preference.

To use dial-peer group feature, configure dial-peers such that there is a unique inbound dial-peer match for calls related to each VRF. Configuring dial-peer group, limits the outbound dial-peer search within the VRF.
Example: Associating Dial-peer Groups to Overcome DN Overlap

If a call is received on VRF1 and there are two dial-peers with same destination-pattern (one dial-peer bind to VRF1 and second dial-peer bind to VRF2), then by default, CUBE picks the VRF in random to route the call.

If you intended to route this call only to VRF1 dial-peer, then dial-peer group can be applied on inbound dial-peer which will restrict the CUBE to route the call only across the dial-peers within the dial-peer group and not pick a dial-peer bind to a different VRF.

The following scenario is considered in the below example:

- VRF1 associated with Gigabitethernt Interface 0/0 and 0/1
- VRF 2 associated with Gigabitethernet Inetface 0/2
- Dial-peer Group: dpg1
- VRF1 is associated with dial-peer group - dpg 1
- Outbound dial-peer 300 is selected as preference 1
- Inbound dial-peer 3000 associated with VRF 1 and dial-peer group 1 (dpg1)
- Outbound Dial-peer: 300 – destination pattern “3001” associated with VRF1
- Outbound dial-peer: 301 – destination pattern “3001” associated with VRF2

Configure a dial-peer group and set the outbound dial-peer preference.

```
Device# enable
Device# configure terminal
Device(config)# voice class dpg 1
Device(voice-class)# dial-peer 300 preference 1
```

Create inbound dial-peer and associated with dial-peer group 1 (dpg1)

```
Device(config)# dial-peer voice 3000 voip
Device(config-dial-peer)# video codec h264
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# session transport udp
Device(config-dial-peer)# destination dpg 1
Device(config-dial-peer)# incoming called-number 3001
Device(config-dial-peer)# voice-class sip bind control source-interface GigabitEthernet0/1
```
Device(config-dial-peer)# voice-class sip bind media source-interface GigabitEthernet0/1
Device(config-dial-peer)# dtmf-relay sip-kpml
Device(config-dial-peer)# srtp fallback
Device(config-dial-peer)# codec g711ulaw

Creating outbound dial-peer with destination pattern ‘3001’ associated with VRF1.

Device(config)# dial-peer voice 300 voip
Device(config)# destination-pattern 3001
Device(config)# video codec h264
Device(config)# session protocol sipv2
Device(config)# session target ipv4:10.0.0.1
Device(config)# voice-class sip bind control source-interface GigabitEthernet0/1
Device(config)# voice-class sip bind media source-interface GigabitEthernet0/1
Device(config)# dtmf-relay sip-kpml
Device(config)# codec g711ulaw

Creating outbound dial-peer with destination pattern ‘3001’ associated with VRF2.

Device(config)# dial-peer voice 301 voip
Device(config)# destination-pattern 3001
Device(config)# video codec h264
Device(config)# session protocol sipv2
Device(config)# session target ipv4:11.0.0.1
Device(config)# voice-class sip bind control source-interface GigabitEthernet0/2
Device(config)# voice-class sip bind media source-interface GigabitEthernet0/2
Device(config)# dtmf-relay sip-kpml
Device(config)# codec g711ulaw

With above dial-peer group configuration, whenever dial-peer “3000” is matched as inbound dial-peer, CUBE will always route call using dial-peer “300” (VRF1). Without dial-peer group, CUBE would have picked dial-peers “300”(VRF1) and “301”(VRF2) in random to route the call.

Device# show vrf brief
Name      Default RD Protocols Interfaces

300      voip up 3001 0 syst ipv4:10.0.0.1
301      voip up 3001 0 syst ipv4:11.0.0.1

IP Overlap with VRF

Generally, on a router, two interfaces cannot be configured with the same IP address. With the VRF feature, you can configure two or more interfaces with the same IP address because, each interface having the same IP address belongs to a unique VRF and hence belongs to a different routing domain. However, for successful call processing, you must ensure that appropriate call routing protocols are configured on the VRFs.
The following is a sample configuration:

Configure Gigabit Ethernet 0/0 that belongs to VRF1 with IP address 10.0.0.0.

```
Device# enable
Device# configure terminal
Device(config)# ip vrf VRF1
Device(config)# rd 1:1
Device(config)# exit
```

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet0/0
Device(config-if)# ip vrf forwarding VRF1
Device(config-if)# ip address 10.0.0.0 255.255.255.0
Device(config-if)# speed auto
Device(config-if)# exit
```

Configure Gigabit Ethernet 0/1 that belongs to VRF2 with IP address 10.0.0.0.

```
Device# enable
Device# configure terminal
Device(config)# ip vrf VRF2
Device(config)# rd 1:1
Device(config)# exit
```

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet0/1
Device(config-if)# ip vrf forwarding VRF2
Device(config-if)# ip address 10.0.0.0 255.255.255.0
Device(config-if)# speed auto
Device(config-if)# exit
```

For call routing on VRF1 and VRF2, ensure that appropriate routing entries are configured for both VRF1 and VRF2.

---

**Note**

The above configurations are specific to VRF support only. For call routing, appropriate routing protocols must be configured in the network.

Even though Gigabit Ethernet 0/0 and Gigabit Ethernet 0/1 have an overlapping IP address, the call processing is not overlapped as they belong to different VRFs.

**show ip interface brief** command shows that GigabitEthernet 0/0 and GigabitEthernet 0/1 have an overlapping IP address:

```
Device# show ip interface brief
Interface  IP-Address  OK? Method Status          Protocol
Embedded-Service-Engine0/0 unassigned YES NVRAM administratively down down
GigabitEthernet0/0     10.0.0.0     YES NVRAM up           up
GigabitEthernet0/1     10.0.0.0     YES NVRAM up           up
GigabitEthernet0/1.1    unassigned  YES NVRAM up           up
GigabitEthernet0/2     unassigned  YES NVRAM up           up
```

Cisco Unified Border Element Configuration Guide
show voip rtp connections command shows a video call that is established on CUBE across different interfaces belonging to different VRFs having Overlap IP address:

```
Device# show voip rtp connections
VoIP RTP Port Usage Information:

Using Server Groups with VRF

Whenever destination server group is used with VRF, ensure that the server group should have the session targets, belonging to the same network as that of sip bind on the dial-peer, where the server-group is configured. This is because the dial-peer bind is mandatory with VRF and only one sip bind can be configured on any given dial-peer.

The following scenario is considered in the below example:

Interfaces and associated IP address

- GigabitEthernet0/0/2 12.0.0.1
- GigabitEthernet0/0/1 11.0.0.1

```
Device# show ip interface brief
Interface        IP-Address OK? Method Status Protocol
GigabitEthernet0/0/0 10.0.0.1 YES NVRAM up up
GigabitEthernet0/0/1 11.0.0.1 YES NVRAM up up
GigabitEthernet0/0/2 12.0.0.1 YES NVRAM up up

- dial-peer 200 is bind to GigabitEthernet0/0/1

- server-group 1 (belonging to VRF1) is applied to dial-peer 200
```

```
Device(config)# dial-peer voice 200 voip
Device(config-dialpeer)# destination-pattern 4......
Device(config-dialpeer)# session protocol sipv2
Device(config-dialpeer)# session transport udp
Device(config-dialpeer)# session server-group 1
Device(config-dialpeer)# voice-class sip bind control source-interface GigabitEthernet0/0/1
Device(config-dialpeer)# voice-class sip bind media source-interface GigabitEthernet0/0/1
```
Codec g711ulaw

As dial-peer 200 is bind to GigabitEthernet0/0/1, the session targets configured in the “server-group 1” should belong to the network which is reachable by the bind source interface GigabitEthernet0/0/1 as shown below:

Device(config)# voice class server-group 1
Device(config-class)# ipv4 11.0.0.22
Device(config-class)# ipv4 11.0.0.8 preference 2

Inbound Dial-Peer Matching Based on Multi-VRF

From Cisco IOS Release 15.6(3)M and Cisco IOS XE Denali 16.3.1 onwards, dial-peer matching is done based on the VRF ID associated with a particular interface.

Example: Inbound Dial-Peer Matching based on Multi-VRF

Prior to Cisco IOS 15.6(3)M and Cisco IOS XE Denali 16.3.1 releases, when an incoming out-of-dialog message such as INVITE, REGISTER, OPTIONS, NOTIFY, and so on are received on a particular VRF bound interface, inbound dial-peer matching was done using the complete set of inbound dial-peers regardless of the VRF association. The response would be sent based on this matched dial-peer. Since the inbound dial-peer selected could have a different VRF bound to it, the response was sent to the wrong VRF.

To overcome this issue, the inbound dial-peers are filtered based on the incoming VRF and then followed by the regular inbound dial-peer matching. Now, the response is sent to the same VRF on which the request was received.

Consider the following configuration example output to understand the inbound dial-peer matching criteria used in multi-VRF:

```
interface GigabitEthernet0/0
ip address 8.39.18.37 255.255.0.0
duplex auto
ip vrf forwarding VRF ID1
speed auto

interface GigabitEthernet0/1
ip address 9.39.18.55 255.255.0.0
duplex auto
ip vrf forwarding VRF ID2
speed auto

interface GigabitEthernet0/2
ip address 10.39.18.68 255.255.0.0
duplex auto
ip vrf forwarding VRF ID3
speed auto

dial-peer voice 1000 voip
description “Inbound dial-peer bound to VRF ID2”
session protocol sipv2
session target sip-server
session transport udp
incoming called-number 5678
voice-class sip bind control source-interface GigabitEthernet0/1
voice-class sip bind media source-interface GigabitEthernet0/1
```
Prior to Cisco IOS 15.6(3)M and Cisco IOS XE Denali 16.3.1 releases, when an incoming call is received for the dialed number 5678 on GigabitEthernet0/0 (VRF ID1), inbound dial-peer matching was done based on the called-number 5678. In this case, dial-peer 1000 which is bound to GigabitEthernet0/1 (VRF ID2) was considered to be the first matched dial-peer for this call. And, the response was sent incorrectly to VRF ID2 instead of VRF ID1.

With the introduction of VRF aware inbound dial-peer matching, the initial filtering is done based on the VRF ID and then based on the called-number. For the above example, a call with called-number of 5678 that is received on GigabitEthernet0/0 with VRF ID 1 configured, the dial-peers will first be filtered to those that are bound to GigabitEthernet 0/0 before selection of the inbound dial-peer is performed. Now, the response is sent successfully on VRF ID1.

Whenever the VRF ID is added, modified, or removed under the interface, it is mandatory to execute the following command before making any calls: `clear interface <interface>`. If the `clear interface <interface>` command is not executed, the dial-peer is bound to the old VRF ID and not to the new VRF ID.
Inbound dial-peer matching based on VRF ID is selected in the following order of preference:

1. Dial-peer based configuration
2. Tenant based configuration
3. Global based configuration

---

**Example: Tenant based Inbound Dial-Peer Matching**

```plaintext
voice class tenant 1
  bind control source-interface GigabitEthernet0/0
  bind media source-interface GigabitEthernet0/0
  dial-peer voice 2000 voip
    description "Inbound dial-peer bound to VRF-ID 1"
    session protocol sipv2
    session target sip-server
    session transport udp
    incoming called-number 5678
    voice-class sip tenant 1
    codec g711ulaw
```

**Example: Global based Inbound Dial-Peer Matching**

```plaintext
voice service voip
  sip
    bind control source-interface GigabitEthernet0/0
    bind media source-interface GigabitEthernet0/0
```

---

**VRF Aware DNS for SIP Calls**

The VRF Aware DNS for SIP Calls feature enables you to specify the Virtual Routing and Forwarding (VRF) table so that the domain name system (DNS) can forward queries to name servers using the VRF table.

Because the same IP address can be associated with different DNS servers in different VRF domains, a separate list of name caches for each VRF is maintained. The DNS looks up the specific VRF name cache before sending a query to the VRF name server. All IP addresses obtained from a VRF-specific name cache are routed using the VRF table.

While processing a SIP call, if a hostname has to be resolved, only the VRF associated with the SIP call is used during DNS resolutions.

---

**Note**

Ensure that the name-server is configured using `ip name-server vrf` command. For configuration details, see Name Server Configuration.
High Availability with VRF

CUBE supports VRF in both HSRP and RG Infra high availability mode. VRF is supported on CUBE box-to-box and inbox high availability types.

For box-to-box high availability in Aggregation Services Routers 1000 Series and Integrated Services Routers 4000 Series, RG interface must not be associated with VRF where as the inbound and outbound interfaces (meant for handling VoIP traffic) can be associated with VRF’s depending upon the deployment.

For box-to-box high availability in Integrated Services Routers Generation 2, HSRP interface must not be associated with VRF where as the inbound and outbound interfaces (meant for handling VoIP traffic) can be associated with VRFs depending upon the deployment.

All the configurations including the VRF based RTP port range has to be identical on active and standby routers. VRF IDs will be check pointed before and after the switchover.

Configuration Examples

Note: The steps in the following configuration example is for a new network and hence it is assumed that there is no existing configuration.

Example: Configuring Multi-VRF in Standalone Mode

The configuration in this scenario is as shown below where the Gigabitethernet 0/1 is assigned to VRF1 and GigabitEthernet 0/2 is assigned to VRF2.

Figure 33: Multi-VRF in Standalone Mode

Configuring VRF

```
Device# enable
Device# configure terminal
Device(config)# ip vrf VRF1
Device(config)# rd 1:1
Device(config)# ip vrf VRF2
Device(config)# rd 2:2
Device(config)# exit
```

Associating interfaces with VRF
Device(config)# interface GigabitEthernet0/1
Device(config-if)# ip vrf forwarding VRF1
Device(config)# interface GigabitEthernet0/2
Device(config-if)# ip vrf forwarding VRF2

If an IP address is already assigned to an interface, then associating a VRF with interface will disable the interface and remove the existing IP address. An error message (sample error message shown below) is displayed on the console. Assign the IP address to proceed further.

% Interface GigabitEthernet0/1 IPv4 disabled and address(es) removed due to enabling VRF VRF1

Configure Interface GigabitEthernet0/1

Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet0/1
Device(config-if)# ip address 10.0.0.2 255.255.255.0
Device(config-if)# speed auto
Device(config-if)# exit

Configure Interface GigabitEthernet0/2

Device(config)# interface GigabitEthernet0/2
Device(config-if)# ip address 11.0.0.2 255.255.255.0
Device(config-if)# speed auto
Device(config-if)# exit

Creating Dial-peer

Creating Inbound Dial-peer:

Device(config)# dial-peer voice 1111 voip
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# incoming called-number 1111
Device(config-dial-peer)# codec g711ulaw

Creating Outbound Dial-peer:

Device(config)# dial-peer voice 2222 voip
Device(config-dial-peer)# destination pattern 1111
Device(config-dial-peer)# session protocol sipv2

Execute the following command to verify the dial-peer association with interface:

Device# show dial-peer voice summary

<table>
<thead>
<tr>
<th>TAG</th>
<th>TYPE</th>
<th>MIN</th>
<th>OPER</th>
<th>PREFIX</th>
<th>DEST-PATTERN</th>
<th>FER</th>
<th>PASS</th>
<th>SESS-TARGET</th>
<th>STAT</th>
<th>PORT</th>
<th>KEEPALIVE</th>
<th>VRF</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>voip</td>
<td>up</td>
<td>up</td>
<td>-</td>
<td>-</td>
<td>0</td>
<td>syst</td>
<td>ipv4:10.0.0.2</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>VRF1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2222</td>
<td>voip</td>
<td>up</td>
<td>up</td>
<td>-</td>
<td>-</td>
<td>0</td>
<td>syst</td>
<td>ipv4:11.0.0.2</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
VRF2

**Configure Binding**

- Control and Media on a dial-peer have to bind with same VRF. Else, while configuring, the CLI parser will display an error.

- Whenever global sip bind interface associated with a VRF is added, modified, or removed, you should restart the sip services under voice service voip sip mode so that the change in global sip bind comes into effect with associated VRF ID.

```
Device(config)# voice service voip
Device(conf-voi-serv)# sip
Device(conf-serv-sip)# call service stop
Device(conf-serv-sip)# no call service stop
Device(conf-serv-sip)# end
```

```
Device(config)# dial-peer voice 1111 voip
Device(config-dial-peer)# voice-class sip bind control source-interface GigabitEthernet0/1
Device(config-dial-peer)# voice-class sip bind media source-interface GigabitEthernet0/1
```

```
Device(config)# dial-peer voice 2222 voip
Device(config-dial-peer)# voice-class sip bind control source-interface GigabitEthernet0/2
Device(config-dial-peer)# voice-class sip bind media source-interface GigabitEthernet0/2
```

Execute the following command to verify the interface association with VRF:

```
Device# show ip vrf brief
```

```
Name       Default RD Interfaces
Mgmt-intf  <not set>  Gi0
VRF1       1:1        Gi0/1
VRF2       2:2        Gi0/2
```

Execute the following command to verify a successful and active calls:

For a single call, you should be able to see two RTP connections as shown in the below example.

```
Device# show voip rtp connections
```

```
VoIP RTP Port Usage Information:
Max Ports Available: 23001, Ports Reserved: 101, Ports in Use: 2

Media-Address Range Min Max Ports Available Reserved In-use
Global Media Pool 8000 48198 19999 101 0

Example: Configuring RG Infra High Availability with VRF

Example: Configuring RG Infra High Availability with VRF

Below configuration example is applicable for Cisco ASR 1000 Series Aggregated Services Routers (ASR) and Cisco 4000 Series Integrated Services Routers (ISR G3).

Do not configure VRF on the interface that is used for RG Infra. Traffic of VRF and RG Infra should be on different interfaces.

Figure 34: Multi-VRF in High Availability Mode (RG Infra)
Configuration on Active Router

The configurations of Active Router and Stand By Router should be identical.

Configuring VRF

Device> enable
Device# configure terminal
Device(config)# ip vrf VRF1
Device(config)# rd 1:1
Device(config)# ip vrf VRF2
Device(config)# rd 2:2

Device(config)# voice service voip
Device(config)# no ip address trusted authenticate
Device(config)# media bulk-stats
Device(config)# allow-connections sip to sip
Device(config)# redundancy-group 1
Device(config)# sip

Device(config)# redundancy
Device(config)# mode none
Device(config)# application redundancy
Device(config)# group 1
Device(config)# name raf-b2b
Device(config)# priority 1
Device(config)# timers delay 30 reload 60
Device(config)# control GigabitEthernet0/0/0 protocol 1
Device(config)# data GigabitEthernet0/0/0

Associating interfaces with VRF

Device(config)# interface GigabitEthernet0/2
Device(config-if)# ip vrf forwarding vrf2

Note

If an IP address is already assigned to an interface, then associating a VRF with interface will disable the interface and remove the existing IP address. An error message (sample error message shown below) is displayed on the console. Assign the IP address to proceed further.

% Interface GigabitEthernet0/1 IPv4 disabled and address(es) removed due to enabling VRF VRF1

GigabitEthernet0/0/0 is used for configuring RG Infra and therefore do not configure any VRF with this interface.

Device(config)# interface GigabitEthernet0/0/0
Device(config-if)# ip address 14.2.43.81 255.255.0.0
Device(config-if)# negotiation auto
Device(config-if)# cdp enable

Inbound interface - GigabitEthernet0/1 is used for voice traffic configured with VRF1.
Device(config)# interface GigabitEthernet0/1
Device(config-if)# ip vrf forwarding VRF1
Device(config-if)# ip address 10.0.0.3 255.0.0.0
Device(config-if)# negotiation auto
Device(config-if)# cdp enable
Device(config-if)# redundancy rii 1
Device(config-if)# redundancy group 1 ip 10.0.0.1 exclusive

Outbound interface - GigabitEthernet0/2 is used for voice traffic configured with VRF2.

Device(config)# interface GigabitEthernet0/2
Device(config-if)# ip vrf forwarding VRF2
Device(config-if)# ip address 11.0.0.3 255.0.0.0
Device(config-if)# negotiation auto
Device(config-if)# cdp enable
Device(config-if)# redundancy rii 2
Device(config-if)# redundancy group 1 ip 11.0.0.1 exclusive

Creating Dial-peer

Creating Inbound Dial-peer:

Device(config)# dial-peer voice 1111 voip
Device(config-dial-peer)# destination pattern 1111
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# session target ipv4:10.0.0.2
Device(config-dial-peer)# incoming called-number 1111

Creating Outbound Dial-peer:

Device(config)# dial-peer voice 3333 voip
Device(config)# destination-pattern 2222
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# session target ipv4:11.0.0.2

Configuring Binding

Control and Media on a dial-peer have to bind with same VRF. Else, while configuring, the CLI parser will display an error.

Device(config)# dial-peer voice 1111 voip
Device(config-dial-peer)# voice-class sip bind control source-interface GigabitEthernet0/1
Device(config-dial-peer)# voice-class sip bind media source-interface GigabitEthernet0/1

Device(config)# dial-peer voice 3333 voip
Device(config-dial-peer)# voice-class sip bind control source-interface GigabitEthernet0/2
Device(config-dial-peer)# voice-class sip bind media source-interface GigabitEthernet0/2

Configuration on Standby Router
The configurations of Active and Stand By should be identical.

Configuring VRF

Device> enable
Device# configure terminal
Device(config)# ip vrf VRF1
Device(config)# rd 1:1
Device(config)# ip vrf VRF2
Device(config)# rd 2:2
Device(config)# voice service voip
Device(config)# no ip address trusted authenticate
Device(config)# media bulk-stats
Device(config)# allow-connections sip to sip
Device(config)# redundancy-group 1
Device(config)# sip
Device(config)# redundancy
Device(config)# mode none
Device(config)# application redundancy
Device(config)# group 1
Device(config)# name raf-b2b
Device(config)# priority 1
Device(config)# timers delay 30 reload 60
Device(config)# control GigabitEthernet0/0/0 protocol 1
Device(config)# data GigabitEthernet0/0/0

Associating interfaces with VRF

Device(config)# interface GigabitEthernet0/2
Device(config-if)# ip vrf forwarding VRF2

Note

If an IP address is already assigned to an interface, then associating a VRF with interface will disable the interface and remove the existing IP address. An error message (sample error message shown below) is displayed on the console. Assign the IP address to proceed further.

% Interface GigabitEthernet0/1 IPv4 disabled and address(es) removed due to enabling VRF VRF1

GigabitEthernet0/0/0 is used for configuring RG Infra and therefore do not configure any VRF with this interface.

Device(config)# interface GigabitEthernet0/0/0
Device(config-if)# ip address 14.2.43.81 255.255.0.0
Device(config-if)# negotiation auto
Device(config-if)# cdp enable

Inbound interface - GigabitEthernet0/1 is used for voice traffic configured with VRF1.

Device(config)# interface GigabitEthernet0/1
Device(config-if)# ip vrf forwarding VRF1
Device(config-if)# ip address 10.0.0.4 255.0.0.0
Device(config-if)# negotiation auto
Device(config-if)# cdp enable
Device(config-if)# redundancy rii 1
Device(config-if)# redundancy group 1 ip 10.0.0.1 exclusive

Outbound interface - GigabitEthernet0/2 is used for voice traffic configured with VRF2.

Device(config)# interface GigabitEthernet0/2
Device(config-if)# ip vrf forwarding VRF2
Device(config-if)# ip address 11.0.0.4 255.0.0.0
Device(config-if)# negotiation auto
Device(config-if)# cdp enable
Device(config-if)# redundancy rii 2
Device(config-if)# redundancy group 1 ip 11.0.0.1 exclusive

Creating Dial-peer

Creating Inbound Dial-peer:

Device(config)# dial-peer voice 1111 voip
Device(config-dial-peer)# destination pattern 1111
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# session target ipv4:10.0.0.2
Device(config-dial-peer)# incoming called-number 1111

Creating Outbound Dial-peer:

Device(config)# dial-peer voice 3333 voip
Device(config)# destination-pattern 2222
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# session target ipv4:11.0.0.2

Configuring Binding

Note: Control and Media on a dial-peer have to bind with same VRF. Else, while configuring, the CLI parser will display an error.

Device(config)# dial-peer voice 1111 voip
Device(config-dial-peer)# voice-class sip bind control source-interface GigabitEthernet0/1
Device(config)# voice-class sip bind media source-interface GigabitEthernet0/1
Device(config)# dial-peer voice 3333 voip
Device(config)# voice-class sip bind control source-interface GigabitEthernet0/2
Device(config)# voice-class sip bind media source-interface GigabitEthernet0/2

Example: Configuring HSRP High Availability with VRF

Note

Below configuration example is applicable for Cisco Integrated Services Routers Generation 2 (ISR G2) Platforms. [Cisco 2900 Series Integrated Services Routers and Cisco 3900 Series Integrated Services Routers]
Do not configure VRF on the interface that is used for HSRP. Traffic of VRF and HSRP should be on different interfaces.

**Figure 35: Multi-VRF in High Availability Mode (HSRP)**

**Configuration on Active Router**

The configurations of Active Router and Stand By Router should be identical.

**Configuring VRF**

```
Device> enable
Device# configure terminal
Device(config)# ip vrf VRF1
Device(config)# rd 1:1
Device(config)# ip vrf VRF2
Device(config)# rd 2:2
```

**Associating interfaces with VRF**

```
Device(config)# interface GigabitEthernet0/1
Device(config-if)# ip vrf forwarding VRF1

Device(config)# interface GigabitEthernet0/2
Device(config-if)# ip vrf forwarding VRF2
```

**Note**

If an IP address is already assigned to an interface, then associating a VRF with interface will disable the interface and remove the existing IP address. An error message (sample error message shown below) is displayed on the console. Assign the IP address to proceed further.

```
% Interface GigabitEthernet0/1 IPv4 disabled and address(es) removed due to enabling VRF VRF1
```

The interface used for HSRP should not be configured with any VRF. In this example, GigabitEthernet0/0/0 is used for configuring HSRP and therefore no VRF is associated with this interface.
Example: Configuring HSRP High Availability with VRF

Inbound interface - GigabitEthernet0/1 is used for voice traffic configured with VRF1.

Outbound interface - GigabitEthernet0/2 is used for voice traffic configured with VRF2.

Creating Dial-peer

Creating Inbound Dial-peer:
Device(config-dial-peer)# session protocol sipv2  
Device(config-dial-peer)# session target ipv4:10.0.0.2  
Device(config-dial-peer)# incoming called-number 1111  

Creating Outbound Dial-peer:

Device(config)# dial-peer voice 3333 voip  
Device(config)# destination-pattern 2222  
Device(config-dial-peer)# session protocol sipv2  
Device(config-dial-peer)# session target ipv4:11.0.0.2

Configuring Binding

**Note**
Control and Media on a dial-peer have to bind with same VRF. Else, while configuring, the CLI parser will display an error.

Device(config)# dial-peer voice 1111 voip  
Device(config-dial-peer)# voice-class sip bind control source-interface GigabitEthernet0/1  
Device(config-dial-peer)# voice-class sip bind media source-interface GigabitEthernet0/1  

Device(config)# dial-peer voice 3333 voip  
Device(config-dial-peer)# voice-class sip bind control source-interface GigabitEthernet0/2  
Device(config-dial-peer)# voice-class sip bind media source-interface GigabitEthernet0/2

**Configuration on Standby Router**

**Note**
The configurations of Active and Stand By should be identical.

Configuring VRF

Device> enable  
Device# configure terminal  
Device(config)# ip vrf VRF1  
Device(config)# rd 1:1  
Device(config)# ip vrf VRF2  
Device(config)# rd 2:2

Associating interfaces with VRF

Device(config)# interface GigabitEthernet0/1  
Device(config-if)# ip vrf forwarding VRF1

Device(config)# interface GigabitEthernet0/2  
Device(config-if)# ip vrf forwarding VRF2
If an IP address is already assigned to an interface, then associating a VRF with an interface will disable the interface and remove the existing IP address. An error message (sample error message shown below) is displayed on the console. Assign the IP address to proceed further.

% Interface GigabitEthernet0/1 IPv4 disabled and address(es) removed due to enabling VRF VRF1

The interface used for HSRP should not be configured with any VRF. In this example, GigabitEthernet0/0/0 is used for configuring HSRP and therefore no VRF is associated with this interface.

```
Device(config)# interface GigabitEthernet0/0/0
Device(config-if)# ip address 14.2.43.82 255.255.0.0
Device(config-if)# standby version 2
Device(config-if)# standby 93 ip 14.2.43.81
Device(config-if)# standby 93 priority 50
Device(config-if)# standby 93 preempt
Device(config-if)# standby 93 name cubah
Device(config-if)# standby 93 track 1 decrement 5
Device(config-if)# standby 93 track 2 decrement 5
Device(config-if)# duplex auto
Device(config-if)# speed auto
```

Inbound interface - GigabitEthernet0/1 is used for voice traffic configured with VRF1.

```
Device(config)# interface GigabitEthernet0/1
Device(config-if)# ip vrf forwarding VRF1
Device(config-if)# ip address 10.0.0.4 255.0.0.0
Device(config-if)# standby version 2
Device(config-if)# standby 63 ip 10.0.0.3
Device(config-if)# standby 63 priority 50
Device(config-if)# standby 63 preempt
Device(config-if)# standby 63 track 1 decrement 5
Device(config-if)# duplex auto
Device(config-if)# speed auto
Device(config-if)# media-type rj45
```

Outbound interface - GigabitEthernet0/2 is used for voice traffic configured with VRF2.

```
Device(config)# interface GigabitEthernet0/2
Device(config-if)# ip vrf forwarding VRF2
Device(config-if)# ip address 11.0.0.4 255.0.0.0
Device(config-if)# standby version 2
Device(config-if)# standby 36 ip 11.0.0.3
Device(config-if)# standby 36 priority 50
Device(config-if)# standby 36 preempt
Device(config-if)# standby 36 track 1 decrement 5
Device(config-if)# duplex auto
Device(config-if)# speed auto
Device(config-if)# media-type rj45
```

```
Device(config)# ipc zone default
Device(config-ipczone)# association 1
Device(config-ipczone-assoc)# no shutdown
```
Device(config-ipczone-assoc)# protocol sctp
Device(config-ipc-protocol-sctp)# local port 5000
Device(config-ipc-local-sctp)# local-ip 14.2.43.82
Device(config-ipc-local-sctp)# exit
Device(config-ipc-protocol-sctp)# remote port 5000
Device(config-ipc-remote-sctp)# remote-ip 14.2.43.81

Creating Dial-peer

Creating Inbound Dial-peer:

Device(config)# dial-peer voice 1111 voip
Device(config-dial-peer)# destination pattern 1111
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# session target ipv4:10.0.0.2
Device(config-dial-peer)# incoming called-number 1111

Creating Outbound Dial-peer:

Device(config)# dial-peer voice 3333 voip
Device(config)# destination-pattern 2222
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# session target ipv4:11.0.0.2

Configuring Binding

---

**Note**

Control and Media on a dial-peer have to bind with the same VRF. Else, while configuring, the CLI parser will display an error.

---

Device(config)# dial-peer voice 1111 voip
Device(config-dial-peer)# voice-class sip bind control source-interface GigabitEthernet0/1
Device(config)# voice-class sip bind media source-interface GigabitEthernet0/1

Device(config)# dial-peer voice 3333 voip
Device(config)# voice-class sip bind control source-interface GigabitEthernet0/2
Device(config)# voice-class sip bind media source-interface GigabitEthernet0/2

Verification of redundancy States

On Active Router

Device(config)# show redundancy status

my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
Mode = Duplex
Unit ID = 0

Maintenance Mode = Disabled
Manual Swact = enabled
Communications = Up

client count = 17
client_notification_TMR = 120000 milliseconds
RF debug mask = 0x0

On Standby Router

Device(config)# show redundancy status

my state = 8 -STANDBY HOT
peer state = 13 ACTIVE
Mode = Duplex
Unit ID = 0

Maintenance Mode = Disabled
Manual Swact = enabled
Communications = Up

client count = 17
client_notification_TMR = 120000 milliseconds
RF debug mask = 0x0

Troubleshooting Tips

The following commands are helpful for troubleshooting:

- **show voip rtp connections**

  The following is an example where media flow-around is configured. The output shows 0 connections since media does not flow through Cisco UBE.

  ```
  Device#show voip rtp connections
  VoIP RTP Port Usage Information:
  Max Ports Available: 19999, Ports Reserved: 101, Ports in Use: 0
  Port range not configured
  Media-Address Range Min Max Ports Ports Ports
  -----------------------------------------------
  Global Media Pool 8000 48198 19999 101 0
  -----------------------------------------------
  No active connections found
  ```

- **show call active voice compact**

  ```
  Device#show call active voice compact
  <callID> A/O FAX T<sec> Codec type Peer Address IP R<ip>:<udp> VRF
  4021 ORG T45 g711ulaw VOIP P7474 8.41.17.71:27754 VRF1
  4020 ANS T45 g711ulaw VOIP Psipp 8.41.17.71:17001 VRF1
  ```

- **debug ccsip verbose**

  The output of **debug ccsip verbose** command is wordy and may cause issues when enabled on a busy network environment.
CHAPTER 27

Configuring Multi-Tenants on SIP Trunks

This feature allows specific global configurations for multiple tenants on SIP trunks that allow differentiated services for tenants. Configuring Multi-Tenants on SIP Trunks allows each tenant to have their own individual configurations. The configurations include timers, credentials, bind requests, and other parameters which are available under sip-ua and voice service voip/sip configurations. Multi-tenant functionality helps to create multiple configurations with ease and provides support for scalable and flexible mix of typical enterprise services.

- Feature Information for Configuring Multi-Tenants on SIP Trunks, on page 369
- Information About Configuring Multi-tenants on SIP Trunks, on page 369
- How to Configure Multi-Tenants on SIP Trunks, on page 373
- Example: SIP Trunk Registration in Multi-Tenant Configuration, on page 375

Feature Information for Configuring Multi-Tenants on SIP Trunks

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Support for Configuring Multi Tenants on SIP Trunks | Cisco IOS 15.6(2)T Cisco IOS XE Denali 16.3.1 | This feature allows the provision to configure specific global configurations for multiple tenants on SIP trunks. The following commands were introduced: `voice class tenant <tag>` and `voice-class sip tenant <tag>`.

Information About Configuring Multi-tenants on SIP Trunks

With the introduction of multi-tenancy support on CUBE, the sip-specific attributes can be configured at per tenant basis in addition to the existing global or dial-peer levels.
The `voice class tenant <tag>` command allows sip-specific attributes to be configured at per tenant basis. The command `voice class tenant <tag>` can be then applied to individual dial-peers, thereby associating them to a particular tenant. See the following table "Table 44: Multi-Tenant Configuration List" for information on the complete list of configurations present under the `voice class tenant <tag>`.

If tenants are configured under dial-peer, then configurations are applied in the following order of preference.

- Dial-peer configuration
- Tenant configuration
- Global configuration

That is, if the value of the attribute under dial-peer configuration is system, then the value is taken from the tenant configuration. And, if the value under the tenant configuration is also system, then the global configuration is used.

If there are no tenants configured under dial-peer, then the configurations are applied using the default behavior in the following order:

- Dial-peer configuration
- Global configuration

The following table lists the various configurations present under `voice class tenant <tag>`. For more information on specific configurations, see the Voice and Video command reference guide lists.

How to Configure Multi-Tenants on SIP Trunks

Configuring Multi-Tenants on SIP Trunks

SUMMARY STEPS

1. enable
2. configure terminal
3. Use the following commands to configure multi-tenants:
   - `voice class tenant <tag>` in the global configuration mode
     Once you configure the `voice class tenant <tag>` command in the global mode, the configuration will move to the `voice class tenant <tag>` submode. You can configure all the sip-specific attributes in this submode.
   - `voice-class sip tenant <tag>` in the dial-peer configuration mode
4. end

DETAILED STEPS

<table>
<thead>

</tbody>
</table>
### Command or Action

| Purpose |
|------------------|------------------|
| !Configuring tenant 1 under dial-peer 10  
Device (config)# dial-peer voice 10 voip  
Device (config-dial-peer)# voice-class sip tenant 1  
Device (config-dial-peer)# end  
--------------- |
| !Configuring tenant 2 under dial-peer 20  
Device (config)# dial-peer voice 20 voip  
Device (config-dial-peer)# voice-class sip tenant 2  
Device (config-dial-peer)# end  
--------------- |
| !An example for the use of the "no" form of command  
voice-class sip tenant  
Router(config)# dial-peer voice 3000 voip  
Router(config-dial-peer)# voice-class sip tenant 1  
Router(config-dial-peer)# no voice-class sip tenant 1  
When the no form is configured, the dial-peer is no longer associated with the tenant tag configuration. The attributes are now applied using the default order of dial-peer followed by the global configuration.  
--------------- |
| Step 4  
end  
Example:  
Device(config-dial-peer)# end  
Returns to privileged EXEC mode.  
--------------- |

### Example: SIP Trunk Registration in Multi-Tenant Configuration

For SIP trunk registration, the `voice class tenant <tag>` command is not associated with any dial-peer configuration. All outgoing registrations are triggered to the Registrars when credentials are configured under `voice class tenant <tag>`.

Router# show run | sec tenant

**Voice class tenant 1**

registrar 1 ipv4:10.64.86.35:9051 expires 3600  
credentials username aaaa password 7 06070E204D realm aaaa.com  
outbound-proxy ipv4:10.64.86.35:9057  
bind control source-interface GigabitEthernet0/0

**Voice class tenant 2**

registrar 1 ipv4:9.65.75.45:9052 expires 3600  
credentials username bbbb password 7 110B1B0715 realm bbbb.com  
outbound-proxy ipv4:10.64.86.40:9040  
bind control source-interface GigabitEthernet0/1

For multi-tenancy support on Cisco Unified Border Element, you can configure voice class tenants with different credentials, but having the same registrar. In that scenario, it is recommended that you configure the
CLI commands **sip-server** and **registrar** under **voice class tenant** configuration. The following is a sample configuration:

```
voice class tenant 1
  credentials number 1111 username test password 7 071B245B5D1D realm ipvoice.jp
  authentication username test password 7 06120A3258
  registrar ipv4:1.1.1.1 expires 120
  sip-server ipv4:1.1.1.1

voice class tenant 2
  credentials number 2222 username test password 7 09584B1E0A11 realm ipvoice.jp
  authentication username test2 password 7 071B245F5A
  registrar ipv4:1.1.1.1 expires 120
  sip-server ipv4:1.1.1.1
```

CHAPTER 28

Codec Support and Restrictions

This chapter provides advanced information about the support of and restrictions for certain codecs on CUBE. For basic information on how to configure codecs, refer to the Introduction to Codecs section.

- Feature Information for Codec Support on CUBE, on page 379
- ISAC Codec Support on CUBE, on page 380
- AAC-LD MP4A-LATM Codec Support on Cisco UBE, on page 380

Feature Information for Codec Support on CUBE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<table>
<thead>

</thead>
<tbody>
<tr>
<td>AAC-LD MP4A-LATM Codec Support on Cisco UBE</td>
<td>15.4(1)T Cisco IOS XE Release 3.12S</td>
<td>The AAC-LD MP4A-LATM codec is a wideband audio codec used by video endpoints. MP4A-LATM is an MPEG-4 audio coding standard, where LATM is Low-Overhead MPEG-4 Audio Transport Multiplex. The Cisco Unified Border Element (Cisco UBE) supports MP4A-LATM to enable call flows involving endpoints that use this codec, especially for media recording. The following commands were introduced or modified: codec mp4a-latm, codec preference tag mp4a-latm</td>
</tr>
<tr>
<td>ISAC Codec Support on CUBE</td>
<td>15.1(1)T</td>
<td>The ISAC Codec Support on CUBE The following commands were introduced by this feature: codec isac, codec preference tag isac.</td>
</tr>
</tbody>
</table>
ISAC Codec Support on CUBE

The iSAC codec is an adaptive VoIP codec specially designed to deliver wideband sound quality in both low- and high-bit rate applications. The iSAC codec automatically adjusts the bit-rate for the best quality or a fixed bit rate can be used if the network characteristics are known. This codec is designed for wideband VoIP communications. The iSAC codec offers better quality with reduced bandwidth for sideband applications.

Restrictions for ISAC Codec Support on CUBE

• Low complexity is not supported for the iSAC codec.

AAC-LD MP4A-LATM Codec Support on Cisco UBE

As part of this feature, Cisco UBE supports the following:

• Accept and send MP4A-LATM codec and corresponding FMTP profiles
• Configure MP4A-LATM under dial-peer or under voice-class codec as preferred codec
• Pass across real-time transport protocol (RTP) media for MP4A-LATM codec without any interworking
• Offer pre-configured FMTP profile for MP4A-LATM for DO-EO (Delayed-Offerto Early-Offer) calls
• Offer more than one FMTP profile (each with different payload type number) as mentioned by the offering endpoint, so that the answering endpoint can choose the best option.
• Offer only one instance of MP4A-LATM if media forking is applicable. The offered instance is the first one received in the offer.
• Calculate bandwidth for MP4A-LATM on the basis of either “b=TIAS” attribute or “bitrate” parameter in the FMTP attribute. If none of them are present in the session description protocol (SDP), the default maximum bandwidth, that is, 128 Kbps will be used for calculation.
• The following Cisco UBE features are supported with the MP4A-LATM codec:
  • Basic call (audio and video) flow-around and flow-through (FA and FT).
  • Voice Class Codec support in Cisco UBE with codec filtering
  • SRTP and SRCTP passthrough for SIP-to-SIP calls
  • Supplementary services
  • RSVP
  • Dynamic payload type interworking for DTMF and codec packets for SIP-to-SIP calls
  • Media Anti-Trombone with SIP signaling control on CUBE
  • Support for SIP UPDATE message per RFC 3311
  • RTP Media Loopback
  • Media forking for IP based calls using Zephyr recording server
  • Cisco UBE Mid-call Re-INVITE consumption
  • Signaling forking (Fastweb multile SIP Early Dialog Support, FA and FT)
  • Maximum bandwidth-based CAC
  • Media Policing
  • Box-to-Box High Availability (B2B HA)
  • Inbox High Availability (Inbox HA)
Restrictions for AAC-LD MP4A-LATM Codec Support on Cisco UBE

Cisco UBE does not support the following:

- Codec transcoding between MP4A-LATM and other codecs
- Dual-tone Multifrequency (DTMF) interworking with MP4A-LATM codec
- Non-SIP-SIP, that is, SIP to other service provider interface (SPI) interworking with MP4A-LATM codec
CHAPTER 29

Codec Preference Lists

This chapter describes how to negotiate an audio codec from a list of codec associated with a preference. This chapter also describes how to disable codec filtering by configuring CUBE to send an outgoing offer with all configured audio codecs in the list assuming that the dspfarm supports all these codecs.

• Feature Information for Negotiation of an Audio Codec from a List of Codecs, on page 383
• Codecs Configured Using Preference Lists, on page 384
• Prerequisites for Codec Preference Lists, on page 384
• Restrictions for Codecs Preference Lists, on page 385
• How to Configure Codec Preference Lists, on page 385
• Troubleshooting Negotiation of an Audio Codec from a List of Codecs, on page 388
• Verifying Negotiation of an Audio Codec from a List of Codecs, on page 388

Feature Information for Negotiation of an Audio Codec from a List of Codecs

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

## Codecs Configured Using Preference Lists

SIP-to-SIP calls configured using codecs using preference lists have the following features:

- Incoming and outgoing dial-peers can be configured with different preference lists.

- Both normal transcoding and high-density transcoding are supported with preference lists.

- Midcall codec changes for supplementary services are supported with preference lists. Transcoder resources are dynamically inserted or deleted when there is a codec or RTP-NTE to in-band DTMF interworking required.

- Reinvite-based supplementary services that are invoked from the Cisco Unified Communications Manager (CUCM), like call hold, call resume, Music On Hold (MOH), call transfer, and call forward are supported with preference lists.

- T.38 fax and fax passthrough switchover with preference lists are supported.

- Reinvite-based call hold and call resume for the Secure Real-Time Transfer protocol (SRTP) and Real-Time Transport Protocol (RTP) interworking on CUBE is supported with preference lists.

- High availability is supported for calls that use codecs with preference lists. But calls requiring the transcoder to be invoked are not checkpointed. During midcall renegotiation, if the call releases the transcoder, then the call is checkpointed.

## Prerequisites for Codec Preference Lists

- Transcoding configuration on the CUBE.

- The digital signal processor (DSP) requirements to support the transcoding feature on the CUBE.
Restrictions for Codecs Preference Lists

For All Calls (SIP-to-SIP, H323-to-H323, SIP-to-H323 calls)

- Video codecs are not supported with preference lists.
- Multiple audio streams are not supported.
- High-density transcoding is not supported when delayed offer to early offer is configured. Only low density transcoding is supported.
- Codec re-packetization feature is not supported when preference lists are configured.

For H323-to-H323 and SIP-to-H323 Calls

The below restrictions do not exist for SIP-to-SIP calls from 15.1(2)T and Cisco IOS XE Release 3.8S onwards.

- You can configure dissimilar preference lists on the incoming and outgoing dial peers.
- Incoming and outgoing dial-peers cannot be configured with the different preference lists.
- Transcoding is not supported when preference lists are used.
- Mid-call codec changes and supplementary services (call-hold / resume, call forward) do not work when a preference list is configured.
- Mid-call insertion or deletion of transcoder is not supported with preference lists.
- Rotary dial peers are not supported when preference lists are used.
- Both incoming and outgoing dial-peers need to be configured with the same codec voice classes.
- The preference of codecs configured in a codec voice classes is not be applied to the outgoing call-leg. Basically codec filtering is applied first and only the filtered codecs will be sent out in the outgoing offer from CUBE.
- T.38 fax, fax-passthru and modem-passthru is not be supported with preference lists.
- SRTP<->RTP is not supported with preference lists.
- When a codec voice class is configured, call establishment is un-predictable when a transcoder is involved in the call. The call succeeds only if the end points choose the first codec in the list of offered codecs.

Note
Codec preference in the voice class codec on the outgoing call leg is not followed when the same codecs are available in the respective incoming invite with SDP with different codec preference. Cube prioritizes and follows the incoming invite with SDP codec preference when compared to the voice class codec preference on the outgoing dial-peer leg.

How to Configure Codec Preference Lists

Configuring Audio Codecs Using a Codec Voice Class and Preference Lists

Preferences can be used to determine which codecs will be selected over others.

A codec voice class is a construct within which a codec preference order can be defined. A codec voice class can then be applied to a dial peer, which then follows the preference order defined in the codec voice class.
SUMMARY STEPS

1. enable
2. configure terminal
3. voice class codec tag
4. Do the following for each audio codec you want to configure in the voice class:
   • codec preference value codec-type [bytes payload-size fixed-bytes ]
   • codec preference value isac [mode {adaptive | independent} [bit-rate value framesize { 30 | 60 } [fixed] ]
   • codec preference value ilbc [mode frame-size [bytes payload-size]]
   • codec preference value mp4-latm [profile tag]
5. exit
6. dial-peer voice number voip
7. voice-class codec tag offer-all
8. end

DETAILED STEPS

</tbody>
</table>

**Example:**

Device(config-dial-peer)# voice-class codec 10

**Step 8**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

Device(config-dial-peer)# end

---

### Disabling Codec Filtering

Cisco UBE is configured to filter common codecs for the subsets, by default. The filtered codecs are sent in the outgoing offer. You can configure the Cisco UBE to offer all the codecs configured on an outbound leg instead of offering only the filtered codecs.

**Note**

This configuration is applicable only for early offer calls from the Cisco UBE. For delayed offer calls, by default all codecs are offered irrespective of this configuration.

Perform this task to disable codec filtering and allow all the codecs configured on an outbound leg.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dial-peer voice tag voip
4. voice-class codec tag offer-all
5. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

Device> enable

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**
```
  dial-peer voice  tag  voip
```
Example:
```
Device(config)# dial-peer voice 10 voip
```
Enters dial peer voice configuration mode.

**Step 4**
```
  voice-class codec  tag  offer-all
```
Example:
```
Device(config-dial-peer)# voice-class codec 10 offer-all
```
Adds all the configured voice class codec to the outgoing offer from the Cisco UBE.

**Step 5**
```
  end
```
Example:
```
Device(config-dial-peer)# end
```
Exits the dial peer voice configuration mode.

### Troubleshooting Negotiation of an Audio Codec from a List of Codecs

Use the following commands to debug any errors that you may encounter when you configure the Negotiation of an Audio Codec from a List of Codecs on Each Leg of a SIP-to-SIP Call on the Cisco Unified Border Element feature:

- `debug ccsip all`
- `debug voip ccapi input`
- `debug sccp messages`
- `debug voip rtp session`

For DSP-related debugs, use the following commands:

- `debug voip dsmp all`
- `debug voip dsmp rtp both payload all`
- `debug voip ipipgw`

### Verifying Negotiation of an Audio Codec from a List of Codecs

Perform this task to display information to verify Negotiation of an Audio Codec from a List of Codecs on Each Leg of a SIP-to-SIP Call on the Cisco Unified Border Element configuration. These `show` commands need not be entered in any specific order.
SUMMARY STEPS

1. enable
2. show call active voice brief
3. show voip rtp connections
4. show sccp connections
5. show dsfparm dsp active

DETAILED STEPS

Step 1 enable

Enables privileged EXEC mode.

Step 2 show call active voice brief

Displays a truncated version of call information for voice calls in progress.

Example:

Device# show call active voice brief

Verifying Negotiation of an Audio Codec from a List of Codecs

The system detects media inactivity and long duration calls. The call details are provided including IP addresses, rtt, pl, delay, and g729br8 TextRelay status.

**Step 3**

**show voip rtp connections**
Displays Real-Time Transport Protocol (RTP) connections.

**Example:**

```
Device# show voip rtp connections
VoIP RTP active connections :
No. CallId dstCallId LocalRTP RmtRTP LocalIP RemoteIP
1 11 12 16662 19304 192.0.2.1 192.0.2.1
2 12 11 17404 16512 192.0.2.2 192.0.2.3
3 13 14 18422 2000 192.0.2.4 9.44.26.3
4 15 14 16576 2000 192.0.2.6 192.0.2.5
```

**Step 4**

**show sccp connections**
Displays information about the connections controlled by the Skinny Client Control Protocol (SCCP) transcoding and conferencing applications.

**Example:**

```
Device# show sccp connections
sess_id conn_id stype mode codec sport rport ripaddr
5 5 xcode sendrecv g729b 16576 2000 192.0.2.3
5 6 xcode sendrecv g711u 18422 2000 192.0.2.4
```

**Step 5**

**show dspfarm dsp active**
Displays active DSP information about the DSP farm service.

**Example:**

```
Device# show dspfarm dsp active
SLOT DSP VERSION STATUS CHNL USE TYPE RSC_ID BRIDGE_ID PKTS_TXED PKTS_RXED
0 1 27.0.201 UP 1 USED xcode 1 0x9 5 8
0 1 27.0.201 UP 1 USED xcode 1 0x8 2558 17
```

---

Verifying Negotiation of an Audio Codec from a List of Codecs

The system detects media inactivity and long duration calls. The call details are provided including IP addresses, rtt, pl, delay, and g729br8 TextRelay status.

**Step 3**

**show voip rtp connections**
Displays Real-Time Transport Protocol (RTP) connections.

**Example:**

```
Device# show voip rtp connections
VoIP RTP active connections :
No. CallId dstCallId LocalRTP RmtRTP LocalIP RemoteIP
1 11 12 16662 19304 192.0.2.1 192.0.2.1
2 12 11 17404 16512 192.0.2.2 192.0.2.3
3 13 14 18422 2000 192.0.2.4 9.44.26.3
4 15 14 16576 2000 192.0.2.6 192.0.2.5
```

**Step 4**

**show sccp connections**
Displays information about the connections controlled by the Skinny Client Control Protocol (SCCP) transcoding and conferencing applications.

**Example:**

```
Device# show sccp connections
sess_id conn_id stype mode codec sport rport ripaddr
5 5 xcode sendrecv g729b 16576 2000 192.0.2.3
5 6 xcode sendrecv g711u 18422 2000 192.0.2.4
```

**Step 5**

**show dspfarm dsp active**
Displays active DSP information about the DSP farm service.

**Example:**

```
Device# show dspfarm dsp active
SLOT DSP VERSION STATUS CHNL USE TYPE RSC_ID BRIDGE_ID PKTS_TXED PKTS_RXED
0 1 27.0.201 UP 1 USED xcode 1 0x9 5 8
0 1 27.0.201 UP 1 USED xcode 1 0x8 2558 17
```

---
PART V

DSP Services

• Transcoding, on page 393
• Transrating, on page 411
• Call Progress Analysis Over IP-to-IP Media Session, on page 413
Transcoding

Transcoding is a process of converting one voice codec to another. For example, transcoding iLBC-G.711 or iLBC-G.729.

In every transcoding operation, media flows through CUBE.

LTI based Transcoding

- Internal API is used to access Digital Signaling Processor (DSP) resources for transcoding.
- Transcoding resources (DSPFARM) and CUBE need to be on the same platform.
- Only DSPFARM profile configuration is required. Skinny Client Control Protocol (SCCP) configuration is not required.
- No TCP socket is opened and no registration is used.
- DSPFARM profile is associated to a new application type CUBE.

```
Device(config)# dspfarm profile 1 transcode
Device(config-dspfarm-profile)# associate application CUBE
```

- With LTI transcoding, higher performance is achieved since there is no need for extra SCCP legs and associated RTP streams. The performance will be in line high density mode offered with SCCP based transcoding.
- `crypto pki trustpoint` configuration is not required for Secure Real-time Transport Protocol (SRTP) to Real-time Transport Protocol (RTP) calls.

Note

Cisco Aggregated Services Routers 1000 Series (ASR 1K), Cisco Integrated Services Generation 2 Routers (ISR G2), and Cisco 4000 Series Integrated Services Routers (ISR G3) support LTI-based Transcoding.

SCCP based Transcoding

- Skinny Client Control Protocol (SCCP) protocol is used for controlling Digital Signaling Processor (DSP) resources used for transcoding.
- Transcoding resources (DSPFARM) and CUBE can be on different platforms.
- SCCP client (For example, `sccp ccm` configuration and SCCP server (telephony service) configuration is required apart from DSPFARM profile configuration.
- DSPFARM registers with Cisco Unified Border Element over TCP Socket, using SCCP.
• DSPFARM profile is associated to SCCP using the following commands:

Device(config)# dspfarm profile 1 transcode
Device(config-dspfarm-profile)# associate application SCCP

• High density transcoding needs to be enabled for higher performance. High density transcoding will flow-around through the transcoder

• Secure Real-time Transport Protocol (SRTP) to Real-time Transport Protocol (RTP) using transcoder requires crypto pki trustpoint configuration to establish the Transport Layer Security (TLS) connection with SCCP server.

Note
Integrated Services Routers Generation 1 series and Integrated Services Routers Generation 2 Series devices support SCCP-based Transcoding only.

• Configuring LTI-Based Transcoding, on page 394
• Configuration Examples for LTI Based Transcoding, on page 395
• Configuring SCCP-based Transcoding (ISR-G2 devices only), on page 398
• TLS for SCCP Connection for DSP Services, on page 400
• Configuring Secure Transcoding, on page 401
• Configuration Examples for SCCP Based Transcoding, on page 409

Configuring LTI-Based Transcoding

Note
We recommend that you configure LTI-based Transcoding for Cisco Aggregated Services Routers (ASR), Cisco Integrated Services Generation 2 Routers (ISR G2), and Cisco 4000 Series Integrated Services Routers (ISR G3).

SUMMARY STEPS

1. enable
2. configure terminal
3. voice-card voice-interface-slot-number
4. dspfarm services dspfarm
5. exit
6. dspfarm profile profile-identifier transcode
7. codec codec
8. maximum sessions sessions
9. associate application CUBE
10. exit

</tbody>
</table>

**Configuration Examples for LTI Based Transcoding**

**Example: LTI-based Transcoding**

```
! Enabling dspfarm services under voice-card
Device(config)# voice-card 0/1
Device(config-voicecard)# dspfarm
Device(config-voicecard)# dsp services dspfarm
Device(config-voicecard)# exit
```
 Configuration Examples for LTI Based Transcoding

! Configuring dspfarm profile
Device(config)# dspfarm profile 1 transcode
Device(config-dspfarm-profile)# codec g711ulaw
Device(config-dspfarm-profile)# codec g711alaw
Device(config-dspfarm-profile)# codec g729r8
Device(config-dspfarm-profile)# maximum sessions 10
Device(config-dspfarm-profile)# associate application CUBE
Device(config-dspfarm-profile)# exit

! Starting Service Engine
Device(config)# interface ServiceEngine0/1/0
Device(config-if)# no shutdown
Device(config-if)# exit

Example: Secure LTI-based Transcoding

!Client trustpoints use HTTP to receive certificate from CA.
Device(config)#ip http server

!Generate an RSA Keypair.
!(This step generates Private and Public keys. In this example, CUBE is just a label. It can be anything.)
crypto key generate rsa general-keys label CUBE modulus 1024
The name for the keys will be: CUBE
% The key modulus size is 1024 bits
% Generating 1024 bit RSA keys, keys will be non-exportable...
[OK] (elapsed time was 0 seconds)

!Configure IOS CA Server. In this example, CA Server is named cube-ca.
crypto pki server cube-ca
database level complete
no database archive
grant auto
lifetime certificate 1800
Secure-CUBE(cs-server)#no shut
%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key
% or type Return to exit
Password:
Re-enter password:
% Generating 1024 bit RSA keys, keys will be non-exportable...
[OK] (elapsed time was 0 seconds)
% Certificate Server enabled.

!Create PKI trustpoints for cube for TLS communication.
crypto pki trustpoint CUBE-TLS
enrollment url http://X.X.X.X:80
serial-number none
domain-name none
ip-address none
subject-name CN=Secure-CUBE
revocation-check none
rsakeypair CUBE

Authenticate the trustpoint with CA server and accept certificate of CA

crypto pki authenticate CUBE-TLS
Certificate has the following attributes:  
  Fingerprint MD5: BCEBB5A1 1AC882F7 24BE476D 06537711  
  Fingerprint SHA1: CE2FEEA5 42515B33 3EF6A8F6 7E31D6DF 8E32BE6

% Do you accept this certificate? [yes/no]: yes
Trustpoint CA certificate accepted.

Enroll the trustpoint with CA server.
In this step the CUBE receives a signed certificate from CA.

Secure-CUBE(config)#crypto pki enroll CUBE-TLS
%
% Start certificate enrollment ..
% Create a challenge password. You will need to verbally provide this 
  password to the CA Administrator in order to revoke your certificate.  
  For security reasons your password will not be saved in the configuration. 
  Please make a note of it.

Password:
Re-enter password:

% The subject name in the certificate will include: CN=Secure-CUBE  
% The fully-qualified domain name will not be included in the certificate  
Request certificate from CA? [yes/no]: yes
% Certificate request sent to Certificate Authority
% The 'show crypto pki certificate verbose CUBE-TLS' command will show the 
  fingerprint.

Configure TCP TLS as transport protocol

voice service voip
sip
session transport tcp tls

Assign trustpoint for sip-ua, this trustpoint is used for all SIP signaling between CUBE and CUCM.
sip-ua
crypto signaling remote-addr <cucm pub ip address> 255.255.255.255 trustpoint CUBE-TLS
crypto signaling remote-addr <cucm sub ip address> 255.255.255.255 trustpoint CUBE-TLS

Or or default trustpoint can be configured for all SIP signaling from CUBE.
sip-ua
crypto signaling default trustpoint CUBE-TLS

!Enable SRTP.
Voice service voip
srtp fallback

!Configure secure transcoder is required.
dspfarm profile 1 transcode universal security
codec g711ulaw
codec g711alaw
codec g729ar8
codec g729abr8
maximum sessions 10
associate application CUBE

### TLS for SCCP Connection for DSP Services

The Cisco Unified Border Element supports Transport Layer Security (TLS) to be enabled or disabled between the Skinny Call Control Protocol (SCCP) server and the SCCP client. By default, TLS is enabled, which provides added protection at the transport level and ensures that SRTP keys are not easily accessible. Once TLS is disabled, the SRTP keys are not protected.

SRTP-RTP interworking is available with normal and universal transcoders. The transcoder on the Cisco Unified Border Element is invoked using SCCP messaging between the SCCP server and the SCCP client. SCCP messages carry the SRTP keys to the digital signal processor (DSP) farm at the SCCP client. The
transcoder can be within the same router or can be located in a separate router. TLS should be disabled only when the transcoder is located in the same router. To disable TLS, configure the no form of the tls command in DSPFARM profile configuration mode. Disabling TLS improves CPU performance.

Configuring Secure Transcoding

Configuring the Certificate Authority

Perform the steps described in this section to configure the certificate authority.

SUMMARY STEPS

1. enable
2. configure terminal
3. ip http server
4. crypto pki server cs-label
5. database level complete
6. grant auto
7. no shutdown
8. exit

### Configuring a Trustpoint for the Secure Universal Transcoder

Perform the task in this section to configure, authenticate, and enroll a trustpoint for the secure universal transcoder.

**Before you begin**

Before you configure a trustpoint for the secure universal transcoder, you should configure the certificate authority, as described in the Configuring the Certificate Authority, on page 401.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint name**
4. **enrollment url url**
5. **serial-number**
6. **revocation-check method**
7. **rsakeypair key-label**
8. **end**
9. **crypto pki authenticate name**
10. **crypto pki enroll name**
11. **exit**
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable&lt;br&gt;&lt;br&gt;<strong>Example:</strong>&lt;br&gt;&lt;br&gt;Device&gt; enable</td>
<td>Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal&lt;br&gt;&lt;br&gt;<strong>Example:</strong>&lt;br&gt;&lt;br&gt;Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>

### Configuring DSPFARM Services

For configuration steps, see Configuring LTI-Based Transcoding.

### Associating SCCP to the Secure DSPFARM Profile

Perform the task in this section to associate SCCP to the secure DSPFARM profile.

**Before you begin**

Before you associate SCCP to the secure DSPFARM profile, you should configure DSPFARM services, as described in the “Configuring DSPFARM Services”.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `sccp local interface-type interface-number`
4. `sccp ccm ip-address identifier identifier-number version version-number`
5. `sccp`
6. `associate ccm identifier-number priority priority-number`
7. `associate profile profile-identifier register device-name`
8. `dspfarm profile profile-identifier transcode universal security`
9. `trustpoint trustpoint-label`
10. `codec codec-type`
11. Repeat Step 10 to configure required codecs.
12. `maximum sessions number`
13. `associate application sccp`
14. `no shutdown`
15. `exit`

#### DETAILED STEPS

<td>Associates a Cisco Unified CallManager with a Cisco CallManager group and establishes its priority within the group.</td>
</tr>
<tr>
<td><code>associate ccm identifier-number priority priority-number</code></td>
<td>• In the example, the following parameters are set:</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• The number 1 identifies the Cisco Unified CallManager.</td>
</tr>
<tr>
<td>Device(config-sccp-ccm)# <code>associate ccm 1 priority 1</code></td>
<td>• The Cisco Unified CallManager is configured with the highest priority within the Cisco CallManager group.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| 7    | **associate** profile profile-identifier **register** device-name | Associates a DSPFARM profile with a Cisco CallManager group.  
  - In the example, the following parameters are set:  
    - The number 1 identifies the DSPFARM profile.  
    - Sxcoder is configured as the user-specified device name in Cisco Unified CallManager.  
  | Example:  
  ```  
  Device(config-sccp-ccm)# associate profile 1 register sxcoder  
  ```  |
| 8    | dspfarm profile profile-identifier **transcode** universal security | Defines a profile for DSPFARM services and enters DSPFARM profile configuration mode.  
  - In the example, the following parameters are set:  
    - Profile 1 is enabled for transcoding.  
    - Profile 1 is enabled for secure DSPFARM services.  
  | Example:  
  ```  
  Device(config-sccp-ccm)# dspfarm profile 1 transcode universal security  
  ```  |
| 9    | trustpoint trustpoint-label | Associates a trustpoint with a DSPFARM profile.  
  - In the example, the trustpoint to be associated with the DSPFARM profile is labeled secdsp.  
  | Example:  
  ```  
  Device(config-dspfarm-profile)# trustpoint secdsp  
  ```  |
| 10   | codec codec-type | Specifies the codecs that are supported by a DSPFARM profile.  
  - In the example, the g711ulaw codec is specified.  
  | Example:  
  ```  
  Device(config-dspfarm-profile)# codec g711ulaw  
  ```  |
| 11   | Repeat Step 10 to configure required codecs. | -- |
| 12   | **maximum** sessions **number** | Specifies the maximum number of sessions that are supported by the profile.  
  - In the example, a maximum of 84 sessions are supported by the profile. The maximum number of sessions depends on the number of DSPs available for transcoding.  
  | Example:  
  ```  
  Device(config-dspfarm-profile)# maximum sessions 84  
  ```  |
| 13   | associate application sccp | Associates SCCP to the DSPFARM profile.  
  | Example:  
  ```  
  Device(config-dspfarm-profile)# associate application sccp  
  ```  |
| 14   | no shutdown | Allocates DSPFARM resources and associates them with the application.  
  | Example:  
  ```  
  Device(config-dspfarm-profile)# no shutdown  
  ```  |
Registering the Secure Universal Transcoder to the CUBE

Perform the task in this section to register the secure universal transcoder to the Cisco Unified Border Element. The Cisco Unified Border Element Support for SRTP-RTP Interworking feature supports both secure transcoders and secure universal transcoders.

**Before you begin**

Before you register the secure universal transcoder to the Cisco Unified Border Element, you should associated SCCP to the secure DSPFARM profile, as described in the *Associating SCCP to the Secure DSPFARM Profile*, on page 404.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `telephony-service`
4. `sdspfarm transcode sessions number`
5. `sdspfarm tag number device-name`
6. `em logout time1 time2 time3`
7. `max-epones max-epones`
8. `max-dn max-directory-numbers`
9. `ip source-address ip-address`
10. `secure-signaling trustpoint label`
11. `tftp-server-credentials trustpoint label`
12. `create cnf-files`
13. `no sccp`
14. `sccp`
15. `end`

</table>
| **Step 3** telephony-service | Specifies the maximum number of transcoding sessions allowed per Cisco CallManager Express router.  
  • In the example, a maximum of 84 DSPFARM sessions are specified.    |
| Example:                  |                                                                                                                                 |
| Device(config)# telephony-service | Permits a DSPFARM to be registered to Cisco Unified CallManager Express and associates it with an SCCP client interface's MAC address.  
  • In the example, DSPFARM 1 is associated with the sxcoder device. |
| **Step 4** sdpfarm transcode sessions number | Configures three time-of-day-based timers for automatically logging out all Extension Mobility feature users.  
  • In the example, all users are logged out from Extension Mobility after 00:00. |
| Example:                  |                                                                                                                                 |
| Device(config-telephony)# sdpfarm transcode sessions 84 | Sets the maximum number of Cisco IP phones to be supported by a Cisco CallManager Express router.  
  • In the example, a maximum of four phones are supported by the Cisco CallManager Express router. |
| **Step 7** max-ephones max-ephones | Sets the maximum number of extensions (ephone-dns) to be supported by a Cisco Unified CallManager Express router.  
  • In the example, a maximum of four extensions is allowed. |
| Example:                  |                                                                                                                                 |
| Device(config-telephony)# max-ephones 4 | Identifies the IP address and port through which IP phones communicate with a Cisco Unified CallManager Express router.  
  • In the example, 10.13.2.52 is configured as the router IP address. |
| **Step 9** ip source-address ip-address |                                                                                                                                 |
| Example:                  |                                                                                                                                 |
| Device(config-telephony)# ip source-address 10.13.2.52 |                                                                                                                                 |

### Configuration Examples for SCCP Based Transcoding

**Example: SCCP-based Transcoding**

```
! Enabling dspfarm services under voice-card
Device(config)# voice-card 1
Device(config-voicecard)# dspfarm
Device(config-voicecard)# dsp services dspfarm
Device(config-voicecard)# exit

! Configuring Telephony Service
Device(config)# telephony-service
Device(config-telephony)# sdspfarm units 1
```
Device(config-telephony)# sdspfarm transcode sessions 128
Device(config-telephony)# sdspfarm tag 1 CUBE-XCODE
Device(config-telephony)# max-ephones 10
Device(config-telephony)# max-dn 10
Device(config-telephony)# ip source-address 10.1.1.1 port 2000
Device(config-telephony)# exit

! Configuring SCCP
Device(config)# no sccp
Device(config)# sccp local GigabitEthernet0/0
Device(config)# sccp ccm 10.1.1.1 identifier 1 version 4.0
Device(config)# sccp
Device(config)# sccp ccm group 1
Device(config-sccp-ccm)# associate ccm 1 priority 1
Device(config-sccp-ccm)# associate profile 1 register CUBE-XCODE
Device(config-sccp-ccm)# exit

! Configuring dspfarm profile
Device(config)# dspfarm profile 1 transcode
Device(config-dspfarm-profile)# codec g711ulaw
Device(config-dspfarm-profile)# codec g711alaw
Device(config-dspfarm-profile)# codec g729r8
Device(config-dspfarm-profile)# maximum sessions 10
Device(config-dspfarm-profile)# associate application SCCP
Device(config-dspfarm-profile)# exit
Transrating is a process of configuring a different packetization for a voice codec. For example, transrating G.729 20ms to G.729 30ms.

- Voice Packetization, on page 411
- Configuring Transrating for a Codec, on page 412

Voice Packetization

After the voice wavelength is digitized, the DSP collects the digitized data for an amount of time until there is enough data to fill the payload of a single packet.

With G.711, either 20 ms or 30 ms worth of voice is transmitted in a single packet. 20 ms worth of voice corresponds to 160 samples per packet. With 20 ms worth of voice per packet, 50 packets are created per second: 1 sec / 20 ms = 50.

The packetization rate has a direct effect on the total amount of bandwidth needed. More packets require more headers, and each header adds 40 bytes to the packet. The Table 12: Codec and Bandwidth Information, on page 48 table shows the effect of packetization rates on bandwidth utilization.

Codecs such as G.729 also compress the digitized output. G.729 creates a codeword for every 10 ms of voice. This “codeword” is a predefined representation of a 10-ms sample of human voice. Two codewords are contained in each packet at 50 packets per second or three codewords at 33.3 packets per second. Because the codewords need fewer bits, the overall bandwidth required is reduced.

Table 47: Packetization for different Codecs

# Configuring Transrating for a Codec

## SUMMARY STEPS

1. `enable`  
2. `configure terminal`  
3. `dial-peer voice number voip`  
4. `codec codec-name bytes voice-payload-size [fixed-bytes]`  
5. `end`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable`  
**Example:**  
Device> enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| Step 2 | `configure terminal`  
**Example:**  
Device> configure terminal | Enters global configuration mode. |
| Step 3 | `dial-peer voice number voip`  
**Example:**  
Device(config)# dial-peer voice 1 voip | Enters dial peer configuration mode for the specified VoIP dial peer. |
| Step 4 | `codec codec-name bytes voice-payload-size [fixed-bytes]`  
**Example:**  
Device(config-dial-peer)# codec g729r8 bytes 30 fixed-byte | Configures a different packetizations for a voice codec. |
| Step 5 | `end`  
**Example:**  
Device(config-dial-peer)# end | Exits to privileged EXEC mode. |
CHAPTER 32

Call Progress Analysis Over IP-to-IP Media Session

The Call Progress Analysis Over IP-IP Media Session feature enables the detection of automated answering systems and live human voices on outbound calls and communicates the detected information to the external application. Typically, call progress analysis (CPA) is extensively used in contact center deployments in conjunction with the outbound Session Initiation Protocol (SIP) dialer, where CPA is enabled on the Cisco Unified Border Element (Cisco UBE), and digital signal processors (DSP) perform the CPA functionality.

- Feature Information for Call Progress Analysis Over IP-IP Media Session, on page 413
- Restrictions for Call Progress Analysis Over IP-to-IP Media Session, on page 414
- Information About Call Progress Analysis Over IP-IP Media Session, on page 415
- How to Configure Call Progress Analysis Over IP-to-IP Media Session, on page 416
- Configuration Examples for the Call Progress Analysis Over IP-to-IP Media Session, on page 419

Feature Information for Call Progress Analysis Over IP-IP Media Session

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 48: Feature Information for Call Progress Analysis Over IP-to-IP Media Session

</tr>
<tr>
<td>Support for additional call flows</td>
<td>15.5(2)T</td>
<td>Call Progress Analysis feature is enhanced to support the following call-flows: • 180 SIP response received without SDP • Direct call connect (without 18x from Service Provider) • Multiple 18x response to INVITE • Early dialog UPDATE • Dialer-CUBE CPA call record</td>
</tr>
<tr>
<td>Support for additional call flows</td>
<td>Cisco IOS XE Release 3.15S</td>
<td>Call Progress Analysis feature is enhanced to support the following call-flows: • 180 SIP response received without SDP • Direct call connect (without 18x from Service Provider) • Multiple 18x response to INVITE • Early dialog UPDATE • Dialer-CUBE CPA call record</td>
</tr>
</tbody>
</table>

Restrictions for Call Progress Analysis Over IP-to-IP Media Session

- Only SIP-to-SIP Early Offer (EO-to-EO) call flows are supported.
- Session Description Protocol (SDP) passthrough and flow-around media calls are not supported.
- Only the G711 flavor of codec is supported.
- High Availability (HA) is not supported.
- Skinny Client Control Protocol (SCCP)-based digital signal processor (DSP) farm is not supported.
- CPA cannot not be detected if Dialer uses Inband as DTMF relay mechanism, that is, Inband to RTP-NTE DTMF inter-working is not supported with CPA.
- CPA call record is not supported for "180 without SDP" and "Direct Call Connect (without 18x)" call flows from Service Provider.
Information About Call Progress Analysis Over IP-IP Media Session

Call Progress Analysis

Call progress analysis (CPA) is a DSP algorithm that analyzes the Real-Time Transport Protocol (RTP) voice stream to look for special information tones (SIT), fax or modem tones, human speech, and answering machine tones. CPA also passes the voice information to Cisco IOS or Cisco Unified Border Element (Cisco UBE).

CPA is initiated on receiving a new SIP INVITE with x-cisco-cpa content. While a call is in progress, the DSP or the Xcoder analyzes the incoming voice or media stream. The DSP identifies the type of voice stream based on statistical voice patterns or specific tone frequencies and provides the information to the Cisco UBE. The Cisco UBE notifies the dialer with a SIP UPDATE with x-cisco-cpa content along with the detected event. Based on the report, the caller (dialer) can decide to either transfer the call or terminate the call.

To use the CPA functionality, you must enable CPA and configure CPA timing and threshold parameters.

Table 49: X-cisco-cpa content meaning

### How to Configure Call Progress Analysis Over IP-to-IP Media Session

#### Enabling CPA and Setting the CPA Parameters

Perform the following task to enable CPA and set the CPA timing and threshold parameters:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dspfarm profile profile-identifier transcode
4. call-progress-analysis
5. exit
6. voice service voip
7. cpa timing live-person max-duration
8. cpa timing term-tone max-duration
9. cpa threshold active-signal signal-threshold
10. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```bash
Device> enable
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# configure terminal</td>
<td>Enters DSP farm profile configuration mode, defines a profile for DSP farm services, and enables the profile for transcoding.</td>
</tr>
<tr>
<td><strong>Step 3</strong> dspfarm profile profile-identifier transcode</td>
<td>Enables call progress analysis (CPA) on Cisco UBE.</td>
</tr>
<tr>
<td>Example:</td>
<td>- You must configure this command to activate the CPA feature and set CPA parameters.</td>
</tr>
<tr>
<td>Device(config)# dspfarm profile 15 transcode</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> call-progress-analysis</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-dspfarm-profile)# call-progress-analysis</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-dspfarm-profile)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> voice service voip</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# voice service voip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> cpa timing live-person max-duration</td>
<td>(Optional) Sets the maximum waiting time (in milliseconds) that the CPA algorithm uses to determine if a call is answered by a live human.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(conf-voi-serv)# cpa timing live-person 2501</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> cpa timing term-tone max-duration</td>
<td>(Optional) Sets the maximum waiting time (in milliseconds) that the CPA algorithm uses to wait for the answering machine termination tone after the answering machine is detected.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(conf-voi-serv)# cpa timing term-tone 15500</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> cpa threshold active-signal signal-threshold</td>
<td>(Optional) Sets the threshold (in decibels) of an active signal that is related to the measured noise floor level.</td>
</tr>
<tr>
<td>Example:</td>
<td>- If a signal threshold configured by this command is greater than the measured noise floor level, then the signal is considered as active. The active signal thresholds that you can configure are 9, 12, 15, 18, and 21 decibels.</td>
</tr>
<tr>
<td>Device(conf-voi-serv)# cpa threshold active-signal 18db</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> end</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(conf-voi-serv)# end</td>
<td></td>
</tr>
</tbody>
</table>
Verifying the Call Progress Analysis Over IP-to-IP Media Session

Perform this task to verify that call progress analysis has been configured for a digital signal processor (DSP) farm profile.

SUMMARY STEPS

1. enable
2. show dspfarm profile profile-identifier

DETAILED STEPS

Step 1 enable
Enables privileged EXEC mode.

Example:
Device> enable

Step 2 show dspfarm profile profile-identifier
Displays the configured DSP farm profile information for a selected Cisco Call Manager group. In the following sample output, the Call Progress Analysis field shows that CPA is enabled.

Example:
Device# show dspfarm profile 3

Profile ID = 3, Service = Universal TRANSCODING, Resource ID = 3
Profile Description :
Profile Service Mode : Non Secure
Profile Admin State : UP
Profile Operation State : ACTIVE
Application : CUBE Status : ASSOCIATED
Resource Provider : FLEX_DSPRM Status : UP
Number of Resource Configured : 4
Number of Resources Out of Service : 0
Number of Resources Active : 0
Codec Configuration: num_of_codecs:4
Codec : g711ulaw, Maximum Packetization Period : 30
Codec : g711alaw, Maximum Packetization Period : 30
Codec : g729ar8, Maximum Packetization Period : 60
Codec : g729abr8, Maximum Packetization Period : 60
Noise Reduction : ENABLED
Call Progress Analysis : ENABLED

Troubleshooting Tips

Use the following commands to troubleshoot the call progress analysis for SIP-to-SIP calls:

• debug csip all
• debug voip ccapi inout
The following examples show how to enable CPA and set a few timing and threshold parameters. Depending on your requirements, you can configure more timing and threshold parameters.

```
Device> enable
Device# configure terminal
Device(config)# dspfarm profile 15 transcode
Device(config-dspfarm-profile)# call-progress-analysis
Device(config-dspfarm-profile)# exit
Device(config)# voice service voip
Device(conf-voi-serv)# cpa timing live-person 2501
Device(conf-voi-serv)# cpa timing term-tone 15500
Device(conf-voi-serv)# cpa threshold active-signal 18db
Device(conf-voi-serv)# end
```
Example: Enabling CPA and Setting the CPA Parameters
PART VI

Video

• Video Suppression, on page 423
CHAPTER 33

Video Suppression

The video suppression feature allows pass-through of only audio and image (for T.38 Fax) media types in SDP and drops all other media capabilities.

- Feature Information for Video Suppression, on page 423
- Restrictions, on page 423
- Information About Video Suppression, on page 424
- Configuring Video Suppression, on page 424
- Troubleshooting Tips, on page 425

Feature Information for Video Suppression

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 51: Feature Information for Video Suppression

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support for Video Suppression</td>
<td>Cisco IOS 15.6(2)T</td>
<td>This feature allows pass-through of only audio and application (for T.38 Fax) media types and drops all other media types in SDP.</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS XE Denali 16.3.1</td>
<td>The following commands are introduced: audio forced, voice-class sip audio forced</td>
</tr>
</tbody>
</table>

Restrictions

- Supports only SIP-SIP calls.
• Video suppression is not supported in SDP pass-through mode.

• Video suppression feature removes both video and application m-lines in the incoming SDP. It is not possible to remove application m-line alone and pass across video m-line parameters.

Information About Video Suppression

Video suppression feature enables CUBE to interwork with the networks that support only audio and image media types in SDP and the networks that support video and application media types in addition to audio and image media types.

By default video suppression feature is disabled on CUBE and hence the video capabilities are passed through in SDP. Passing across the video capabilities could cause interoperability issues if one of the networks do not support video capabilities.

By enabling video suppression feature, you can configure CUBE to pass-through audio and image only, and drop all other capabilities such as video and application m-lines. This helps enterprises to interwork with audio capable networks and video capable networks smoothly.

You can enable video suppression at dial-peer level and at global configuration level.

Feature Behavior

• If video suppression is enabled on any of the dial-peers (inbound or outbound), video capabilities are not offered for that particular call.

• Configuring `voice-class sip audio forced [system]` command at a dial-peer level makes use of global configuration level settings for allowing only audio and image media.

• Video suppression feature will work as expected even when codec transparent feature is configured.

Configuring Video Suppression

SUMMARY STEPS

1. enable
2. configure terminal
3. Enter one of the following commands:
   • In the dial-peer configuration mode
     `voice-class sip audio forced`
   • In the global VoIP SIP configuration mode
     `audio forced`
4. end
## Detailed Steps

## Troubleshooting Tips

The following commands are useful for debugging:

- show voip rtp connections
- show call active voice brief
- show call active video brief
- debug voip dialpeer
- debug ccsip all
- debug voip ccapi inout
PART VII

Media Services

• Configuring RTCP Report Generation, on page 429
CHAPTER 34

Configuring RTCP Report Generation

The assisted Real-time Transport Control Protocol (RTCP) feature adds the ability for Cisco Unified Border Element (Cisco UBE) to generate standard RTCP keepalive reports on behalf of endpoints. RTCP reports determine the liveliness of a media session during prolonged periods of silence, such as call hold or mute. Therefore, it is important for the Cisco UBE to generate RTCP reports irrespective of whether the endpoints send or receive media.

Cisco UBE generates RTCP report only when inbound and outbound call legs are SIP, or SIP to H.323, or H.323 to SIP.

- Finding Feature Information, on page 429
- Prerequisites, on page 429
- Restrictions, on page 430
- Configuring RTCP Report Generation on Cisco UBE, on page 430
- Troubleshooting Tips, on page 431
- Feature Information for Configuring RTCP Report Generation, on page 432

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites

Cisco Unified Border Element

- Cisco IOS Release 15.1(2)T or a later release must be installed and running on your Cisco Unified Border Element.
Cisco Unified Border Element (Enterprise)

- Cisco IOS XE Release 3.17S or a later release must be installed and running on your Cisco ASR 1000 Series Router and Cisco ISR 4000 Series Router.

Restrictions

- RTCP report generation over IPv6 is not supported.
- RTCP report generation is not supported for Secure Real-time Transport Protocol (SRTP) or SRT Control Protocol (SRTCP) pass-through as Cisco UBE is not aware of the media encryption or decryption keys.
- RTCP report generation is not supported for loopback calls, T.38 fax, and modem relay calls.
- RTCP or SRTCP report generation is not supported when Cisco UBE inserts a Digital Signal Processor (DSP) for RTP-SRTP interworking on RTP and SRTP call legs.
- RTCP report generation is not supported when there is a call hold with an invalid media address such as 0.0.0.0 in Session Description Protocol (SDP) or Open Logical Channel (OLC).
- RTCP report generation is not supported for RTCP multiplexed with RTP on the same address and port.
- RTCP report generation is not supported on enterprise aggregation services routers (ASRs) and 4000 series integrated services routers (ISRs) when Media Termination Points are collocated with the Cisco Unified Border Element. It affects RFC2833 and RFC4733 DTMF generation when MTP is used for DTMF conversion from Out-of-Band (OOB) to RFC2833 or RFC4733.
- RTCP packet generation is not supported on the SIP leg when the H.323 leg puts the SIP leg on hold in a Slow Start to Delayed-Offer call.

Configuring RTCP Report Generation on Cisco UBE

RTCP keepalive packets indicate session liveliness. When configured on Cisco UBE, RTCP keepalive packets are sent on both inbound and outbound SIP or H.323 call legs.

Perform this task to configure RTCP report generation on Cisco UBE.

SUMMARY STEPS

1. enable
2. configure terminal
3. voice service voip
4. allow-connections from-type to to-type
5. rtcp keepalive
6. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

- **configure terminal**
  - Example:
    - Router# configure terminal

**Step 3**

- **voice service voip**
  - Example:
    - Router(config)# voice service voip

**Step 4**

- **allow-connections from-type to to-type**
  - Example:
    - Router(conf-voi-serv)# allow-connections sip to sip

**Step 5**

- **rtpc keepalive**
  - Example:
    - Router(conf-voi-serv)# rtpc keepalive

**Step 6**

- **end**
  - Example:
    - Router(conf-voi-serv)# end

---

**Troubleshooting Tips**

Use the following debug commands for debugging related to RTCP keepalive packets:

- **debug voip rtpc packet** -- Shows details related to RTCP keepalive packets such as RTCP sending and receiving paths, Call ID, Globally Unique Identifier (GUID), packet header, and so on.

```
Router# debug voip rtpc packet
01:06:27.450: //6/xxxxxxxxxxxx/RTP/Event/voip_rtp_send_rtcp_keepalive: Generate RTCP Keepalive
  *Mar 17 01:06:27.450: rtcp_send_report: Attributes
    (src ip=192.168.30.3, src port=17101, dst ip=192.168.30.4, dst port=18619
     bye=0, initial=1, ssrc=0x07111E02, keepalive=1)
    (rtcp=0x2E5AF214, ssrc=0x07111E02, source->ssrc=0x00001E03, total_len=36)
  2E5AF210: 80C90001 07111E02 81CA0006 .I.......J..
  2E5AF220: 07111E02 010F302E 302E3040 392E3435 ......0.0.0@9.45
  2E5AF230: 2E33302E 33000000 00 ....30.3....
```
Under moderate traffic loads, the **debug voip rtp packet** command produces a high volume of output and the command should be enabled only when the call volume is very low.

- **debug voip rtp packet** -- Shows details about VoIP RTP packet debugging trace.

```
Router# debug voip rtp packet
VOIP RTP All Packets debugging is on
```

- **debug voip rtp session** -- Shows all RTP session debug information.

```
Router# debug voip rtp session
VOIP RTP All Events debugging is on
```

- **debug voip rtp error** -- Shows details about debugging trace for RTP packet error cases.

```
Router# debug voip rtp error
VOIP RTP Errors debugging is on
```

- **debug ip rtp protocol** -- Shows details about RTP protocol debugging trace.

```
Router# debug ip rtp protocol
RTP protocol debugging is on
```

- **debug voip rtcp session** -- Shows all RTCP session debug information.

```
Router# debug voip rtcp session
VOIP RTCP Events debugging is on
```

- **debug voip rtcp error** -- Shows details about debugging trace for RTCP packet error cases.

```
Router# debug voip rtcp error
VOIP RTCP Errors debugging is on
```

---

**Feature Information for Configuring RTCP Report Generation**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

PART VIII

Media Recording

- Network-Based Recording, on page 437
- SIPREC (SIP Recording), on page 463
- Video Recording - Additional Configurations, on page 487
- Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording, on page 493
- Cisco Unified Communications Gateway Services--Extended Media Forking, on page 501
Network-Based Recording

The Network-Based Recording feature supports software-based forking for Real-time Transport Protocol (RTP) streams. Media forking provides the ability to create midcall multiple streams (or branches) of audio and video associated with a single call and then send the streams of data to different destinations. To enable network-based recording using Cisco Unified Border Element (CUBE), you can configure specific commands or use a call agent. CUBE acts as a recording client and MediaSense Session Initiation Protocol (SIP) recorder acts a recording server.

- Feature Information for Network-Based Recording, on page 437
- Restrictions for Network-Based Recording, on page 438
- Information About Network-Based Recording Using CUBE, on page 439
- How to Configure Network-Based Recording, on page 442
- Additional References for Network-Based Recording, on page 462

Feature Information for Network-Based Recording

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

</tr>
</tbody>
</table>
Restrictions for Network-Based Recording

- Network-based recording is not supported for the following calls:
  - Calls that do not use Session Initiation Protocol (SIP). Must be a SIP-to-SIP call flow
  - Flow-around calls
  - Session Description Protocol (SDP) pass-through calls
  - Real-time Transport Protocol (RTP) loopback calls
  - High-density transcoder calls
  - IPv6-to-IPv6 calls
  - IPv6-to-IPv4 calls with IPv4 endpoint.
  - Secure Real-time Transport Protocol (SRTP) passthrough calls
  - SRTP-RTP calls with forking for SRTP leg (forking is supported for the RTP leg)
  - Resource Reservation Protocol (RSVP)
  - Multicast music on hold (MOH)

- Any media service parameter change via Re-INVITE or UPDATE from Recording server is not supported
  Midcall renegotiation and supplementary services can be done through the primary call only.

- Media service parameter change via Re-INVITE or UPDATE message from the recording server is not supported

- Recording is not supported if CUBE is running a TCL IVR application with the exception of survivability.tcl, which is supported with network based recording.

- Media mixing on forked streams is not supported

- Digital Signal Processing (DSP) resources are not supported on forked legs
Restrictions for Video Recording

- If the main call has multiple video streams (m-lines), the video streams other than the first video m-line are not forked.
- Application media streams of the primary call are not forked to the recording server.
- Forking is not supported if the anchor leg or recording server is on IPv6.
- High availability is not supported on forked video calls.

Information About Network-Based Recording Using CUBE

Deployment Scenarios for CUBE-based Recording

CUBE as a recording client has the following functions:

- Acts as a SIP user agent and sets up a recording session (SIP dialog) with the recording server.
- Acts as the source of the recorded media and forwards the recorded media to the recording server.
- Sends information to a server that helps the recording server associate the call with media streams and identifies the participants of the call. This information sent to the recording server is called metadata.

Note

CUBE simply forwards the RTP streams it receives to the SIP recorder. It does not support omitting any pre-agent VRU activity from the recording.

If you want to omit the VRU segment from a recording, you must use the Unified CVP to route the agent segment of the call back through CUBE. To do this, you need to separate ingress and media forking function from one another, which means you must either route the call through the ingress router a second time, or route it through a second router.

Given below is a typical deployment scenario of a CUBE-based recording solution. The information flow is described below:

Figure 36: Deployment Scenario for CUBE-based Recording Solution

1. Incoming call from SIP trunk.
2. Outbound call to a Contact Centre
3. Media between endpoints flow through CUBE

4. CUBE sets up a new SIP session with MediaSense based on policy.

5. CUBE forks RTP media to MediaSense. For an audio call, audio is forked. For a video call, both audio and video are forked. For an audio-only configuration in an audio-video call, only audio is forked. There will be two or four m-lines to the recording server, based on the type of recording.

The metadata carried in the SIP session between the recording client and the recording server is to:

- Carry the communication session data that describes the call.
- Send the metadata to the recording server. The recording server uses the metadata to associate communication sessions involving two or more participants with media streams.

The call leg that is created between the recording client and the recording server is known as the recording session.

**Open Recording Architecture**

The Open Recording Architecture (ORA) comprises of elements, such as application management server and SIP bridge, to support IP-based recording. The ORA IP enables recording by solving topology issues, which accelerates the adoption of Cisco unified communication solutions.

Following are the three layers of the ORA architecture:
**Network Layer**

The ORA network layer is comprised of call control systems, media sources, and IP foundation components, such as routers and switches.

**Capture and Media Processing Layer**

The ORA capture and media processing layer includes core functions of ORA—terminating media streams, storage of media and metadata, and speech analytics that can provide real-time events for applications.

**Application Layer**

The ORA application layer supports in-call and post-call applications through open programming interfaces. In-call applications include applications that make real-time business decisions (for example, whether to record a particular call or not), control pause and resume from Interactive Voice Response (IVR) or agent desktop systems, and perform metadata tagging and encryption key exchange at the call setup.

Post-call applications include the following:

- Traditional compliance search, replay, and quality monitoring.
- Advanced capabilities, such as speech analytics, transcription, and phonetic search.
- Custom enterprise integration.
- Enterprise-wide policy management.

**Media Forking Topologies**

The following topologies support media forking:

**Media Forking with Cisco UCM**

The figure below illustrates media forking with Cisco Unified CallManager (Cisco UCM) topology. This topology supports replication of media packets to allow recording by the caller agent. It also enables CUBE to establish full-duplex communication with the recording server. In this topology, SIP recording trunk is enhanced to have additional call metadata.
Media Forking without Cisco UCM

The topology below shows media forking without the Cisco UCM topology. This topology supports static configuration on CUBE and the replication of media packets to allow recording caller-agent and full-duplex interactions at an IP call recording server.

SIP Recorder Interface

SIP is used as a protocol between CUBE and the MediaSense SIP server. Extensions are made to SIP to carry the recording session information needed for the recording server. This information carried in SIP sessions between the recording client and the recording server is called metadata.

Metadata

Metadata is the information that is passed by the recording client to the recording server in a SIP session. Metadata describes the communication session and its media streams.

Metadata is used by the recording server to:

- Identify participants of the call.
- Associate media streams with the participant information. Each participant can have one or more media streams, such as audio and video.
- Identify the participant change due to transfers during the call.

The recording server uses the metadata information along with other SIP message information, such as dialog ID and time and date header, to derive a unique key. The recording server uses this key to store media streams and associate the participant information with the media streams.

How to Configure Network-Based Recording

Configuring Network-Based Recording (with Media Profile Recorder)

12. destination-pattern [+] string [T]

13. session protocol sipv2

14. session target ipv4: [recording-server-destination-address | recording-server-dns]

15. session transport tcp

16. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> media profile recorder <em>profile-tag</em></td>
<td>Configures the media profile recorder and enters media profile configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# media profile recorder 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> (Optional) media-type audio</td>
<td>Configures recording of audio only in a call with both audio and video. If this configuration is not done, both audio and video are recorded.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(cfg-mediaprofile)# media-type audio</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> media-recording <em>dial-peer-tag</em> [dial-peer-tag2...dial-peer-tag5]</td>
<td>Configures the dial-peers that need to be configured.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(cfg-mediaprofile)# media-recording 8000 8001 8002</td>
<td><strong>Note</strong> You can specify a maximum of five dial-peer tags.</td>
</tr>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Exits media profile configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(cfg-mediaprofile)# exit</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 7</strong> media class tag</td>
<td>Configures a media class and enters media class configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# media class 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> recorder profile tag</td>
<td>Configures the media profile recorder.</td>
</tr>
<tr>
<td>Example: Device(cfg-mediaclass)# recorder profile 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> exit</td>
<td>Exits media class configuration mode.</td>
</tr>
<tr>
<td>Example: Device(cfg-mediaclass)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> dial-peer voice dummy-recorder-dial-peer-tag voip</td>
<td>Configures a recorder dial peer and enters dial peer voice configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# dial-peer voice 8000 voip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> media-class tag</td>
<td>Configures media class on a dial peer.</td>
</tr>
<tr>
<td>Example: Device(config-dial-peer)# media-class 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> destination-pattern [+] string [T]</td>
<td>Specifies either the prefix or the full E.164 telephone number (depending on your dial plan) to be used for a dial peer.</td>
</tr>
<tr>
<td>Example: Device(config-dial-peer)# destination-pattern 595959</td>
<td></td>
</tr>
</tbody>
</table>

**Note**  
The predefined valid entries for `string` are the digits 0 to 9, the letters A to F and, the following special characters:  
- The asterisk (*) and pound sign (#) that appear on standard touch-tone dial pads.  
- Plus sign (+), which indicates that the preceding digit occurred one or more times.  
- Backslash symbol (\), which is followed by a single character, and matches that character.

Media Forking functionality does not work with the wildcard entries other than the predefined set.

</table>
Verifying the Network-Based Recording Using CUBE

Perform this task to verify the configuration of the Network-Based Recording Using CUBE. The `show` and `debug` commands can be entered in any order.

**SUMMARY STEPS**

1. `enable`
2. `show voip rtp connections`
3. `show voip recmsp session`
4. `show voip recmsp session detail call-id call-id`
5. `show voip rtp forking`
6. `show call active voice compact`
7. `show call active video compact`
8. `show sip-ua calls`
9. `show call active video brief`
10. `debug cc sip messages` (for audio calls)
11. `debug cc sip messages` (for video calls)
12. `debug cc sip messages` (for audio-only recording in a call with both audio and video)
13. Enter one of the following:
   - `debug cc sip all`
   - `debug voip recmsp all`
   - `debug voip ccapi all`
   - `debug voip fpi all` (for ASR devices only)

**DETAILED STEPS**

**Step 1**
`enable`
Enables privileged EXEC mode.

**Example:**

```
Device> enable
```

**Step 2**
`show voip rtp connections`
Displays Real-Time Transport Protocol (RTP) connections. Two extra connections are displayed for forked legs.

**Example:**

```
Device# show voip rtp connections
VoIP RTP Port Usage Information:
Max Ports Available: 8091, Ports Reserved: 101, Ports in Use: 8
Port range not configured, Min: 16384, Max: 32767

</tbody>
</table>

Found 8 active RTP connections

#### Step 3

**show voip recmsp session**

Displays active recording Media Service Provider (MSP) session information internal to CUBE.

**Example:**

```
Device# show voip recmsp session
```

RECMSP active sessions:
- MSP Call-ID: 143
  - AnchorLeg Call-ID: 141
  - ForkedLeg Call-ID: 145

Found 1 active sessions

#### Step 4

**show voip recmsp session detail call-id call-id**

Displays detailed information about the recording MSP Call ID.

**Example:**

```
Device# show voip recmsp session detail call-id 145
```

RECMSP active sessions:
Detailed Information

---

Recording MSP Leg Details:
- Call ID: 143
- GUID: 7C5946D38ECD

- **AnchorLeg Details:**
  - Call ID: 141
  - Forking Stream type: voice-nearend
  - Participant: 708090

- **Non-anchor Leg Details:**
  - Call ID: 140
  - Forking Stream type: voice-farend
  - Participant: 10000

- **Forked Leg Details:**
  - Call ID: 145
  - Near End Stream CallID 145
  - Stream State: ACTIVE
  - Far End stream CallID 146
Stream State ACTIVE
Found 1 active sessions

Device# show voip recmsp session detail call-id 5

RECMSP active sessions:
Detailed Information

Recording MSP Leg Details:
Call ID: 5
GUID : 1E01B6000000

AnchorLeg Details:
Call ID: 1
Forking Stream type: voice-nearend
Forking Stream type: video-nearend
Participant: 1777

Non-anchor Leg Details:
Call ID: 2
Forking Stream type: voice-farend
Forking Stream type: video-farend
Participant: 1888

Forked Leg Details:
Call ID: 6
Voice Near End Stream CallID 6
Stream State ACTIVE
Voice Far End stream CallID 7
Stream State ACTIVE
Video Near End stream CallID 8
Stream State ACTIVE
Video Far End stream CallID 9
Stream State ACTIVE
Found 1 active sessions

<table>
<thead>
<tr>
<th>Output Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stream State</td>
<td>Displays the state of the call. This can be ACTIVE or HOLD.</td>
</tr>
<tr>
<td>Msp Call-Id</td>
<td>Displays an internal Media service provider call ID and forking related statistics for an active forked call.</td>
</tr>
<tr>
<td>Anchor Leg Call-id</td>
<td>Displays an internal anchor leg ID, which is the dial peer where forking enabled. The output displays the participant number and stream type. Stream type voice-near end indicates the called party side.</td>
</tr>
<tr>
<td>Non-Anchor Call-id</td>
<td>Displays an internal non-anchor leg ID, which is the dial peer where forking is not enabled. The output displays the participant number and stream type. Stream type voice-near end indicates the called party side.</td>
</tr>
<tr>
<td>Forked Call-id</td>
<td>This forking leg call-id will show near-end and far-end stream call-id details with state of the Stream . Displays an internal foked leg ID. The output displays near-end and far-end details of a stream.</td>
</tr>
</tbody>
</table>

Step 5

`show voip rtp forking`

Displays RTP media-forking connections.

Example:
Device# show voip rtp forking
VoIP RTP active forks :
Fork 1
  stream type voice-only (0): count 0
  stream type voice+dtmf (1): count 0
  stream type dtmf-only (2): count 0
  stream type voice-nearend (3): count 1
  remote ip 10.42.29.7, remote port 38526, local port 18648
    codec g711ulaw, logical ssrc 0x53
    packets sent 29687, packets received 0
  stream type voice+dtmf-nearend (4): count 0
  stream type voice-farend (5): count 1
  remote ip 10.42.29.7, remote port 50482, local port 17780
    codec g711ulaw, logical ssrc 0x55
    packets sent 29686, packets received 0
  stream type voice+dtmf-farend (6): count 0
  stream type video (7): count 0

<table>
<thead>
<tr>
<th>Output Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote ip 10.42.29.7, remote port 38526, local</td>
<td>Recording server IP, recording server port, and local CUBE device port</td>
</tr>
<tr>
<td>port 18648</td>
<td>where data for stream 1 was first sent from.</td>
</tr>
<tr>
<td>remote ip 10.42.29.7, remote port 50482, local</td>
<td>Recording server IP, recording server port, and local CUBE device port</td>
</tr>
<tr>
<td>port 17780</td>
<td>where data for stream 2 was first sent from.</td>
</tr>
<tr>
<td>packets sent 29686</td>
<td>Number of packets sent to the recorder</td>
</tr>
<tr>
<td>codec g711ulaw</td>
<td>Codec negotiated for the recording leg.</td>
</tr>
</tbody>
</table>

**Step 6**

show call active voice compact

Displays a compact version of voice calls in progress. An additional call leg is displayed for media forking.

**Example:**

Device# show call active voice compact
<callID> A/O FAX T<sec> Codec type Peer Address IP R<ip>:<udp>
Total call-legs: 3
  140 ANS T644 g711ulaw VOIP P10000 10.42.30.32:18638
  141 ORG T644 g711ulaw VOIP P708090 10.42.30.189:26184
  145 ORG T643 g711ulaw VOIP P595959 10.42.29.7:38526

**Step 7**

show call active video compact

Displays a compact version of video calls in progress.

**Example:**

Device# show call active video compact
<callID> A/O FAX T<sec> Codec type Peer Address IP R<ip>:<udp>
Total call-legs: 3
  1 ANS T14 H264 VOIP-VIDEO P1777 10.104.8.94:20036
  2 ORG T14 H264 VOIP-VIDEO P1888 10.104.8.98:29652
  6 ORG T13 H264 VOIP-VIDEO P1234 10.104.105.232:39318

**Step 8**

show sip-ua calls

Displays active user agent client (UAC) and user agent server (UAS) information on SIP calls.
Example:

Device# show sip-ua calls
Total SIP call legs:2, User Agent Client:1, User Agent Server:1
SIP UAC CALL INFO

SIPREC (SIP Recording)

The SIPREC (SIP Recording) feature supports media recording for Real-time Transport Protocol (RTP) streams in compliance with section 3.1.1. of RFC 7245, with CUBE acting as the Session Recording Client. SIP is used as a protocol between CUBE and the recording server. Recording of a media session is done by sending a copy of a media stream to the recording server. Metadata is the information that is passed by the recording client to the recording server in a SIP session. The recording metadata describes the communication session and its media streams, and also identifies the participants of the call. CUBE acts as the recording client and any third party recorder acts as the recording server.

Feature Information for SIPREC-based Recording

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

</tbody>
</table>
Prerequisites for SIPREC Recording

Make sure that:

- Recorders must be reachable from CUBE
- SIPREC should be configured; else, CUBE will fall back to the existing Network-Based Recording implementation. For more information, see Network-Based Recording section.
- CUBE supports the SIP Recording Metadata model format requirements specified in draft-ietf-siprec-metadata-17. Recorders must support metadata format of ver17 at a minimum
- CUBE should be in compliance with the Session Recording Protocols defined in draft-ietf-siprec-protocol-16. CUBE supports only the “siprec Option” Tag and the “src feature” tag among the various other extensions defined in the protocols draft; CUBE does not support the SDP extensions.

Restrictions for SIPREC Recording

SIPREC-based recording is not supported for the following calls:

- Any media service parameter change via Re-INVITE or UPDATE from recording server is not supported. For example, hold-resume or any codec changes
- IPv6-to-IPv6 call recording
- IPv6-to-IPv4 call recording if the recording server is configured on the IPv6 call leg
- Calls that do not use Session Initiation Protocol (SIP). Must be a SIP-to-SIP call flow
- Flow-around calls
- Session Description Protocol (SDP) pass-through calls
- Real-time Transport Protocol (RTP) loopback calls
- High-density transcoder calls
- Secure Real-time Transport Protocol (SRTP) pass-through calls
- SRTP-RTP calls with forking for SRTP leg (forking is supported for the RTP leg)
- Multicast music on hold (MOH)
- Mid-call renegotiation and supplementary services like Hold/Resume, control pause, and so on are not supported on the recorder call leg
- Recording is not supported if CUBE is running a TCL IVR application with the exception of survivability.tcl, which is supported with SIPREC based recording
- Media mixing on forked streams is not supported
- Digital Signal Processing (DSP) resources are not supported on forked legs

Restrictions for Video Recording
Information About SIPREC Recording Using CUBE

Deployment

You need to have:

- Participants — SIP UAs involved in the Communication Session. The UA can be any SIP element.
- Communication Session (CS) — Session established between the endpoints.
- Session Recording Client (SRC) — CUBE acts as the session recording client that triggers the recording session.
- Session Recording Server (SRS) — A SIP User Agent (UA) which is a specialized media server and that acts as a sink for the recorded media and metadata.
- Recording Session (RS) — SIP dialog established between CUBE (recording client) and the recording server.
- Recording Metadata — Information on the CS and the associated media stream data sent from CUBE to RS.

The following figure illustrates a third party recorder deployment with CUBE.

*Figure 37: Deployment Scenario for SIPREC Recording Solution*

Information flow is described below:

1. Incoming call from SIP trunk
2. Outbound call to Contact Center
3. Media between endpoints flow through CUBE
4. CUBE sets up a new SIP session with the recording device (SRS)
5. CUBE forks RTP media to SRS

In the preceding illustration, the Real Time Protocol (RTP) carries voice data and media streams between the user agents and CUBE. The RTP unidirectional stream represents the communication session forked from CUBE to the recording server to indicate forked media. The Session Initiation protocol (SIP) carries call signaling information along with the metadata information. Media streams from CUBE to recording server are unidirectional because only CUBE sends recorded data to recording server; the recording server does not send any media to CUBE.

Metadata has the following functions:

- Carry the communication session data (audio and video calls) that describes the call to the recording server.
- Identifies the participants list.
- Identifies the session and media association time.

If there are any changes in the call sessions, for example, hold-resume, transfer and so on, these sessions are notified to the recording server through metadata.

**SIPREC High Availability Support**

High availability is supported for SIPREC recording using CUBE. All metadata elements will be checkpointed in a forked call when high-availability is configured. In the event of SSO, all the forked calls and media contexts are preserved on failover.

**How to Configure SIPREC-Based Recording**

**Configuring SIPREC-Based Recording (with Media Profile Recorder)**

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `media profile recorder profile-tag`
4. *(Optional) `media-type audio`*
5. `media-recording dial-peer-tag [dial-peer-tag2...dial-peer-tag5]`
6. `exit`
7. `media class tag`
8. `recorder profile tag siprec`
9. `exit`
10. `dial-peer voice dummy-recorder-dial-peer-tag voip`
11. `media-class tag`
12. `destination-pattern [+ string [T]]`
### Media Recording

#### Configuring SIPREC-Based Recording (with Media Profile Recorder)

13. session protocol sipv2
14. session target ipv4: [recording-server-destination-address | recording-server-dns]
15. session transport tcp
16. end

### Detailed Steps

This m-line carries the media stream from the SRC to the SRS.</td>
</tr>
</tbody>
</table>
ParticipantCSAssociation class describes the association of the first participant to a CS for a period of time. A participant can associate and dissociate from a CS several times.

ParticipantCS association class has the following attributes:

- Associate-time—Time when the participant is associated to CS.
- Disassociate-time—Time when the participant is disassociated from a CS.

Each CS object is represented by one session element. Each session element has a unique 'session_id' attribute which helps to identify unique CS sessions.

ParticipantCSAssociation class describes the association of the second participant to a CS for a period of time. A participant can associate and dissociate from a CS several times.

The 'session_id' attribute helps to identify unique CS session of the second participant.

Participant stream association class describes the association of either participant 1 or 2 to a media stream for a period of time, as a sender or as a receiver, or both. These streams can be either audio or video or both.

ParticipantStream association class has the following attributes:

- Associate-time—Time when the participant starts contributing for a media stream.
- Disassociate-time—Time when the participant stops receiving a media stream.

### Example: Hold with Send-only / Recv-only Attribute in SDP

When a participant puts the audio call on hold with send-only attribute, the stream is sent only in one direction.

Here, in a normal recording session, both participants sent audio and video streams.

<recording xmlns="urn:ietf:params:xml:ns:recording:1">

</recording>
In this scenario, the second participant puts the call on hold using sendonly and the first participant will respond using recvonly. You can see from the participantStream association element that the second participant only sends audio and video streams and the first participant just receives the media streams.

The output after the second participant puts the call on hold with sendonly attribute:

```
Content-Type: application/sdp

v=0
o=CiscoSystemsSIP-GW-UserAgent 2973 4880 IN IP4 9.42.25.149
s=SIP Call

a=fmtp:101 0-16
a=ptime:20
a=sendonly
a=label:2
m=video 16500 RTP/AVP 97
a=rtpmap:97 H264/90000
a=fmtp:97 profile-level-id=42801E;packetization-mode=0
a=sendonly
a=label:3
m=video 16502 RTP/AVP 97
a=rtpmap:97 H264/90000
a=fmtp:97 profile-level-id=42801E;packetization-mode=0
a=sendonly
a=label:4
```
When the first participant puts the call on hold with inactive SDP attribute, there will be not any active streams in the metadata.
Example: Escalation

During escalation, video streams will be added to the Re-INVITE meta-data sent to the recorder.

In the below example, you can see the metadata representation of an original audio call sent in the initial INVITE to the recorder where both the participants send and receive audio streams.

```
Content-Type: application/sdp
Content-Disposition: session; handling=required

v=0
o=CiscoSystemsSIP-GW-UserAgent 6360 4788 IN IP4 9.42.25.149
s=SIP Call
c=IN IP4 9.42.25.149
t=0 0
m=audio 16628 RTP/AVP 8 101
c=IN IP4 9.42.25.149
a=rtpmap:8 PCMA/8000
a=inactive
```

After escalation, video streams get added into the participantStream association element in metadata for both the participants. There will be 4 streams in total.
Example: De-escalation

During de-escalation, video streams will be truncated in the Re-INVITE metadata sent to the recorder.

In the below example, you can see two streams each for the audio and video calls in the metadata.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<recording xmlns="urn:ietf:params:xml:ns:recording:1">
  ...
  <stream stream_id="e5Zhtv1CEeSBPasYHx7YVg==" session_id="evv2v/1CEeSBM6sYHx7YVg=="/>
    <label>4</label>
  </stream>
  ...
  <participantstreamassoc participant_id="evyS5/1CEeSB0asYHx7YVg==">
    <send>evyS5/1CEeSB0ksYHx7YVg==</send>
    <recv>evyS5/1CEeSB0qsYHx7YVg==</recv>
    <send>e5Zhtv1CEeSBPsYHx7YVg==</send>
    <recv>e5Zhtv1CEeSBPsYHx7YVg==</recv>
  </participantstreamassoc>
</recording>
```

Example: De-escalation

During de-escalation, video streams will be truncated in the Re-INVITE metadata sent to the recorder.

In the below example, you can see two streams each for the audio and video calls in the metadata.
After de-escalation, video streams are removed from the metadata and only audio calls will be present in the `participantStream association` element.

Configuration Example for Metadata Variations with Different Transfer Flows

Example: Transfer of Re-INVITE/REFER Consume Scenario

In the case of Re-INVITE or REFER Consume transfer scenarios, CUBE receives re-INVITE with caller-id change. This re-INVITE will have the remote-party-ID details.

After transfer, participant A is disassociated from the call and participant C joins the call. This information is provided in the metadata sent to the recording server. Here, 7774442214 associates and 7774442212 dissociates from the call.

INVITE sip:7774442216@10.64.86.102:5060;transport=tcp SIP/2.0
From: <sip:7774442212@10.104.54.52>;tag=498652-97a89a01
To: <sip:7774442216@10.64.86.102>;tag=7C798-1441
...
...
Remote-Party-ID: <sip:7774442214@10.104.54.52>;party=calling;screen=yes;privacy=off
Contact: <sip:7774442214@10.104.54.52:5060;transport=tcp>
...

<participant participant_id="vm+z2xM6EeWAIN4iOrLrag==" nameID aor="sip:7774442214@10.104.54.52"> </nameID>
</participant>

<participant sessionassoc participant_id="vm+z2xM6EeWAIN4iOrLrag==" session_id="vACJ+xM6EeWAF9410rLrag=="> <associate-time>2015-06-16T08:44:32.869Z</associate-time> </participant sessionassoc>

Example: Caller-ID UPDATE Request and Response Scenario

In case of Re-INVITE based transfer, any UPDATE request will contain caller-id changes. These changes are forwarded to the remote party and once CUBE receives a 200OK message, the remote-party-ID details are transferred.

The response of UPDATE request contains the associated caller-id changes. The CUBE forwards the response UPDATE information to the remote party with caller-id changes after the UPDATE request. From the metadata, you can see that the participants A and C disassociate from the call and participants B and D joins (associates) the call. Here, 7774442212 and 7774442216 disassociates from the call and 7774442214 and 7774442218 joins the call after the caller-id update.

Configuration Example for Metadata Variations with Call Disconnect

Example: Disconnect while Sending Metadata with BYE

When the original call disconnects without any reason, CUBE initiates a BYE session with the recording server along with the metadata.

In this case, the metadata contains the end time of the session along with the disassociation time of all the active participants from the call.

BYE sip:55555555@8.41.17.71:13961;transport=UDP SIP/2.0

CHAPTER 37

Video Recording - Additional Configurations

This module describes the following additional configurations that can be done for Video Recording:

- Request a Full-Intra Frame using RTCP or SIP INFO methods.
- Configure an H.264 Packetization mode.
- Monitor Intra-Frames and Reference Frames

- Feature Information for Video Recording - Additional Configurations, on page 487
- Information About Additional Configurations for Video Recording, on page 488
- How to Configure Additional Configurations for Video Recording, on page 488
- Verifying Additional Configurations for Video Recording, on page 491

Feature Information for Video Recording - Additional Configurations

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 55: Feature Information for Network-Based Recording of Video Calls Using Cisco Unified Border Element

<table>

<tbody>
<tr>
<td>Network-Based Recording of Video Calls Using Cisco Unified Border Element</td>
<td>15.3(3)M Cisco IOS XE Release 3.10S</td>
<td>The Network-Based Recording of Video Calls Using Cisco Unified Border Element feature supports software-based forking and recording of video calls. The following commands were introduced or modified: media profile video, ref-frame-req-rtpc, ref-frame-req-sip-info, video profile, h264-packetization-mode, monitor-ref-frames.</td>
</tr>
</tbody>
</table>
Information About Additional Configurations for Video Recording

Full Intra-Frame Request

Full Intra-Frame Request is a request sent for an I-frame. An I-frame is an entire key or reference frame that is compressed without considering preceding or succeeding video frames. Succeeding video frames are differences to the original I-frame (what has moved) instead of entire video frame information.

The call between Cisco Unified Border Element and the Cisco MediaSense server is established after the call between the endpoints is established. As a result, the Real-Time Transport Protocol (RTP) channel between the endpoints gets established first and the RTP channel with the recording server gets established later. The impact of this delay is more on video recording because the initial I-frame from the endpoint may not get forked, and frames that follow cannot get decoded. To mitigate the impact of the lost RTP video packets, Cisco Unified Border Element generates Full Intra-Frame Request (FIR) using either Real-Time Transport Control Protocol (RTCP) or SIP INFO, or both, requesting the endpoint to send a fully encoded video frame in the subsequent RTP packet.

The following types of FIR are supported on network-based recording of video calls using Cisco Unified Border Element:

- RTCP FIR (based on RFC 5104).
- SIP INFO FIR (based on RFC 5168).
- Both RTCP FIR and SIP INFO FIR (Cisco Unified Border Element can be configured to send both RTCP FIR and SIP INFO requests at the same time).

How to Configure Additional Configurations for Video Recording

Enabling FIR for Video Calls (Using RTCP of SIP INFO)

Perform this task to enable Full Intra-Frame Request (FIR) during the network-based recording of a video call using Real-Time Transport Control Protocol (RTCP) or using the Session Initiation Protocol (SIP) INFO method.

SUMMARY STEPS

1. enable
2. configure terminal
3. media profile video media-profile-tag
4. Do one of the following:
   - ref-frame-req rtcp retransmit-count retransmit-number
   - ref-frame-req sip-info
5. end
**Detailed Steps**

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td>Device(cfg-mediaprofile)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring H.264 Packetization Mode**

When a device configured as CUBE is offered more than one H.264 packetization mode on an inbound video call leg, the device offers all received modes to the outbound call leg, allowing dynamic change of mode during a call. However when a call is forked, the MediaSense recording server is not able to support this dynamic change of the packetization mode.

This feature restricts the device and allows it to offer only the configured packetization mode to the outbound call leg when media forking is configured.

**Summary Steps**

1. enable
2. configure terminal
3. media profile video media-profile-tag
4. h264-packetization-mode packetization mode
5. end
## DETAILED STEPS

</tbody>
</table>

## Monitoring Reference files or Intra Frames

Perform this task to configure device to perform deep packet inspection (DPI) of RTP packets received from an endpoint and keep track of how many instantaneous decoder refresh (IDR) frames have been received and the timestamp of the IDRs.

## SUMMARY STEPS

1. enable
2. configure terminal
3. media profile video media-profile-tag
4. monitor-ref-frames
5. end

### Verifying Additional Configurations for Video Recording

Perform this task to verify the additional configurations of the video recording. The `show` commands can be entered in any order.

#### SUMMARY STEPS

1. **enable**
2. `show call active video called-number number | include VideoRtcpIntraFrameRequestCount`
3. `show call active video called-number number | include VideoSipInfoIntraFrameRequestCount`
4. `show call active video | include VideoTimeOfLastReferenceFrame`
5. `show call active video | include VideoReferenceFrameCount`

#### DETAILED STEPS

**Step 1** enable

Enables privileged EXEC mode.

Example:

Device> enable

**Step 2** show call active video called-number number | include VideoRtcpIntraFrameRequestCount

Displays the number of RTCP FIR requests sent on each leg.

Example:

Device# show call active video called-number 990057 | include VideoRtcpIntraFrameRequestCount

! Main call legs
VideoRtcpIntraFrameRequestCount=1
VideoRtcpIntraFrameRequestCount=1

!CUBE does not generate FIR request on forked leg
VideoRtcpIntraFrameRequestCount=0

Step 3  
show call active video called-number number | include VideoSipInfoIntraFrameRequestCount
Displays the number of SIP INFO FIR requests sent on each leg.

Example:
Device# show call active video called-number 990062 | include VideoSipInfoIntraFrameRequestCount

! Main call legs
VideoSipInfoIntraFrameRequestCount=1
VideoSipInfoIntraFrameRequestCount=1

!CUBE does not generate FIR request on forked leg
VideoSipInfoIntraFrameRequestCount=0

Step 4  
show call active video | include VideoTimeOfLastReferenceFrame
Displays the timestamp of latest IDR frame.

Step 5  
show call active video | include VideoReferenceFrameCount
Displays the number of IDR frames received on that call leg.
Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording

The Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording feature provides support for the transmission of globally unique identifiers (GUIDs) received from a third-party private branch exchange (PBX) to the recording server using an established Session Initiation Protocol (SIP) session, making CUBE recording more interoperable with third-party vendors.

- Feature Information for Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording, on page 493

</tr>
</thead>
<tbody>
<tr>
<td>Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording</td>
<td>Cisco IOS 15.4(3)M, Cisco IOS XE 3.13S</td>
<td>The Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording feature provides support for the transmission of globally unique identifiers (GUIDs) received from a third-party private branch exchange (PBX) to the recording server via an established SIP session, making CUBE recording more interoperable with third-party vendors.</td>
</tr>
</tbody>
</table>

Restrictions for Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording

- The third-party GUID must be received through an INVITE message or a 200 OK message (depending on whether the third-party PBX is initiating the call [caller] or receiving the call [callee]). No other request type, including re-invites, is supported.
- The third-party GUID can be received only through the primary inbound call leg or the primary outbound call leg.

Information About Third-Party GUID Capture for Correlation Between Calls and SIP-based recording

Enterprise call control systems such as the Cisco Unified Communications Manager (CUCM) use globally unique identifiers (GUIDs) to correlate the multiple call legs of a single call. The call can then be forwarded or transferred, creating additional call legs associated with the same GUID. When recording is configured, CUBE initiates a SIP session with a recording server and forks the media packets it receives or transmits, along with participant information like called number, calling number, Remote Party ID (RPID), and P-Asserted-Identity (PAI).

While the Cisco-Guid header (used by CUCM) is transmitted to the recording server, third-party GUIDs are not. Third-party GUIDs can be received through an INVITE message or a 200 OK message, depending on whether the third-party PBX is initiating the call [caller] or receiving the call [callee].

Forwarding the GUID to the recording server enables correlation between call records of the PBX and the recording server.

How to Capture Third-Party GUID for Correlation Between Calls and SIP-based Recording

To capture the third-party GUID and forward it to the recording server, you need to copy a third-party GUID header that CUBE receives, configure a SIP copylist for that header, and apply it to the primary inbound and
outbound call leg dial peers. A SIP profile is configured to copy this incoming header to a user-defined variable and apply it to an outgoing header on the recording leg dial peer.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `voice class sip-copylist tag`
4. `sip-header ThirdParty-GUID-headername`
5. `exit`
6. `dial-peer voice inbound-dialpeer-tag voip`
7. `voice class sip-copylist tag`
8. `exit`
9. `dial-peer voice outbound-dialpeer-tag voip`
10. `voice class sip-copylist tag`
11. `exit`
12. `voice class sip-profiles profile-id`
13. `request INVITE peer-header sip GUID-header-to-copy copy header-value-to-match copy-variable`
14. `request INVITE sip-header header-to-add add header-value-to-add`
15. `request INVITE sip-header GUID-header-to-modify modify header-value-to-match header-value-to-replace`
16. `exit`
17. `dial-peer voice recorder-dial-peer-tag voip`
18. `voice-class sip profiles profile-tag`
19. `end`

```
Device(config-class)# request INVITE sip-header
Unsupported add "Unsupported: Dummy Header"
```

#### Step 15
**request INVITE sip-header GUID-header-to-modify**
**modify header-value-to-match header-value-to-replace**

**Example:**
```
Device(config-class)# request INVITE sip-header
Unsupported modify ".*" "Third-Party-GUID: \u01"
```

#### Step 16
**exit**

**Example:**
```
Device(config-class)# exit
```

#### Step 17
**dial-peer voice recorder-dial-peer-tag voip**

**Example:**
```
Device(config)# dial-peer voice 2 voip
```

#### Step 18
**voice-class sip profiles profile-tag**

**Example:**
```
Device(config-dial-peer)# voice-class sip profiles 30
```

#### Step 19
**end**

**Example:**
```
Device(config-dial-peer)# end
```

---

## Verifying Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording

### SUMMARY STEPS

1. **debug ccsip messages** for an INVITE message
2. **debug ccsip messages** for a 200 OK message

### DETAILED STEPS

#### Step 1
**debug ccsip messages** for an INVITE message

Displays all Session Initiation Protocol (SIP) Service Provider Interface (SPI) messages for an INVITE message.

**Example:**
Configuration Examples for Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording

Step 2  
```
debug ccsip messages
```

for a 200 OK message

Displays all Session Initiation Protocol (SIP) Service Provider Interface (SPI) messages for a 200 OK message.

**Example:**
```
Received:
SIP/2.0 200 OK
Via: SIP/2.0/UDP 9.44.29.32:5060;branch=z9hG4bK121F62

```

```
Configuration Examples for Third-Party GUID Capture for Correlation Between Calls and SIP-based Recording

! Create a copylist
Device(config)# voice class sip-copylist 100
! GUID for third party PBX
Device(config-class)# sip-header Third-Party-GUID
!GUID for CUCM
Device(config-class)# sip-header Cisco-Guid
Device(config-class)# exit

! Apply copylist to inbound dial peer so that headers specified in copylist are copied
Device(config)# dialpeer voice 2 voip
Device(config-dial-peer)# voice class sip-copylist 100
Device(config-dial-peer)# exit

! SIP profile copies incoming third-party GUID to a variable from a peer header. This variable
! is then used modify outgoing headers
Device(config)# voice class sip-profiles 10
Device(config-class)# request INVITE peer-header sip Third-Party-GUID copy "(.*)" u01
Device(config-class)# request INVITE sip-header Unsupported add "Unsupported: Dummy Header"
Device(config-class)# request INVITE sip-header Unsupported modify ".*" "Third-Party-GUID: \u01"
```
Device(config-class)# exit

! Apply SIP profile to outbound dial peer
Device(config)# dial-peer voice 2 voip
Device(config-dial-peer)# voice-class sip profiles 30
CHAPTER 39

Cisco Unified Communications Gateway Services--Extended Media Forking

The Cisco Unified Communications (UC) Services API provides a unified web service interface for the different services in IOS gateway thereby facilitating rapid service development at application servers and managed application service providers.

This chapter explains the Extended Media Forking (XMF) provider that allows applications to monitor calls and trigger media forking on Real-time Transport Protocol (RTP) and Secure RTP calls.

- Feature Information for Cisco Unified Communications Gateway Services—Extended Media Forking, on page 501
- Restrictions for Extended Media Forking, on page 502
- Information About Cisco Unified Communications Gateway Services, on page 502
- How to Configure UC Gateway Services, on page 509
- Configuration Examples for UC Gateway Services, on page 516

Feature Information for Cisco Unified Communications Gateway Services—Extended Media Forking

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

</tr>
</tbody>
</table>
Restrictions for Extended Media Forking

The Extended Media Forking does not support the following:

- Media renegotiation.
- Media mixing on forked media streams.
- recordTone insertion with SRTP calls.
- mediaForkingReason tag is only to notify midcall stream events; notification for events such as codec change.
- Supplementary services.
- High Availability (HA).
- Virtual Routing and Forwarding (VRF) or Multi-VRF.

Note

Only voice media stream is supported.

Information About Cisco Unified Communications Gateway Services

Extended Media Forking (XMF) Provider and XMF Connection

The XMF provider allows applications to monitor calls and trigger media forking on the calls and has the capability to service up to 32 applications. The XMF provider can invoke a call-based or a connection-based media forking using the Unified Communications (UC) API. After the media forking is invoked, it can preserve the media forking initiated by the web application if the WAN connection to the application is lost. The XMF provider also provides the recording tone to the parties involved in the call.

The XMF connection describes the relationship between an XMF call and the endpoint (or trunk) involved in the call. A connection abstraction maintained in the gateway has the following connection states:

- IDLE: This state is the initial state for all new connections. Such connections are not actively part of a telephone call, yet their references to the Call and Address objects are valid. Connections typically do
not stay in the IDLE state for long and quickly transition to other states. The application may choose to be notified at this state using the event filters and if done, call/connection at the gateway provider will use the NotifyXmfConnectionData(CREATED) message to notify the application listener that a new connection is created.

- ADDRESS_COLLECT: In this state the initial information package is collected from the originating party and is examined according to the “dialing plan” to determine the end of collection of addressing information. In this state, the call in the gateway collects digits from the endpoint. No notification is provided.

- CALL_DELIVERY: On the originating side, this state involves selecting of the route as well as sending an indication of the desire to set up a call to the specified called party. On the terminating side, this state involves checking the busy/idle status of the terminating access and also informing the terminating message of an incoming call. The application may choose to be notified at this state using the event filters and if done, the call or connection at the gateway provider will use the NotifyXmfConnectionData (CALL_DELIVERY) message to notify the application listener.

- ALERTING: This state implies that the Address is being notified of an incoming call. The application may choose to be notified at this state using the event filters and if done, the call or connection at the gateway provider will use the NotifyXmfConnectionData (ALERTING) message to notify the application listener.

- CONNECTED: This state implies that a connection and its Address is actively part of a telephone call. In common terms, two parties talking to one another are represented by two connections in the CONNECTED state. The application may choose to be notified at this state using the event filters and if done, the call or connection at the gateway provider will use the NotifyXmfConnectionData (CONNECTED) message to notify the application listener.

- DISCONNECTED: This state implies it is no longer part of the telephone call. A Connection in this state is interpreted as once previously belonging to this telephone call. The application may choose to be notified at this state using the event filters and if done, the call or connection at the gateway provider will use the NotifyXmfConnectionData (DISCONNECTED) message to notify the application listener.

**XMF Call-Based Media Forking**

In call-based media forking of the gateway, the stream from the calling party is termed as near-end stream and the stream from the called party is termed as far-end stream.

The XMF provider actively handles single media forking request per session. Any new media forking request from the external application will override or stop the current forking instance and would start a new forking instance (to the appropriate target IP address or ports).

After the media forking request is accepted, the XMF provider returns a response message and starts to fork media streams of a connection to the target forked streams. A NotifyXmfCallData message will be notified to the application for the updated media forking status, that is, FORK-FAILED, FORK_STARTED, or FORK_DONE.

**XMF Connection-Based Media Forking**

In connection-based media forking of the gateway, the incoming stream to the connection is termed as near-end stream and the outgoing stream of the connection is termed as far-end stream.
The XMF provider actively handles single media forking request per session. Any new media forking request from the external application will override or stop the current forking instance and would start a new forking instance (to the appropriate target IP address or ports).

After the media forking request is accepted, the XMF provider returns a response message and starts to fork media streams of a connection to the target forked streams.

*Figure 38: XMF Connection-Based Media Forking*

A NotifyXmfConnectionData message will be notified to the application for the updated media forking status:

- **FORK_FAILED**—Media forking is setup failure. No forked RTP connections can be established to target RTP addresses.
- **FORK_STARTED**—Media forking is set up successfully. Both Tx (transmit) and Rx (receive) forked RTP connections are established and connected to target (farEnd and nearEnd) RTP addresses.
- **FORK_DONE**—Media forking is completed. Both Tx and Rx forked RTP connections are released.

**Extended Media Forking API with Survivability TCL**

Cisco Unified Border Element (CUBE) supports Survivability TCL Script to co-exist with Cisco Unified Communication (UC) Services API.

Cisco UC Services API XMF interface supports media forking for all the calls controlled by survivability TCL script including the survivability re-attempted calls. Thus, all the calls controlled by survivability TCL script can be recorded when requested by Cisco UC Services XMF API.

Cisco Unified Communications Manager controlled Gateway recording utilizes XMF to trigger media forking on CUBE or SIP based PSTN gateways in the supported call flows.
Media forking is allowed only for survivability TCL script supported by Cisco Unified Customer Voice Portal (CVP). CVP survivability TCL script is not supported in High Availability mode.

The following call scenarios are supported:

- Basic comprehensive call
- Calls with Refer Consume
- Calls with Mid-call failure
- Calls with alternative route with initial call failure

There are no configuration changes required for enabling CVP survivability TCL support with Cisco UC Gateway Services API.

### Media Forking for SRTP Calls

- SRTP forking is supported in XCC and XMF application service providers and the supported APIs are RequestCallMediaForking, RequestCallMediaSetAttributes, and RequestConnectionMediaForking.
- SRTP forking is supported for SRTP-to-SRTP, SRTP-to-RTP, and RTP-to-SRTP calls.
  - For SRTP-to-SRTP calls, media forking on either leg would result in SRTP streams being forked.
  - For SRTP fallback calls, after the initial offer, CUBE will fall back to RTP. Media forking either call legs would result in RTP streams being forked.
  - For SRTP-to-RTP interworking calls, a digital signal processor (DSP) is required and involves transcoding. In this case, one leg would be SRTP and the other leg RTP.
- SRTP Crypto keys are notified over the API.
- Supports automatic stopping of media forking when stream changes from SRTP or to SRTP.
  - The optional mediaForkingReason tag in XMF or XCC Notify messages indicates that the forking has been stopped internally.
  - mediaForkingReason tag is only present when the connection changes state, such as mid-call re-INVITE. SRTP stream can change to RTP or SRTP stream can change keys mid-call.
  - mediaForkingReason tag is always accompanied by FORK_DONE.

### Crypto Tag

For SRTP forking, the optional Crypto tag in NotifyXmfConnectionData or NotifyXmfCallData message indicates the context of an actively forked SRTP connection.

The Crypto tag is only present in the notification message where FORK_STARTED tag is present.
The optional Crypto tag specifies the following:

- The Crypto suite used for encryption and authentication algorithm.
- The base64 encoded mastery key and salt used for encryption.

Crypto suite can be one of the two suites supported in IOS:

- AES_CM_128_HMAC_SHA1_32
- AES_CM_128_HMAC_SHA1_80

### Note

The application is notified of the content in Crypto and inline SDP lines.

### Multiple XMF Applications and Recording Tone

Multiple XMF allows multiple (maximum 32) web applications to register with the XMF provider as separate XMF applications and provide redundancy for the voice calls recording. Recording tone provides recording tone capability to the recording sessions. Recording tone is supported for IP to IP, IP to TDM, and TDM to TDM trunks.

An example topology is as shown below where 4 CUCM applications are deployed. CUCM triggers media forking request to Cisco UBE. Recording tone is played to the parties involved in the call based on the recordTone parameter set in the media forking request.
Media forking can be invoked using any of the following APIs:

- RequestXmfConnectionMediaForking
- RequestXmfCallMediaForking
- RequestXmfCallMediaSetAttributes

The “recordTone” parameter can be enabled in any of the above requests and recording tone will be played for the parties involved in the call. The “recordTone” parameter in the API request can have the following values:

- COUNTRY_US
- COUNTRY_AUSTRALIA
- COUNTRY_GERMANY
- COUNTRY_RUSSIA
- COUNTRY_SPAIN
- COUNTRY_SWITZERLAND
There is no difference in the recording tone beep when any country value is chosen. Recording tone beep is played at an interval of every 15 seconds. Digital signal processors and other resources are not utilized for playing recording tone even for transcoded calls. No specific configuration is required to enable or disable recording tone. By default, no recording tone is enabled.

If “recordTone” parameter is enabled only on the farEndAddr, then this tone is played only on the outgoing leg. Likewise, if enabled only on the nearEndAddr, then the tone is played only on the incoming leg. When enabled in both the far and near end, then recording tone is played on both the legs.

The RequestXmfConnectionMediaForking API allows insertion of recording tone on a per connection basis. There could be scenarios where one leg receives two recordTone insertion requests. When a leg receives recordTone insertion request, the nearEnd request always takes precedence over the farEnd request.

**Forking Preservation**

After media forking is initiated by the web application, the forking can be preserved to continue the recording, even if the WAN connection to the application is lost or if the application is unregistered.

*Figure 40: Forking Preservation*

The “preserve” parameter value can be set to TRUE or FALSE in any of the 3 forking requests (RequestXmfConnectionMediaForking, RequestXmfCallMediaForking, or RequestXmfCallMediaSetAttributes) from the application to Cisco UBE.

- If the “preserve” parameter received is TRUE, then forking will continue the recording, even if the WAN connection to application is lost or application is unregistered.

- If the “preserve” parameter received is FALSE, then forking will not continue the recording.

- If the “preserve” parameter is not received in the media forking request, then forking will not continue the recording.
# How to Configure UC Gateway Services

## Configuring Cisco Unified Communication IOS Services on the Device

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip http server`
4. `ip http max-connections value`
5. `ip http timeout-policy idle seconds life seconds requests value`
6. `http client connection idle timeout seconds`
7. `uc wsapi`
8. `message-exchange max-failures number`
9. `probing max-failures number`
10. `probing interval keepalive seconds`
11. `probing interval negative seconds`
12. `source-address ip-address`
13. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip http server</td>
<td>Enables the HTTP server (web server) on the system.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip http server</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip http max-connections</td>
<td>Sets the maximum number of concurrent connections to the HTTP server</td>
</tr>
<tr>
<td><strong>value</strong></td>
<td>that will be allowed. The default value is 5.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip http max-connection 100</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

Sets the characteristics that determine how long a connection to the HTTP server should remain open. The characteristics are:

- **idle**—The maximum number of seconds the connection will be kept open if no data is received or response data cannot be sent out on the connection. Note that a new value may not take effect on any already existing connections. If the server is too busy or the limit on the idle time or the number of requests is reached, the connection may be closed sooner. The default value is 180 seconds (3 minutes).

- **life**—The maximum number of seconds the connection will be kept open, from the time the connection is established. Note that the new value may not take effect on any already existing connections. If the server is too busy or the limit on the idle time or the number of requests is reached, it may close the connection sooner. Also, since the server will not close the connection while actively processing a request, the connection may remain open longer than the specified life time if processing is occurring when the life maximum is reached. In this case, the connection will be closed when processing finishes. The default value is 180 seconds (3 minutes). The maximum value is 86400 seconds (24 hours).

- **requests**—The maximum limit on the number of requests processed on a persistent connection before it is closed. Note that the new value may not take effect on any already existing connections. If the server is too busy or the limit on the idle time or the life time is reached, the connection may be closed before the maximum number of requests are processed. The default value is 1. The maximum value is 86400.

### Command or Action

**Step 5**

`ip http timeout-policy idle seconds life seconds requests value`  
**Example:**

```
Device(config)# ip http timeout-policy idle 600 life 86400 requests 86400
```

**Purpose**

Sets the number of seconds that the client waits in the idle state until it closes the connection.

**Step 6**

`http client connection idle timeout seconds`  
**Example:**

```
Device(config)# http client connection idle timeout 600
```

**Step 7**

`uc wsapi`  
**Example:**

```
Device(config)# uc wsapi
```

Enters Cisco Unified Communication IOS Service configuration mode.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 8    | message-exchange max-failures `number`  
**Example:**  
Device(config-uc-wsapi)# message-exchange max-failures 2 | Configures the maximum number of failed message exchanges between the application and the provider before the provider stops sending messages to the application. Range is 1 to 3. Default is 1. |
| 9    | probing max-failures `number`  
**Example:**  
Device(config-uc-wsapi)# probing max-failures 5 | Configures the maximum number of failed probing messages before the router unregisters the application. Range is 1 to 5. Default is 3. |
| 10   | probing interval keepalive `seconds`  
**Example:**  
Device(config-uc-wsapi)# probing interval keepalive 255 | Configures the time interval between probing messages when the session is in a keepalive state. Range is from 1 to 255 seconds. Default is 5 seconds.  
**Note** The keepalive timer restarts when a valid HTTP message is received from the UC services API. The following are valid HTTP messages that can restart the timer:  
- RESPONSE_XMF_REGISTER  
- RESPONSE_XMF_CONN_MEDIA_FORKING  
- SOLICIT_XMF_PROBING  
- NOTIFY_XMF_CONNECTION_DATA |
| 11   | probing interval negative `seconds`  
**Example:**  
Device(config-uc-wsapi)# probing interval negative 10 | Configures the interval between negative probing messages, in seconds. |
| 12   | source-address `ip-address`  
**Example:**  
Device(config-uc-wsapi)# source-address 192.1.12.14 | Configures the IP address (hostname) as the source IP address for the UC IOS service.  
**Note** The source IP address is used by the provider in the NotifyProviderStatus messages. |
| 13   | end  
**Example:**  
Device(config-uc-wsapi)# end | Returns to privileged EXEC mode. |
Configuring the XMF Provider

SUMMARY STEPS

1. enable
2. configure terminal
3. uc wsapi
4. source-address ip address
5. provider xmf
6. no shutdown
7. remote-url index url
8. end

### Verifying the UC Gateway Services

The show commands can be entered in any order.

#### SUMMARY STEPS

1. enable
2. show wsapi registration all
3. show wsapi registration xmf remote-url-index
4. show call media-forking

#### DETAILED STEPS

**Step 1**

**enable**

Enables privileged EXEC mode.

**Example:**

Device> enable

**Step 2**

**show wsapi registration all**

Displays the details of applications registered. Each registered application is identified by a different ID.

**Example:**

Device# show wsapi registration all

```
Provider XMF
------------------------------------------------------------------------
registration index: 11
  id: 2E7C3034:XMF:myapp:26
  appUrl: http://pascal-lnx.cisco.com:8094/xmf
  appName: myapp
  provUrl: http://9.45.46.16:8090/cisco_xmf
  prober state: STEADY
  connEventsFilter: CREATED|REDIRECTED|ALERTING|CONNECTED|TRANSFERRED|CALL_DELIVERY|DISCONNECTED|HANDOFF_JOIN|HANDOFF_LEAVE
  mediaEventsFilter: DTMF|MEDIA_ACTIVITY|MODE_CHANGE|TONE_DIAL|TONE_OUT_OF_SERVICE|TONE_SECOND_DIAL
```
show wsapi registration xmf remote-url-index

Displays the details of only a particular XMF registered application with any ID ranging from 1 to 32.

Example:

Device# show wsapi registration xmf 1

show call media-forking

Displays the forked stream information.

Example:

Device# show call media-forking

Warning: Output may be truncated if sessions are added/removed concurrently!
Session  | Call  |  n/f  | Destination (port address)  
---|---|---|---
187  | BA  | near 45864  | 10.104.105.232  
188  | BA  | far 54922  | 10.104.105.232  
189  | B9  | near 45864  | 10.104.105.232  
190  | B9  | far 54922  | 10.104.105.232

Troubleshooting Tips

Use the following `debug` commands to troubleshoot the UC Gateway Services configurations.

- `debug wsapi infrastructure all`
- `debug wsapi xcc all`
- `debug wsapi xmf all`
- `debug wsapi xmf messages`
- `debug wsapi infrastructure detail`
- `debug voip application`
- `debug voip application media forking`
Configuration Examples for UC Gateway Services

Example: Configuring Cisco Unified Communication IOS Services

The following example shows how to configure the device for Cisco Unified Communication IOS Services and enable the HTTP server:

Device> enable
Device# configure terminal
Device(config)# ip http server
Device(config)# ip http max-connection 100
Device(config)# ip http timeout-policy idle 600 life 86400 requests 86400
Device(config)# http client connection idle timeout 600
Device(config)# uc wsapi
Device(config-uc-wsapi)# message-exchange max-failures 2
Device(config-uc-wsapi)# probing max-failures 5
Device(config-uc-wsapi)# probing interval keepalive 255
Device(config-uc-wsapi)# probing interval negative 10
Device(config-uc-wsapi)# source-address 192.1.12.14
Device(config-uc-wsapi)# end

Example: Configuring the XMF Provider

The following example shows how to enable the XMF providers. The configuration specifies the address and port that the application uses to communicate with the XMF provider:

Device> enable
Device# configure terminal
Device(config)# uc wsapi
Device(config-uc-wsapi)# provider xmf
Device(config-uc-wsapi)# no shutdown
Device(config-uc-wsapi)# remote-url 1 http://test.com:8090/ucm_xmf
Device(config-uc-wsapi)# end

Example: Configuring UC Gateway Services

uc wsapi
message-exchange max-failures 5
response-timeout 10
source-address 192.1.12.14
probing interval keepalive 250
probing interval negative 20
provider xmf
remote-url 1 http://pascal-lnx.cisco.com:8050/ucm_xmf
PART IX

CUBE Media Proxy

• CUBE Media Proxy, on page 519
CUBE Media Proxy

The CUBE Media Proxy is a solution that provides multiple forking function and it is built on the CUBE architecture. Multiple forks are required for recorder redundancy and advanced media processing needs. The CUBE Media Proxy supports mandatory and optional recorders. CUSP supports the CUBE Media Proxy with functions such as recorder redundancy and load balancing.

- Feature Information for CUBE Media Proxy, on page 519
- Supported Platforms, on page 520
- Restrictions for CUBE Media Proxy, on page 520
- Information About Multiple Media Forking Using CUBE Media Proxy, on page 520
- How to Configure CUBE Media Proxy for Media Forking, on page 526
- Recording State Notification, on page 539
- Support for Mid-Call Features, on page 542
- Secure Recording of Secure Calls, on page 545
- Support for High Availability (HA), on page 546
- Media Latch, on page 547

Feature Information for CUBE Media Proxy

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 57: Feature Information for Recording Proxy

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUBE Media Proxy</td>
<td>IOS XE Gibraltar Release 16.10.1a</td>
<td>The CUBE Media Proxy solution provides multiple forking function for redundancy and advanced media processing.</td>
</tr>
</tbody>
</table>
Supported Platforms

CUBE Media Proxy is supported on the following Cisco Router Platforms running on Cisco IOS XE Software Releases:

- Cisco 4000 Series-Integrated Services Routers (ISR G3 - 4331, 4351, 4431, 4451)
- Cisco Aggregated Services Routers (ASR - ASR1001-X, ASR1002-X, ASR1004 with RP2 and ESP40, ASR1006 with RP2 and ESP40)
- Cisco Cloud Services Routers (CSR1000V series)

Restrictions for CUBE Media Proxy

The CUBE Media Proxy does not support the following:

- Video recording
- Recording of calls from the endpoints that are registered with the Cloud. Example, Cisco Webex Teams Hybrid calls.
- Secure media (SRTP) forking of non secure calls
- SRTP fall back
- Midcall block
- Collocation with CUBE
- Midcall updates from the recorders such as pause or resume recording, RE-INVITE with SDP changes, INVITE that replaces header that is sent by recorders when they switch from active to standby CUBE Media Proxy.

Midcall update "BYE" from the recorders is supported.

- If the primary recorder sends a=inactive in the response SDP, the same is forwarded to CUCM. Forking is not triggered to any of the recorders.

Information About Multiple Media Forking Using CUBE Media Proxy

Deployment Scenarios for CUBE Media Proxy Based Media Forking

The CUBE Media Proxy as a media forking solution supports the following functions:

- Recording forking to multiple recorders
• Recorder redundancy by hunting algorithm
• Recording session policy control
• Load balancing during the initial call setup
• High Availability
• Transport protocols such as TLS, TCP and, UDP

Given below are the deployment scenarios of CUBE Media Proxy solution. You can deploy the CUBE Media Proxy for both external and internal calls. The information flow is described below:

*Figure 41: Deployment Scenarios for CUBE Media Proxy*

1. External or internal call is set up between the endpoints.
2. The CUBE Media Proxy receives the media forking request.
3. The CUBE Media Proxy sets up sessions with recorders based on the proxy policy.

   • Mandatory recorder: Proxy policy is configured to set a recorder as mandatory. First, the CUBE Media Proxy tries to establish a connection with the mandatory recorder. Forking to the remaining recorders happens only if the connection with the mandatory recorder is successful.
• Optional recorders: When the proxy policy is not configured, all the recorders are set as optional. CUBE Media Proxy continues to try to establish a connection with the remaining recorders even if any of the recorders fail.

**Note**  
If the proxy server receives '486' response from the initial recording server, CUBE does not fork the INVITE to other recorders. To perform alternative routing, configure the **voice hunt user-busy** command in global configuration mode.  
Example: **Router(config)# voice hunt user-busy**

4. The CUBE Media Proxy sends the invite to the recorders via CUSP.

5. CUSP performs load balancing and redundancy among recorders.

**Note**  
The minimum supported Release of CUCM and CUSP required for the CUBE Media Proxy solution are CUCM Release 12.5.1 and CUSP Release 9.1.8 respectively.

**Media Forking Topologies for CUBE Media Proxy**

The following topologies support media forking using CUBE Media Proxy:

**Gateway Forking to CUBE Media Proxy**

The figure below illustrates the forking to CUBE Media Proxy via Gateway. This topology supports non secure forking.

*Figure 42: Gateway Forking to CUBE Media Proxy*

**Phone BiB Forking to CUBE Media Proxy**

The figure below illustrates the forking to CUBE Media Proxy via phone BiB. This topology supports secure forking of all calls and non secure forking of non secure calls.
Recording Metadata

Metadata is the information that a Recording Server receives from a recording client in a SIP session. The SIP header in the recording request that the CUBE Media Proxy receives from CUCM contains metadata that provides information on the communication session. The CUBE Media Proxy sends this SIP INVITE header with metadata to all the configured recorders.

A sample SIP header of a recording request is given below. A SIP header of size up to 583 bytes is supported.

```
From: "abcd" <sip:198101@10.200.25.137;
x-nearend;x-refci=27298698;x-nearendclusterid=NY-NJ-Labcluster;
x-nearenddevice=SEP2834A28318CE;
x-nearendaddr=198101;x-farendrefci=27298699;
x-farendclusterid=NY-NJ-Labcluster;x-farenddevice=AFIFIM-VI1;x-farendaddr=172001;
x-sessionid=696dd5d3f7755c6abdc438e93d01febf
;tag=14087-b35a5915-3167-4d6a-871d-c12121602bf-27298703
```

The following metadata from the SIP header is sent in all the requests and responses of a recording session. A maximum of 16 parameters are supported in the metadata of a SIP header.

```
; x-nearend;x-refci=27298698;x-nearendclusterid=NY-NJ-Labcluster;
x-nearenddevice=SEP2834A28318CE;
x-nearendaddr=198101;x-farendrefci=27298699;
x-farendclusterid=NY-NJ-Labcluster;x-farenddevice=AFIFIM-VI1;x-farendaddr=172001;
x-sessionid=696dd5d3f7755c6abdc438e93d01febf
```

For more information on recording metadata, see, Recording Metadata in CUCM Features and Services Guide.

Session Identifier

CUBE Media Proxy supports Session Identifier for tracking of a recording session. "Session-ID" header in the SIP request and response message provides the details of the identifier. The Session Identifier refers to the value of the identifier.

The Session-ID comprises of two Universally Unique Identifiers (UUIDs) corresponding to the initiator and recipient of the recording request respectively.
• Local UUID corresponds to UUID of the User Agent that sends a recording request to the participants of a recording session.
• Remote UUID corresponds to UUID of the User Agent that receives the recording request in a recording session.

**Configuring Support for Session Identifier**

Session Identifier support is enabled on CUBE Media Proxy by default and no additional configuration is required.

**Session-ID Handling**

The CUBE Media Proxy generates a unique UUID locally, and this UUID is passed as local UUID value in the Session-ID header of the following SIP request and response:

• Request to primary and optional recorders from CUBE Media Proxy.
• Response to CUCM from CUBE Media Proxy.

The following events are involved in the Session-ID handling by CUBE Media Proxy:

1. The Session-ID header in the recording request from CUCM to CUBE Media Proxy contains UUID of CUCM as local UUID and a "NULL" for remote UUID as shown in the following example.

   Session-ID: db248b6cbdc547bb6c6f6f69f6e6b6;remote=00000000000000000000000000000000

2. The CUBE Media Proxy locally generates a local UUID. The Session-ID header with this local UUID value and the remote UUID with a "NULL" is sent in the request to the primary recorder.

   Session-ID: 8dfb2f2e1d4c518db6122080fb8b1d83;remote=00000000000000000000000000000000

3. The CUBE Media Proxy receives a 200 OK response from the primary recorder. The Session-ID header of the response message contains UUID of the primary recorder as Local UUID, and the locally generated UUID by CUBE Media Proxy as the remote UUID.

   Session-ID: 4fd24d912193531a7f8d750ad16e19;remote=8dfb2f2e1d4c518db6122080fb8b1d83

4. The CUBE Media Proxy sends a 200 OK response to CUCM. The Session-ID header of the response message contains locally generated UUID by CUBE Media Proxy as local UUID, and UUID of CUCM as remote UUID.

   Session-ID: 8dfb2f2e1d4c518db6122080fb8b1d83;remote=db248b6cbdc547bb6c6f6f69f6e6b6

5. CUBE Media Proxy sends a forking request to the remaining four recorders with Session-ID header containing locally generated UUID as the local UUID and a "NULL" value for the remote UUID.
6. CUBE Media Proxy receives 200 OK response from the remaining four recorders. The Session-ID header of the response message from each recorder contains UUID of the recorder as the local UUID and the locally generated UUID by the CUBE Media Proxy as the remote UUID.

Session-ID: 4fd24d9121935531a7f8d750ad17f20;remote=8dfb2f2e1d4c518db6122080f8b8b1d83

7. CUBE Media Proxy sends a SIP Info Message to CUCM with status of the recorders. For more information on SIP Info Message, see SIP Info Messages from CUBE Media Proxy to CUCM, on page 539. The Session-ID header of the SIP Info Message contains locally generated UUID by CUBE Media Proxy as local UUID and the UUID of CUCM as remote UUID.

Session-ID: 8dfb2f2e1d4c518db6122080f8b8b1d83

CUBE Media Proxy also handles recording request that does not contain a Session-ID header. Session-ID of the incoming recording requests does not have any negative impact on the CUBE Media Proxy. However, Session-ID is useful for troubleshooting the call flow.

Troubleshooting Tips

You can use the following show command to troubleshoot any issues with the Session Identifier.

• **show call active voice session-id** *WORD*

  WORD can be complete session identifier (local, remote, or both), or wildcard pattern of local or remote UUID. The valid wildcard patterns for search are *, 0-9, a-f, A-F.

```
Device# show call active voice session-id 8dfb2f2e1d4c518db6122080f8b8b1d83
Telephony call-legs: 0
SIP call-legs: 6
H323 call-legs: 0
Call agent controlled call-legs: 0
.
.

```
How to Configure CUBE Media Proxy for Media Forking

Following are the steps to configure CUBE Media Proxy for Media Forking:

1. Configuring Outbound Dial-Peers to the Recorders, on page 526
2. Configuring CUBE Media Proxy, on page 527
3. Configuring Inbound Dial-Peer from CUCM, on page 529

Configuring Outbound Dial-Peers to the Recorders

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice dummy-recorder-dial-peer-tag voip
4. destination-pattern [+] string
5. session protocol sipv2
6. session target ipv4:[recording-server-destination-address | recording-server-dns]
7. session transport tcp
8. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td>Configures a recorder dial peer and enters dial peer voice configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>dial-peer voice dummy-recorder-dial-peer-tag voip</td>
<td>Specifies either the prefix or the full E.164 telephone number (depending on your dial plan) to be used for a dial peer.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# dial-peer voice 8000 voip</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>destination-pattern [+ string]</td>
<td>Specifies a network-specific address for a dial peer.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-dial-peer)# destination-pattern 595959</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>session protocol sipv2</td>
<td>Configures the VoIP dial peer to use Session Initiation Protocol (SIP).</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-dial-peer)# session protocol sipv2</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>session target ipv4: [recording-server-destination-address</td>
<td>Specifies a network-specific address for a dial peer.</td>
</tr>
<tr>
<td>recording-server-dns]</td>
<td>Keyword and argument are as follows:</td>
</tr>
<tr>
<td>Example:</td>
<td>• ipv4: destination address --IP address of the dial peer,</td>
</tr>
<tr>
<td></td>
<td>in this format: xxx.xxx.xxx.xxx</td>
</tr>
<tr>
<td></td>
<td>Note: You can configure CUSP to support recorder redundancy and load balancing, by specifying the IPv4 Address of the CUSP in the session target command. The Recording Proxy sends the INVITEs to the recorders via CUSP.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>session transport tcp</td>
<td>Configures a VoIP dial peer to use Transmission Control Protocol (TCP). Using the session transport command, you can also configure UDP and TLS protocols.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-dial-peer)# session transport tcp</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-dial-peer)# end</td>
</tr>
</tbody>
</table>

**Configuring CUBE Media Proxy**

**SUMMARY STEPS**

1. enable
### Configuring CUBE Media Proxy

2. configure terminal
3. media profile recorder profile-tag
4. media-recording proxy [dial-peer-tag1 dial-peer-tag2 dial-peer-tag3 dial-peer-tag4 dial-peer-tag5]
5. proxy policy mandatory dial-peer-tag
6. exit
7. media class tag
8. recorder profile tag
9. exit

### DETAILED STEPS

<tr>
<td>Device(config)# media profile recorder 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> media-recording proxy [dial-peer-tag1 dial-peer-tag2 dial-peer-tag3 dial-peer-tag4 dial-peer-tag5]</td>
<td>Configures the dial-peers for recording. The <strong>proxy</strong> configures the first dial-peer of the sequence for establishing a B2B call and the remaining dial-peers for media forking.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(cfg-mediaprofile)# media-recording proxy 8000 8001 8002</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> proxy policy mandatory dial-peer-tag</td>
<td>Configures the specified dial-peer for establishing a B2B call.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

**Note** You can specify a maximum of five dial-peer tags.
### CUBE Media Proxy

#### Configuring Inbound Dial-Peer from CUCM

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dial-peer voice call-manager-dial-peer-tag voip
4. incoming uri {from | request | to | via} tag
5. media-class tag
6. exit

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(cfg-mediaprofile)# proxy policy mandatory 8001</td>
<td>You can specify only one dial-peer tag for establishing a B2B call. The dial-peer tag that is specified, must be one of the dial-peer tags configured using the <strong>media-recording proxy</strong> command. Each Recorder Group receives one fork. When the recording session policy control is set to mandatory, the recording session failure for Recorder Group 1, fails the recording sessions for remaining Recorder Groups that are configured. The command <strong>proxy policy mandatory</strong> will initiate recording only when it is configured along with the command <strong>media recording proxy</strong> that is mentioned in Step 4.</td>
</tr>
</tbody>
</table>

**Note**

- **Step 6**
  - exit
  - Example:
    - Device(cfg-mediaprofile)# exit

  Exits media profile configuration mode.

- **Step 7**
  - media class tag
  - Example:
    - Device(config)# media class 100

  Configures a media class and enters media class configuration mode.

- **Step 8**
  - recorder profile tag
  - Example:
    - Device(cfg-mediaclass)# recorder profile 100

  Configures the media profile recorder.

- **Step 9**
  - exit
  - Example:
    - Device(cfg-mediaclass)# exit

  Exits media class configuration mode.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `enable`          | Enables privileged EXEC mode.  
  Example:  
  `Device> enable`  
| 2    | `configure terminal` | Enters global configuration mode.  
  Example:  
  `Device# configure terminal`  
| 3    | `dial-peer voice call-manager-dial-peer-tag voip` | Configures an inbound dial peer and enters dial peer voice configuration mode.  
  Example:  
  `Device(config)# dial-peer voice 1000 voip`  
| 4    | `incoming uri {from | request | to | via } tag` | Configures the voice class that is used to match the VoIP dial-peer to the URI of an incoming call from CUCM via the header in an incoming SIP Invite message.  
  Note For more information on `incoming uri` command, see `incoming uri`.  
  Example:  
  `Device(config-dial-peer)# incoming uri via 101`  
| 5    | `media-class tag` | Configures media class on the inbound dial peer from CUCM.  
  Example:  
  `Device(config-dial-peer)# media-class 100`  
| 6    | `exit`            | Exits media class configuration mode.  
  Example:  
  `Device(cfg-mediaclass)# exit`  

Verifying Media Forking Using CUBE Media Proxy Configuration

Perform this task to verify the configuration of the CUBE Media Proxy for multiple media forking. The `show` and `debug` commands can be entered in any order.

SUMMARY STEPS

1. `enable`
2. `show voip rtp connections`
3. `show voip remsp session`
4. `show voip remsp session detail call-id call-id`
5. `show voip rtp forking`
6. `show call active voice compact`
7. show sip-ua calls
8. show media-proxy sessions
9. show media-proxy sessions summary
10. show media-proxy sessions summary history
11. show media-proxy sessions call-id call-id
12. show media-proxy sessions session-id WORD
13. show media-proxy sessions metadata-session-id x-session-id
14. debug ccsip messages (for audio calls)
15. Enter one of the following:
   • debug ccsip all
   • debug voip recmsp all
   • debug voip ccapi all
   • debug voip fpi all (for ASR devices only)

DETAILED STEPS

Step 1 enable
Enables privileged EXEC mode.

Example:

Device> enable

Step 2 show voip rtp connections
Displays Real-Time Transport Protocol (RTP) connections. Every recording session has one rtp connection each towards the recorders and one rtp connection towards the recording source that is on the inbound side.

Example:

Device# show voip rtp connections
VoIP RTP Port Usage Information:
Max Ports Available: 19999, Ports Reserved: 101, Ports in Use: 3
Port range not configured

   Min  Max  Ports  Ports
Media-Address Range  Port  Port  Available  Reserved  In-use
Global Media Pool    8000  48198  19999     101        3

VoIP RTP active connections :
No. CallId  dstCallId  LocalRTP  RmtRTP  LocalIP  RemoteIP  MPSS  VRF
 1  248     249      8218     8372   198.51.100.1  192.0.2.1  NO   NA
 2  249     248      8220     9000   198.51.100.1  192.0.2.1  NO   NA
 3  252     251      8222     9238   198.51.100.1  192.0.2.1  NO   NA

Found 3 active RTP connections

Step 3 show voip recmsp session
Displays active recording Media Service Provider (MSP) session information internal to CUBE Media Proxy.

Example:

Device# show voip recmsp session
RECMSP active sessions:
MSP Call-ID    AnchorLeg Call-ID    ForkedLeg Call-ID
143           141                145
Found 1 active sessions

Step 4  
**show voip recmsp session detail call-id call-id**

Displays detailed information about the recording MSP Call ID.

**Example:**

```
Device# show voip recmsp session detail call-id 145
RECMSP active sessions:
Detailed Information
------------------------
Recording MSP Leg Details:
Call ID: 143
GUID : 7C5946D38ECD

AnchorLeg Details:
Call ID: 141
Forking Stream type: voice-nearend
Participant: 708090

Non-anchor Leg Details:
Call ID: 140
Forking Stream type: voice-farend
Participant: 10000

Forked Leg Details:
Call ID: 145
Voice Near End Stream CallID 145
Stream State ACTIVE
Found 1 active sessions
```

Step 5  
**show voip rtp forking**

Displays RTP media-forking connections.

**Example:**

```
Device# show voip rtp forking
VoIP RTP active forks :
Fork 1
   stream type voice-only (0): count 0
   stream type voice+dtmf (1): count 0
   stream type dtmf-only (2): count 0
   stream type voice-nearend (3): count 1
      remote ip 192.0.2.1, remote port 38526, local port 18648
        codec g711ulaw, logical ssrc 0x53
      packets sent 29687, packets received 0
   stream type voice+dtmf-nearend (4): count 0
   stream type voice+dtmf-farend (6): count 0
   stream type video (7): count 0
   stream type video-nearend (8): count 0
   stream type video-farend (9): count 0
   stream type application (10): count 0
```

Step 6  
**show call active voice compact**

Displays a compact version of voice calls in progress. An additional call leg is displayed for media forking.

**Example:**
Device# show call active voice compact
<callID> A/O FAX T<sec> Codec Type Peer Address IP R<ip>:<udp>
Total call-legs: 3
  140 ANS T644 g711ulaw VOIP P10000 192.0.2.1:18638
  141 ORG T644 g711ulaw VOIP P708090 198.51.100.1:26184
  145 ORG T643 g711ulaw VOIP P595959 192.0.2.2:38526

Step 7 show sip-ua calls
Displays active user agent client (UAC) and user agent server (UAS) information on SIP calls.

Example:

Device# show sip-ua calls
Total SIP call legs:3, User Agent Client:2, User Agent Server:1
SIP UAC CALL INFO

Step 8

show media-proxy sessions

Displays the inbound and forked Call-ID, Session-ID, and dial peer tag details of the active recording sessions. The "Secure" field in the command output is tagged Y if the recording session is secure and N if the recording session is non-secure.

Example:

Device# show media-proxy sessions

<table>
<thead>
<tr>
<th>No.</th>
<th>Call-ID</th>
<th>Session-ID</th>
<th>Dialpeer-Tag</th>
<th>Secure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>7253/-</td>
<td>a234a20672ce596d969c59ee9767f127; aaaaaaaaaaaaaaaaaaaaaaaaaaaaa</td>
<td>10</td>
<td>N</td>
</tr>
<tr>
<td>2</td>
<td>7253/7254</td>
<td>bbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb; a234a20672ce596d969c59ee9767f127</td>
<td>11</td>
<td>N</td>
</tr>
<tr>
<td>3</td>
<td>7253/7260</td>
<td>bbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb; a234a20672ce596d969c59ee9767f127</td>
<td>12</td>
<td>N</td>
</tr>
<tr>
<td>4</td>
<td>7253/7262</td>
<td>bbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb; a234a20672ce596d969c59ee9767f127</td>
<td>13</td>
<td>N</td>
</tr>
<tr>
<td>5</td>
<td>7253/7264</td>
<td>bbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb; a234a20672ce596d969c59ee9767f127</td>
<td>14</td>
<td>N</td>
</tr>
<tr>
<td>6</td>
<td>7253/7266</td>
<td>bbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb; a234a20672ce596d969c59ee9767f127</td>
<td>15</td>
<td>N</td>
</tr>
</tbody>
</table>

Step 9

show media-proxy sessions summary

Displays the active recording session details such as the dial peer tag, IP address, port number, number of failed recording sessions, and total number of recording sessions.

Example:

Device# show media-proxy sessions summary

<table>
<thead>
<tr>
<th>No.</th>
<th>Inbound/Forked</th>
<th>Dialpeer-Tag</th>
<th>IP:Port</th>
<th>Total/Failed Sessions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Forked</td>
<td>100</td>
<td>ipv4:192.0.2.2:6680</td>
<td>2/0</td>
</tr>
<tr>
<td>2</td>
<td>Forked</td>
<td>200</td>
<td>ipv4:192.0.2.2:6220</td>
<td>2/0</td>
</tr>
<tr>
<td>3</td>
<td>Inbound</td>
<td>5678</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Step 10

show media-proxy sessions summary history

Displays the details of all the completed recording sessions. Once the recording session is completed, the session details moves to the call history table. Total Sessions refers to the cumulative value of all the completed recording sessions.

Example:

Device# show media-proxy sessions summary history

<table>
<thead>
<tr>
<th>No.</th>
<th>Inbound/Forked</th>

</table>

**Note**
To clear the history data for the CUBE Media Proxy recording sessions, use the command `clear media-proxy sessions summary history`, in privileged EXEC mode.

Device# clear media-proxy sessions summary history

Following is the sample output of the command `show media-proxy sessions summary history` after clearing the CUBE Media Proxy recording session history data.

Device# show media-proxy sessions summary history

<table>
<thead>
<tr>
<th>No.</th>
<th>Inbound/Forked</th>
<th>Dialpeer Tag</th>
<th>IP:Port</th>
<th>Total/Failed Sessions</th>
</tr>
</thead>
</table>

**Step 11**

**show media-proxy sessions call-id call-id**

Displays the details of the inbound leg and all the forked legs that are associated with the specified SIP leg call-ID. MSP call-ID is not a valid call-ID for this command. Specify the CCAPI call identifier of the SIP leg.

**Example:**

Device# show media-proxy sessions call-id 2

CC Call-ID: 1 Inbound-leg
Dur: 00:00:15 tx: 0/0 rx: 1484/296800 lost: 0/0/0 delay: 0/0/0ms
Remote-Addr: 198.51.100.1:6009 Local-Addr: 192.0.2.1:8000 rtt:0ms pl:0/0/0ms
Dialpeer-Tag: 100 Negotiated-Codec: g711ulaw
SRTP-Status: off SRTP-Cipher: NA
LocalUUID: 6bde661e9767590b930f3427ad6e94e9 RemoteUUID: aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa

CC Call-ID: 2 Forked-leg (Primary)
Dur: 00:00:15 tx: 1484/296800 rx: 0/0 lost: 0/0/0 delay: 0/0/0ms

Dialpeer-Tag: 500 Negotiated-Codec: g711ulaw
SRTP-Status: off SRTP-Cipher: NA
LocalUUID: ccccccccccccccccccdddddddddd RemoteUUID: 6bde661e9767590b930f3427ad6e94e9
Step 12

**show media-proxy sessions session-id** *WORD*

Displays the details of the Media Proxy recording sessions that are associated with the specified session-ID. To display the details of a specific call-leg, specify the complete session ID string as, `local-uuid;remote=remote-uuid`. Tokens that are allowed for *WORD* are `'*'`, `[0-9]`, `[a-f]`, and `[A-F]`.

**Example:**

```
Device# show media-proxy sessions session-id 6bde661e9767590b930f3427ad6e94e9
CC Call-ID: 1 Inbound-leg
Dur: 00:00:15 tx: 0/0 rx: 1484/296800 lost: 0/0/0 delay: 0/0/0ms
Remote-Addr: 198.51.100.1:6009 Local-Addr: 192.0.2.1:8000 rtt: Oms pl: 0/0ms
Dialpeer-Tag: 200 Negotiated-Codec: g711ulaw
SRTP-Status: off SRTP-Cipher: NA
LocalUUID: 6bde661e9767590b930f3427ad6e94e9 RemoteUUID: aaaaaaaaaaaaaaaaaaaaaaaaaaaaa

CC Call-ID: 2 Forked-leg (Primary)
Dur: 00:00:15 tx: 1484/296800 rx: 0/0 lost: 0/0/0 delay: 0/0/0ms
Remote-Addr: 198.51.100.1:6000 Local-Addr: 192.0.2.1:8002 rtt: Oms pl: 0/0ms
Dialpeer-Tag: 300 Negotiated-Codec: g711ulaw
SRTP-Status: off SRTP-Cipher: NA
LocalUUID: ccccccccccccccccccccccccccccccc RemoteUUID: 6bde661e9767590b930f3427ad6e94e9

CC Call-ID: 9 Forked-leg
Dur: 00:00:15 tx: 1479/295800 rx: 0/0 lost: 0/0/0 delay: 0/0/0ms
Remote-Addr: 198.51.100.1:6004 Local-Addr: 192.0.2.1:8006 rtt: Oms pl: 0/0ms
Dialpeer-Tag: 400 Negotiated-Codec: g711ulaw
SRTP-Status: off SRTP-Cipher: NA
LocalUUID: ccccccccccccccccccccccccccccccccccccccc RemoteUUID: 6bde661e9767590b930f3427ad6e94e9

CC Call-ID: 11 Forked-leg
Dur: 00:00:15 tx: 1479/295800 rx: 0/0 lost: 0/0/0 delay: 0/0/0ms
Remote-Addr: 198.51.100.1:6005 Local-Addr: 192.0.2.1:8008 rtt: Oms pl: 0/0ms
Dialpeer-Tag: 500 Negotiated-Codec: g711ulaw
SRTP-Status: off SRTP-Cipher: NA
LocalUUID: ccccccccccccccccccccccccccccccccccccccccccc RemoteUUID: 6bde661e9767590b930f3427ad6e94e9
```

Step 13

**show media-proxy sessions metadata-session-id** *x-session-id*

Displays the details of the Media Proxy recording sessions based on the *x-session-id* present in the "From" header of the INVITE from CUCM.
Example:

```plaintext
Device# show media-proxy sessions metadata-session-id 696dd5d3f7755c6abdc438e93d01febf
CC Call-ID: 77 Inbound-leg
Dur: 00:00:46 tx: 0/0 rx: 3105/578880 lost: 0/0/0 delay: 0/0/0ms
Remote-Addr: 198.51.100.1:8010 Local-Addr: 198.51.100.1:8048 rtt: Oms pl: 0/0ms
Dialpeer-Tag: 1 Negotiated-Codec: g711ulaw
SRTP-Status: off SRTP-Cipher: NA
LocalUUID: 52b282b804c5fd098eaba3696c00de2 RemoteUUID: aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa

CC Call-ID: 78 Forked-leg (Primary)
Dur: 00:00:46 tx: 3105/578880 rx: 0/0 delay: 0/0/0ms
Remote-Addr: 198.51.100.1:8014 Local-Addr: 198.51.100.1:8050 rtt: Oms pl: 0/0ms

Remote-Addr: 198.51.100.1:8030 Local-Addr: 198.51.100.1:8058 rtt: Oms pl: 0/0ms
Dialpeer-Tag: 6 Negotiated-Codec: g711ulaw
SRTP-Status: off SRTP-Cipher: NA
LocalUUID: bbbbbbbbbbbbbbbbbbbbbbbbbbbbb RemoteUUID: 52b282b804c5fd098eaba3696c00de2
```

Step 14  `debug csip messages` (for audio calls)

The CUBE Media Proxy sends INVITEs to the recorders with a single stream, which successfully forks the primary call to the recorders. INVITEs to recorders have a single m-line with a send-only attribute.

Step 15  Enter one of the following:

- `debug csip all`
- `debug voip recmsp all`
- `debug voip capi all`
- `debug voip fpi all` (for ASR devices only)

Displays detailed debug messages.
Recording State Notification

SIP Info Messages from CUBE Media Proxy to CUCM

The CUBE Media Proxy sends SIP Info message to CUCM for providing the consolidated status of all the recorders, after the recording session is established or tried with all the recorders.

A SIP Info message is sent during the following stages of a recording session:

1. Initial Call: After receiving response from all the configured recorders during the initial call, a SIP Info message with status of each recorder is sent to the initiator of the recording session.

2. Mid-Call: When status of any of the recorders changes during the midcall, another SIP Info message with status of each recorder is sent to the initiator of the recording session. The scenario corresponds to any of the recorders sending a "BYE" or rejecting a midcall RE-INVITE.

Note

All the scenarios in the upcoming sections explains CUBE Media Proxy supporting two recorders. However, CUBE Media Proxy supports five recorders.

XML Format of a SIP Info Message

The Content-Type header present in the SIP Info message is

Content-Type: application/x-cisco-proxy-recording-status+xml

The XML format of a SIP info message is given below.

<recorderList>
  <recorder>
    <uri>recorder1</uri>
    <recordertype>Mandatory</recordertype>
    <status>Success</status>
    <errormessage>null</errormessage>
  </recorder>
  <recorder>
    <uri>recorder2</uri>
    <recordertype>Mandatory</recordertype>
    <status>Failed</status>
    <errormessage>SIP error code received from Recorder</errormessage>
  </recorder>
</recorderList>
Table 58: Details of XML Tag and Data Type

<table>

</tr>
<tr>
<td>recorder-1 and recorder-2 are down.</td>
<td>&lt;failure&gt;</td>
<td>&lt;failure&gt;</td>
</tr>
<tr>
<td>recorder-1 and recorder-2 responds to the call with a 488 Not Acceptable Here response.</td>
<td>&lt;failure&gt;</td>
<td>&lt;failure&gt;</td>
</tr>
</tbody>
</table>
SIP Info Message Sent During the Initial Call (One Recorder as Mandatory and Remaining as Optional)

For information on how to configure the recorders as Mandatory, see Step 3, Step 4 and, Step 5 of Configuring CUBE Media Proxy, on page 527.

The SIP Info Message sent during a recording session depends on the scenarios that are given in the following table.

Table 60: Call scenarios and recorder status during the initial call with a mandatory recorder

<table>
<thead>
<tr>
<th>Scenario</th>
<th>&lt;status&gt; of recorder-1 in a SIP Info Message</th>
<th>&lt;status&gt; of recorder-2 in a SIP Info Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Call to the mandatory recorder recorder-1 is established and forking to the optional recorder recorder-2 is triggered successfully.</td>
<td>&lt;success&gt;</td>
<td>&lt;success&gt;</td>
</tr>
<tr>
<td>Call to the mandatory recorder recorder-1 is rejected with a failure message and hence the optional recorder recorder-2 is not tried.</td>
<td>&lt;failure&gt;</td>
<td>&lt;failure&gt;</td>
</tr>
<tr>
<td>Note: Error code is sent in the &lt;errormessage&gt;.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Call to the mandatory recorder recorder-1 is established and when the optional recorder recorder-2 is tried, the mandatory recorder disconnects with a BYE.</td>
<td>&lt;failure&gt;</td>
<td>&lt;cancelled&gt;</td>
</tr>
<tr>
<td>Note: BYE is sent in the &lt;errormessage&gt;.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Note: The connection to the optional recorder is cancelled as the primary recorder disconnects.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>After the call is established with mandatory recorder recorder-1 and the optional recorder recorder-2, the mandatory recorder disconnects with a BYE.</td>
<td>&lt;failure&gt;</td>
<td>&lt;disconnected&gt;</td>
</tr>
<tr>
<td>Note: BYE is sent in the &lt;errormessage&gt;.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Note: The optional recorder is disconnected.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note: After a SIP Info Message is sent, a 200 OK response is received from the initiator of the recording session.
After a SIP Info Message is sent, a **200 OK** response is received from the initiator of the recording session. CUCM sends a **415 Unsupported Media Type** message if the INFO sent from CUBE Media Proxy has a malformed XML body.

**Support for Mid-Call Features**

CUBE Media Proxy supports mid-call signalling events that involve RE-INVITEs from CUCM to the recorders. The CUBE Media Proxy handles the RE-INVITEs that request for an SDP change, codec change, session refresh and, direction change in SDP. Based on the change in the status of the recorders during the mid-call, SIP Info messages are sent from the recorders to the CUCM.

CUBE Media Proxy also supports mid-call RE-INVITE with no SDP change.

The CUBE Media Proxy supports the mid-call features given in the table below, when all the recorders are configured as optional.

**Table 61: Details of Mid-Call Scenarios and the events (optional recorders)**

<table>
<thead>
<tr>
<th>Mid-Call Scenario (optional recorders)</th>
<th>Events in the Mid-Call Scenario</th>
</tr>
</thead>
</table>
| Mid-call session refresh              | 1. CUCM sends a mid-call RE-INVITE with no SDP change.  
                                         | 2. The CUBE Media Proxy sends the RE-INVITE to the primary recorder only. |
| Mid-call directory change             | 1. CUCM sends a mid-call RE-INVITE with direction change in SDP.  
                                         | 2. The CUBE Media Proxy sends the RE-INVITE to the primary recorder.  
                                         | 3. The primary recorder sends a **200 OK** response to CUBE Media Proxy, which sends this response to CUCM.  
                                         | 4. The CUBE Media Proxy sends the RE-INVITE to the remaining recorders. |
| Mid-call codec change with a **200OK** from the primary recorder | 1. CUCM sends a mid-call RE-INVITE with a codec change in SDP.  
                                         | 2. The CUBE Media Proxy sends the RE-INVITE to the primary recorder.  
                                         | 3. The primary recorder sends a **200OK** response for the codec change to CUBE Media Proxy, which sends this response to CUCM.  
                                         | 4. The CUBE Media Proxy sends the RE-INVITE containing new codec to the remaining recorders.  
<pre><code>                                     | 5. The remaining recorders send a **200OK** response to CUBE Media Proxy. |
</code></pre>
<table>
<thead>
<tr>
<th>Mid-Call Scenario (optional recorders)</th>
<th>Events in the Mid-Call Scenario</th>
</tr>
</thead>
</table>
| Mid-call codec change with failure status of the primary recorder | 1. CUCM sends a mid-call RE-INVITE with a codec change in SDP.  
2. The CUBE Media Proxy sends the RE-INVITE to the primary recorder.  
3. The primary recorder sends a 488 error response for the codec change to CUBE Media Proxy, which sends this response to CUCM.  
4. REINVITE is not sent to the remaining recorders. |
| Mid-call codec change with failure status of the recorders | 1. CUCM sends a mid-call RE-INVITE with a codec change in SDP.  
2. The CUBE Media Proxy sends the RE-INVITE to the primary recorder.  
3. The primary recorder sends a 200OK response for the codec change to CUBE Media Proxy, which sends this response to CUCM.  
4. The CUBE Media Proxy sends the RE-INVITE containing new codec to the remaining recorders.  
5. Two of the recorders send a 488 error response for the codec change to CUBE Media Proxy and the remaining recorders respond with a 200OK.  
6. CUBE Media Proxy sends a BYE to the failed recorders and disconnects them. |
| Mid-call SRTP suite or SRTP key change with a 200OK from the primary recorder | 1. CUCM sends a mid-call RE-INVITE with an SRTP key change.  
2. The CUBE Media Proxy sends the RE-INVITE to the primary recorder.  
3. The primary recorder sends a 200OK response for the codec change to CUBE Media Proxy, which sends this response to CUCM.  
4. The CUBE Media Proxy sends the RE-INVITE containing new SRTP key to the remaining recorders.  
5. The remaining recorders send a 200OK response to CUBE Media Proxy. |
| Mid-call SRTP suite or SRTP key change with failure status of the primary recorder | 1. CUCM sends a mid-call RE-INVITE with an SRTP key change.  
2. The CUBE Media Proxy sends the RE-INVITE to the primary recorder.  
3. The primary recorder sends a 488 error response for the SRTP key change to CUBE Media Proxy, which sends this response to CUCM.  
4. REINVITE is not sent to the remaining recorders. |
### Mid-Call Scenario (optional recorders)

<table>
<thead>
<tr>
<th>Events in the Mid-Call Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. CUCM sends a mid-call RE-INVITE with an SRTP change.</td>
</tr>
<tr>
<td>2. The CUBE Media Proxy sends the RE-INVITE to the primary recorder.</td>
</tr>
<tr>
<td>3. The primary recorder sends a 200 OK response for the SRTP key change to CUBE Media Proxy, which sends this response to CUCM.</td>
</tr>
<tr>
<td>4. The CUBE Media Proxy sends the RE-INVITE containing new SRTP key to the remaining recorders.</td>
</tr>
<tr>
<td>5. Two of the recorders send a 488 error response for the SRTP key change to CUBE Media Proxy and the remaining recorders respond with a 200 OK.</td>
</tr>
<tr>
<td>6. CUBE Media Proxy sends a BYE to the failed recorders and disconnects them.</td>
</tr>
</tbody>
</table>

The CUBE Media Proxy supports the mid-call features given in the table below, when a mandatory recorder is configured.

### Table 62: Details of Mid-Call Scenarios and the events (mandatory recorder)

<table>
<thead>
<tr>
<th>Mid-Call Scenario (mandatory recorder)</th>
<th>Events in the Mid-Call Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mid-call SDP change with failure status of the mandatory recorder</td>

</tr>
<tr>
<td></td>
<td>3. The primary recorder sends a 488 error response or 503 error response for the SDP change to CUBE Media Proxy, which sends this response to CUCM.</td>
</tr>
<tr>
<td></td>
<td>4. REINVITE is not sent to the remaining recorders.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Mid-call SDP change with failure status of the recorders</th>
<th>Events in the Mid-Call Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. CUCM sends a mid-call RE-INVITE with any of the SDP changes.</td>
<td></td>
</tr>
<tr>
<td>2. The CUBE Media Proxy sends the RE-INVITE to the primary recorder.</td>
<td></td>
</tr>
<tr>
<td>3. The primary recorder sends a 200 OK response for the SDP change to CUBE Media Proxy, which sends this response to CUCM.</td>
<td></td>
</tr>
<tr>
<td>4. The CUBE Media Proxy sends the RE-INVITE to the remaining recorders.</td>
<td></td>
</tr>
<tr>
<td>5. One of the recorders responds with a 488 error response for the SDP change to CUBE Media Proxy and the remaining recorders respond with a 200 OK.</td>
<td></td>
</tr>
<tr>
<td>6. CUBE Media Proxy sends a BYE to the failed recorder and disconnects the same.</td>
<td></td>
</tr>
</tbody>
</table>

A mid-call SIP Info message containing status of the recorders is sent to the CUCM when the mid-call RE-INVITEs to the recorders fail.
During the mid-call, the following events happen when the primary recorder sends a \texttt{BYE} to the CUBE Media Proxy:

- Primary recorder as Optional: CUBE Media Proxy sends a \texttt{200OK} response to the primary recorder. The CUBE Media Proxy does not send \texttt{BYE} to CUCM. The call-leg between CUCM and the CUBE Media Proxy enters midcall-signaling block mode to reduce interoperability issues that arise to consuming mid-call RE-INVITES. The call-leg between the CUBE Media Proxy and the primary recorder remains in a dormant state. Hence the primary recorder stops recording. However, the remaining recorders continue with the recording.

- Primary recorder as Mandatory: CUBE Media Proxy sends \texttt{BYE} from the mandatory recorder to CUCM. All the recorders disconnect and the recording stops.

## Secure Recording of Secure Calls

The CUBE Media Proxy solution supports secure recording of secure calls. Following are the events that are involved in forking of a secure recording request.

1. The CUBE Media Proxy receives a secure recording request from CUCM over TLS transport through SIP INVITE with SDP body containing SRTP crypto attributes.

2. The CUBE Media Proxy enters the SRTP-SRTP passthrough mode and sends the secure recording request to the primary recorder through SIP INVITE with SDP containing crypto attributes.

3. It is not required to explicitly configure the SRTP on the dial-peers toward the recorders. TLS configuration on the dial-peers from CUBE Media Proxy to the recorders must be done. For information on how to configure TLS on dial-peers to the recorders, see \texttt{Configuring SIP TLS}.

4. The CUBE Media Proxy offers all the crypto suites that are received from CUCM to the primary recorder. The crypto suite that is negotiated with the primary recorder is offered to the remaining recorders.

5. SRTP media packets are successfully forked to all the recorders.

CUBE Media Proxy supports SRTP media pass-through for SRTP. Hence the CUBE Media Proxy never rejects the SRTP media packets.

TCP TLS is required for signaling.
Support for High Availability (HA)

High Availability (HA) feature ensures that the active recording sessions are preserved whenever the CUBE Media Proxy router experiences an outage. Stateful Switchover (SSO) preserves the recording sessions and post-switchover teardown of recording sessions. The CUBE Media Proxy recording sessions continue to be active even after the Active CUBE Media Proxy box goes down (provided a redundant standby box is present). The Standby CUBE Media Proxy box becomes active and service new recording requests.

Note: CUBE Media Proxy does not support ISSU (upgrade) from legacy CUBE versions.

In a recording session, the call-leg with primary recorder and forked call-leg with the remaining recorders is checkpointed in the Standby CUBE Media Proxy router. If the Active device goes down, the Standby device ensures that the forking call is active and is able to exchange further transactions between the recorders and the CUCM. There is no change in the number of call-legs on the Active box and Standby box. The Active and Standby devices must have the same configurations for checkpointing to happen correctly.

CUBE Media Proxy supports Box-to-Box High Availability and Inbox High Availability with up to five recorders. The support extends to both secure and non secure calls.

The following conditions and restrictions apply to the current implementation of SSO.

- Checkpointing is not done on the call-leg that is in the middle of a transaction.
- HA is supported for all mid-call transactions that include REINVITE, UPDATE, or BYE from CUCM. Checkpointing is done after the completion of mid-call transactions. Checkpointing is not done if the SSO happens when the mid-call transactions are in progress.
- Checkpointing is done only for the recorders that were successfully connected before the SSO.
- When one of the optional recorders sends BYE, CUBE Media Proxy sends an Info message to CUCM with the updated status of all the recorders. Checkpointing for the recorder status happens only after receiving a 200OK response from CUCM for the Info message. Checkpointing is not done if the SSO happens after receiving the BYE from the recorder and before receiving a 200OK response for the Info Message from CUCM.
- BYE received from any of the recorders, is checkpointed.
- Info messages that indicate the status change of the recorders are checkpointed after a response is received for the corresponding Info message.
- Metadata, SRTP context, and common Session ID used across all the five recorders are checkpointed.

You can use the following show commands to monitor the recording sessions on the Active and the Standby instances of CUBE Media Proxy.

- `show call active voice compact`
- `show voip rtp connections`
- `show voip recmsp session`
Media Latch

By default, the CUBE Media Proxy does source address validation to check if the IP address and port details that are received in the UDP header of the RTP or SRTP packets, matches with the details in the SDP sent by the SIP User Agent. The packets without matching IP address and port are dropped.

In a typical SCCP-based BiB recording using CUBE Media Proxy recording solution, CUCM first sends an SDP with the IP address and a dummy port to the CUBE Media Proxy to get the capabilities of CUBE Media Proxy. CUCM then sends this SDP to the SCCP phone. The CUBE Media Proxy does not know the vBiB IP address and port details of the SCCP phone. In these call flows, the IP address and port details in the media packets that are sent from vBiB of the SCCP phone to SCCP phone, are different from the IP address and port details in the packets that are sent from CUCM to the CUBE Media Proxy.

Media Latching is enabled in the CUBE Media Proxy by default so that the CUBE Media Proxy learns the remote IP address and port details from the UDP transport header of the first RTP or SRTP packet. Media latching is turned on for every call flowing through the CUBE Media Proxy, and works for initial and mid-call scenarios. Media Latching will be always turned on in the inbound leg (CUCM leg), such that the media packets are accepted even if they are sent from a source IP address and port that is different from the IP address that is advertised in the SDP.
Media Latch
PART X

SIP Header Manipulation

• Passing Headers Unsupported by CUBE, on page 551
• Copying SIP Headers, on page 553
• Manipulating SIP Status-Line Header of SIP Responses, on page 561
Passing Headers Unsupported by CUBE

This feature is used to pass parameters that are unsupported by CUBE, but mandatory to the service provider from one leg to another. When a SIP message is received, a check is done for the header, and if it is available, it is copied into a copy list and passed on to the outbound dial peer leg.

- Feature Information for Copying with SIP Profiles, on page 551
- Example: Passing a Header Not Supported by CUBE, on page 551

Feature Information for Copying with SIP Profiles

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support for conditional header manipulation of SIP headers</td>
<td>15.1(3)T Cisco IOS XE Release 3.6S</td>
<td>This feature allows users to copy content from one header to the other. This is done by copying the content of messages into variables which can then be used to modify other SIP headers. This feature modifies the following commands: voice class sip-profiles, response, request, voice-class sip copy-list, sip-header</td>
</tr>
</tbody>
</table>

Example: Passing a Header Not Supported by CUBE

CUBE does not pass “x-cisco-tip”. However, certain TelePresence equipments require “TIP”.

The SIP profile below will look for "x-cisco-tip" in the inbound contact header then pass it in the outbound contact header.
Example: Passing a Header Not Supported by CUBE

Inbound Contact Header
Contact: <sip:89016442998@161.44.77.193;transport=udp;x-cisco-tip

Outbound Contact Header
Contact: <sip:89016442998@10.86.176.19:5060>;x-cisco-tip

Create a copylist to pass the Contact Header from the incoming message to the outgoing message. The “x-cisco-tip” is not copied in this step as it is unsupported by CUBE.

!Create a copyList
Device(config)# voice class sip-copylist 1
Device(config-class)# sip-header Contact
Device(config-class)# exit

!Apply the copylist to incoming dial peer.
Device(config)# dial-peer voice 1 voip
Device(config-dial-peer)# description incoming SIP Trunk
Device(config-dial-peer)# incoming called-number
Device(config-dial-peer)# voice-class sip copy-list 1

Create a SIP profile that copies “x-cisco-tip” into a variable, and use that variable to modify the outgoing Contact header. Apply the SIP profile to an outbound dial peer.

Device# voice class sip-profiles 3001

!Copy the Contact header from the incoming dial peer into variable u01
Device(config-class)# request INVITE peer-header sip Contact copy "(;x-cisco-tip)" u01

!Modify the outgoing SIP Invite with this variable.
Device(config-class)# request INVITE sip-header Contact modify "$" \"\u01\""

!Apply the SIP Profile to the outgoing dial peer.
Device(config)# dial-peer voice 5000 voip
Device(config-dial-peer)# description outbound SIP
Device(config-dial-peer)# destination-pattern 5...$
Device(config-dial-peer)# voice-class sip profiles 3001
CHAPTER 42

Copying SIP Headers

This feature shows you how outgoing SIP headers can be manipulated using information from incoming and other outgoing SIP headers.

- Feature Information for Copying with SIP Profiles, on page 553
- How to Copy SIP Header Fields to Another, on page 554
- Example: Copying the To Header into the SIP-Req-URI, on page 557

Feature Information for Copying with SIP Profiles

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

How to Copy SIP Header Fields to Another

Copying From an Incoming Header and Modifying an Outgoing Header

To copy content from an incoming header that a device receives to an outgoing header, configure a SIP copylist for that header and apply it to an incoming dial peer. A SIP profile is configured to copy this incoming header to a user-defined variable and apply it to an outgoing header.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice class sip-copylist  tag
4. Do one of the following:
   - sip-header header-name
   - sip-header SIP-Req-URI
5. exit
6. dial-peer voice inbound-dial-peer-tag voip
7. voice class sip-copylist  tag
8. exit
9. voice class sip-profiles  profile-id
10. { request | response } message peer-header sip header-to-copy copy header-value-to-match copy-variable
11. { request | response } message {sip-header | sdp-header} header-to-modify modify header-value-to-match header-value-to-replace
12. exit
13. dial-peer voice inbound-dial-peer-tag voip
14. voice class sip-copylist  tag
15. exit

### Purpose

**Command or Action**

- **Step 14**
  - `voice class sip-copylist` _tag_
  - **Example:**
    
    ```
    Device(config-dial-peer)# voice class sip-copylist 100
    ```

- **Step 15**
  - `exit`

**Purpose**

- Applies the copy list to the dial-peer.
- Exits to global configuration mode.

---

**What to do next**

Apply the SIP profile to an outbound dial peer.

### Copying From One Outgoing Header to Another

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `voice class sip-profiles` _profile-id_
4. `{request | response} message {sip-header | sdp-header} header-to-copy copy header-value-to-match copy-variable`
5. `{request | response} message {sip-header | sdp-header} header-to-modify modify header-value-to-match header-value-to-replace`
6. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable` | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Step 2** | `configure terminal` | Enters global configuration mode. |
| **Step 3** | `voice class sip-profiles` _profile-id_  
  - **Example:**
    
    ```
    Device(config)# voice class sip-profiles 10
    ``` | Creates a SIP profile and enters voice class configuration mode. |
| **Step 4** | `{request | response} message {sip-header | sdp-header} header-to-copy copy header-value-to-match copy-variable`  
  - **Example:**
    
    ```
    Device(config-class)# request INVITE sip-header TO copy “sip:(.*)@” u01
    ``` | Copies the contents of the specified header from an outbound message into a copy variable. |
### SIP Header Manipulation

#### Example: Copying the To Header into the SIP-Req-URI

### What to do next
Apply the SIP Profile to an outbound dial peer.

### Example: Copying the To Header into the SIP-Req-URI

#### Copying Contents from One Header to Another

Given below is a scenario in an organization, where the provider has sent only a global reference number in the SIP-Req-URI header of the INVITE message, and has placed the actual phone destination number only in the To: SIP header. The CUCM typically routes on the SIP-Req-URI.

Given below is the original SIP message, where the INVITE has a non-routable value of 43565432A5. The actual phone destination number is 25555552 and is present in the To: SIP header.

### Figure 44: Incoming SIP Message

```
INVITE sip:43565432A5@192.168.1.100:5060 SIP/2.0
From: <sip:027784200@A.eu;user=phone>
To: <sip:25555552@A.eu>
```

Given below is the SIP message that is required. Note that 43565432A5 has changed to 25555552 in the SIP INVITE.
Because CUBE is a back-to-back user agent, the incoming dial peer is matched to the outgoing dial peer. The SIP Profile configured below copies the value from the incoming dial peer.

```
Device# voice class sip-profiles 1
!Copy the To header from the incoming dial peer into variable u01
Device(config-class)# request INVITE peer-header sip TO copy "sip:(.*)@" u01
!Modify the outgoing SIP Invite with this variable.
Device(config-class)# request INVITE sip-header SIP-Req-URI modify ".*@(.*)" "INVITE sip:u01@\1"
```

Apply the SIP profile to the incoming dial peer.

```
Device(config)# dial-peer voice 99 voip
Device(config-dial-peer)# outgoing to CUCM
Device(config-dial-peer)# destination-pattern 02555555.
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# session target ipv4:10.1.2.3

!Applying SIP profile to the dial peer
Device(config-dial-peer)# voice-class sip profiles 1
Device(config-dial-peer)# voice-class code 1
Device(config-dial-peer)# dtmf-relay rtp-nte
Device(config-dial-peer)# no vad
```

Additionally, if you would like to copy the To: Header from the inbound dial peer to the outbound dial peer, use a copy list.

```
!Create a copy List
Device(config)# voice class sip-copylist 1
Device(config-class)# sip-header TO
Device(config-class)# exit

!Apply the copy list to incoming dial peer.
Device(config)# dial-peer voice 1 voip
Device(config-dial-peer)# description incoming SIP Trunk
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# session target sip-server
Device(config-dial-peer)# incoming uri to TRUNK
Device(config-dial-peer)# voice-class code 1
Device(config-dial-peer)# voice-class sip copy-list 1

Device(config)# voice class uri TRUNK sip
Device(config-class)# user-id 2555555.
Device(config-class)# end
```
Example: Copying the To Header into the SIP-Req-URI
CHAPTER 43

Manipulating SIP Status-Line Header of SIP Responses

The SIP status line is a SIP response header, and it can be modified like any other SIP headers of a message. It can either be modified with a user-defined value, or the status line from an incoming response can be copied to an outgoing SIP response. The SIP header keyword used for the response status line is `SIP-StatusLine`.

- Feature Information for Manipulating SIP Responses, on page 561
- Copying Incoming SIP Response Status Line to Outgoing SIP Response, on page 562
- Modifying Status-Line Header of Outgoing SIP Response with User Defined Values, on page 565

Feature Information for Manipulating SIP Responses

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Table 65: Feature Information for Manipulating SIP Responses

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| SIP Profile Enhancements for SIP responses and error codes | 15.4(1)T Cisco IOS XE Release 3.12S | This feature extends SIP profiles to allow the following:  
  - Modification of the outgoing SIP response status line. Previously, only modification of outgoing SIP requests and responses was possible.  
  - Copying of the incoming SIP response status-line. The information from the peer-leg status-line can then be copied to user-variables and applied to the outbound response status-line. This option can be used to pass-thru the error-code and error phrase from peer-leg. Previously, only copying of SIP headers were possible.  
  - Before applying a SIP profile to a response from CUBE, the response can be mapped to its corresponding request. |
Feature Name | Releases | Feature Information
--- | --- | ---
Support for conditional header manipulation of SIP headers | 15.1(3)T Cisco IOS XE Release 3.6S | This feature allows users to copy content from one header to the another. This is done by copying the content of messages into variables which can then be used to modify other SIP headers.

This feature modifies the following commands: `voice class sip-profiles, response, request, voice-class sip copy-list, sip-header`

### Copying Incoming SIP Response Status Line to Outgoing SIP Response

To copy content from the status line of an incoming SIP response that a device receives to an outgoing response, configure a SIP copylist for SIP status line and apply it to an incoming dial peer. A SIP profile must be configured to copy the status line of an incoming SIP response to a user-defined variable and apply it to an outgoing SIP response.

*Figure 46: Call Flow for Copying the Status Line from the Incoming SIP Response to the Outgoing SIP Response*

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `voice class sip-copylist tag`
4. `sip-header SIP-StatusLine`
5. `exit`
6. `dial-peer voice inbound-dial-peer-id voip`
7. `voice-class sip copy-list list-id`
8. `exit`
9. `voice class sip-profiles tag`
10. `response response-code peer-header sip` `SIP-StatusLine` `copy` `match-pattern` `copy-variable`
11. `response response-code sip-header` `SIP-StatusLine` `modify` `match-pattern` `copy-variable`
12. `exit`

</tbody>
</table>
### Command or Action

#### Step 9

- `voice class sip-profiles tag`

**Example:**

```
Device(config)# voice class sip-profiles 10
```

**Purpose:** Enables dial peer-based VoIP SIP profile configurations and enters voice class configuration mode.

#### Step 10

- `response response-code peer-header sip SIP-StatusLine copy match-pattern copy-variable`

**Example:**

```
Device(config-class)# response ANY peer-header sip SIP-StatusLine copy "(.*)" u01
```

**Purpose:** Copies responses from the corresponding incoming call leg into a copy variable.

#### Step 11

- `response response-code sip-header SIP-StatusLine modify match-pattern copy-variable`

**Example:**

```
Device(config-class)# response ANY sip-header SIP-StatusLine modify ".*" "\u01"
```

**Purpose:** Modifies an outgoing response using the copy variable defined in the previous step.

#### Step 12

- `exit`

**Example:**

```
Device(config-class)# exit
```

**Purpose:** Exits voice class configuration mode and returns to global configuration mode.

---

### What to do next

Apply the SIP profile to the outbound dial peer to copy the SIP response to the outbound leg.
Modifying Status-Line Header of Outgoing SIP Response with User Defined Values

**What to do next**

Associate the SIP profile with an outbound dial peer.
PART XI

Payload Type Interoperability

• Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls, on page 569
CHAPTER 44

Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls

The Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls feature provides dynamic payload type interworking for dual tone multifrequency (DTMF) and codec packets for Session Initiation Protocol (SIP) to SIP calls.

Based on this feature, the Cisco Unified Border Element (Cisco UBE) interworks between different dynamic payload type values across the call legs for the same codec. Also, Cisco UBE supports any payload type value for audio, video, named signaling events (NSEs), and named telephone events (NTEs) in the dynamic payload type range 96 to 127.

- Symmetric and Asymmetric Calls, on page 570
- High Availability Checkpointing Support for Asymmetric Payload, on page 571
- How to Configure Dynamic Payload Type Passthrough for DTMF and Codec Packets for SIP-to-SIP Calls, on page 572
- Configuration Examples for Assymetric Payload Interworking, on page 575

Feature Information for Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 66: Feature Information for Dynamic Payload Interworking for DTMF and Codec Packets Support

Restrictions for Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls

The Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls feature is not supported for the following:
- H323-to-H323 and H323-to-SIP calls.
- All transcoded calls.
- Secure Real-Time Protocol (SRTP) pass-through calls.
- Flow-around calls.
- Asymmetric payload types are not supported on early-offer (EO) call legs in a delayed-offer to early-offer (DO-EO) scenario.
- Cisco fax relay.
- Multiple $m$ lines with the same dynamic payload types, where $m$ is:

$$m = \text{audio }<\text{media-port1}> \text{ RTP/AVP XXX} \hspace{0.5cm} m = \text{video }<\text{media-port2}> \text{ RTP/AVP XXX}$$

Symmetric and Asymmetric Calls

Cisco UBE supports dynamic payload type negotiation and interworking for all symmetric and asymmetric payload type combinations. A call leg on Cisco UBE is considered as symmetric or asymmetric based on the payload type value exchanged during the offer and answer with the endpoint:
• A symmetric endpoint accepts and sends the same payload type.
• An asymmetric endpoint can accept and send different payload types.

The Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls feature is enabled by default for a symmetric call. An offer is sent with a payload type based on the dial-peer configuration. The answer is sent with the same payload type as was received in the incoming offer. When the payload type values negotiated during the signaling are different, the Cisco UBE changes the Real-Time Transport Protocol (RTP) payload value in the VoIP to RTP media path.

To support asymmetric call legs, you must enable The Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls feature. The dynamic payload type value is passed across the call legs, and the RTP payload type interworking is not required. The RTP payload type handling is dependent on the endpoint receiving them.

High Availability Checkpointing Support for Asymmetric Payload

High availability for a call involving asymmetric payloads is supported. In case of fail-over from active to stand-by, the asymmetric payload interworking will be continued as new active CUBE passes across the payload type values according to the negotiation and call establishment.

*Figure 48: Sample High-Availability Topology*
# How to Configure Dynamic Payload Type Passthrough for DTMF and Codec Packets for SIP-to-SIP Calls

## Configuring Dynamic Payload Type Passthrough at the Global Level

Perform this task to configure the pass through of DTMF or codec payload to the other call leg (instead of performing dynamic payload type interworking) feature at the global level.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `voice service voip`
4. `sip`
5. `asymmetric payload {dtmf | dynamic-codecs | full | system}`
6. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> voice service voip</td>
<td>Enters voice service configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# voice service voip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> sip</td>
<td>Enters voice service SIP configuration mode.</td>
</tr>
<tr>
<td>Example: Device(conf-voi-serv)# sip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> asymmetric payload {dtmf</td>
<td>dynamic-codecs</td>
</tr>
</tbody>
</table>
Configuring Dynamic Payload Type Passthrough for a Dial Peer

Perform this task to configure the pass through of DTMF or codec payload to the other call leg (instead of performing dynamic payload type interworking) feature at the dial-peer level.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dial-peer voice tag voip
4. voice-class sip asymmetric payload {dtmf | dynamic-codecs | full | system}
5. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>2.</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>dial-peer voice tag voip</td>
<td>Enters dial peer voice configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# dial-peer voice 77 voip</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>voice-class sip asymmetric payload {dtmf</td>
<td>dynamic-codecs</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

*Note* The `dtmf` and `dynamic-codecs` keywords are internally mapped to the `full` keyword to provide asymmetric payload type support for audio and video codecs, DTMF, and NSEs.
Verifying Dynamic Payload Interworking for DTMF and Codec Packets Support

This task shows how to display information to verify Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls configuration feature. These `show` commands need not be entered in any specific order.

**SUMMARY STEPS**

1. `enable`
2. `show call active voice compact`
3. `show call active voice`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device&gt; <code>enable</code></td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td></td>
<td>Device# <code>show call active voice</code></td>
<td></td>
</tr>
</tbody>
</table>

**Troubleshooting Tips**

Use the following commands to debug any errors that you may encounter when you configure the Dynamic Payload Type Interworking for DTMF and Codec Packets for SIP-to-SIP Calls feature:

- `debug ccsip all`
- `debug voip ccapip inout`
Use the following debug commands to troubleshoot HA Checkpointing for Asymmetric Payload:

- debug voip ccapi all
- debug voice high-availability all
- debug voip rtp error
- debug voip rtp inout
- debug voip rtp packet
- debug voip rtp high-availability
- debug voip rtp function
- debug cc sip all

Use the following show commands to troubleshoot HA Checkpointing for Asymmetric Payload:

- show redundancy state
- show redundancy inter-device
- show standby brief
- show voice high-availability summary
- show voip rtp stats
- show voip rtp high-availability stats
- show voip rtp connection detail
- show call active voice brief
- show call active voice [summary]
- show call active video brief
- show call active video [summary]
- show align
- show memory debug leak

Configuration Examples for Assymmetric Payload Interworking

Example: Asymmetric Payload Interworking—Passthrough Configuration

```棠
! voice service voip
   allow-connections sip to sip
   sip
      rel1xx disable
      asymmetric payload full
      midcall-signaling passthru
!
   dial-peer voice 1 voip
      voice-class sip asymmetric payload full
      session protocol sipv2
      rtp payload-type cisco-codec-fax-ind 110
      rtp payload-type cisco-codec-video-h264 112
      session target ipv4:9.13.8.23
!
```
In the above example, it is assumed that 110 and 112 are not used for any other payload.

**Example: Asymmetric Payload Interworking—Interworking Configuration**

```plaintext
!  
voice service voip  
  allow-connections sip to sip  
!  
dial-peer voice 1 voip  
  session protocol sipv2  
  rtp payload-type cisco-codec-fax-ind 110  
  rtp payload-type cisco-codec-video-h264 112  
  session target ipv4:9.13.8.23  
!  
```

In the above example, it is assumed that 110 and 112 are not used for any other payload.
PART XII

Protocol Interworking

• Delayed-Offer to Early-Offer, on page 579
• H.323-to-SIP Interworking on CUBE, on page 589
• H.323-to-H.323 Interworking on CUBE, on page 595
• SIP RFC 2782 Compliance with DNS SRV Queries, on page 609
Delayed-Offer to Early-Offer

The Delayed-Offer to Early-Offer (DO-EO) feature allows CUBE to convert a delayed offer that it receives into an early offer. This feature is supported in the Media Flow-Around mode.

This feature also supports high-density transcoding calls, where transcoding IP addresses and port numbers are exchanged between the sender and receiver. This feature also supports midcall renegotiation of codecs required if an exchange of parameters that is not end-to-end causes an inefficient media flow.

- Feature Information for Delayed-Offer to Early-Offer, on page 579
- Prerequisites for Delayed-Offer to Early-Offer, on page 580
- Restrictions for Delayed-Offer to Early-Offer Media Flow-Around, on page 580

- MidCall Renegotiation Support for Delayed-Offer to Early-Offer Calls, on page 584
- High-Density Transcoding Calls in Delayed-Offer to Early-Offer, on page 586

## Feature Information for Delayed-Offer to Early-Offer

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

### Table 67: Feature Information for Delayed-Offer to Early-Offer

<table>

**Prerequisites for Delayed-Offer to Early-Offer**

Configure delayed-offer to early-offer in media flow-around mode.

**Restrictions for Delayed-Offerto Early-Offer Media Flow-Around**

- CUBE does not support change in IP address or port number in the locally triggered RE-INVITE response.
- CUBE does not support DE-EO Media Flow-Around for video calls.

**Delayed-Offerto Early-Offer in Media Flow-Around Calls**

Delayed-Offerto Early-Offer (DO-EO) allows CUBE to convert a delayed offer (DO) into an early offer (EO) in the media flow-around mode.

CUBE sends its local IP address in the initial EO INVITE Session Description Protocol (SDP) message. In the image, this is illustrated by INVITE (SDP1, CUIP1). Later, an additional RE-INVITE is locally generated by CUBE to communicate the SDP message details from the sender. This is illustrated by RE-INVITE (SDP5, IP2) in the below image. The RE-INVITE response is consumed by CUBE and not communicated to the sender.

![Figure 49: Delayed Offer to Early Offer in Media Flow-Around Calls](image)

CUBE supports delayed offer to early offer for SIP-to-SIP video calls. CUBE generates an outgoing Early Offer INVITE with the configured codec list, for a incoming Delayed Offer INVITE.
DO-EO video call is supported if both audio and video codecs are configured under a dial peer. **codec profile** command defines the codec attributes for Video (H263, H264) and Audio (AAC_LD) codecs. The codec attributes configured under codec-profile is used to generate the a=fmtp attribute line in the Early Offer SDP.

### Configuring Delayed Offer to Early Offer

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. Configure conversion of a delayed offer to an early offer:
   - In dial-peer configuration mode
     ```
     voice-class sip early-offer forced
     ```
   - In global VoIP SIP configuration mode
     ```
     early-offer forced
     ```
4. **end**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  enable
  **Example:**
  Device> enable | Enables privileged EXEC mode. Enter your password if prompted. |
| **Step 2**
  configure terminal
  **Example:**
  Device# configure terminal | Enters global configuration mode. |
| **Step 3**
  Configure conversion of a delayed offer to an early offer:
  - In dial-peer configuration mode
    ```
    voice-class sip early-offer forced
    ```
  - In global VoIP SIP configuration mode
    ```
    early-offer forced
    ```
  **Example:**
  In dial-peer configuration mode:
  ```
  Device (config) dial-peer voice 10 voip
  Device (config-dial-peer) voice-class sip
  early-offer forced
  Device (config-dial-peer) end
  ```
  **Example:** | |
In global VoIP SIP mode:

```
Device(config)# voice service voip
Device (config-voi-serv)# sip
Device (config-voi-sip)# early-offer forced
Device (config-voi-sip)# end
```

**Step 4**
```
end
```
Exits to privileged EXEC mode.

---

## Configuring Delayed Offer to Early Offer for Video Calls

### SUMMARY STEPS

1. enable
2. configure terminal
3. codec profile tag profile
4. dial-peer voice number number voip
5. codec codec profile
6. video codec codec profile
7. voice-class sip early-offer forced
8. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| Step 2 configure terminal | Enters global configuration mode. |
| Example: Device# configure terminal |

| Step 3 codec profile tag profile | Configures the audio and video codec profiles. |
| Example: codec profile 1 aacld codec profile 2 H264 |

| Step 4 dial-peer voice number number voip | Enters dial peer configuration mode for the specified VoIP dial peer. |
| Example: Device(config)# dial-peer voice 1 voip |
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong> codec codec profile Example: Device(config-dial-peer)# profile 1 aacld</td>
<td>Audio codec profile is applied on the dial peer.</td>
</tr>
<tr>
<td><strong>Step 6</strong> video codec codec profile Example: Device(config-dial-peer)# video codec h264 profile 2</td>
<td>Video codec profile is applied on the dial peer.</td>
</tr>
<tr>
<td><strong>Step 7</strong> voice-class sip early-offer forced Example: Device (config-dial-peer)# voice-class sip early-offer forced</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> end</td>
<td>Exits to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

## Configuring Delayed Offer to Early Offer Medial Flow-Around

### SUMMARY STEPS

1. enable
2. configure terminal
3. medial flow-around
4. Configure conversion of a delayed offer to an early offer:
   - In dial-peer configuration mode
     voice-class sip early-offer forced
   - In global VoIP SIP configuration mode
     early-offer forced
5. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable Example: Device&gt; enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal Example:</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command/Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# configure terminal</td>
<td>Enables media flow-around.</td>
</tr>
</tbody>
</table>

### Step 3

**medial flow-around**

**Example:**

Device(config-voi-serv)# media flow-around

### Step 4

Configure conversion of a delayed offer to an early offer:

- In dial-peer configuration mode
  
  `voice-class sip early-offer forced`

- In global VoIP SIP configuration mode
  
  `early-offer forced`

**Example:**

In dial-peer configuration mode:

```
Device (config) dial-peer voice 10 voip
Device (config-dial-peer) voice-class sip early-offer forced
Device (config-dial-peer) end
```

**Example:**

In global VoIP SIP mode:

```
Device(config)# voice service voip
Device (config-voi-serv) sip
Device (config-voi-sip) early-offer forced
Device (config-voi-sip) end
```

### Step 5

`end`

Exits to privileged EXEC mode.

---

**MidCall Renegotiation Support for Delayed-Offer to Early-Offer Calls**

When CUBE converts a delayed offer into an early offer, an incomplete exchange of Format specific parameters (FMTP) occurs during call establishment, resulting in either the noninitiation of media transmission or media transmission in a quality that may not be the best. This is especially a problem in video calls.

To overcome this situation, midcall renegotiation of capabilities can be configured.

The `early-offer forced renegotiate [always]` command is used to configure this in global VoIP configuration mode (config-voi-serv) and the `voice-class sip early-offer forced renegotiate` command is dial-peer configuration mode (config-dial-peer) and voice-class configuration mode (config-class).
Figure 50: MidCall Renegotiation of Capabilities

The **early-offer forced renegotiate** command triggers a delayed-offer RE-INVITE if the negotiated codecs are one of the following:

- aacld—Audio codec AACLD 90000 bps
- h263—Video codec H263
- h263+—Video codec H263+
- h264—Video codec H264
- mp4a—Wideband audio codec

The **early-offer forced renegotiate always** command always triggers a delayed-offer RE-INVITE. This option can be used to support all other codecs.

### Restrictions for MidCall Renegotiation Support for DO-EO Calls

- If **midcall-signaling block** or **midcall-signaling passthru media-change** commands have been configured, the feature does not work because a midcall RE-INVITE is not triggered by CUBE.
- If initial call is transcoded, then midcall re-invite is not triggered by CUBE.

#### Note

For EO to EO calls, the Delayed-Offer midcall RE-INVITE is not triggered by the CUBE, if either **midcall-signaling block** or **midcall-signaling passthru media-change** command is configured.

### Configuring Mid Call Renegotiation Support for Delayed-Offer to Early-Offer Calls

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dial-peer voice id voip
4. media transcoder high-density
### High-Density Transcoding Calls in Delayed-Offer to Early-Offer

High-Density Transcoding Calls in the media flow-around DO-to-EO mode is a feature where the transcoding IP address and port number are exchanged between the originating and terminating user agents. For high-density transcoding calls, CUBE is in the media flow-through mode even if media flow-around is configured.

In the figure below, XIP1 is passed to CUCM1 when a 200 OK is received from SBC1. ACK from CUCM1 triggers new RE-INVITE with transcoding IP address and port number (XIP2) and this RE-INVITE has to be locally handled in CUBE.

**Figure 51: High-Density Transcoding Calls in DO-to-EO**

---

**5. end**

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> dial-peer voice id voip</td>
<td>Enters dial-peer configuration mode and configures the selected dial peer.</td>
</tr>
<tr>
<td><strong>Step 4</strong> media transcoder high-density</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device (config) dial-peer voice 10 voip</td>
<td></td>
</tr>
<tr>
<td>Device (config-dial-peer) media transcoder high-density</td>
<td></td>
</tr>
<tr>
<td>Device (config-dial-peer) end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Exits to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
The **media transcoding high-density** command is used to configure this feature in dial-peer configuration mode (config-dial-peer). Refer to “Modes for Configuring Dial Peers” section to enter these modes and configure this feature.

For high-density transcoding calls with a common codec, CUBE should be in Media Flow-Through mode even though media flow-around is configured.

**Figure 52: High-Density Transcoding Calls for Common Codecs in DO-to-EO**

Restrictions for High-Density Transcoding DO-EO Calls

For high-density transcoding calls with a common codec, CUBE will be in Media Flow-through mode even though Media Flow-Around is configured.

Configuring High-Density Transcoding

To configure High-Density Transcoding delayed offer to early offer calls in media flow-around mode, perform the following steps:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. media transcoder high-density
5. sip
6. early offer-forced
7. end

**DETAILED STEPS**

<table>
<thead>
<tr>

**Example:**  
Device(config-voi-sip)# end | Exits the present configuration mode. |
CHAPTER 46

H323-to-SIP Interworking on CUBE

This chapter describes how to configure H.323-to-SIP interworking in CUBE and lists the various features supported in this interworking model.

- Prerequisites, on page 589
- Restrictions, on page 589
- H323-to-SIP Basic Call Interworking, on page 590
- H323-to-SIP Supplementary Features Interworking, on page 592
- H.323-to-SIP Codec Progress Indicator Interworking for Media Cut-Through, on page 593
- Configuring H323-to-SIP Interworking, on page 593

Prerequisites

- Enable CUBE on the device
- Perform basic H.323 gateway configuration. See Configuring H.323 Gateway (Optional)
- Perform basic H.323 gatekeeper configuration. See Configuring H.323 Gatekeeper (Optional)

Restrictions

- Changing codecs during rotary dial peer selection is not supported.
- Voice class codec is not supported.
- Configure extended capabilities on dial peers for fast start-to-early media scenarios.
- Delayed Offer to Slow-Start is not supported for SRTP-to-SRTP H.323-to-SIP calls.
- During a triggered INVITE scenario the Cisco UBE always generates a delayed offer INVITE.
- Fast-start to delayed-media signal interworking is not supported.
- Fast Start to Early Offer Supplementary Service will not work without extended capabilities configured under dial-peer.
- GSMFR and GSMEFR codecs are not supported.
- Media flow-around is not supported.
- Passing multiple diversion headers or multiple contact header in 302 to the H.323 leg is not supported.
- RSVP for supplementary scenarios is not supported.
- Session refresh is not supported.
- SIP-to-H.323 Supplementary Services based on H.450 is not supported.
- Slow-start to early media signal interworking is not supported.
• Supplementary services are Empty Capability Set (ECS) based supplementary services from the H.323 perspective, not H.450 supplementary services.
• LTI based transcoding is not supported.
• Transcoding for supplementary calls is not supported.
• SCCP based codec transcoding is not supported with an exception of Delayed-Offer to Slow-Start with static codec.
• DTMF interworking rtp-n te to inband is supported only with non-high-density transcoding in a delayed-offer to slow-start call.

H323-to-SIP Basic Call Interworking

This feature enables the IP-to-IP gateway to bridge calls between networks that support different VoIP call-signaling protocols (SIP and H.323). The SIP-to-H.323 protocol interworking capabilities of the CUBE support the following:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Supported Release</th>
<th>Additional Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic voice calls</td>
<td>12.4(11)T</td>
<td></td>
</tr>
<tr>
<td>(G.711 and G.729 codecs)</td>
<td></td>
<td></td>
</tr>

CHAPTER 47

H.323-to-H.323 Interworking on CUBE

This chapter describes how to configure and enable features for H.323-to-H.323 connections on CUBE. Configuring H.323-to-H.323 connections on a CUBE opens all ports by default. If CUBE has a public IP address and a PSTN connection, CUBE becomes vulnerable to malicious attackers who can execute toll fraud across the gateway. To eliminate this threat, you can bind an interface to a private IP address that is inaccessible to untrusted hosts. In addition, you can protect any public or untrusted interface by configuring a firewall or an access control list (ACL) to prevent unwanted traffic from traversing the router.

Feature Information for H.323-to-H.323 Interworking

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 70: Feature Information for H.323-to-H.323 Interworking

<table>

<td>12.3(11)T—H.323-to-H.323 Call Failure Recovery (Rotary) on a Cisco Unified Border Element. Eliminates codec restrictions and enables the Cisco UBE to restart codec negotiation with the originating endpoint based on the codec capabilities of the next dial peer in the rotary group for H.323-to-H.323 interconnections.</td>
</tr>
</tbody>
</table>

Signal Interworking | 12.3(11)T | H.323-to-H.323 Interworking Between Fast Start and Slow Start. This feature enables the Cisco UBE to bridge calls between VoIP endpoints that support only H.323 FastStart procedures and endpoints that support only normal H.245 signaling (SlowStart). |

Prerequisites

- Enable CUBE application on a device
- Perform basic H.323 gateway configuration. See Configuring H.323 Gateway
- Perform basic H.323 gatekeeper configuration. See Configuring H.323 Gatekeeper

Restrictions

- Voice class codec is not supported.
- LTI-based transcoding is not supported.
- Supplementary services with transcoding is not supported.
- DTMF Interworking rtp-n te to out of band is not supported when high density transcoder is enabled. Use normal transcoding for rtp-n te to out of band DTMF interworking.
- SCCP based codec transcoding is not supported. An exception to this restriction is slow start to slow start with a static codec.

Slow Start to Fast-Start Interworking

The slow-start to fast-start interworking feature allows two endpoints configured for slow start and fast start respectively to connect with each other through CUBE without dropping the call.
Restrictions for Slow-Start and Fast-Start Interworking

- Slow-start to fast-start interworking is supported only for H.323-to-H.323 calls.
- Transcoding in slow-start to fast-start interworking is not supported.

Enabling Interworking between Slow Start and Fast Start

Configure interworking between slow start and fast start on both inbound and outbound call legs.

**Note**

This task should not be used in situations where fast-start to fast-start or slow-start to slow-start calls are possible.

**Before you begin**

Ensure that a codec is configured on incoming and outgoing call legs.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. Use one of the following commands to configure interworking between slow start and fast start.
   - `call start interwork` in global VoIP configuration mode
   - `call start interwork` in voice class configuration and applied to inbound and outbound dial peers.
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Router&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>

</tr>
<tr>
<td>!Applying the voice class to a dial peer.</td>
</tr>
<tr>
<td>Device(config)# dial-peer voice 20 voip</td>
</tr>
<tr>
<td>Device(config-dial-peer)# voice-class h323 10</td>
</tr>
</tbody>
</table>

### Call Failure Recovery (Rotary)

Call failure recovery (Rotary) is a feature that provides the flexibility to route a call to a destination with multiple paths based on the policy of a service provider. If one path disconnects the call for any reason (like unreachableDestination, destinationReject, noPermission etc), the call can be routed by choosing another dial peer to the same destination based on configured preference.

Rotary is implemented using the dial peer hunt feature (see Configuring Hunt Groups), and the search for a successful dial peer continues until a `huntstop` command is encountered.

The feature described in this chapter is an enhancement that removes a restriction on codec configuration, that requires for identical codec capabilities configured on all dial peers in a rotary group. This is done by supporting an Empty Capability set (TCS=0) when rotary is configured.

The feature allows the CUBE to restart the codec negotiation process with the originating endpoint based on the codec capabilities of the next dial peer in the rotary group.

### Enabling Call Failure Recovery (Rotary) without Identical Codec Configuration

**Before you begin**

Configure Call Failure Recovery (Rotary) using dial-peer hunt groups. See Configuring Dial-Peer Hunt Groups.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. h323
**5. emptycapability**

**6. exit**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>Device(conf-serv-h323)# emptycapability</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Exits the current mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(conf-serv-h323)# exit</td>
<td></td>
</tr>
</tbody>
</table>

**Managing H.323 IP Group Call Capacities**

Managing maximum capacity for an IP group is done with carrier IDs created on an IP trunk group. If you do not configure specific carrier IDs, you can use the `ip circuit default only` command to create a single carrier. However, if you want to use carrier ID-based routing, or if you need extra control for load and resource balancing, you must configure carrier IDs in conjunction with the `voice source-group` command.

CUBE works with the `voice source-group` command to provide matching criteria for incoming calls. The `voice source-group` command assigns a name to a set of source IP group characteristics. The terminating gateway uses these characteristics to identify and translate the incoming VoIP call. If there is no voice source group match, the default carrier ID is used, any source carrier ID on the incoming message is transmitted.
without change, and no destination carrier is available. Call-capacity information is reported to the gatekeeper, but carrier routing information is not.

If the voice source group matches, the matched source carrier ID is used and the target carrier ID defined in the voice source group is used for the destination carrier ID.

**Note**
You can use this task only when there are no active calls are active.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. h323
5. ip circuit max-calls maximum-calls
6. ip circuit carrier-id carrier-name [reserved-calls reserved ]
7. ip circuit default only
8. exit

**DETAILED STEPS**

</tbody>
</table>

**Configuration Examples for Managing H.323 IP Group Call Capacities**

The following examples show a default carrier with no voice source group configured:

**Example: Default Carrier with No Voice Source Group**

voice service voip
allow-connections h323 to h323
h323
ip circuit max-calls 1000
ip circuit default only

If there is no incoming source carrier ID:

- Capacity only is reported to the gatekeeper using the default circuit (two call legs).
- No source or destination carrier information is reported.

If there is an incoming source carrier ID:

- Two call legs are counted against the default circuit and reported to the GK.
- The source carrier ID is passed through the gateway to the terminating leg.

The following examples show a configuration with more reserved calls than the default value for the `max-calls` argument (1000):

**Example: Configuration with Default Calls in Excess of 1000**

This example assigns 1100 calls to other carriers, leaving 400 calls available to the default carrier:

```plaintext
voice service voip
allow-connections h323 to h323
h323
ip circuit max-calls 1000
ip circuit carrier-id AA reserved-calls 500
ip circuit carrier-id bb reserved-calls 500
ip circuit carrier-id cc reserved-calls 100
```

The following examples show the default carrier configured with an incoming source carrier but no voice source group configured.

**Note**

In this example, 800 call legs are implicitly reserved for the default circuit.

**Example: Default Carrier and Incoming Source Carrier with No Voice Source Group**

```plaintext
voice service voip
allow-connections h323 to h323
h323
ip circuit max-calls 1000
ip circuit carrier-id AA reserved-calls 200
```

If there is no incoming source carrier ID:

- Capacity only is reported to the GK using the default circuit (two call legs).
- No source or destination carrier information is reported.

If there is an incoming source carrier ID called “AA”:

- One call leg is counted against circuit “AA”.
- One call leg (outbound) is counted against the default circuit.
• The source carrier ID is passed through the gateway to the terminating leg.

If there is an incoming source carrier ID called “BB” (for example) or anything other than “AA”:
  • Two call legs are counted against the default circuit.
  • The source carrier ID “BB” is passed through the gateway to the terminating leg.

The following examples show the first voice source-group match case:

Example: Voice Source-Group Match Case 1

```plaintext
voice service voip
allow-connections h323 to h323
h323
  ip circuit max-calls 1000
  ip circuit carrier-id AA reserved-calls 200
!
voice source-group 1
  carrier-id source AA
  carrier-id target AA
```

If there is no incoming source carrier ID, the default circuit is used because there is no match in the voice source group.

If there is an incoming source carrier ID called “AA,” the following are in effect:
  • The voice source group matches.
  • Both call legs are counted against circuit “AA”.
  • The source carrier ID is passed through the gateway to the terminating leg.
  • The destination carrier ID is “AA”.

The following examples show the second voice source group match case:

Example: Voice Source-Group Match Case 2

```plaintext
voice service voip
allow-connections h323 to h323
h323
  ip circuit max-calls 1000
  ip circuit carrier-id AA reserved-calls 200
  ip circuit carrier-id BB reserved-calls 200
!
voice source-group 1
  carrier-id source AA
  carrier-id target BB
```

If there is no incoming source carrier ID, the default circuit is used because there is no match in the voice source group.

If there is an incoming source carrier ID called “AA”:
  • The voice source-group matches.
  • One leg is counted against circuit “AA”.
  • One leg is counted against circuit “BB”.
  • The source carrier ID is passed through the gateway to the terminating leg.
  • The destination carrier ID is “BB”.

The following examples show the third voice source-group match case:
**Example: Voice Source-Group Match Case 3**

```
voice service voip
  allow-connections h323 to h323
h323
  ip circuit max-calls 1000
  ip circuit carrier-id AA reserved-calls 200
  ip circuit carrier-id BB reserved-calls 200

voice source-group 1
access-list 1
  carrier-id source BB
```

If the access-list matches, the following apply:

- One leg is counted against circuit “BB”.
- One leg is counted against the default circuit (for the destination circuit).
- The source carrier ID is synthesized to “BB” and used to report to the gatekeeper. It is also used on the outgoing setup.

If a source carrier ID is received on the incoming setup, it is overridden with the synthesized carrier ID.

**Overlap Signaling**

Overlap signaling requires that called digits be sent one-by-one as they are received from the calling device. The first digit is sent in a call setup message and subsequent digits are sent in information messages. This technique is used when a receiving gateway is able to recognize variable-length phone numbers, and requires that the originating gateway signal the end of the call setup process.

Overlap signaling is implemented by matching destination patterns on the dial peers. When H.225 signal overlap is configured on the originating gateway, it sends the SETUP to the terminating gateway once a dial-peer match is found. The originating gateway sends all further digits received from the user to the terminating gateway using INFO messages until it receives a sending complete message from the user. The terminating gateway receives the digits in SETUP and subsequent INFO messages and does a dial-peer match. If a match is found, it sends a SETUP with the collected digits to the PSTN. All subsequent digits are sent to the PSTN using INFO messages to complete the call.

**Configuring Overlap Signaling**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. h323
5. h225 signal overlap
6. h225 timeout t302 seconds
7. exit

Verifying H.323-to-H.323 Interworking

To verify Cisco Unified Border Element feature configuration and operation, perform the following steps (listed alphabetically) as appropriate.

Note: The word “calls” refers to call legs in some commands and output.
SUMMARY STEPS

1. show call active video
2. show call active voice
3. show call active fax
4. show call history video
5. show call history voice
6. show call history fax
7. show crm
8. show dial-peer voice
9. show running-config
10. show voip rtp connections

DETAILED STEPS

Step 1  show call active video
Use this command to display the active video H.323 call legs.

Step 2  show call active voice
Use this command to display call information for voice calls that are in progress.

Step 3  show call active fax
Use this command to display the fax transmissions that are in progress.

Step 4  show call history video
Use this command to display the history of video H.323 call legs.

Step 5  show call history voice
Use this command to display the history of voice call legs.

Step 6  show call history fax
Use this command to display the call history table for fax transmissions that are in progress.

Step 7  show crm
Use this command to display the carrier ID list or IP circuit utilization.

Step 8  show dial-peer voice
Use this command to display information about voice dial peers.

Step 9  show running-config
Use this command to verify which H.323-to-H.323, H.323-to-SIP, or SIP-to-SIP connection types are supported.

Step 10 show voip rtp connections
Use this command to display active Real-Time Transport Protocol (RTP) connections.
Troubleshooting H.323-to-H.323 Interworking

Caution

Under moderate traffic loads, these `debug` commands produce a high volume of output.

- `debug cch323 all`
- `debug h225 asn1`
- `debug h225 events`
- `debug h225 q931`
- `debug h245 asn1`
- `debug h245 events`
- `debug voip ipipgw`
- `debug voip ccap inout`
CHAPTER 48

SIP RFC 2782 Compliance with DNS SRV Queries

Effective with Cisco IOS XE Release 2.5, the Domain Name System Server (DNS SRV) query used to determine the IP address of the user endpoint is modified in compliance with RFC 2782 (which supersedes RFC 2052). The DNS SRV query prepends the protocol label with an underscore "_" character to reduce the risk of duplicate names being used for unrelated purposes. The form compliant with RFC 2782 is the default style.

- Finding Feature Information, on page 609
- Prerequisites SIP RFC 2782 Compliance with DNS SRV Queries, on page 609
- Information SIP RFC 2782 Compliance with DNS SRV Queries, on page 610
- How to Configure SIP-RFC 2782 Compliance with DNS SRV Queries, on page 610

- Verifying, on page 613
- Feature Information for SIP RFC 2782 Compliance with DNS SRV Queries, on page 613

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites SIP RFC 2782 Compliance with DNS SRV Queries

Cisco Unified Border Element

- Cisco IOS Release 12.2(8)T or a later release must be installed and running on your Cisco Unified Border Element.

Cisco Unified Border Element (Enterprise)

- Cisco IOS XE Release 2.5 or a later release must be installed and running on your Cisco ASR 1000 Series Router.
Information SIP RFC 2782 Compliance with DNS SRV Queries

Session Initiation Protocol (SIP) on Cisco VoIP gateways uses the DNS SRV query to determine the IP address of the user endpoint. The query string has a prefix in the form of "protocol.transport." and is attached to the fully qualified domain name (FQDN) of the next hop SIP server. This prefix style originated in RFC 2052. Beginning with Cisco IOS XE Release 2.5, a second style, in compliance with RFC 2782, prepends the protocol label with an underscore "_"; for example, "_protocol._transport." The addition of the underscore reduces the risk of the same name being used for unrelated purposes. The form compliant with RFC 2782 is the default style.

The DNS SRV lookup is always attempted first for a Fully Qualified Domain Name (FQDN). If the DNS SRV lookup fails CUBE falls back to A-AAAA lookup. If you manually add a port number to a FQDN, the CUBE performs an A-AAAA lookup instead of SRV lookup.

Example:
'session target dns:cisco.com' would perform an SRV lookup and 'session target dns:cisco.com:5060' would perform an A-AAAA lookup.

How to Configure SIP-RFC 2782 Compliance with DNS SRV Queries

Configuring DNS Server Query Format RFC 2782 Compliance with DNS SRV Queries

Compliance with RFC 2782 changes the DNS SRV protocol label style. RFC 2782 updates RFC 2052 by prepending the protocol label with an underscore character. The prefix format compliant with RFC 2782 is the default format. However, backward compatibility is available, allowing newer versions of Cisco IOS software to work with older networks that support only RFC 2052 DNS SRV prefix style.

To configure the format of DNS SRV queries to comply with RFC 2782, complete this task.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. sip-ua
5. srv version {1 | 2}
6. exit

You do not have to perform this task if you want to use the default RFC 2782 format.

### Configuring DNS Server Lookups

Following is the example to configure `._sip._udp`.

```
!                  
dial-peer voice 1 voip
 session protocol sipv2
 session transport udp
 session target dns:cisco.com
!
```

Following are the examples to configure `._sip._tcp`.

```
! 
```
Following is the example to configure '_sips._tcp'.

Following is the sample configuration for a local DNS SRV.

Locally hosted DNS SRV entries are not supported until IOS-XE release 3.17S.

Troubleshooting Tips

You can use the following commands to troubleshoot the DNS SRV issues.

debug ip dns view

debug ip domain
Verifying

The following example shows sample output from the `show sip-ua status` command used to verify the style of DNS server queries:

```
Router# show sip-ua status
SIP User Agent Status
SIP User Agent for UDP : ENABLED
SIP User Agent for TCP : ENABLED
SIP User Agent bind status(signaling): DISABLED
SIP User Agent bind status(media): DISABLED
SIP max-forwards : 6
SIP DNS SRV version: 1 (rfc 2052)
```

Feature Information for SIP RFC 2782 Compliance with DNS SRV Queries

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

</tbody>
</table>
| Support for SRTP-SRTP interworking | Cisco IOS XE Everest 16.5.1b | This feature allows secure calls between two enterprises using different cipher suites. Supported cipher suites are as follows: 
- AEAD_AES_256_GCM 
- AEAD_AES_128_GCM 
- AES_CM_128_HMAC_SHA1_80 
- AES_CM_128_HMAC_SHA1_32 |
Prerequisites for SRTP-SRTP Interworking

- Cisco IOS XE Everest Release 16.5.1b or later

Note
SRTP-SRTP Interworking feature is not supported on Cisco ISR G2 Series Routers.

Restrictions for SRTP-SRTP Interworking

- Asymmetric SRTP fallback configuration is not supported
- Call admission control (CAC) is not supported
- Call Progress Analysis (CPA) is not supported
- Transcoding calls are not supported
- SRTCP-RTCP interworking is not supported
- More than one audio and video m-line is not supported
- Unified CME and Unified SRST flows and SIP-TDM flows are not supported

Information About SRTP-SRTP Interworking

From Cisco IOS XE Everest Release 16.5.1b onwards, when SRTP is enabled, by default Cisco Unified Border Element supports secure calls between networks using different cipher suites. The cipher suites supported for SRTP-SRTP interworking with default preference order is as follows:

- AEAD_AES_256_GCM
- AEAD_AES_128_GCM
- AES_CM_128_HMAC_SHA1_80
- AES_CM_128_HMAC_SHA1_32
Figure 53: SRTP-SRTP Interworking

CUBE allows you to change the list of preference order of the cipher-suites. Cipher-suite preference can be configured globally (under `voice service voip >> sip`), on a voice class tenant, or on a dial-peer.

The preference range is from 1 to 4, where 1 represents highest preference. CUBE offers SRTP cipher-suites in SDP offer based on the preference configured. For SDP answer, the highest configured preference cipher-suite that matches the offer from peer is selected.

**Supplementary Services Support**

The following supplementary services are supported:

- Midcall codec change with voice class codec configuration
- Reinvite-based call hold and resume
- Music on hold (MoH) invoked from the Cisco Unified Communications Manager (Cisco UCM), where the call leg changes between SRTP and RTP for an MoH source
- Reinvite-based call forward and call transfer
- Call transfer based on a REFER message, with local consumption or pass-through of the REFER message on the CUBE
- Call forward based on a 302 message, with local consumption or pass-through of the 302 message on the CUBE
- T.38 fax switchover
- Fax pass-through switchover

For call transfers involving REFER and 302 messages (messages that are locally consumed on CUBE), end-to-end media renegotiation is initiated from CUBE only when you configure the `supplementary-service media-renegotiate` command in voice service `voip` configuration mode.
Any call-flow wherein there is a switchover from RTP to SRTP on the same SIP call-leg requires the supplementary-service media-renegotiate command enabled in global or voice service voip configuration mode to ensure there is 2-way audio.

Example call-flows:
- RTP-SRTP transfer on CUCM side
- Non-secure MOH being played during secure call hold or resume

When supplementary services are invoked from the end points, the call can switch between SRTP and RTP during the call duration. Hence, Cisco recommends that you configure such SIP trunks for SRTP fallback. For information on configuring SRTP fallback, refer Enabling SRTP Fallback, on page 625.

How to Configure SRTP-SRTP Interworking

Configuring SRTP

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice tag voip
4. destination-pattern string
5. session protocol sipv2
6. session target ipv4:destination-address
7. incoming called-number string
8. srtp
9. codec codec
10. end
11. dial-peer voice tag voip
12. Repeat Steps 4, 5, 6, and 7 to configure a second dial peer.
13. srtp
14. codec codec
15. exit

DETAILED STEPS

<table>

<tr>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 2** | **configure terminal**<br>Example: `Device# configure terminal`
| Enters global configuration mode. |
| **Step 3** | **dial-peer voice tag voip**<br>Example: `Device(config)# dial-peer voice 201 voip`
| Defines a particular dial peer, to specify the method of voice encapsulation, and enters dial peer voice configuration mode.  
  - In the example, the following parameters are set:<br>    - Dial peer 201 is defined.  
    - VoIP is shown as the method of encapsulation. |
| **Step 4** | **destination-pattern string**<br>Example: `Device(config-dial-peer)# destination-pattern 5550111`
| Specifies either the prefix or the full E.164 telephone number to be used for a dial peer string.  
  - In the example, 5550111 is specified as the pattern for the telephone number. |
| **Step 5** | **session protocol sipv2**<br>Example: `Device(config-dial-peer)# session protocol sipv2`
| Specifies a session protocol for calls between local and remote routers using the packet network.  
  - In the example, the `sipv2` keyword is configured so that the dial peer uses the SIP protocol. |
| **Step 6** | **session target ipv4:destination-address**<br>Example: `Device(config-dial-peer)# session target ipv4:10.13.25.102`
| Designates an IP address where calls will be sent.  
  - In the example, calls matching this outbound dial-peer will be sent to 10.13.25.102. |
| **Step 7** | **incoming called-number string**<br>Example: `Device(config-dial-peer)# incoming called-number 5550111`
| Specifies a digit string that can be matched by an incoming call to associate the call with a dial peer.  
  - In the example, 5550111 is specified as the pattern for the E.164 or private dialing plan telephone number. |
| **Step 8** | **srtp**<br>Example: `Device(config-dial-peer)# srtp`
| Specifies that SRTP is used to enable secure calls for the dial peer. |
| **Step 9** | **codec codec**<br>Example: `Device(config-dial-peer)# codec g711ulaw`
| Specifies the voice coder rate of speech for the dial peer.  
  - In the example, G.711 mu-law at 64,000 bps, is specified as the voice coder rate for speech. |

**Configuring Cipher Suite Preference (optional)**

No additional configurations are required if you want to configure the default preference order. Use the following procedure for changing the default preference.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice class srtp-crypto tag
4. crypto preference cipher-suite
5. exit
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> voice class srtp-crypto tag</td>
<td>Enters voice class configuration mode and assign an identification tag for a srtp-crypto voice class.</td>
</tr>
<tr>
<td>Example: Device(config)# voice class srtp-crypto 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> crypto preference cipher-suite</td>
<td>Specifies the preference for an SRTP cipher-suite that will be offered by Cisco Unified Border Element (CUBE) in the SDP in offer and answer. You can configure a maximum of four preferences.</td>
</tr>
<tr>
<td>Example: Device(config-class)# crypto 1 Aead_AES_256_GCM</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Exists the present configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config-class)# exit</td>
<td></td>
</tr>
</tbody>
</table>

Example

What to do next
Assign SRTP Crypto voice class globally, or on a voice-class tenant, or on a dial-peer. For more information, see Applying Crypto Suite Selection Preference (optional), on page 623.

Applying Crypto Suite Selection Preference (optional)

Before you begin
• Ensure that an srtp voice-class is created using the **voice class srtp-crypto crypto-tag** command

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **Apply crypto suite selection preference**
   • In global configuration mode:
     • **voice service voice**
## Applying Crypto Suite Selection Preference (optional)

- **sip**
- **srtp-crypto** crypto-tag

- In voice class tenant configuration mode:
  - **voice class tenant** tag
  - **srtp-crypto** crypto-tag

- In dial-peer configuration mode:
  - **dial-peer voice** tag voip
  - **voice-class sip srtp-crypto** crypto-tag

### DETAILED STEPS

Enabling SRTP Fallback

You can configure SRTP with the fallback option so that a call can fall back to RTP if SRTP is not supported by the other call end. Enabling SRTP fallback is required for supporting nonsecure supplementary services such as MoH, call forward, and call transfer.

SUMMARY STEPS

1. enable
2. configure terminal
3. Enter one of the following commands:
   • In dial-peer configuration mode
     dial-peer
     voice
tag
voip
srtp
fallback (for interworking with devices other than Cisco Unified Communications Manager)
or
voice-class sip srtp
negotiate cisco (Enable this CLI along with srtp fallback command to support SRTP fallback with Cisco Unified Communications Manager )

- In global VoIP SIP configuration mode

voice service voip

sip

srtp

fallback (for interworking with devices other than Cisco Unified Communications Manager)

or

srtp

negotiate cisco (Enable this CLI along with srtp fallback command to support SRTP fallback with Cisco Unified Communications Manager )

4. exit

**Example:**

```bash
Device(config)# dial-peer voice 10 voip
Device(config-dial-peer)# srtp fallback
```

**Example:**

```bash
Device(config)# dial-peer voice 10 voip
Device(config-dial-peer)# voice-class sip srtp negotiate Cisco

**Example:**

```bash
Device(config)# voice service voip
Device(config)# sip
Device(conf-voi-serv)# srtp fallback

**Example:**

```bash
Device(config)# voice service voip
Device(config)# sip
Device(conf-voi-serv)# srtp negotiate cisco
```

**Step 4**

**exit**

**Example:**

```bash
Device(conf-voi-serv)# exit
```

Exits present configuration mode and enters privileged EXEC mode.
Configuration Examples

Example: Configuring SRTP-SRTP Interworking

The following example shows how to configure support for SRTP-SRTP interworking. In this example, the incoming call leg preference is set to AEAD_AES_256_GCM crypto-suite and the outgoing call leg preference is set to AES_CM_128_HMAC_SHA1_80 crypto-suite.

Configure SRTP:

```
Device> enable
Device# configure terminal
Device(config)# dial-peer voice 300 voip
Device(config-dial-peer)# description "inbound dialpeer for 81560"
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# incoming called-number 81560
Device(config-dial-peer)# srtp
Device(config-dial-peer)# codec g711ulaw
Device(config-dial-peer)# end
```

Create a voice class srtp-crypto 100 and assign AEAD_AES_256_GCM crypto-suite with highest preference:

```
Device(config)# voice class srtp-crypto 100
Device(config-class)# crypto 1 AEAD_AES_256_GCM
```

Assign srtp-crypto 100 on incoming dial-peer:

```
Device(config)# dial-peer voice 300 voip
Device(config-dial-peer)# voice-class sip srtp-crypto 100
Device(config-dial-peer)# codec g711ulaw
Device(config-dial-peer)# srtp
```

Create a voice class srtp-crypto 103 and assign AES_CM_128_HMAC_SHA1_80 crypto-suite with highest preference:

```
Device> enable
Device# configure terminal
Device(config)# voice class srtp-crypto 103
Device(config-class)# crypto 1 AES_CM_128_HMAC_SHA1_80
```

Assign srtp-crypto 103 on outgoing dial-peer:

```
Device(config)# dial-peer voice 400 voip
```
Device(config-dial-peer)# **voice-class sip srtp-crypto 103**
Device(config-dial-peer)# **codec g711ulaw**
Device(config-dial-peer)# **srtp**

Device# **show sip-ua calls**

**Example: Changing the Cipher-Suite Preference**

Specify SRTP cipher-suite preference:

```plaintext
Device> enable
Device(config)# configure terminal
Device(config)# voice class srtp-crypto 100
Device(config-class)# crypto 1 Aead_AES_256_GCM
Device(config-class)# crypto 2 Aead_AES_128_GCM
Device(config-class)# crypto 4 AES_CM_128_HMAC_SHA1_32
```

The following is the snippet of `show running-config` command output showing the cipher-suite preference:

```plaintext
Device# show running-config
voice class srtp-crypto 100
crypto 1 Aead_AES_256_GCM
crypto 2 Aead_AES_128_GCM
crypto 4 AES_CM_128_HMAC_SHA1_32
```

If you want to change the preference 4 to AES_CM_128_HMAC_SHA1_80, execute the following command:
Device(config-class)# crypto 4 AES_CM_128_HMAC_SHA1_80

The following is the snippet of `show running-config` command output showing the change in cipher-suite:

Device# show running-config
class srtp-crypto 100
crypto 1 AEAD_AES_256_GCM
crypto 2 AEAD_AES_128_GCM
crypto 4 AES_CM_128_HMAC_SHA1_80

If you want to change the preference of AES_CM_128_HMAC_SHA1_80 to 3, execute the following commands:

Device(config-class)# no crypto 4
Device(config-class)# crypto 3 AES_CM_128_HMAC_SHA1_80

The following is the snippet of `show running-config` command output showing the cipher-suite preference overwritten:

Device# show running-config
class srtp-crypto 100
crypto 1 AEAD_AES_256_GCM
crypto 2 AEAD_AES_128_GCM
crypto 3 AES_CM_128_HMAC_SHA1_80
SRTP-RTP Interworking

The Cisco Unified Border Element (CUBE) Support for SRTP-RTP Interworking feature allows secure network to non-secure network calls and provides operational enhancements for Session Initiation Protocol (SIP) trunks from Cisco Unified Call Manager and Cisco Unified Call Manager Express. Support for Secure Real-Time Transport Protocol (SRTP) to Real-Time Transport Protocol (RTP) interworking in a network is enabled for SIP-SIP audio calls.

- Feature Information for SRTP-RTP Interworking, on page 633
- Prerequisites for SRTP-RTP Interworking, on page 634
- Restrictions for SRTP-RTP Interworking, on page 634
- Information About SRTP-RTP Interworking, on page 634

Feature Information for SRTP-RTP Interworking

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

### Prerequisites for SRTP-RTP Interworking

- SRTP-RTP interworking is supported with Cisco Unified CallManager 7.0 and later releases.
- DSP resources are required for platforms running on Cisco IOS Releases. For more information on configuring DSP resources, see Transcoding.
- Platforms running on Cisco IOS XE Releases do not require DSP resources.

### Restrictions for SRTP-RTP Interworking

- Asymmetric SRTP fallback configuration is not supported.
- Dial peer hunting is not supported.
- Video calls are not supported on platforms running on Cisco IOS Releases.
- More than one video m-line is not supported.
- DTMF interworking is not supported on ISR G2 (2900, 3900) series routers. It is supported only on platforms running on Cisco IOS XE Releases.

### Information About SRTP-RTP Interworking

To configure support for SRTP-RTP interworking, you should understand the following concepts:

### Support for SRTP-RTP Interworking

The Cisco Unified Border Element Support for SRTP-RTP Interworking feature connects SRTP Cisco Unified CallManager domains with the following:

- RTP Cisco Unified CallManager domains. Domains that do not support SRTP or have not been configured for SRTP, as shown in the figure below.
- RTP Cisco applications or servers. For example, Cisco Unified MeetingPlace, Cisco WebEx, or Cisco Unity, which do not support SRTP, or have not been configured for SRTP, or are resident in a secure data center, as shown in the figure below.
- RTP to third-party equipment. For example, IP trunks to PBXs or virtual machines, which do not support SRTP.
The Cisco Unified Border Element Support for SRTP-RTP Interworking feature connects SRTP enterprise domains to RTP SIP provider SIP trunks. SRTP-RTP interworking connects RTP enterprise networks with SRTP over an external network between businesses. This provides flexible secure business-to-business communications without the need for static IPsec tunnels or the need to deploy SRTP within the enterprise, as shown in the figure below.

SRTP-RTP interworking also connects SRTP enterprise networks with static IPsec over external networks, as shown in the figure below.

SRTP-RTP interworking on the CUBE in a network topology uses single-pair key generation. Existing audio and dual-tone multifrequency (DTMF) transcoding is used to support voice calls. SRTP-RTP interworking support is provided in both flow-through and high-density mode. There is no impact on SRTP-SRTP pass-through calls.

SRTP is configured on one dial peer using the `srtp` and `srtp fallback` commands. RTP is configured on the other dial peer. The dial peer configuration takes precedence over the global configuration on the CUBE.

Fallback handling occurs if one of the call endpoints does not support SRTP. The call can fall back to RTP-RTP, or the call can fail, depending on the configuration. Fallback takes place only if the `srtp fallback` command is configured on the respective dial peer. RTP-RTP fallback occurs when no transcoding resources are available for SRTP-RTP interworking.
Using SRTP-RTP Chain for Interworking Between AES_CM_128_HMAC_SHA1_32 and AES_CM_128_HMAC_SHA1_80 Crypto Suites

A single Cisco Unified Call Manager (CUCM) device cannot terminate a Secure Real-time Transport Protocol (SRTP) connection with an IP Phone using the AES_CM_128_HMAC_SHA1_32 crypto suite and initiate an SRTP connection with an external CUBE device with the AES_CM_128_HMAC_SHA1_80 crypto suite at the same time.

For Cisco Unified Call Manager (Unified Communications Manager) and IP Phone devices that support only AES_CM_128_HMAC_SHA1_32 crypto suite, the interim SRTP-RTP interworking solution that is described below can be implemented.

- CUCM or IP Phone side:
  - An SRTP connection using the AES_CM_128_HMAC_SHA1_32 crypto suite exists between the IP Phone and CUBE1.
  - An RTP connection exists between CUBE1 and CUBE2.

- SIP trunk side—An SRTP connection using the AES_CM_128_HMAC_SHA1_80 crypto suite is initiated by CUBE2 here. In the image below, CUBE2 is the border element on the Customer Network and SBC is the border element on the Service Provider Network.

Figure 57: SRTP-RTP Interworking Supporting AES_CM_128_HMAC_SHA1_32 crypto suite

Note

- AES_CM_128_HMAC_SHA1_32 to AES_CM_128_HMAC_SHA1_80 interworking is not supported up to Cisco IOS 15.5(3)M Release and Cisco IOS XE Everest 16.4.1 Release.

- From Cisco IOS XE Everest 16.5.1b Release onwards, SRTP-SRTP interworking is supported and therefore SRTP-RTP chain is not required.
Supplementary Services Support

The following supplementary services are supported:

- Midcall codec change with voice class codec configuration
- Reinvite-based call hold and resume
- Music on hold (MoH) invoked from the Cisco Unified Communications Manager (Cisco UCM), where the call leg changes between SRTP and RTP for an MoH source
- Reinvite-based call forward and call transfer
- Call transfer based on a REFER message, with local consumption or pass-through of the REFER message on the CUBE
- Call forward based on a 302 message, with local consumption or pass-through of the 302 message on the CUBE
- T.38 fax switchover
- Fax pass-through switchover

For call transfers involving REFER and 302 messages (messages that are locally consumed on CUBE), end-to-end media renegotiation is initiated from CUBE only when you configure the `supplementary-service media-renegotiate` command in voice service voip configuration mode.

---

**Note**

Any call-flow wherein there is a switchover from RTP to SRTP on the same SIP call-leg requires the `supplementary-service media-renegotiate` command enabled in global or voice service voip configuration mode to ensure there is 2-way audio.

Example call-flows:

- RTP -SRTP transfer on CUCM side
- Non-secure MOH being played during secure call hold or resume

---

When supplementary services are invoked from the end points, the call can switch between SRTP and RTP during the call duration. Hence, Cisco recommends that you configure such SIP trunks for SRTP fallback. For information on configuring SRTP fallback, refer to [Enabling SRTP Fallback](#), on page 625.
How to Configure Support for SRTP-RTP Interworking

Configuring SRTP-RTP Interworking Support

Note
From Cisco IOS XE Everest Release 16.5.1b onwards, the following crypto suites are enabled by default on the SRTP leg:

- AEAD_AES_256_GCM
- AEAD_AES_128_GCM
- AES_CM_128_HMAC_SHA1_80
- AES_CM_128_HMAC_SHA1_32

Use the following procedure for changing the default preference list.

Perform the task in this section to enable SRTP-RTP interworking support between one or multiple Cisco Unified Border Elements for SIP-SIP audio calls. In this task, RTP is configured on the incoming call leg and SRTP is configured on the outgoing call leg.

Note
This feature is available only on Cisco IOS images with security package.

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice tag voip
4. destination-pattern string
5. session protocol sipv2
6. session target ipv4: destination-address
7. incoming called-number string
8. codec codec
9. end
10. dial-peer voice tag voip
11. Repeat Steps 4, 5, 6, and 7 to configure a second dial peer.
12. srtp
13. codec codec
14. exit
### Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable`           | Enables privileged EXEC mode.  
  **Example:**  
  `Device>` `enable`  
  - Enter your password if prompted. |
| Step 2 | `configure terminal` | Enters global configuration mode.  
  **Example:**  
  `Device# configure terminal` |
| Step 3 | `dial-peer voice tag voip`  
  **Example:**  
  `Device(config)# dial-peer voice 201 voip` | Defines a particular dial peer, to specify the method of voice encapsulation, and enters dial peer voice configuration mode.  
  - In the example, the following parameters are set:  
    - Dial peer 201 is defined.  
    - VoIP is shown as the method of encapsulation. |
| Step 4 | `destination-pattern string`  
  **Example:**  
  `Device(config-dial-peer)# destination-pattern 5550111` | Specifies either the prefix or the full E.164 telephone number to be used for a dial peer string.  
  - In the example, 5550111 is specified as the pattern for the telephone number. |
| Step 5 | `session protocol sipv2`  
  **Example:**  
  `Device(config-dial-peer)# session protocol sipv2` | Specifies a session protocol for calls between local and remote routers using the packet network.  
  - In the example, the `sipv2` keyword is configured so that the dial peer uses the SIP protocol. |
| Step 6 | `session target ipv4: destination-address`  
  **Example:**  
  `Device(config-dial-peer)# session target ipv4: 10.13.25.102.` | Designates an IPv4 destination address where calls will be sent.  
  - In the example, calls matching this outbound dial-peer will be sent to 10.13.25.102. |
| Step 7 | `incoming called-number string`  
  **Example:**  
  `Device(config-dial-peer)# incoming called-number 5550111` | Specifies a digit string that can be matched by an incoming call to associate the call with a dial peer.  
  - In the example, 5550111 is specified as the pattern for the E.164 or private dialing plan telephone number. |
| Step 8 | `codec codec`  
  **Example:**  
  `Device(config-dial-peer)# codec` | Specifies the voice coder rate of speech for the dial peer.  
  - In the example, G.711 mu-law at 64,000 bps, is specified as the voice coder rate for speech. |
### Configuring Crypto Authentication

#### Configuring Crypto Authentication

**Note**

Effective Cisco IOS XE Everest Releases 16.5.1b, `srtp-auth` command is deprecated. Although this command is still available in Cisco IOS XE Everest software, executing this command does not cause any configuration changes. Use `voice class srtp-crypto` command to configure the preferred cipher-suites for the SRTP call leg (connection). For more information, see SRTP-SRTP Interworking.

#### SUMMARY STEPS

1. *enable*
2. *configure terminal*
3. Execute the commands based on your configuration mode
   - In dial-peer configuration mode:
     
     ```
     dial-peer voice tag voip
     voice-class sip srtp-auth {sha1-32 | sha1-80 | system}
     ```
   - In global VoIP SIP configuration mode:
     
     ```
     voice service voip
     sip
     srtp-auth {sha1-32 | sha1-80}
     ```

4. end

### DETAILED STEPS

#### Example:

```
Device(conf-serv-sip)# end
```

---

## Enabling SRTP Fallback

You can configure SRTP with the fallback option so that a call can fall back to RTP if SRTP is not supported by the other call end. Enabling SRTP fallback is required for supporting nonsecure supplementary services such as MoH, call forward, and call transfer.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
   - In dial-peer configuration mode
     ```
     dial-peer
     voice
     tag
     voip
     srtp
     fallback (for interworking with devices other than Cisco Unified Communications Manager)
     ```
   - In global VoIP SIP configuration mode
     ```
     voice service voip
     sip
     srtp
     fallback (for interworking with devices other than Cisco Unified Communications Manager)
     ```
   - **voice-class sip srtp negotiate cisco** (Enable this CLI along with `srtp fallback` command to support SRTP fallback with Cisco Unified Communications Manager)
   - **voice-class sip srtp negotiate cisco** (Enable this CLI along with `srtp fallback` command to support SRTP fallback with Cisco Unified Communications Manager)
4. **exit**
### DETAILED STEPS

<table>
<thead>

<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| configure terminal| |
| Example:          | |
| Device# configure terminal | |

| **Step 3**        | Enables call fallback to nonsecure mode. |
| Enter one of the following commands: | |
| • In dial-peer configuration mode | |
| dial-peer | |
| voice | |
| tag | |
| voip | |
| srtpt | |
| fallback (for interworking with devices other than Cisco Unified Communications Manager) | |
| or | |
| voice-class sip srtpt | |
| negotiate cisco (Enable this CLI along with srtpt fallback command to support SRTP fallback with Cisco Unified Communications Manager) | |
| • In global VoIP SIP configuration mode | |
| voice service voip | |
| sip | |
| srtpt | |
| fallback (for interworking with devices other than Cisco Unified Communications Manager) | |
| or | |
| srtpt | |
| negotiate cisco (Enable this CLI along with srtpt fallback command to support SRTP fallback with Cisco Unified Communications Manager) | |

**Example:**

```
Device(config)# dial-peer voice 10 voip
Device(config-dial-peer)# srtpt fallback
```

<td></td>
</tr>
<tr>
<td><code>cisco</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

**exit**

**Example:**

Device(conf-voi-serv)#  **exit**

Exits present configuration mode and enters privileged EXEC mode.

---

**Troubleshooting Tips**

The following commands help in troubleshooting SRTP-RTP supplementary services support:

- `debug ccsip all`
- `debug voip ccapi inout`

**Verifying SRTP-RTP Supplementary Services Support**

Perform this task to verify the configuration for SRTP-RTP supplementary services support.

**SUMMARY STEPS**

1. **enable**
2. **show call active voice brief**

**DETAILED STEPS**

**Step 1**

**enable**

Enables privileged EXEC mode.

**Example:**
Configuration Examples for SRTP-RTP Interworking

Example: SRTP-RTP Interworking

The following example shows how to configure support for SRTP-RTP interworking. In this example, the incoming call leg is RTP and the outgoing call leg is SRTP.

```bash
%SYS-5-CONFIG_I: Configured from console by console
dial-peer voice 201 voip
destination-pattern 5550111
session protocol sipv2
session target ipv4:10.13.25.102
incoming called-number 5550112
codec g711ulaw
```
Example: Configuring Crypto Authentication

Effective Cisco IOS XE Everest Releases 16.5.1b, `srtp-auth` command is deprecated. Although this command is still available in Cisco IOS XE Everest software, executing this command does not cause any configuration changes. Use `voice class srtp-crypto` command to configure the preferred cipher-suites for the SRTP call leg (connection). For more information, see SRTP-SRTP Interworking.

Example: Configuring Crypto Authentication (Dial Peer Level)

The following example shows how to configure Cisco UBE to support an SRTP connection using the AES_CM_128_HMAC_SHA1_80 crypto suite at the dial peer level:

```
Device> enable
Device# configure terminal
Device(config)# dial-peer voice 15 voip
Device(config-dial-peer)# voice-class sip srtp-auth sha1-80
Device(config-dial-peer)# end
```

Example: Configuring Crypto Authentication (Global Level)

The following example shows how to configure Cisco UBE to support an SRTP connection using the AES_CM_128_HMAC_SHA1_80 crypto suite at the global level:

```
Device> enable
Device# configure terminal
Device(config)# voice service voip
Device(config-voi-serv)# sip
Device(config-serv-sip)# srtp-auth sha1-80
Device(config-serv-sip)# end
```
SRTP-SRTP Pass-Through

SRTP-SRTP pass-through feature allows pass-through of encrypted media from one call-leg to the other.

</tbody>
</table>
Information About SRTP-SRTP Pass-Through

Cisco Unified Border Element supports SIP calls between endpoints using Transport Layer Security (TLS) for SIP signaling encryption and Secure Real-Time Protocol (SRTP) to provide RTP media encryption. However, these two encryption mechanisms may not be deployed simultaneously, depending on the required call flow invoked on the associated configuration.

The following are conditions of the SRTP Passthrough feature:

- SRTP Passthrough must be configured on both legs of the call. If the target adjacency does not support SRTP Passthrough, then the call is rejected by error message 415 (Unsupported Media Type).
- "m=.. RTP/SAVP .." and a="crypto:..." fields coming in on an Invite from one adjacency are passed on in an Invite to the target adjacency.
- "m=...RTP/SAVP..." is a required field in the Invite to trigger SRTP Passthrough behavior in the SBC.

Pass-Through of Unsupported Crypto Suites

Note

Effective from Cisco IOS XE Everest Release 16.5.1b, CUBE supports AEAD_AES_128_GCM and AEAD_AES_256_GCM crypto-suites. For more information, see SRTP-SRTP Interworking.

CUBE supports transparent passthrough of all (supported and unsupported) crypto suites.

Until Cisco IOS Release 15.6(1)T and Cisco IOS XE Release 3.17S, CUBE and DSP supported SRTP pass-through only for AES_CM_128_HMAC_SHA1_80 crypto suite.

From Cisco IOS Release 15.6(1)T and Cisco IOS XE Release 3.17S onwards, CUBE supports pass-through of the following unsupported crypto suites:

- AEAD_AES_128_GCM
- AEAD_AES_256_GCM
- AEAD_AES_128_CCM
• AEAD_AES_256_CCM

CUBE has the ability to pass across crypto attributes (containing any unsupported crypto suites) as well as media packets (encrypted with unsupported crypto suites).

If SRTP pass-thru feature is enabled, media interworking will not be supported. Ensure that you have symmetric configuration on both the incoming and outgoing dial-peers to avoid media-related issues.

**Configure Pass-Through of Unsupported Crypto Suites for a Specific Dial Peer**

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **dial-peer voice tag voip**
4. **destination-pattern string**
5. **session protocol sipv2**
6. **session target ipv4: destination-address**
7. **incoming called-number string**
8. **srtppass-thru**
9. **codec codec**
10. **end**
11. **dial-peer voice tag voip**
12. Repeat Steps 4, 5, 6, and 7 to configure a second dial peer.
13. **srtppass-thru**
14. **codec codec**
15. **exit**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| Step 3 | dial-peer voice tag voip | Defines a particular dial peer, to specify the method of voice encapsulation, and enters dial peer voice configuration mode.  
- In the example, the following parameters are set:  
  - Dial peer 201 is defined.  
  - VoIP is shown as the method of encapsulation. |

| Step 4 | destination-pattern string | Specifies either the prefix or the full E.164 telephone number to be used for a dial peer string.  
- In the example, 5550111 is specified as the pattern for the telephone number. |

| Step 5 | session protocol sipv2 | Specifies a session protocol for calls between local and remote routers using the packet network.  
- In the example, the sipv2 keyword is configured so that the dial peer uses the IETF SIP. |

| Step 6 | session target ipv4: destination-address | Designates a network-specific address to receive calls from a VoIP or VolPv6 dial peer.  
- In the example, the IP address of the dial peer to receive calls is configured as 10.13.25.102. |

| Step 7 | incoming called-number string | Specifies a digit string that can be matched by an incoming call to associate the call with a dial peer.  
- In the example, 5550111 is specified as the pattern for the E.164 or private dialing plan telephone number. |

| Step 8 | srtp pass-thru | Enables transparent passthrough of all crypto suites for a specific dial peer. |

| Step 9 | codec codec | Specifies the voice coder rate of speech for the dial peer.  
- In the example, G.711 mu-law at 64,000 bps, is specified as the voice coder rate for speech. |

| Step 10 | end | Exits dial peer voice configuration mode. |
### Purpose

Command or Action | Purpose |
--- | --- |
**Step 11** | ```dial-peer voice tag voip ```
**Example:**
```
Device(config)# dial-peer voice 200 voip
```
Definitions a particulary dial peer, to specify the method of voice encapsulation, and enters dial peer voice configuration mode.
- In the example, the following parameters are set:
  - Dial peer 200 is defined.
  - VoIP is shown as the method of encapsulation.

**Step 12** | Repeat Steps 4, 5, 6, and 7 to configure a second dial peer. -- |
**Step 13** | ```srtp pass-thru ```
**Example:**
```
Device(config-dial-peer)# srtp pass-thru
```
Enables transparent passthrough of all crypto suites for a specific dial peer.

**Step 14** | ```codec codec ```
**Example:**
```
Device(config-dial-peer)# codec g711ulaw
```
Specifies the voice coder rate of speech for the dial peer.
- In the example, G.711 mu-law at 64,000 bps, is specified as the voice coder rate for speech.

**Step 15** | ```exit ```
**Example:**
```
Device(config-dial-peer)# exit
```
Exits dial peer voice configuration mode.

---

### Configure Pass-Through of Unsupported Crypto Suites Globally

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `voice service voip`
4. `srtp pass-thru`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | ```enable ```
**Example:**
```
Device> enable
```
Enables privileged EXEC mode.
- Enter your password if prompted.
<table>
<thead>

### Configuration Examples for SRTP-SRTP Pass-Through

**Example for SRTP=SRTP Pass-Through**

```conf
enable
configure terminal
dial-peer voice 201 voip
destination-pattern 5550111
session protocol sipv2
session target ipv4:10.13.25.102
incoming called-number 5550111
srtp
codec g711ulaw
end

dial-peer voice 200 voip
destination-pattern 5550111
session protocol sipv2
session target ipv4:10.13.25.101
incoming called-number 5550111
srtp
codec g711ulaw
end
```

**Example for Pass-Through of Unsupported Crypto Suites for a specific dial peer**

```conf
enable
configure terminal
```
Example for Pass-Through of Unsupported Crypto Suites Globally

enable
configure terminal
voice service voip
srtp pass-thru
end

High Availability on Cisco 4000 Series Integrated Services Routers

The High Availability (HA) feature allows you to benefit from the failover capability of Cisco Unified Border Element (Cisco UBE) on two routers, one active and one standby. When the active router goes down for any reason, the standby router takes over seamlessly, preserving and processing your calls.

Figure 58: Cisco UBE High Availability

- About Cisco UBE High Availability on Cisco 4000 Series ISR, on page 657
- How to Configure Cisco UBE High Availability on Cisco 4000 Series ISR, on page 661

- Troubleshoot High Availability Issues, on page 675

About Cisco UBE High Availability on Cisco 4000 Series ISR

Cisco UBE supports Box-to-box redundancy on Cisco 4000 Series Integrated Services Router (Cisco 4000 Series ISR) and uses Redundancy Group Infrastructure to provide High Availability.

Box-to-Box Redundancy

Box-to-box redundancy enables configuring a pair of routers to act as back up for each other. In the router pair, the active router is determined based on the failover conditions. The router pair continuously exchange status messages. Cisco UBE session information is checkpointed across the active and standby router. This enables the standby router to immediately take over all Cisco UBE call processing responsibilities when the active router becomes unavailable.
Redundancy Group (RG) Infrastructure

A group of redundant interfaces form a Redundancy Group. The active and standby routers are connected by a configurable control link and data synchronization link. The control link is used to communicate the redundancy state for each router. The data synchronization link is used to transfer stateful information to synchronize the stateful database for the calls and media flows. Each pair of redundant interfaces is configured with the same unique ID number, also known as the Redundancy Interface Identifier (RII).

A Virtual IP address (VIP) is configured on interfaces that connect to the external network. All signaling and media is sourced from and sent to the Virtual IP address. External devices such as Cisco Unified Communication Manager, uses VIP as the destination IP address for the calls traversing through Cisco UBE.

The following figure shows the redundancy group configured for a pair of routers with a single outgoing interface.

*Figure 59: Redundancy Group Configuration*

Network Topology

This section describes how to configure the following network topology, in which an active and standby pair of routers is used in a SIP trunk deployment between a Cisco Unified Communications Manager (Unified CM) and a service provider (SP) SIP trunk for PSTN access.
In this topology, both active and standby routers have the same configuration and both platforms are connected through a physical switch across same interfaces. This is required for Cisco UBE HA to work. For example, the CUBE-1 and CUBE-2 interface towards WAN must terminate on the same switch. Multiple interfaces or sub-interfaces can be used on either LAN or WAN side. Also, one Cisco UBE has a lower IP address across all three interfaces on the same Cisco UBE platform.

We recommend that you keep the following in mind when configuring this topology:

- Use a dedicated interface that is connected through a switch for checkpointing the RG control and data traffic across the two routers.

- A keepalive interface that is used for check-pointing RG control and data traffic must be in a different subnet or VLAN if the redundancy group ID is the same for the two different Cisco UBE HA pairs.

- You can configure a maximum of two redundancy groups. Hence, there can be only two active and standby pairs within the same network.

- Source all signaling and media from and to the Virtual IP address.

- Always save the running configuration to avoid losing it due to router reload during a failover.

- Virtual Routing and Forwarding
  - Define Virtual Router Forwarding (VRF) in the same order on both active and standby routers for an accurate synchronization of data.
  - You can configure VRFs only on Traffic interfaces (SIP and RTP). Do not configure VRF on RG Control and Data interface.
  - VRF configurations on both the active and standby router must be identical. VRF IDs are checkpointed for the calls before and after switchover (includes VRF-based RTP port range).

- Manually copy the configurations from one router to the other.

- When the configuration is replicated on the standby router, it is not committed to the startup configuration; it is in the running configuration. You must run the `write memory` command to commit the changes that are synchronized from the active router on the standby router.

**Considerations and Restrictions**

The following is a list of further considerations and restrictions you should know before configuring this topology:
Considerations

- Only active calls are checkpointed (Calls that are connected with 200 OK or ACK transaction completed).
- When you apply and save the configuration for the first time, the platform must be reloaded.
- For H.323, and TCP-based calls, media preservation is supported after the failover, but session signaling is not preserved.
- If you have Cisco Unified Customer Voice Portal (CVP) in your network, we recommend that you configure TCP session transport for the SIP trunk between CVP and Cisco UBE.
- Upon failover, the previously active Cisco UBE reloads by design.
- Cisco UBE uses the primary IP address to communicate Smart Licensing information.
- For SIP-SIP TLS calls (using Cisco IOS XE Release 3.11 or later), configure both the active and standby Cisco UBE as trust points to a common external CA Server.
- TCP sessions are not preserved during the failover. Remote user agents are expected to reestablish TCP sessions (using port 5060) before sending subsequent messages.
- Call Admission Control (CAC) continues to work after switchover. After stateful switchover, no calls are allowed if the CAC limit is reached before the switchover.
- Up to 6 multimedia lines in the SDP are checkpointed for Cisco UBE HA. From Cisco IOS XE Release 3.17 onwards, SDP Passthru (up to 2 m-lines) calls are also checkpointed.
- Survivability.tcl preservation is supported from Cisco IOS XE Release 3.17 onwards for Unified Customer Voice Portal (CVP) deployments.
- SRTP-RTP, SRTP-SRTP, and SRTP Passthru are supported.
- Port channel is supported for both RG control data and traffic interfaces only from Cisco IOS XE 16.3.1 onwards.

Figure 61: Additional Supported Options for Cisco UBE HA

- LTI-based transcoder call flow preservation is supported from Cisco IOS XE Release 3.15 onwards and requires same DSP module capacity on both active and standby in the same slot or subslot.
Restrictions

- IPv6 is not supported.
- All SCCP-based media resources (Conference bridge, Transcoding, Hardware MTP, and Software MTP) are not supported.
- Cisco Unified Survivable Remote Site Telephony (Unified SRST) or TDM Gateway co-location on Cisco UBE HA is not supported.
- Routers connected through Metropolitan Area Network (MAN) Ethernet regardless of latency are not supported.
- Out-of-band DTMF (Notify or KPML) is not supported post switchover. Only rtp-nnte to rtp-nnte and voice-inband to voice-inband DTMF works after the switchover.
- Media-flow around and UC Services API (Cisco Unified Communications Manager Network-Based Recording) are not supported.
- Signaling and media preservation are not supported over a crossover cable connection for the RG-control or data link.
- You cannot terminate Wide Area Network (WAN) on Cisco UBE directly or Data HA on either side. Both active and standby routers must be in the same Data Center and connected to the same physical switch.
- The Courtesy Callback (CCB) feature is not supported if a callback was registered with Cisco Unified Customer Voice Portal (CVP) and then a switchover was done on Cisco UBE.
- You cannot configure a secondary IP address for the interfaces.
- If the redundancy group ID is same for the two different Cisco UBE HA pairs, then the keepalive interface that is used for checkpointing RG control and data traffic must be in a different subnet or VLAN.
- Call Progress Analysis (CPA) calls (before transferred to the agent), SCCP-based media resources, Noise Reduction, Acoustic Shock Protection (ASP), and transcoding calls are not supported.
- The failover time for a Box-to-box application is higher than the Inbox application.

How to Configure Cisco UBE High Availability on Cisco 4000 Series ISR

Before You Begin

- Use Cisco IOS-XE Release 3.11 and or later on both active and standby routers.
- Ensure that you have the required licenses for configuring high availability. For detailed information, see Cisco Unified Border Element Data Sheet.
- Connect the active and the standby router through a layer 2 connection for the control path.
Configure High Availability

SUMMARY STEPS

1. Configure the Redundancy Group (RG).
2. Configure interface tracking.
3. Configure the interfaces.
4. Configure SIP Binding.
5. (Optional) If H.323 calls are involved, enable H.323 binding.
6. Configure the Punt Policing feature.
7. Configure the RG group under voice service voip. This enables Box-to-box Cisco UBE HA.
8. Configure the Media Inactivity timer.
9. Reload the router.
10. Configure the peer router.
11. Point the attached devices to the Cisco UBE Virtual IP (VIP) address.

DETAILED STEPS

Step 1 Configure the Redundancy Group (RG).
a) Enter application redundancy mode.
   
   **Example:**
   
   ```plaintext
   Router>enable
   Router#configure terminal
   Router(config)#redundancy
   Router(config-r)#mode none
   Router(config-red)#application redundancy
   Router(config-red-app)#group 1
   ```
   
b) Configure a name for the redundancy group.
   
   **Example:**
   
   ```plaintext
   Router(config-red-app-grp)#name cube-ha
   ```
   
   where `cube-ha` is the name of the redundancy group.
   
c) Specify the initial priority and failover threshold for a redundancy group.
   
   **Example:**
   
   ```plaintext
   Router(config-red-app-grp)#priority 100 failover threshold 75
   ```
   
   where 100 is priority value and 75 is the threshold value. The router with highest priority and threshold value among the HA pair acts as the active router.
d) Configure the timers for delay and reload.

**Example:**
```
Router(config-red-app-grp)#timers delay 30 reload 60
```
Delay timer which is the amount of time to delay the RG group’s initialization and role negotiation after the interface comes up.
Default: 30 seconds. Range is 0-10000 seconds.
Reload timer is the amount of time to delay RG group initialization and role-negotiation after a reload.
Default: 60 seconds. Range is 0-10000 seconds.

e) Configure the interface used to exchange keepalive and hello messages between the router pair.

**Example:**
```
Router(config-red-app-grp)#control GigabitEthernet0/0/2 protocol 1
```
where GigabitEthernet0/0/2 is the interface and protocol 1 is the protocol instance that is attached to the interface.

f) Configure the interface that is used for checkpointing of data traffic.

**Example:**
```
Router(config-red-app-grp)#data GigabitEthernet0/0/2
```

g) Configure RG group tracking.

**Example:**
```
Router(config-red-app-grp)#track 1 shutdown
Router(config-red-app-grp)#track 2 shutdown
```

h) Specify the protocol instance that will be attached to a control interface and enters redundancy application protocol configuration mode.

**Example:**
```
Router(config-red-app-grp)#protocol 1
```

i) Configure the two timers for hellotime and holdtime.

**Example:**
```
Router(config-red-app-grp)#timers hellotime 3 holdtime 10
```

**Hellotime**—Interval between successive hello messages.
Default is 3 seconds. Range is 250 milliseconds-254 seconds.

**Holdtime**—The interval between the receipt of a hello message and the presumption that the sending router has failed. This duration has to be greater than the hellotime.
Default is 10 seconds. Range is 750 milliseconds-255 seconds.
We recommend that you configure the holdtime timer configured to be at least 3 times the value of the hellotime timer.

**Step 2** Configure interface tracking.
The **track** command is used in RG to track the voice traffic interface state so that the active router initiates switchover after the traffic interface is down.
Configure the following commands at the global level to track the status of the interface.
Configure High Availability

**Example:**

```
Router(config)#track 1 interface GigabitEthernet0/0/0 line-protocol
Router(config)#track 2 interface GigabitEthernet0/0/1 line-protocol
```

**Step 3** Configure the interfaces.

a) Configure the redundancy interface identifier for the redundancy group.

Required for generating a Virtual MAC (VMAC) address. You must use the same rii ID value on the interface of each router (active and standby) that has the same Virtual IP address.

If there is more than one Box-to-box HA pair on the same LAN, each pair MUST have unique rii IDs on their respective interfaces (to prevent collision). **show redundancy application group all** must indicate the correct local and peer information.

**Example:**

```
Router(config)#interface GigabitEthernet0/0/0
Router(config-if)#ip address 203.0.113.10 255.255.0.0
Router(config-if)#negotiation auto
Router(config-if)#redundancy rii 1
```

b) Associate the interface with the redundancy group created.

**Example:**

```
Router(config-if)#redundancy group 1 ip 203.0.113.12 exclusive
```

c) Configure interface for RG control and data.

**Example:**

```
Router(config)#interface GigabitEthernet0/0/2
Router(config-if)#ip address 198.51.100.1 255.255.255.0
Router(config-if)#media-type rj45
Router(config-if)#negotiation auto
```

**Step 4** Configure SIP Binding.

Configure Cisco UBE to bind SIP messages to the interface that is configured with a Virtual IP address (VIP) for the RG group employed.

**Example:**

```
Router(config)#dial-peer voice 1 voip
Router(config-dial-peer)#session protocol sipv2
Router(config-dial-peer)#incoming called-number 2000
Router(config-dial-peer)#voice-class sip bind control source-interface GigabitEthernet0/0/0
Router(config-dial-peer)#voice-class sip bind media source-interface GigabitEthernet0/0/0
Router(config-dial-peer)#codec g711ulaw
Router(config-dial-peer)#!

Router(config)#dial-peer voice 2 voip
Router(config-dial-peer)#destination-pattern 2000
Router(config-dial-peer)#session protocol sipv2
Router(config-dial-peer)#session target ipv4:203.0.113.13
Router(config-dial-peer)#voice-class sip bind control source-interface GigabitEthernet0/0/1
Router(config-dial-peer)#voice-class sip bind media source-interface GigabitEthernet0/0/1
Router(config-dial-peer)#codec g711ulaw
```
Step 5  (Optional) If H.323 calls are involved, enable H.323 binding.

Under the interface used by H.323, configure voip-bind with its source address equal to the interface’s VIP for the RG group employed.

Example:

```
Router#voice service voip
Router(config-vol-serv)#h323
Router(config-serv-h323)#call preserve limit-media-detection
Router(config-serv-h323)#no h225 timeout keepalive

Router(config)#interface GigabitEthernet0/0/0
Router(config-if)#ip address 203.0.113.10 255.255.0.0
Router(config-if)#media-type rj45
Router(config-if)#negotiation auto
Router(config-if)#redundancy rii 1
Router(config-if)#redundancy group 1 ip 9.13.25.123 exclusive
Router(config-if)#h323-gateway voip interface
Router(config-if)#h323-gateway voip bind srcaddr 203.0.113.12

Router(config)#interface GigabitEthernet0/0/1
Router(config-if)#ip address 192.0.2.1 255.255.255.0
Router(config-if)#media-type rj45
Router(config-if)#negotiation auto
Router(config-if)#redundancy rii 2
Router(config-if)#redundancy group 1 ip 192.0.2.3 exclusive
Router(config-if)#h323-gateway voip interface
Router(config-if)#h323-gateway voip bind srcaddr 192.0.2.3
```

Step 6  Configure the Punt Policing feature.

SIP packets towards the virtual IP address and physical IP address match different punt-cause codes. The punt-rate of the virtual IP address with a punt-cause of 60, is lower than the punt-rate of the physical IP address.

To ensure that the behaviour of the SIP packets towards virtual and physical IP address remains the same, you must increase the punt-rate of the virtual IP address by using the `platform punt-policer` command in global configuration mode.

Example:

```
Router(config)#platform punt-policer 60 40000
```

In the preceding example, the punt-rate of the virtual IP address (punt-cause 60) is increased from the default value of 2000 to 40000.

The following table provides details of the fields of the CLI.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>platform punt-policer</code></td>
<td>Configures the Punt Policing feature.</td>
</tr>
<tr>
<td><code>60</code></td>
<td><code>punt-cause</code>—Punt cause. Range is 1–107. Punt cause of the virtual interface is 60.</td>
</tr>
<tr>
<td><code>40000</code></td>
<td><code>punt-rate</code>—Rate limit in packets per second. Range is 10–146484.</td>
</tr>
</tbody>
</table>

Note  The default punt rate value of the virtual IP address and the physical IP address varies with the router platform.
Configure the RG group under **voice service voip**. This enables Box-to-box Cisco UBE HA.

**Example:**

```
Router#voice service voip
Router(conf-voi-serv)#redundancy-group 1
```

**Step 8** Configure the Media Inactivity timer.

The Media Inactivity Timer enables the active and standby router pair to monitor and disconnect calls if no Real-Time Protocol (RTP) packets are received within a configurable time period.

For the SIP calls, the switched over calls are cleared with signaling (as signaling information is preserved for switched calls).

The Media Inactivity Timer releases TCP-based and H.323-based calls. This is used to guard against any hung sessions resulting from the failover when a normal call disconnect does not clear the call.

You must configure the same duration for the Media Inactivity Timer on both routers. The default value is 30 seconds for SIP and H.323 calls. The sample configuration is as follows:

**Example:**

```
Router(config)#ip rtcp report interval 9000
Router(config)#gateway
Router(config-gateway)#media-inactivity-criteria all
Router(config-gateway)#timer receive-rtp 1200
Router(config-gateway)#timer receive-rtcp 5
```

SIP and H.323 call legs are cleared once the RTCP timer expires.

**Step 9** Reload the router.

Once all the preceding configurations are completed, you must save the configurations, and reload the router.

**Example:**

```
Router>enable
Router#reload
```

**Step 10** Configure the peer router.

Follow the preceding steps to configure the standby router. Make sure that you use the correct IP addresses.

**Step 11** Point the attached devices to the Cisco UBE Virtual IP (VIP) address.

The IP-PBX, Unified SIP Proxy, or service provider must route the calls to Cisco UBE’s Virtual IP address.

HA configuration does not handle SIP and H.323 messages to the Cisco UBE’s physical IP addresses.

For H.323 calls, you must disable the keepalive messages in Unified CM configuration.

a. Go to **System** menu, and choose **Service Parameters**. At the bottom of the Service Parameters, enable **Advanced**.

b. Set the **Allow TCP KeepAlives for H323** to False.

c. After this setting is saved, restart the CallManager Services.
Configuration Examples

Example: Control Interface Protocol Configuration

Router#configure terminal
Router(config)#redundancy
Router(config-red)#mode none
Router(config-red)#application redundancy
Router(config-red-app)#protocol 4
Router(config-red-app-prot)#name rg1
Router(config-red-app-prot)#timers hellotime 3 holdtime 10
Router(config-red-app-prot)#authentication text password

Example: Redundancy Group Protocol Configuration

Router#configure terminal
Router(config)#redundancy
Router(red)#application redundancy
Router(config-red-app)#protocol 1
Router(config-red-app-prtcl)#name RG1
Router(config-red-app-prtcl)#timers hellotime 1 holdtime 3
Router(config-red-app-prtcl)#end
Router#configure terminal
Router(config)#redundancy
Router(red)#application redundancy
Router(config-red-app)#protocol 2
Router(config-red-app-prtcl)#name RG1
Router(config-red-app-prtcl)#end

Example: Redundant Traffic Interface Configuration

Router#configure terminal
Router(config)#interface GigabitEthernet 0/0/2
Router(config-if)#ip address 198.51.100.1 255.0.0.0
Router(config-if)#ip nat outside
Router(config-if)#ip virtual-reassembly
Router(config-if)#negotiation auto
Router(config-if)#redundancy rii 200
Router(config-if)#redundancy group 1 ip 198.51.100.50 exclusive decrement 10

Verify Your Configuration

All configuration commands in this task are optional. You can use the show commands in any order.

SUMMARY STEPS

1. show redundancy application group  [group-id  |  all]
2. show redundancy application transport  [clients | group [group-id]]
3. show redundancy application protocol  [protocol-id] [group [group-id]]
4. show redundancy application faults group [group-id]
5. show redundancy application if-mgr  group [group-id]
6. show redundancy application control-interface  group [group-id]
show redundancy application data-interface  group [group-id]

DETAILED STEPS

**Step 1**
```
show redundancy application group  [group-id  |  all]
```

Example:
```
Router#show redundancy application group
Group ID  Group Name    State
--------  ----------    -----  
1         Generic-Redundancy-1  STANDBY
2         Generic-Redundancy2   ACTIVE
```
The following example shows the details of redundancy application group 1:
```
Router#show redundancy application group 1
Group ID:1
Group Name:Generic-Redundancy-1

Administrative State: No Shutdown
Aggregate operational state : Up
My Role: STANDBY
Peer Role: ACTIVE
Peer Presence: Yes
Peer Comm: Yes
Peer Progression Started: Yes

RF Domain: btob-one
RF state: STANDBY HOT
Peer RF state: ACTIVE
```
The following example shows the details of redundancy application group 2:
```
Router#show redundancy application group 2
Group ID:2
Group Name:Generic-Redundancy2

Administrative State: No Shutdown
Aggregate operational state : Up
My Role: ACTIVE
Peer Role: STANDBY
Peer Presence: Yes
Peer Comm: Yes
Peer Progression Started: Yes

RF Domain: btob-two
RF state: ACTIVE
Peer RF state: STANDBY HOT
```

**Step 2**
```
show redundancy application transport  {clients  |  group [group-id]}
```

Example:
```
Router#show redundancy application transport client

Client  Conn#  Priority  Interface  L3    L4
( 0)RF   0      1        CTRL   IPV4  SCTP
( 1)MCP_HA 1      1        DATA   IPV4  UDP_REL
```
The following example shows configuration details for the redundancy application transport group:

Router#show redundancy application transport group

Transport Information for RG (1)
Client = RF

11 0 9.9.9.2 59005 9.9.9.1 59005 DATA IPV4 SCTP
Step 3  

show redundancy application protocol {protocol-id} [group [group-id]}  

Example:  

Router#show redundancy application protocol group  

RG Protocol RG 1  
-----------------
Role: Standby
Negotiation: Enabled
Priority: 50
Protocol state: Standby-hot
Ctrl Intf(s) state: Up
Active Peer: address 1.1.1.2, priority 150, intf Gi0/0/0
Standby Peer: Local
Log counters:
- role change to active: 0
- role change to standby: 1
- disable events: rg down state 1, rg shut 0
- ctrl intf events: up 2, down 1, admin_down 1
- reload events: local request 0, peer request 0

RG Media Context for RG 1  
--------------------------
Ctx State: Standby
Protocol ID: 1
Media type: Default
Control Interface: GigabitEthernet0/0/0
Current Hello timer: 3000
Configured Hello timer: 3000, Hold timer: 10000
Peer Hello timer: 3000, Peer Hold timer: 10000
Stats:
- Pkts 117, Bytes 7254, HA Seq 0, Seq Number 117, Pkt Loss 0
- Authentication not configured
- Authentication Failure: 0
- Reload Peer: TX 0, RX 0
- Resign: TX 0, RX 0
- Active Peer: Present. Hold Timer: 10000
- Pkts 115, Bytes 3910, HA Seq 0, Seq Number 1453975, Pkt Loss 0

RG Protocol RG 2  
-----------------
Role: Active
Negotiation: Enabled
Priority: 135
Protocol state: Active
Ctrl Intf(s) state: Up
Active Peer: Local
Standby Peer: address 1.1.1.2, priority 130, intf Gi0/0/0
Log counters:
- role change to active: 1
- role change to standby: 1
- disable events: rg down state 1, rg shut 0
- ctrl intf events: up 2, down 1, admin_down 1
The following example shows configuration details for the redundancy application protocol group 1:

Router# show redundancy application protocol group 1

RG Protocol RG 1
-----------------
Role: Standby
Negotiation: Enabled
Priority: 50
Protocol state: Standby-hot
Ctrl Intf(s) state: Up
Active Peer: address 1.1.1.2, priority 150, intf Gi0/0/0
Standby Peer: Local
Log counters:
role change to active: 0
role change to standby: 1
disable events: rg down state 1, rg shut 0
ctrl intf events: up 2, down 1, admin_down 1
reload events: local request 0, peer request 0

RG Media Context for RG 1
--------------------------
Ctx State: Standby
Protocol ID: 1
Media type: Default
Control Interface: GigabitEthernet0/0/0
Current Hello timer: 3000
Configured Hello timer: 3000, Hold timer: 10000
Peer Hello timer: 3000, Peer Hold timer: 10000
Stats:
Pkts 120, Bytes 7440, HA Seq 0, Seq Number 120, Pkt Loss 0
Authentication not configured
Authentication Failure: 0
Reload Peer: TX 0, RX 0
Resign: TX 0, RX 0
Active Peer: Present. Hold Timer: 10000
Pkts 118, Bytes 4012, HA Seq 0, Seq Number 1453978, Pkt Loss 0

The following example shows configuration details for the redundancy application protocol group 2:

Router# show redundancy application protocol group 2

RG Protocol RG 2
Role: Active
Negotiation: Enabled
Priority: 135
Protocol state: Active
Ctrl Intf(s) state: Up
Active Peer: Local
Standby Peer: address 1.1.1.2, priority 130, intf Gi0/0/0
Log counters:
role change to active: 1
role change to standby: 1
disable events: rg down state 1, rg shut 0
ctrl intf events: up 2, down 1, admin_down 1
reload events: local request 0, peer request 0

RG Media Context for RG 2

Ctx State: Active
Protocol ID: 2
Media type: Default
Control Interface: GigabitEthernet0/0/0
Current Hello timer: 3000
Configured Hello timer: 3000, Hold timer: 10000
Peer Hello timer: 3000, Peer Hold timer: 10000
Stats:
Pkts 123, Bytes 7626, HA Seq 0, Seq Number 123, Pkt Loss 0
Authentication not configured
Authentication Failure: 0
Reload Peer: TX 0, RX 0
Resign: TX 0, RX 1
Standby Peer: Present. Hold Timer: 10000
Pkts 107, Bytes 3638, HA Seq 0, Seq Number 1453982, Pkt Loss 0

The following example shows configuration details for the redundancy application protocol 1:

Router#show redundancy application protocol 1

Protocol id: 1, name: rg-protocol-1
Hello timer in msecs: 3000
Hold timer in msecs: 10000

Step 4 show redundancy application faults group [group-id]

Example:

Router#show redundancy application faults group

Faults states Group 1 info:
Runtime priority: [50]
RG Faults RG State: Up.
Total # of switchovers due to faults: 0
Total # of down/up state changes due to faults: 2
Faults states Group 2 info:
Runtime priority: [135]
RG Faults RG State: Up.
Total # of switchovers due to faults: 0
Total # of down/up state changes due to faults: 2
The following example shows configuration details specific to redundancy application faults group 1:

Router#show redundancy application faults group 1

Faults states Group 1 info:
Runtime priority: [50]
RG Faults RG State: Up.
Total # of switchovers due to faults: 0
Total # of down/up state changes due to faults: 2

The following example shows configuration details specific to redundancy application faults group 2:

Router#show redundancy application faults group 2

Faults states Group 2 info:
Runtime priority: [135]
RG Faults RG State: Up.
Total # of switchovers due to faults: 0
Total # of down/up state changes due to faults: 2

**Step 5**

```
show redundancy application if-mgr group [group-id]
```

**Example:**

Router#show redundancy application if-mgr group

RG ID: 1

```
interface GigabitEthernet0/0/3.152
---------------------------------------
VMAC 0007.b421.4e21
VIP 55.1.1.255
Shut shut
Decrement 10

interface GigabitEthernet0/0/2.152
---------------------------------------
VMAC 0007.b421.5209
VIP 45.1.1.255
Shut shut
Decrement 10
```

RG ID: 2

```
interface GigabitEthernet0/0/3.166
---------------------------------------
VMAC 0007.b422.14d6
VIP 4.1.255.254
Shut no shut
Decrement 10

interface GigabitEthernet0/0/2.166
---------------------------------------
VMAC 0007.b422.0d06
VIP 3.1.255.254
Shut no shut
Decrement 10
```

The following examples show configuration details for redundancy application interface manager group 1 and group 2:
Router#show redundancy application if-mgr group 1

RG ID: 1

interface GigabitEthernet0/0/3.152
---------------------------------------
VMAC 0007.b421.4e21
VIP 55.1.1.255
Shut shut
Decrement 10

interface GigabitEthernet0/0/2.152
---------------------------------------
VMAC 0007.b421.5209
VIP 45.1.1.255
Shut shut
Decrement 10

Router#show redundancy application if-mgr group 2

RG ID: 2

interface GigabitEthernet0/0/3.166
---------------------------------------
VMAC 0007.b422.14d6
VIP 4.1.255.254
Shut no shut
Decrement 10

interface GigabitEthernet0/0/2.166
---------------------------------------
VMAC 0007.b422.0d06
VIP 3.1.255.254
Shut no shut
Decrement 10

Step 6 show redundancy application control-interface group [group-id]

Example:

Router#show redundancy application control-interface group

The control interface for rg[1] is GigabitEthernet0/0/0
Interface is Control interface associated with the following protocols: 2 1
Interface Neighbors:
Peer: 1.1.1.2 Active RGs: 1 Standby RGs: 2

The control interface for rg[2] is GigabitEthernet0/0/0
Interface is Control interface associated with the following protocols: 2 1
Interface Neighbors:
Peer: 1.1.1.2 Active RGs: 1 Standby RGs: 2

The following example shows configuration details of the redundancy application control-interface group 1:

Router#show redundancy application control-interface group 1

The control interface for rg[1] is GigabitEthernet0/0/0
Interface is Control interface associated with the following protocols: 2 1
Interface Neighbors:
Peer: 1.1.1.2 Active RGs: 1 Standby RGs: 2
The following example shows configuration details of the redundancy application control-interface group 2:

Router# show redundancy application control-interface group 2

The control interface for rg[2] is GigabitEthernet0/0/0
Interface is Control interface associated with the following protocols: 2 1
Interface Neighbors:
Peer: 1.1.1.2 Active RGs: 1 Standby RGs: 2

Step 7

show redundancy application data-interface group [group-id]

Example:

Router# show redundancy application data-interface group

The data interface for rg[1] is GigabitEthernet0/0/1
The data interface for rg[2] is GigabitEthernet0/0/1

The following examples show configuration details specific to redundancy application data-interface group 1 and group 2:

Router# show redundancy application data-interface group 1
The data interface for rg[1] is GigabitEthernet0/0/1

Router# show redundancy application data-interface group 2
The data interface for rg[2] is GigabitEthernet0/0/1

Troubleshoot High Availability Issues

Use the following show and debug commands to troubleshoot any issues:

- show redundancy state
- show redundancy inter-device
- show standby brief
- show standby brief
- show standby internal
- show sip-ua status
- show sip-ua statistics
- show voice high-availability summary
- show voip rtp connection | include connection
- show arp
- debug voip ccapi all
- debug voip ccapi error
- debug voip rtp session
- debug voip rtcp session
• debug voip rtp error
• debug voip rtcp error
• debug voice high-availability all
• debug voice high-availability error
• debug cc sip info
• debug cc sip messages
• debug cc sip media
• debug cc sip error
• debug standby terse

Note
Do not turn on a large number of debugs on a system carrying high volume of active call traffic.
High Availability on Cisco ASR 1000 Series Aggregation Services Routers

The High Availability (HA) feature allows you to benefit from the failover capability of Cisco Unified Border Element (Cisco UBE) on two routers, one active and one standby. When the active router goes down for any reason, the standby router takes over seamlessly, preserving and processing your calls.

Figure 62: Cisco UBE High Availability

• About Cisco UBE High Availability on Cisco ASR 1000 Series Routers, on page 677
• How to Configure Cisco UBE High Availability on Cisco ASR 1000 Series Router, on page 683
• Verify Your Configuration, on page 695
• Troubleshoot High Availability Issues, on page 702

About Cisco UBE High Availability on Cisco ASR 1000 Series Routers

Cisco UBE supports two HA options on the Cisco ASR 1000 Series Aggregation Services Router:

• Box-to-box Redundancy
• Inbox Redundancy

The following table describes the Cisco ASR 1000 Series Router models supported for each redundancy type:
<table>
<thead>
<tr>
<th>Redundancy Type</th>
<th>Router Models</th>
<th>Supported Cisco IOS-XE Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>Box-to-box</td>
<td>• Cisco ASR 1001-X Router</td>
<td>Cisco IOS XE Release 3.11 onwards</td>
</tr>
<tr>
<td></td>
<td>• Cisco ASR 1002-X Router</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Cisco ASR 1004 Router</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Cisco ASR 1006 Router (with a single RP and an ESP)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Cisco ASR 1006-X Router (with a single RP and an ESP)</td>
<td></td>
</tr>
<tr>
<td>Inbox</td>
<td>Cisco ASR 1006 Router</td>
<td>Cisco IOS XE Release 3.11 onwards</td>
</tr>
</tbody>
</table>

Note: Cisco ASR 1006 supports both Box-to-box and Inbox redundancy. You cannot switch between these two modes dynamically.

The following table provides details on the type of information that is preserved in different call types:

<table>
<thead>
<tr>
<th>Call Type</th>
<th>Transport Layer</th>
<th>Call Preservation After Switchover</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP-SIP</td>
<td>UDP</td>
<td>Both media and session signaling are preserved.</td>
</tr>
<tr>
<td>SIP-SIP</td>
<td>TCP/TLS</td>
<td>Both media and session signaling are preserved using port 5060.</td>
</tr>
<tr>
<td>SIP-H.323</td>
<td>TCP or UDP</td>
<td>Only media is preserved. Session signaling is not preserved.</td>
</tr>
<tr>
<td>H.323-H.323</td>
<td>TCP</td>
<td></td>
</tr>
</tbody>
</table>

Inbox Redundancy

Inbox redundancy with Stateful Switchover (SSO) mechanism provides redundancy within the same device. Cisco ASR1006 supports the stateful failover from an active Enhanced Services Processor (ESP) to a standby and from an active Route Processor to a standby on the same box.
Box-to-Box Redundancy

Box-to-box redundancy enables configuring a pair of routers to act as back up for each other. In the router pair, the active router is determined based on the failover conditions. The router pair continuously exchange status messages. Cisco UBE session information is checkpointed across the active and standby router. This enables the standby router to immediately take over all Cisco UBE call processing responsibilities when the active router becomes unavailable.

Redundancy Group (RG) Infrastructure

A group of redundant interfaces form a Redundancy Group. The active and standby routers are connected by a configurable control link and data synchronization link. The control link is used to communicate the redundancy state for each router. The data synchronization link is used to transfer stateful information to synchronize the stateful database for the calls and media flows. Each pair of redundant interfaces is configured with the same unique ID number, also known as the Redundancy Interface Identifier (RII).

A Virtual IP address (VIP) is configured on interfaces that connect to the external network. All signaling and media is sourced from and sent to the Virtual IP address. External devices such as Cisco Unified Communication Manager, uses VIP as the destination IP address for the calls traversing through Cisco UBE.

The following figure shows the redundancy group configured for a pair of routers with a single outgoing interface.
PROTECTED Mode

The default failover redundancy behavior in a box-to-box HA pair is to reload the affected router to avoid out-of-sync conditions or Split brain. From release IOS XE 3.11 onwards, you can configure a Cisco ASR 1000 Series Router to transition into PROTECTED mode, which has the following features:

- Bulk sync request, Call checkpointing, and incoming call processing are disabled.
- You must manually reload a router in PROTECTED mode to come out of this state.

To enable the PROTECTED mode, use the no redundancy-reload command under voice service voip.

Network Topology

This section describes how to configure the following network topology, in which an active and standby pair of routers is used in a SIP trunk deployment between a Cisco Unified Communications Manager (Unified CM) and a service provider (SP) SIP trunk for PSTN access.
In this topology, both active and standby routers have the same configuration and both platforms are connected through a physical switch across same interfaces. This is required for Cisco UBE HA to work. For example, the CUBE-1 and CUBE-2 interface towards WAN must terminate on the same switch. Multiple interfaces or sub-interfaces can be used on either LAN or WAN side. Also, one Cisco UBE has a lower IP address across all three interfaces on the same Cisco UBE platform.

We recommend that you keep the following in mind when configuring this topology:

- Use a dedicated interface that is connected through a switch for checkpointing the RG control and data traffic across the two routers.
- A keepalive interface that is used for checkpointing RG control and data traffic must be in a different subnet or VLAN if the redundancy group ID is the same for the two different Cisco UBE HA pairs.
- You can configure a maximum of two redundancy groups. Hence, there can be only two active and standby pairs within the same network.
- Source all signaling and media from and to the Virtual IP address.
- Always save the running configuration to avoid losing it due to router reload during a failover.
- Virtual Routing and Forwarding
  - Define Virtual Router Forwarding (VRF) in the same order on both active and standby routers for an accurate synchronization of data.
  - You can configure VRFs only on Traffic interfaces (SIP and RTP). Do not configure VRF on RG Control and Data interface.
  - VRF configurations on both the active and standby router must be identical. VRF IDs are checkpointed for the calls before and after switchover (includes VRF-based RTP port range).
  - Manually copy the configurations from one router to the other.
  - When the configuration is replicated on the standby router, it is not committed to the startup configuration; it is in the running configuration. You must run the `write memory` command to commit the changes that are synchronized from the active router on the standby router.

**Considerations and Restrictions**

The following is a list of further considerations and restrictions you should know before configuring this topology:
Considerations

- Only active calls are checkpointed (Calls that are connected with 200 OK or ACK transaction completed).
- When you apply and save the configuration for the first time, the platform must be reloaded.
- For H.323, and TCP-based calls, media preservation is supported after the failover, but session signaling is not preserved.
- If you have Cisco Unified Customer Voice Portal (CVP) in your network, we recommend that you configure TCP session transport for the SIP trunk between CVP and Cisco UBE.
- Upon failover, the previously active Cisco UBE reloads by design.
- Cisco UBE uses the primary IP address to communicate Smart Licensing information.
- For SIP-SIP TLS calls (using Cisco IOS XE Release 3.11 or later), configure both the active and standby Cisco UBE as trust points to a common external CA Server.
- TCP sessions are not preserved during the failover. Remote user agents are expected to reestablish TCP sessions (using port 5060) before sending subsequent messages.
- Call Admission Control (CAC) continues to work after switchover. After stateful switchover, no calls are allowed if the CAC limit is reached before the switchover.
- Up to 6 multimedia lines in the SDP are checkpointed for Cisco UBE HA. From Cisco IOS XE Release 3.17 onwards, SDP Passthru (up to 2 m-lines) calls are also checkpointed.
- Survivability.tcl preservation is supported from Cisco IOS XE Release 3.17 onwards for Unified Customer Voice Portal (CVP) deployments.
- SRTP-RTP, SRTP-SRTP, and SRTP Passthru are supported.
- Port channel is supported for both RG control data and traffic interfaces only from Cisco IOS XE 16.3.1 onwards.

Figure 66: Additional Supported Options for Cisco UBE HA

- LTI-based transcoder call flow preservation is supported from Cisco IOS XE Release 3.15 onwards and requires same DSP module capacity on both active and standby in the same slot or subslot.
- From release Cisco IOS-XE 3.11 onwards, upon failover, you can move the previously active Cisco UBE to a PROTECTED state to avoid the reload.
Restrictions

- IPv6 is not supported.
- All SCCP-based media resources (Conference bridge, Transcoding, Hardware MTP, and Software MTP) are not supported.
- Cisco Unified Survivable Remote Site Telephony (Unified SRST) or TDM Gateway co-location on Cisco UBE HA is not supported.
- Routers connected through Metropolitan Area Network (MAN) Ethernet regardless of latency are not supported.
- Out-of-band DTMF (Notify or KPML) is not supported post switchover. Only rtp-nce to rtp-nte and voice-inband to voice-inband DTMF works after the switchover.
- Media-flow around and UC Services API (Cisco Unified Communications Manager Network-Based Recording) are not supported.
- Signaling and media preservation are not supported over a crossover cable connection for the RG-control or data link.
- You cannot terminate Wide Area Network (WAN) on Cisco UBE directly or Data HA on either side. Both active and standby routers must be in the same Data Center and connected to the same physical switch.
- TheCourtesyCallback (CCB) feature is not supported if a callback was registered with Cisco Unified Customer Voice Portal (CVP) and then a switchover was done on Cisco UBE.
- You cannot configure a secondary IP address for the interfaces.
- If the redundancy group ID is same for the two different Cisco UBE HA pairs, then the keepalive interface that is used for checkpointing RG control and data traffic must be in a different subnet or VLAN.

How to Configure Cisco UBE High Availability on Cisco ASR 1000 Series Router

Before You Begin

- Use the same hardware platform, including the cards and their positioning.
- Place both active and standby routers physically in the same location, which is connected to the same Ethernet LAN.
- If there are currently dual RPs or ESPs in the Cisco ASR 1006 Router, remove the extra RP or ESP and reload the router before configuring the redundancy mode.
- Use Cisco IOS-XE Release 3.11 and or later on both active and standby routers.
- Ensure that you have the required licenses for configuring high availability. For detailed information, see Cisco Unified Border Element Data Sheet.
Configure Inbox High Availability

Enable inbox redundancy.

**Example:**

```bash
Router>enable
Router#configure terminal
Router(config)#redundancy
Router(config-r)#mode sso
Router(config-r)#end
Router(config)#copy run start /* This is to save the configuration */
```

Configure Box-to-Box High Availability

**SUMMARY STEPS**

1. Disable inbox and software redundancy.
2. Configure the Redundancy Group (RG).
3. Configure interface tracking.
4. Configure the interfaces.
5. Configure SIP Binding.
6. (Optional) If H.323 calls are involved, enable H.323 binding.
7. Configure the Punt Policing feature.
8. Configure the RG group under *voice service voip*. This enables Box-to-box Cisco UBE HA.
9. Configure the Media Inactivity timer.
10. Reload the router.
11. Configure the peer router.
12. Point the attached devices to the Cisco UBE Virtual IP (VIP) address.

**DETAILED STEPS**

**Step 1**

Disable inbox and software redundancy.

a) Disable software redundancy.

**Example:**

Disable software redundancy:

```bash
Router>enable
Router#configure terminal
Router(config)#redundancy
Router(config-r)#mode none
```

**Example:**

Disable the inbox redundancy if you are using ASR1006 router:
**Step 1**

Configure the Redundancy Group (RG).

a) Enter application redundancy mode.

**Example:**

```
Router>enable
Router#configure terminal
Router(config)#redundancy
Router(config-r)#mode rpr
```

b) Save the running configuration to a text file in the bootflash.

**Example:**

```
Router>enable
Router#copy running-configuration bootflash:<filename>
```

In the preceding command, provide a name of your preference for `<filename>`.

c) Force the router to go into ROMMON mode upon next reload and erase the existing configuration from the NVRAM:

**Example:**

```
Router>enable
Router#configure terminal
Router(config)#config-register 0x0
Router(config)#write erase
```

d) Reload the router.

**Example:**

```
Router>enable
Router#reload
```

e) At ROMMON prompt, reset the `IOSXE_Dual_IOS` variable to disable the software redundancy.

**Example:**

```
rommon1>IOSXE_Dual_IOS=0
rommon2>sync
```

f) Boot the image from the bootflash or harddisk, or from the network.

**Example:**

```
rommon1>boot bootflash:isr4400-universalk9.03.13.02.S.154-3.S2-ext.SPA.bin
```

g) When the router is up, re-apply the old configuration by copying the configuration file to the running-configuration.

**Example:**

```
Router>enable
Router#copy bootflash:sampleconfig running-configuration
```

h) Change the config register back to a non-zero value.

**Example:**

```
Router>enable
Router#Config-register 0x2102
```

**Step 2**

Configure the Redundancy Group (RG).

a) Enter application redundancy mode.

**Example:**

```
```
Router>enable
Router#configure terminal
Router(config)#redundancy
Router(config-r)#mode none
Router(config-red)#application redundancy
Router(config-red-app)#group 1

b) Configure a name for the redundancy group.
   
   **Example:**
   
   Router(config-red-app-grp)#name cube-ha
   
   where *cube-ha* is the name of the redundancy group.

c) Specify the initial priority and failover threshold for a redundancy group.
   
   **Example:**
   
   Router(config-red-app-grp)#priority 100 failover threshold 75
   
   where 100 is priority value and 75 is the threshold value. The router with highest priority and threshold value among
   the HA pair acts as the active router.

d) Configure the timers for delay and reload.
   
   **Example:**
   
   Router(config-red-app-grp)#timers delay 30 reload 60
   
   Delay timer which is the amount of time to delay the RG group’s initialization and role negotiation after the interface
   comes up.
   
   Default: 30 seconds. Range is 0-10000 seconds.

   Reload timer is the amount of time to delay RG group initialization and role-negotiation after a reload.
   
   Default: 60 seconds. Range is 0-10000 seconds.

e) Configure the interface used to exchange keepalive and hello messages between the router pair.
   
   **Example:**
   
   Router(config-red-app-grp)#control GigabitEthernet0/0/2 protocol 1
   
   where GigabitEthernet0/0/2 is the interface and protocol 1 is the protocol instance that is attached to the interface.

f) Configure the interface that is used for checkpointing of data traffic.
   
   **Example:**
   
   Router(config-red-app-grp)#data GigabitEthernet0/0/2

g) Configure RG group tracking.
   
   **Example:**
   
   Router(config-red-app-grp)#track 1 shutdown
   Router(config-red-app-grp)#track 2 shutdown
   
   If you want protected mode, enter the following command:
   
   Router(config-red-app-grp)#track 3 shutdown

h) Specify the protocol instance that will be attached to a control interface and enters redundancy application protocol
   configuration mode.
Example:
Router(config-red-app-grp)#protocol 1

i) Configure the two timers for hellotime and holdtime.

Example:
Router(config-red-app-grp)#timers hellotime 3 holdtime 10

ehellotime—Interval between successive hello messages.
Default is 3 seconds. Range is 250 milliseconds-254 seconds.

holdtime—The interval between the receipt of a hello message and the presumption that the sending router has failed. This duration has to be greater than the hellotime.
Default is 10 seconds. Range is 750 milliseconds-255 seconds.

We recommend that you configure the holdtime timer configured to be at least 3 times the value of the hellotime timer.

Step 3 Configure interface tracking.

The track command is used in RG to track the voice traffic interface state so that the active router initiates switchover after the traffic interface is down.

Configure the following commands at the global level to track the status of the interface.

Router(config)#track 1 interface GigabitEthernet0/0/0 line-protocol
Router(config)#track 2 interface GigabitEthernet0/0/1 line-protocol

If you want protected mode, enter the following command:
Router(config)#track 3 interface GigabitEthernet0/0/2 line-protocol

Step 4 Configure the interfaces.

a) Configure the redundancy interface identifier for the redundancy group.

Required for generating a Virtual MAC (VMAC) address. You must use the same rii ID value on the interface of each router (active and standby) that has the same Virtual IP address.

If there is more than one Box-to-box HA pair on the same LAN, each pair MUST have unique rii IDs on their respective interfaces (to prevent collision). show redundancy application group all must indicate the correct local and peer information.

Example:

Router(config)#interface GigabitEthernet0/0/0
Router(config-if)#ip address 203.0.113.10 255.255.0.0
Router(config-if)#negotiation auto
Router(config-if)#redundancy rii 1

b) Associate the interface with the redundancy group created.

Example:

Router(config-if)#redundancy group 1 ip 203.0.113.12 exclusive

c) Configure interface for RG control and data.

Example:

Router(config)#interface GigabitEthernet0/0/2
Step 5  Configure SIP Binding.

Configure Cisco UBE to bind SIP messages to the interface that is configured with a Virtual IP address (VIP) for the RG group employed.

Example:

Router(config)#dial-peer voice 1 voip
Router(config-dial-peer)#session protocol sipv2
Router(config-dial-peer)#incoming called-number 2000
Router(config-dial-peer)#voice-class sip bind control source-interface GigabitEthernet0/0/0
Router(config-dial-peer)#voice-class sip bind media source-interface GigabitEthernet0/0/0
Router(config-dial-peer)#codec g711ulaw
Router(config-dial-peer)!

Router(config)#dial-peer voice 2 voip
Router(config-dial-peer)#destination-pattern 2000
Router(config-dial-peer)#session protocol sipv2
Router(config-dial-peer)#voice-class sip bind control source-interface GigabitEthernet0/0/1
Router(config-dial-peer)#voice-class sip bind media source-interface GigabitEthernet0/0/1
Router(config-dial-peer)#codec g711ulaw

Step 6  (Optional) If H.323 calls are involved, enable H.323 binding.

Under the interface used by H.323, configure voip-bind with its source address equal to the interface’s VIP for the RG group employed.

Example:

Router#voice service voip
Router(conf-voi-serv)#h323
Router(conf-serv-h323)#call preserve limit-media-detection
Router(conf-serv-h323)#no h225 timeout keepalive

Router(config)#interface GigabitEthernet0/0/0
Router(config-if)#ip address 203.0.113.10 255.255.0.0
Router(config-if)#media-type rj45
Router(config-if)#negotiation auto
Router(config-if)#redundancy rii 1
Router(config-if)#redundancy group 1 ip 9.13.25.123 exclusive
Router(config-if)#h323-gateway voip interface
Router(config-if)#h323-gateway voip bind srcaddr 203.0.113.12

Router(config)#interface GigabitEthernet0/0/1
Router(config-if)#ip address 192.0.2.1 255.255.255.0
Router(config-if)#media-type rj45
Router(config-if)#negotiation auto
Router(config-if)#redundancy rii 2
Router(config-if)#redundancy group 1 ip 192.0.2.3 exclusive
Router(config-if)#h323-gateway voip interface
Router(config-if)#h323-gateway voip bind srcaddr 192.0.2.3

Step 7  Configure the Punt Policing feature.
SIP packets towards the virtual IP address and physical IP address match different punt-cause codes. The punt-rate of the virtual IP address with a punt-cause of 60, is lower than the punt-rate of the physical IP address.

To ensure that the behaviour of the SIP packets towards virtual and physical IP address remains the same, you must increase the punt-rate of the virtual IP address by using the `platform punt-policer` command in global configuration mode.

**Example:**

```
Router(config)#platform punt-policer 60 40000
```

In the preceding example, the punt-rate of the virtual IP address (punt-cause 60) is increased from the default value of 2000 to 40000.

The following table provides details of the fields of the CLI.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform punt-policer</td>
<td>Configures the Punt Policing feature.</td>
</tr>
<tr>
<td>60</td>
<td><code>punt-cause</code>—Punt cause. Range is 1–107. Punt cause of the virtual interface is 60.</td>
</tr>
<tr>
<td>40000</td>
<td><code>punt-rate</code>—Rate limit in packets per second. Range is 10–146484.</td>
</tr>
</tbody>
</table>

**Note**  
The default punt rate value of the virtual IP address and the physical IP address varies with the router platform.

**Step 8**  
Configure the RG group under `voice service voip`. This enables Box-to-box Cisco UBE HA.

**Example:**

```
Router#voice service voip
Router(conf-voi-serv)#redundancy-group 1
```

For enabling protected mode:

```
Router#voice service voip
Router(conf-voi-serv)#no redundancy-reload
```

**Step 9**  
Configure the Media Inactivity timer.

The Media Inactivity Timer enables the active and standby router pair to monitor and disconnect calls if no Real-Time Protocol (RTP) packets are received within a configurable time period.

For the SIP calls, the switched over calls are cleared with signaling (as signaling information is preserved for switched calls).

The Media Inactivity Timer releases TCP-based and H.323-based calls. This is used to guard against any hung sessions resulting from the failover when a normal call disconnect does not clear the call.

You must configure the same duration for the Media Inactivity Timer on both routers. The default value is 30 seconds for SIP and H.323 calls. The sample configuration is as follows:

**Example:**

```
Router(config)#ip rtcp report interval 9000
Router(config)#gateway
Router(config-gateway)#media-inactivity-criteria all
Router(config-gateway)#timer receive-rtp 1200
```
Router(config-gateway)#timer receive-rtcp 5

SIP and H.323 call legs are cleared once the RTCP timer expires.

**Step 10**

Reload the router.

Once all the preceding configurations are completed, you must save the configurations, and reload the router.

**Example:**

Router>enable
Router#reload

**Step 11**

Configure the peer router.

Follow the preceding steps to configure the standby router. Make sure that you use the correct IP addresses.

**Step 12**

Point the attached devices to the Cisco UBE Virtual IP (VIP) address.

The IP-PBX, Unified SIP Proxy, or service provider must route the calls to Cisco UBE’s Virtual IP address.

HA configuration does not handle SIP and H.323 messages to the Cisco UBE’s physical IP addresses.

For H.323 calls, you must disable the keepalive messages in Unified CM configuration.

a. Go to System menu, and choose Service Parameters. At the bottom of the Service Parameters, enable Advanced.

b. Set the Allow TCP KeepAlives for H323 to False.

c. After this setting is saved, restart the CallManager Services.

### Configuration Examples

The following sample configuration assumes interfaces Gig0/0/0 is used for incoming calls, and Gig0/0/1 is used for outgoing calls, and Gig0/0/2 is used for redundancy.

Verify Your Configuration

Verify Redundancy State on Active and Standby Routers

Use the `show redundancy application group all` command to display the redundancy inter-device states.

---

**Step 1**

**Active Router:**

**Example:**

```
Router#show redundancy application group all
```
Faults states Group 1 info:
  Runtime priority: [100]
  RG Faults RG State: Up.
    Total # of switchover due to faults: 0
  Total # of down/up state changes due to faults: 2
Group ID: 1
Group Name: voice-b2bha

Administrative State: No Shutdown
Aggregate operational state : Up
My Role: ACTIVE
Peer Role: STANDBY
Peer Presence: Yes
Peer Comm: Yes
Peer Progression Started: Yes

RF Domain: btob-one
  RF state: ACTIVE
  Peer RF state: STANDBY HOT

RG Protocol RG 1
------------------
  Role: Active
  Negotiation: Enabled
  Priority: 100
  Protocol state: Active
  Ctrl Intf(s) state: Up
  Active Peer: Local
  Standby Peer: address 203.0.113.11, priority 100, intf Gi0/0/2

Log counters:
  role change to active: 1
  role change to standby: 0
  disable events: rg down state 1, rg shut 0
  ctrl intf events: up 1, down 2, admin_down 1
  reload events: local request 0, peer request 0

RG Media Context for RG 1
--------------------------
  Ctx State: Active
  Protocol ID: 1
  Media type: Default
  Control Interface: GigabitEthernet0/0/2
  Current Hello timer: 3000
  Configured Hello timer: 3000, Hold timer: 10000
  Peer Hello timer: 3000, Peer Hold timer: 10000

Stats:
  Pkts 27719, Bytes 1718578, HA Seq 0, Seq Number 27719, Pkt Loss 0
  Authentication not configured
  Authentication Failure: 0
  Reload Peer: TX 0, RX 0
  Resign: TX 0, RX 0
  Standby Peer: Present, Hold Timer: 10000
    Pkts 27700, Bytes 941800, HA Seq 0, Seq Number 27708, Pkt Loss 0

Step 2  Standby Router:

Example:

Router#show redundancy application group all

Faults states Group 1 info:
  Runtime priority: [100]
  RG Faults RG State: Up.
Verify Call State After Switchover

Use the `show voice high-availability summary` command to verify the following:

- The checkpointing of calls on the standby router after a switchover
• The media-inactivity count on the active router when the calls are over
• Native and non-native (preserved) calls when both call types are present
• Presence of leaked RTP, HA, SPI sessions

**Active Router**

```
Router# show voice high-availability summary

Verify SIP IP Address Bindings

Use the `show sip-ua status` command to verify SIP IP address bindings.

```
Router# show sip-ua status
SIP User Agent Status
SIP User Agent for UDP : ENABLED
SIP User Agent for TCP : ENABLED
SIP User Agent for TLS over TCP : ENABLED
SIP User Agent bind status(signaling): DISABLED
SIP User Agent bind status(media): DISABLED
Snapshot of SIP listen sockets : 2

Local Address Listen Port Secure Listen Port
----------------------------------------- ---------- ----------
203.0.113.13  5060  5061
203.0.113.13  5060  5061
```

Verify Current CPU Use

Use the `show process cpu history` to verify the CPU utilization percentage at regular intervals.
Check CPU utilization before performing a switchover and proceed with a forced failover only when the CPU utilization is less than 70%. You can also use `show process cpu sorted` command repeatedly to know the CPU utilization for a particular process.

**Force a Manual Failover for Testing**

Box-to-box redundancy on the Cisco ASR 1000 Series Router platform supports full stateful switchover of calls. This means the media (RTP) and signaling information of the calls is preserved.

You can expect that switchovers occurring in real environments, where there is a constant mixture of calls in transient (call setup or being modified) and established state, result in some dropped calls during a failover.

To check that your configuration is correct, you can force a manual switchover.

---

A switchover involves the active router reloading, while the standby router takes over and becomes the new active router, processing incoming calls and maintaining the media streams and signaling information for calls until they are complete. The new active router continues to act as such until another switchover occurs. There is no pre-emption mechanism on Box-to-box redundancy.

---

**Before you begin**

Before you start a manual switchover, take note of the following:

- Monitor the CPU utilization % on the active and standby router pair. The active router has the higher CPU utilization as it is actively handling the calls, while the standby router shows little CPU utilization.
- Ensure that you perform a manual switchover when the CPU utilization of the active router is not more than 70%.
- Use the `show voip rtp connection` command to make sure that existing calls across the active and standby router pair are in sync.

You can achieve manual switchovers in various ways:

**Procedure**

- Initiate the manual switchover by using the CLI `redundancy application reload group RG ID self` on the active router.
- Reload of the active router
- Power cycle the active router
- Pull out any RG configured interface of the active router
- Shutdown any RG configured interface of the active router

**Troubleshoot High Availability Issues**

Use the following show and debug commands to troubleshoot High Availability issues:

- `show redundancy application group all`
- `show redundancy application transport clients`
- show redundancy client domain all | inc VOIP RG
- show voice high-availability summary
- show voip fpi stats
- debug voip rtp session
- debug voice high-availability all
- debug voip fpi all
- debug redundancy application group {config | faults | media | protocol | rii transport | vp}

**Note**
On every switchover after reload, you must enable the debugs on the new standby router.

**Note**
Do not turn on many debugs on a system carrying high volume of active call traffic.

**Troubleshooting Tips**
- Check for proper HA states on both the active and standby router in the output of the show commands, like `show redundancy application group`.
- Perform incoming and outgoing ping tests with the VIPs employed.
- In the presence of active calls, look for the use of any physical interface’s IP address in the output of `show voip rtp connections` on both the active and standby routers. VIP must be used in both the show outputs and the debugs.
- In the output of `show voip rtp connection | inc Found` and `show call active voice compact | inc Total` on both the active and standby routers, check for any large number of mismatched calls.
- To debug problems, enable the corresponding debug options:
  - VoIP RTP
  - VoIP FPI
  - VoIP HA
  - SPIs (SIP, H.323, SCCPAPP)
High Availability on Cisco CSR 1000v Series Cloud Services Routers

The High Availability (HA) feature allows you to benefit from the failover capability of Cisco Unified Border Element (Cisco UBE) on two routers, one active and one standby. When the active router goes down for any reason, the standby router takes over seamlessly, preserving and processing your calls.

Figure 67: Cisco UBE High Availability

- About vCUBE High Availability on Cisco CSR 1000v Series Cloud Services Router, on page 705
- How to Configure vCUBE High Availability on Cisco CSR 1000v, on page 711
- Troubleshoot High Availability Issues, on page 717

About vCUBE High Availability on Cisco CSR 1000v Series Cloud Services Router

Cisco Unified Border Element running on Cisco CSR 1000v Series Cloud Services Router is called Virtual Cisco UBE (vCUBE). vCUBE leverages Redundancy Group (RG) Infrastructure to provide high availability. HA is configured between two vCUBE Cisco CSR 1000v instances running on either the same host or across different hosts that are connected through the same switch.

You can configure vCUBE on Cisco CSR 1000v running on virtualized hosts listed in the Cisco Unified Border Element Data Sheet.

Box-to-Box Redundancy

Box-to-box redundancy enables configuring a pair of routers to act as back up for each other. In the router pair, the active router is determined based on the failover conditions. The router pair continuously exchange status messages. Cisco UBE session information is checkpointed across the active and standby router. This
enables the standby router to immediately take over all Cisco UBE call processing responsibilities when the active router becomes unavailable.

**Redundancy Group (RG) Infrastructure**

A group of redundant interfaces form a Redundancy Group. The active and standby routers are connected by a configurable control link and data synchronization link. The control link is used to communicate the redundancy state for each router. The data synchronization link is used to transfer stateful information to synchronize the stateful database for the calls and media flows. Each pair of redundant interfaces is configured with the same unique ID number, also known as the Redundancy Interface Identifier (RII).

A Virtual IP address (VIP) is configured on interfaces that connect to the external network. All signaling and media is sourced from and sent to the Virtual IP address. External devices such as Cisco Unified Communication Manager, uses VIP as the destination IP address for the calls traversing through Cisco UBE.

The following figure shows the redundancy group configured for a pair of routers with a single outgoing interface.

*Figure 68: Redundancy Group Configuration*
Network Topology

Figure 69: Virtual CUBE High Availability
We recommend that you keep the following in mind when enabling this topology:

- Connect the Cisco CSR 1000v running on the server to the virtual switch within the virtualized host. Then connect the virtual switches to external switches using the physical host interfaces. The virtual switch routes the traffic internally between the virtual machines and also connects the external networks.

- Configure the virtual switch to propagate the status of the physical switch so that vCUBE shows the status as "down" when the interface connecting the physical switch is down. vCUBE tracks only the status of the interface connecting the virtual switch. It does not track the status of the interface connecting the physical switch. Therefore, we recommend you to configure the virtual switch to propagate the status of the physical switch.

- Configure HA connectivity using redundancy on virtual switch to avoid checkpointing failures.

In a scenario where the physical switch is down and there is no redundancy configured on virtual switch, the active router continues to process calls as it tracks only the status of virtual switch (which is up). At the same time, the standby router assumes the role of active router as it does not receive keepalive messages from the active router through the physical switch. Hence checkpointing fails. To avoid such scenarios, we recommend you to configure HA connectivity using redundancy on virtual switch.
• Do not track the switches that are used to connect non-networking end devices or LAN, to determine uplink failures.

• Use a dedicated interface that is connected through a switch for checkpointing the RG control and data traffic across the two routers.

• A keepalive interface that is used for check-pointing RG control and data traffic must be in a different subnet or VLAN if the redundancy group ID is the same for the two different Cisco UBE HA pairs.

• You can configure a maximum of two redundancy groups. Hence, there can be only two active and standby pairs within the same network.

• Source all signaling and media from and to the Virtual IP address.

• Always save the running configuration to avoid losing it due to router reload during a failover.

• Virtual Routing and Forwarding
  • Define Virtual Router Forwarding (VRF) in the same order on both active and standby routers for an accurate synchronization of data.
  • You can configure VRFs only on Traffic interfaces (SIP and RTP). Do not configure VRF on RG Control and Data interface.
  • VRF configurations on both the active and standby router must be identical. VRF IDs are checkpointed for the calls before and after switchover (includes VRF-based RTP port range).

• Manually copy the configurations from one router to the other.

• When the configuration is replicated on the standby router, it is not committed to the startup configuration; it is in the running configuration. You must run the write memory command to commit the changes that are synchronized from the active router on the standby router.

Considerations and Restrictions

The following is a list of further considerations and restrictions you should know before configuring this topology:

Considerations

• Only active calls are checkpointed (Calls that are connected with 200 OK or ACK transaction completed).

• When you apply and save the configuration for the first time, the platform must be reloaded.

• For H.323, and TCP-based calls, media preservation is supported after the failover, but session signaling is not preserved.

• If you have Cisco Unified Customer Voice Portal (CVP) in your network, we recommend that you configure TCP session transport for the SIP trunk between CVP and Cisco UBE.

• Upon failover, the previously active Cisco UBE reloads by design.

• Cisco UBE uses the primary IP address to communicate Smart Licensing information.

• For SIP-SIP TLS calls (using Cisco IOS XE Release 3.11 or later), configure both the active and standby Cisco UBE as trust points to a common external CA Server.
• TCP sessions are not preserved during the failover. Remote user agents are expected to reestablish TCP sessions (using port 5060) before sending subsequent messages.

• Call Admission Control (CAC) continues to work after switchover. After stateful switchover, no calls are allowed if the CAC limit is reached before the switchover.

• Up to 6 multimedia lines in the SDP are checkpointed for Cisco UBE HA. From Cisco IOS XE Release 3.17 onwards, SDP Passthru (up to 2 m-lines) calls are also checkpointed.

• Survivability.tcl preservation is supported from Cisco IOS XE Release 3.17 onwards for Unified Customer Voice Portal (CVP) deployments.

• SRTP-RTP, SRTP-SRTP, and SRTP Passthru are supported.

• Port channel is supported for both RG control data and traffic interfaces only from Cisco IOS XE 16.3.1 onwards.

Figure 71: Additional Supported Options for Cisco UBE HA

Restrictions

• Geographic stateful switchover is not supported.

• Calls in the transient state at the time of switchover are not preserved.

• IPv6 is not supported.

• All SCCP-based media resources (Conference bridge, Transcoding, Hardware MTP, and Software MTP) are not supported.

• Cisco Unified Survivable Remote Site Telephony (Unified SRST) or TDM Gateway co-location on Cisco UBE HA is not supported.

• Routers connected through Metropolitan Area Network (MAN) Ethernet regardless of latency are not supported.

• Out-of-band DTMF (Notify or KPML) is not supported post switchover. Only rtp-nte to rtp-nte and voice-inband to voice-inband DTMF works after the switchover.

• Media-flow around and UC Services API (Cisco Unified Communications Manager Network-Based Recording) are not supported.
• Signaling and media preservation are not supported over a crossover cable connection for the RG-control or data link.

• You cannot terminate Wide Area Network (WAN) on Cisco UBE directly or Data HA on either side. Both active and standby routers must be in the same Data Center and connected to the same physical switch.

• The Courtesy Callback (CCB) feature is not supported if a callback was registered with Cisco Unified Customer Voice Portal (CVP) and then a switchover was done on Cisco UBE.

• You cannot configure a secondary IP address for the interfaces.

• If the redundancy group ID is same for the two different Cisco UBE HA pairs, then the keepalive interface that is used for checkpointing RG control and data traffic must be in a different subnet or VLAN.

How to Configure vCUBE High Availability on Cisco CSR 1000v

Before You Begin

• Use Cisco IOS-XE Release 3.11 and or later on both active and standby routers.

• Ensure that you have the required licenses for configuring high availability. For detailed information, see Cisco Unified Border Element Data Sheet.

Configure High Availability

**Step 1** Configure the Redundancy Group (RG).

a) Enter application redundancy mode.

**Example:**

```
Router>enable
Router#configure terminal
Router(config)#redundancy
Router(config-r)#mode none
Router(config-red)#application redundancy
Router(config-red-app)#group 1
```

b) Configure a name for the redundancy group.

**Example:**

```
Router(config-red-app-grp)#name cube-ha
```

where *cube-ha* is the name of the redundancy group.

c) Specify the initial priority and failover threshold for a redundancy group.

**Example:**

```
Router(config-red-app-grp)#priority 100 failover threshold 75
```
where 100 is priority value and 75 is the threshold value. The router with highest priority and threshold value among the HA pair acts as the active router.

d) Configure the timers for delay and reload.

Example:
```
Router(config-red-app-grp)#timers delay 30 reload 60
```
Delay timer which is the amount of time to delay the RG group’s initialization and role negotiation after the interface comes up.
Default: 30 seconds. Range is 0-10000 seconds.
Reload timer is the amount of time to delay RG group initialization and role-negotiation after a reload.
Default: 60 seconds. Range is 0-10000 seconds.

e) Configure the interface used to exchange keepalive and hello messages between the router pair.

Example:
```
Router(config-red-app-grp)#control GigabitEthernet2 protocol 1
```
where GigabitEthernet2 is the interface and protocol 1 is the protocol instance that is attached to the interface.

f) Configure the interface that is used for checkpointing of data traffic.

Example:
```
Router(config-red-app-grp)#data GigabitEthernet2
```

g) Configure RG group tracking.

Example:
```
Router(config-red-app-grp)#track 1 shutdown
Router(config-red-app-grp)#track 2 shutdown
```
h) Specify the protocol instance that will be attached to a control interface and enters redundancy application protocol configuration mode.

Example:
```
Router(config-red-app-grp)#protocol 1
```
i) Configure the two timers for hellotime and holdtime.

Example:
```
Router(config-red-app-grp)#timers hellotime 3 holdtime 10
```
hellotime—Interval between successive hello messages.
Default is 3 seconds. Range is 250 milliseconds-254 seconds.
holdtime—The interval between the receipt of a hello message and the presumption that the sending router has failed. This duration has to be greater than the hellotime.
Default is 10 seconds. Range is 750 milliseconds-255 seconds.

We recommend that you configure the holdtime timer configured to be at least 3 times the value of the hellotime timer.

Step 2 Configure interface tracking.
The **track** command is used in RG to track the voice traffic interface state so that the active router initiates switchover after the traffic interface is down.

Configure the following commands at the global level to track the status of the interface.

```
Router(config)#track 1 interface GigabitEthernet0 line-protocol
Router(config)#track 2 interface GigabitEthernet1 line-protocol
```

**Step 3** Configure the interfaces.

a) Configure the redundancy interface identifier for the redundancy group.

   Required for generating a Virtual MAC (VMAC) address. You must use the same rii ID value on the interface of each router (active and standby) that has the same Virtual IP address.

   If there is more than one Box-to-box HA pair on the same LAN, each pair MUST have unique rii IDs on their respective interfaces (to prevent collision). **show redundancy application group all** must indicate the correct local and peer information.

   **Example:**

   ```
   Router(config)#interface GigabitEthernet0
   Router(config-if)#ip address 203.0.113.10 255.255.0.0
   Router(config-if)#negotiation auto
   Router(config-if)#redundancy rii 1
   ```

b) Associate the interface with the redundancy group created.

   **Example:**

   ```
   Router(config-if)#redundancy group 1 ip 203.0.113.12 exclusive
   ```

c) Configure interface for RG control and data.

   **Example:**

   ```
   Router(config)#interface GigabitEthernet2
   Router(config-if)#ip address 198.51.100.1 255.255.255.0
   Router(config-if)#media-type rj45
   Router(config-if)#negotiation auto
   ```

**Step 4** Configure SIP Binding.

Configure Cisco UBE to bind SIP messages to the interface that is configured with a Virtual IP address (VIP) for the RG group employed.

**Example:**

```
Router(config)#dial-peer voice 1 voip
Router(config-dial-peer)#session protocol sipv2
Router(config-dial-peer)#incoming called-number 2000
Router(config-dial-peer)#voice-class sip bind control source-interface GigabitEthernet0
Router(config-dial-peer)#voice-class sip bind media source-interface GigabitEthernet0
Router(config-dial-peer)#codec g711ulaw
Router(config-dial-peer)#!

Router(config)#dial-peer voice 2 voip
Router(config-dial-peer)#destination-pattern 2000
Router(config-dial-peer)#session protocol sipv2
Router(config-dial-peer)#session target ipv4:203.0.113.13
Router(config-dial-peer)#voice-class sip bind control source-interface GigabitEthernet1
Router(config-dial-peer)#voice-class sip bind media source-interface GigabitEthernet1
```
**Step 5**

(Optional) If H.323 calls are involved, enable H.323 binding.

Under the interface used by H.323, configure voip-bind with its source address equal to the interface’s VIP for the RG group employed.

**Example:**

```
Router#voice service voip
Router(conf-voi-serv)#h323
Router(conf-serv-h323)#call preserve limit-media-detection
Router(conf-serv-h323)#no h225 timeout keepalive

Router(config)#interface GigabitEthernet0
Router(config-if)#ip address 203.0.113.10 255.255.0.0
Router(config-if)#media-type rj45
Router(config-if)#negotiation auto
Router(config-if)#redundancy rii 1
Router(config-if)#redundancy group 1 ip 9.13.25.123 exclusive
Router(config-if)#h323-gateway voip interface
Router(config-if)#h323-gateway voip bind srcaddr 203.0.113.12

Router(config)#interface GigabitEthernet1
Router(config-if)#ip address 192.0.2.1 255.255.255.0
Router(config-if)#media-type rj45
Router(config-if)#negotiation auto
Router(config-if)#redundancy rii 2
Router(config-if)#redundancy group 1 ip 192.0.2.3 exclusive
Router(config-if)#h323-gateway voip interface
Router(config-if)#h323-gateway voip bind srcaddr 192.0.2.3
```

**Step 6**

Configure the Punt Policing feature.

SIP packets towards the virtual IP address and physical IP address match different punt-cause codes. The punt-rate of the virtual IP address with a punt-cause of 60, is lower than the punt-rate of the physical IP address.

To ensure that the behaviour of the SIP packets towards virtual and physical IP address remains the same, you must increase the punt-rate of the virtual IP address by using the `platform punt-policer` command in global configuration mode.

**Example:**

```
Router(config)#platform punt-policer 60 40000
```

In the preceding example, the punt-rate of the virtual IP address (punt-cause 60) is increased from the default value of 2000 to 40000.

The following table provides details of the fields of the CLI.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>platform punt-policer</td>
<td>Configures the Punt Policing feature.</td>
</tr>
<tr>
<td>60</td>
<td>punt-cause—Punt cause. Range is 1–107. Punt cause of the virtual interface is 60.</td>
</tr>
<tr>
<td>40000</td>
<td>punt-rate—Rate limit in packets per second. Range is 10–146484.</td>
</tr>
</tbody>
</table>
Note: The default punt rate value of the virtual IP address and the physical IP address varies with the router platform.

Step 7 Configure the RG group under voice service voip. This enables Box-to-box Cisco UBE HA.

Example:

```
Router#voice service voip
Router(config-voi-serv)#redundancy-group 1
```

Step 8 Configure the Media Inactivity timer.

The Media Inactivity Timer enables the active and standby router pair to monitor and disconnect calls if no Real-Time Protocol (RTP) packets are received within a configurable time period.

For the SIP calls, the switched over calls are cleared with signaling (as signaling information is preserved for switched calls).

The Media Inactivity Timer releases TCP-based and H.323-based calls. This is used to guard against any hung sessions resulting from the failover when a normal call disconnect does not clear the call.

You must configure the same duration for the Media Inactivity Timer on both routers. The default value is 30 seconds for SIP and H.323 calls. The sample configuration is as follows:

Example:

```
Router(config)#ip rtcp report interval 9000
Router(config)#gateway
Router(config-gateway)#media-inactivity-criteria all
Router(config-gateway)#timer receive-rtp 1200
Router(config-gateway)#timer receive-rtcp 5
```

SIP and H.323 call legs are cleared once the RTCP timer expires.

Step 9 Reload the router.

Once all the preceding configurations are completed, you must save the configurations, and reload the router.

Example:

```
Router>enable
Router#reload
```

Step 10 Configure the peer router.

Follow the preceding steps to configure the standby router. Make sure that you use the correct IP addresses.

Step 11 Point the attached devices to the Cisco UBE Virtual IP (VIP) address.

The IP-PBX, Unified SIP Proxy, or service provider must route the calls to Cisco UBE’s Virtual IP address. HA configuration does not handle SIP and H.323 messages to the Cisco UBE’s physical IP addresses.

For H.323 calls, you must disable the keepalive messages in Unified CM configuration.

a. Go to System menu, and choose Service Parameters. At the bottom of the Service Parameters, enable Advanced.

b. Set the Allow TCP KeepAlives for H323 to False.

c. After this setting is saved, restart the CallManager Services.
Configuration Example

Active Router:

```plaintext
voice service voip
no ip address trusted authenticate
allow-connections sip to sip
redundancy-group 2
sip
  bind control source-interface GigabitEthernet1
  bind media source-interface GigabitEthernet1
!
redundancy
  application redundancy
group 1
    name cube_b2b_ha_1
    priority 100 failover threshold 75
timers delay 30 reload 60
control GigabitEthernet2 protocol 1
  data GigabitEthernet2
  track 1 shutdown
protocol 1
  name cube_b2b_ha_1
  authentication text sol_ha1
!
interface GigabitEthernet1
  ip address 192.0.2.1 255.255.255.0
  negotiation auto

  no mop sysid
  redundancy rii 102
  redundancy group 2 ip 192.0.2.3 exclusive
!
interface GigabitEthernet2
  ip address 198.51.100.1 255.255.0.0
  negotiation auto
  no mop enabled
  no mop sysid
!
```

Standby Router:

```plaintext
voice service voip
no ip address trusted authenticate
allow-connections sip to sip
redundancy-group 2
sip
  bind control source-interface GigabitEthernet1
  bind media source-interface GigabitEthernet1
!
redundancy
  application redundancy
group 2
  name cube_b2b_ha_2
  priority 100 failover threshold 75
timers delay 30 reload 60
control GigabitEthernet2 protocol 1
```
data GigabitEthernet2
protocol 1
  name cube_b2b_ha_2
  authentication text sol_ha1
!
interface GigabitEthernet1
ip address 192.0.2.2 255.255.255.0
negotiation auto
no mop enabled
no mop sysid
redundancy rii 102
redundancy group 2 ip 203.0.113.12 exclusive
!
interface GigabitEthernet2
ip address 198.51.100.2 255.255.0.0
negotiation auto
no mop enabled
no mop sysid
!

Troubleshoot High Availability Issues

Use the following show and debug commands to troubleshoot High Availability issues:

- show redundancy state
- show redundancy inter-device
- show standby brief
- show standby internal
- show sip-ua status
- show sip-ua statistics
- show voice high-availability summary
- show voip rtp connection | include connection
- show arp
- debug voip ccapi all
- debug voip ccapi error
- debug voip rtp session
- debug voip rtcp session
- debug voip rtp error
- debug voip rtcp error
- debug voice high-availability all
- debug voice high-availability error
- debug ccsip info
- debug ccsip messages
Troubleshoot High Availability Issues

- debug ccsip media
- debug ccsip error
- debug standby terse

---

Note
Do not turn on a large number of debugs on a system carrying high volume of active call traffic.
HIGH AVAILABILITY ON CISCO INTEGRATED SERVICES ROUTERS (ISR-G2)

The High Availability (HA) feature allows you to benefit from the failover capability of Cisco Unified Border Element (Cisco UBE) on two routers, one active and one standby. When the active router goes down for any reason, the standby router takes over seamlessly, preserving and processing your calls.

Figure 72: Cisco UBE High Availability

- About Cisco UBE High Availability on Cisco ISR-G2, on page 719
- How to Configure Cisco UBE High Availability on Cisco ISR-G2, on page 723
- Verify Your Configurations, on page 736
- Troubleshoot High Availability Issues, on page 745

About Cisco UBE High Availability on Cisco ISR-G2

Cisco UBE supports Box-to-box redundancy on Cisco Integrated Services Router Generation 2 Router (ISR-G2) and uses Hot Standby Routing Protocol (HSRP) technology to provide High Availability.

Box-to-Box Redundancy

Box-to-box redundancy enables configuring a pair of routers to act as back up for each other. In the router pair, active router is determined based on the failover conditions. The router pair continuously exchange status messages. Cisco UBE session information is checkpointed across the active and standby router. This enables the standby router to immediately take over all Cisco UBE call processing responsibilities when the active router becomes unavailable.
Hot Standby Router Protocol (HSRP)

Hot Standby Router Protocol (HSRP) technology provides high network availability by not relying on any single router for routing IP traffic from hosts on the network.

By sharing an IP address and a MAC (Layer 2) address, two or more routers form a virtual router group called a Standby group or HSRP group. This HSRP group acts as a single virtual router to hosts on the LAN. HSRP is used to select an active router and a standby router in an HSRP group. The active router forwards packets that the host sends to the virtual router group. Active and standby routers continually exchange periodic HSRP messages once the protocol has completed the router selection process.

HSRP monitors both the inside and outside interfaces. If any of the interfaces go down, the whole router is considered down and the standby router takes over the responsibilities of the active router.

The RTP streams of established calls are checkpointed between the active and standby routers through the HSRP protocol. Therefore the media streams of established calls are preserved over the HSRP failover from the active to the standby routers. Calls in the transient state (calls that are not established yet, or are in the process of being modified with transfer or hold function) at the time of failover are disconnected.

**HSRP Features**

- **Preemption**—The HSRP preemption feature enables the router with the highest priority to immediately become the active router. Priority is determined as follows.
  1. Priority value that you configure.
  2. IP address.

  In each case, higher value is of a greater priority.

- **Preempt Delay**—The preempt delay feature allows you to delay the preemption for a configurable time period. Preempt delay allows the router to populate its routing table before becoming the active router.

- **Interface Tracking**—Allows you to specify details of another interface on the router of the HSRP group. Interface tracking helps to monitor the change in the HSRP priority of a given HSRP group.

**Network Topology**

This section describes how to configure the following dual-attached and single-attached network topology. The dual-attached network topology is the most common configuration, in which an active and standby pair of routers is used in a SIP trunk deployment between a Cisco Unified Communications Manager (Unified CM) and a service provider (SP) SIP trunk for PSTN access. It is also possible to configure Cisco UBE HSRP Box-to-box redundancy with a single-attached network topology.
In these topologies, both active and standby routers have the same configuration and both platforms are connected through a physical switch across similar interfaces. This is required for Cisco UBE HA to work. For example, the CUBE-1 and CUBE-2 interface towards WAN must terminate on the same switch. Multiple interfaces or sub-interfaces can be used on either LAN or WAN side. Also, one Cisco UBE has a lower IP address across all three interfaces on the same Cisco UBE platform. This criteria decides the HSRP active state.

We recommend that you keep the following in mind when configuring these topologies:

- Configure all interfaces of an HSRP group with the same priority.
- The active and standby router pair, and interface combination on a particular LAN must have a unique HSRP group number.

### Considerations and Restrictions

The following is a list of further considerations and restrictions you should know before configuring this topology:

#### Considerations

- There are slight differences in the HSRP configuration between active and standby routers.
- Configuration synchronization between the active and standby router is manual.
- HSRP virtual addresses support only IPv4 addressing.
- Only active calls are checkpointed (Calls that are connected with 200 OK or ACK transaction completed).
• Upon failover, the previously active Cisco UBE reloads by design.

• Multiple traffic (SIP/RTP) interfaces require Preemption and Interface Tracking.

• In High Availability deployments, Cisco UBE uses a primary IP address to communicate the Smart Licensing information.

• Box-to-box redundancy configuration supports only SIP-SIP calls flows, the SIP transport can be either UDP-UDP or UDP-TCP.

• Port channel interfaces are supported only from Cisco IOS Release 15.6(3)M onwards.

Figure 75: Additional Supported Options for Cisco UBE HA

Restrictions

• IPv6 is not supported.

• All SCCP-based media resources (Conference bridge, Transcoding, Hardware MTP, and Software MTP) are not supported.

• Cisco Unified Survivable Remote Site Telephony (Unified SRST) or TDM Gateway co-location on Cisco UBE HA is not supported.

• Calls that involve supplementary services such as transcoding, DTMF-interworking, IVR, SIP-TLS, RSVP, STUN, RTP-SRTP conversion, or fax/modem features are not preserved during the failover.

• Box-to-box redundancy configuration supports multiple HSRP groups per router, but only a single HSRP group per physical interface.

• Loopback addresses with HSRP are not supported, the SIP bind command must use the HSRP virtual IP address.

• No support for media-flow around or UC Services API (Cisco Unified Communications Manager Network-Based Recording).

• WANs cannot terminate directly on the Cisco UBE or on data HSRP on either sides.

• Call Progress Analysis (CPA) calls (before to being transferred to the agent), SCCP-based media resources, Noise Reduction, Acoustic Shock Protection (ASP), and transrating calls are not checkpointed.
How to Configure Cisco UBE High Availability on Cisco ISR-G2

Before You Begin

- Two identical ISR-G2s equipped with the UC Technology Package license (SL-29-UC-K9 or SL-39-UC-K9) installed, 1G DRAM memory, and Cisco IOS Software release 15.1.2T or later.
- Ensure that you have the required licenses for configuring High Availability. For detailed information, see Cisco Unified Border Element Data Sheet.

Configure High Availability

SUMMARY STEPS

1. Define the redundancy scheme.
2. Enable Cisco UBE and Cisco UBE redundancy.
3. Configure Inter-process Communication (IPC) protocol at the HSRP interface.
4. (Optional) Configure Virtual Route Forwarding (VRF) on the platform.
5. Configure HSRP on the interfaces.
6. Configure Interface Tracking.
7. Bind traffic to the respective interfaces.
8. Configure Media Inactivity feature.
9. Reload the routers.
10. Point the attached devices to the Cisco UBE HSRP Virtual IP (VIP) address.

DETAILED STEPS

Step 1

Define the redundancy scheme.

Example:

Router(config)#redundancy inter-device
Router(config-red-interdevice)#scheme standby SB

The following table provides details of the CLIs used in the configuration.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheme</td>
<td>Redundancy state tracking scheme</td>
</tr>
<tr>
<td>standby</td>
<td>Enables standby (HSRP) state tracking scheme</td>
</tr>
<tr>
<td>SB</td>
<td>HSRP standby group name</td>
</tr>
</tbody>
</table>
The router enters the interdevice configuration mode and names the redundancy scheme that is used between the two routers. The CLIs listed in the preceding example create interdependency between the Cisco UBE redundancy and HSRP.

**Step 2**
Enable Cisco UBE and Cisco UBE redundancy.

**Example:**
Enable Cisco UBE on both routers

```
Router(config)#voice service voip
Router(config-voi-serv)#mode border-element
Router(config-voi-serv)#allow-connections sip to sip
```

Enables Cisco UBE on the router and allows connections between the specific type of endpoints in a VoIP network.

**Example:**
Enable the Cisco UBE redundancy and call checkpointing on both routers

```
Router(config)#voice service voip
Router(config-voi-serv)#redundancy
```

**Step 3**
Configure Inter-process Communication (IPC) protocol at the HSRP interface.

**Example:**
Active Cisco UBE configuration

```
CUBE-1(config)#ipc zone default
CUBE-1(config-ipzone)#association 1
CUBE-1(config-ipzone-assoc)#no shutdown
CUBE-1(config-ipzone-assoc)#protocol sctp
CUBE-1(config-ipc-protocol-sctp)#local-port 5000
CUBE-1(config-ipc-local-sctp)#local-ip 203.0.113.10
CUBE-1(config-ipc-local-sctp)#remote-port 5000
CUBE-1(config-ipc-remote-sctp)#remote-ip 203.0.113.11
```

**Example:**
Standby Cisco UBE configuration

```
CUBE-2(config)#ipc zone default
CUBE-2(config-ipzone)#association 1
CUBE-2(config-ipzone-assoc)#no shutdown
CUBE-2(config-ipzone-assoc)#protocol sctp
CUBE-2(config-ipc-protocol-sctp)#local-port 5000
CUBE-2(config-ipc-local-sctp)#local-ip 203.0.113.11
CUBE-2(config-ipc-local-sctp)#remote-port 5000
CUBE-2(config-ipc-remote-sctp)#remote-ip 203.0.113.10
```

The following table provides details of the CLIs used in the configuration.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipc zone default</td>
<td>Configures the Inter-process Communication Protocol (IPC) and enters IPC zone configuration mode. Use this command to initiate the communication link between the active and standby routers.</td>
</tr>
</tbody>
</table>
Option | Description
---|---
association 1 | Configures an association between the two routers and enters the IPC association configuration mode. Under this, configure the details of the association such as the transport protocol, local port, local IP address, remote port, and remote IP address. Valid association IDs range 1–255. There are no default association IDs.

no shutdown | Restarts a disabled association and the associated transport protocol. For any changes to the transport protocol parameters, you must shut down the association.

protocol sctp | Configures Stream Control Transmission Protocol (SCTP) as the transport protocol for the association and enables SCTP protocol configuration mode.

local-port port_num | Defines the local SCTP port number for communication with the redundant peer.

local-ip ip_addr | Defines the local router's IP address for communication with the redundant peer. The local IP address must match the remote IP address on the redundant router.

remote-port port_num | Defines the remote SCTP port number for communication with the redundant peer.

remote-ip ip_addr | Defines the remote IP address for communication with the redundant peer. All remote IP addresses must point to the same router.

Step 4

(Optional) Configure Virtual Route Forwarding (VRF) on the platform.

Example:

VRF configuration on active and standby Cisco UBE

```plaintext
Router(config)#ip vrf LAN-VRF
Router(config)#rd 1:1
Router(config)#ip vrf WAN-VRF
Router(config)#rd 1:1
```

The following table provides details of the CLIs used in the configuration.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip vrf vrf-name</td>
<td>Creates a VRF with the specified name.</td>
</tr>
</tbody>
</table>

**Note**  
Space is not allowed in the VRF name.
Cisco UBE High Availability with HSRP supports VRF. Traffic interfaces (SIP/RTP) can have VRFs configured. VRF IDs are checkpointed for the calls before and after the switchover. VRF configurations including VRF-based RTP port range, must be identical on both active and standby routers.

**Step 5**
Configure HSRP on the interfaces.

a) Configure the inside interface.

**Example:**
Active Cisco UBE configuration

```
CUBE-1(config)#interface GigabitEthernet0/0
CUBE-1(config-if)#description "Enterprise LAN"
CUBE-1(config-if)#ip vrf forwarding LAN-VRF
CUBE-1(config-if)#ip address 203.0.113.10 255.255.255.0
CUBE-1(config-if)#standby version 2
CUBE-1(config-if)#standby 1 ip 203.0.113.12
CUBE-1(config-if)#standby delay minimum 30 reload 60
CUBE-1(config-if)#standby 1 preempt
CUBE-1(config-if)#standby 1 track 2 decrement 10
CUBE-1(config-if)#standby 1 track 3 decrement 10
CUBE-1(config-if)#standby 1 priority 50
```

**Example:**
Standby Cisco UBE configuration

```
CUBE-2(config)#interface GigabitEthernet0/0
CUBE-2(config-if)#description "Enterprise LAN"
CUBE-2(config-if)#ip vrf forwarding LAN-VRF
CUBE-2(config-if)#ip address 203.0.113.11 255.255.255.0
CUBE-2(config-if)#standby version 2
CUBE-2(config-if)#standby 1 ip 203.0.113.12
CUBE-2(config-if)#standby delay minimum 30 reload 60
CUBE-2(config-if)#standby 1 preempt
CUBE-2(config-if)#standby 1 track 2 decrement 10
CUBE-2(config-if)#standby 1 track 3 decrement 10
CUBE-2(config-if)#standby 1 priority 50
```

b) Configure the outside interface.

**Example:**
Active Cisco UBE configuration

```
CUBE-1(config)#interface GigabitEthernet0/1
CUBE-1(config-if)#description "Enterprise WAN"
CUBE-1(config-if)#ip vrf forwarding WAN-VRF
CUBE-1(config-if)#ip address 192.0.2.1 255.255.255.0
CUBE-1(config-if)#standby version 2
CUBE-1(config-if)#standby 10 ip 192.0.2.5
CUBE-1(config-if)#standby delay minimum 30 reload 60
CUBE-1(config-if)#standby 10 preempt
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rd route-distinguisher</td>
<td>Creates a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y).</td>
</tr>
</tbody>
</table>
Example:

Standby Cisco UBE configuration

CUBE-2(config)#interface GigabitEthernet0/1
CUBE-2(config-if)#description "Enterprise WAN"
CUBE-2(config-if)#ip vrf forwarding WAN-VRF
CUBE-2(config-if)#ip address 192.0.2.2 255.255.255.0
CUBE-2(config-if)#standby version 2
CUBE-2(config-if)#standby 10 ip 192.0.2.5
CUBE-2(config-if)#standby delay minimum 30 reload 60
CUBE-2(config-if)#standby preempt
CUBE-2(config-if)#standby 10 track 2 decrement 10
CUBE-2(config-if)#standby 10 track 3 decrement 10
CUBE-2(config-if)#standby 10 priority 50

Example:

Active Cisco UBE configuration

CUBE-1(config)#interface GigabitEthernet0/2
CUBE-1(config-if)#description "HSRP Interface"
CUBE-1(config-if)#ip address 198.51.100.1 255.255.255.0
CUBE-1(config-if)#standby version 2
CUBE-1(config-if)#standby 100 ip 198.51.100.5
CUBE-1(config-if)#standby delay minimum 30 reload 60
CUBE-1(config-if)#standby preempt
CUBE-1(config-if)#standby 100 name SB
CUBE-1(config-if)#standby 100 track 2 decrement 10
CUBE-1(config-if)#standby 100 track 3 decrement 10
CUBE-1(config-if)#standby 100 priority 50

Example:

Standby Cisco UBE configuration

CUBE-2(config)#interface GigabitEthernet0/2
CUBE-2(config-if)#description "HSRP Interface"
CUBE-2(config-if)#ip address 198.51.100.2 255.255.255.0
CUBE-2(config-if)#standby version 2
CUBE-2(config-if)#standby 100 ip 198.51.100.5
CUBE-2(config-if)#standby delay minimum 30 reload 60
CUBE-2(config-if)#standby preempt
CUBE-2(config-if)#standby 100 name SB
CUBE-2(config-if)#standby 100 track 2 decrement 10
CUBE-2(config-if)#standby 100 track 3 decrement 10
CUBE-2(config-if)#standby 100 priority 50

c) Configure the HSRP interface (between the active and standby Cisco UBE).

Example:

Active Cisco UBE configuration

CUBE-1(config)#interface GigabitEthernet0/2
CUBE-1(config-if)#description "HSRP Interface"
CUBE-1(config-if)#ip address 198.51.100.1 255.255.255.0
CUBE-1(config-if)#standby version 2
CUBE-1(config-if)#standby 100 ip 198.51.100.5
CUBE-1(config-if)#standby delay minimum 30 reload 60
CUBE-1(config-if)#standby preempt
CUBE-1(config-if)#standby 100 name SB
CUBE-1(config-if)#standby 100 track 2 decrement 10
CUBE-1(config-if)#standby 100 track 3 decrement 10
CUBE-1(config-if)#standby 100 priority 50

Example:

Standby Cisco UBE configuration

CUBE-2(config)#interface GigabitEthernet0/2
CUBE-2(config-if)#description "HSRP Interface"
CUBE-2(config-if)#ip address 198.51.100.2 255.255.255.0
CUBE-2(config-if)#standby version 2
CUBE-2(config-if)#standby 100 ip 198.51.100.5
CUBE-2(config-if)#standby delay minimum 30 reload 60
CUBE-2(config-if)#standby preempt
CUBE-2(config-if)#standby 100 name SB
CUBE-2(config-if)#standby 100 track 2 decrement 10
CUBE-2(config-if)#standby 100 track 3 decrement 10
CUBE-2(config-if)#standby 100 priority 50
**Note**  
`ip vrf forwarding vrf-name` is applicable only if you have configured VRF.

The HRSP interface cannot have VRFs associated with it. For a Cisco UBE deployment that has VRFs configured for SIP/RTP interfaces, you must have minimum of three interfaces. Otherwise, you can use any of the LAN interfaces as an HRSP interface.

The following table provides details of the CLIs used in the configuration.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface type number</code></td>
<td>Configures an interface type and enters the interface configuration mode.</td>
</tr>
<tr>
<td><code>ip address ip_address subnet_mask</code></td>
<td>Configures an IP address for an interface.</td>
</tr>
<tr>
<td>`standby version {1</td>
<td>2}`</td>
</tr>
<tr>
<td><code>standby [group-number] ip [ip_address]</code></td>
<td>Activates HSRP.</td>
</tr>
<tr>
<td></td>
<td>- If you do not configure a group number, the default group number is 0.</td>
</tr>
<tr>
<td></td>
<td>The group number range is 0–255 for HSRP version 1 and 0–4095 for HSRP</td>
</tr>
<tr>
<td></td>
<td>version 2.</td>
</tr>
<tr>
<td></td>
<td>- The value for the <code>ip_address</code> argument is the virtual IP address of the</td>
</tr>
<tr>
<td></td>
<td>virtual device. For HSRP to elect a designated device, you must configure</td>
</tr>
<tr>
<td></td>
<td>the virtual IP address for at least one of the devices in the group; it</td>
</tr>
<tr>
<td></td>
<td>can be learned on the other devices in the group.</td>
</tr>
<tr>
<td><code>standby delay minimum min-seconds reload</code></td>
<td>Configures the delay period before the initialization of HSRP group.</td>
</tr>
<tr>
<td><code>reload-seconds</code></td>
<td>- The <code>min-seconds</code> value is the minimum time (in seconds) to delay the</td>
</tr>
<tr>
<td></td>
<td>HSRP group initialization after an interface comes up. This minimum delay</td>
</tr>
<tr>
<td></td>
<td>period applies to all subsequent interface events.</td>
</tr>
<tr>
<td></td>
<td>- The <code>reload-seconds</code> value is the time period to delay after the device</td>
</tr>
<tr>
<td></td>
<td>has reloaded. This delay period applies only to the first interface-up event</td>
</tr>
<tr>
<td></td>
<td>after the device has reloaded.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The recommended <code>min-seconds</code> value is 30 and the recommended</td>
</tr>
<tr>
<td></td>
<td><code>reload-seconds</code> value is 60.</td>
</tr>
<tr>
<td><code>standby group-number preempt</code></td>
<td>Allows the router to become the active router when the priority is higher</td>
</tr>
<tr>
<td></td>
<td>than all other HSRP-configured routers in the HSRP group. If you do not</td>
</tr>
<tr>
<td></td>
<td>use the <code>standby preempt</code> command in the configuration for a router, that</td>
</tr>
<tr>
<td></td>
<td>router does not become the active router, even if the priority is higher</td>
</tr>
<tr>
<td></td>
<td>than all other routers.</td>
</tr>
</tbody>
</table>
Configure High Availability

<table>
<thead>
<tr>
<th>Description</th>
<th>Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures HSRP to track a device and change the HSRP priority on the basis of the state of the device. Decrement value specifies the value by which the HSRP priority of the tracked device is decremented (or incremented) when the device goes down (or becomes available).</td>
<td>standby group-number track track-process-number decrement value</td>
</tr>
<tr>
<td>Defines the Hot Standby priority that is used in choosing the active router. The range is 1–255, where 1 denotes the lowest priority and 255 the highest priority.</td>
<td>standby x priority</td>
</tr>
<tr>
<td>In cases where the standby priority is the same, the device with the higher IP address assumes the role of the active router.</td>
<td></td>
</tr>
<tr>
<td>Associates the specified VRF with the interface.</td>
<td>ip vrf forwarding vrf-name</td>
</tr>
</tbody>
</table>

Step 6
Configure Interface Tracking.

Example:
Active and standby Cisco UBE configuration

```
Router(config)#track 1 interface Gig0/0 line-protocol
Router(config)#track 2 interface Gig0/1 line-protocol
Router(config)#track 3 interface Gig0/2 line-protocol
```

Create a tracking list to track the line-protocol state of an interface.

The following table provides details of the CLIs used in the configuration.

<table>
<thead>
<tr>
<th>Description</th>
<th>Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enters tracking configuration mode.</td>
<td>track object-number interface interface-id line-protocol</td>
</tr>
<tr>
<td>• The object-number identifies the tracked object and the range is 1–500.</td>
<td></td>
</tr>
<tr>
<td>• The interface-id represents the interface that is tracked.</td>
<td></td>
</tr>
</tbody>
</table>

Step 7
Bind traffic to the respective interfaces.

a) Bind traffic that is destined to the outside (Service Provider (SP) SIP trunk) to the outside physical interface.

Example:
Active and standby Cisco UBE configuration

```
Router(config)#dial-peer voice 100 voip
Router(config-dial-peer)#description TO SERVICE PROVIDER
Router(config-dial-peer)#destination-pattern 9T
Router(config-dial-peer)#session protocol sipv2
Router(config-dial-peer)#session target ipv4:y.y.y.y
Router(config-dial-peer)#voice-class sip bind control source-interface GigabitEthernet0/1
Router(config-dial-peer)#voice-class sip bind media source-interface GigabitEthernet0/1
```
b) Bind traffic that is destined to the inside (Unified CM or IP PBX) to the inside physical interface.

**Example:**
Active and standby Cisco UBE configuration

```
CUBE(config)#dial-peer voice 200 voip
CUBE(config-dial-peer)#description TO CUCM
CUBE(config-dial-peer)#destination-pattern 555...
CUBE(config-dial-peer)#session protocol sipv2
CUBE(config-dial-peer)#session target ipv4:203.0.113.1
CUBE(config-dial-peer)#voice-class sip bind control source-interface GigabitEthernet0/0
CUBE(config-dial-peer)#voice-class sip bind media source-interface GigabitEthernet0/0
```

Binding the traffic to the respective interfaces ensures that all RTP and SIP packets are created with the virtual IP associated with the respective physical interface.

The following table provides details of the CLIs used in the configuration.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>dial-peer voice</strong> <em>number voip</em></td>
<td>Defines a local dial peer.</td>
</tr>
<tr>
<td><strong>description</strong> <em>string</em></td>
<td>Provides a description for the dial-peer group.</td>
</tr>
<tr>
<td><strong>destination-pattern</strong> <em>string</em></td>
<td>Defines the phone number that identifies the destination pattern that is associated with the dial-peer.</td>
</tr>
<tr>
<td><strong>session-protocol sipv2</strong></td>
<td>Configures SIP as the session protocol type.</td>
</tr>
<tr>
<td><strong>session target</strong> <em>ip-address</em></td>
<td>Configures the network address of the remote router to which you want to send a call once a local voice-network dial peer is matched.</td>
</tr>
<tr>
<td><strong>voice-class sip bind control source-interface</strong> <em>interface-id</em></td>
<td>Sets a source interface for signaling and media packets. The binding applies to the specified interfaces only.</td>
</tr>
<tr>
<td><strong>voice-class sip bind media source-interface</strong> <em>interface-id</em></td>
<td></td>
</tr>
</tbody>
</table>

| **voice-class sip bind control source-interface** *interface-id* | *control*—Binds signaling packets. |
| **voice-class sip bind media source-interface** *interface-id* | *binds*—Binds media packets. |
| **source-interface** *interface-id* | *source-interface* *interface-id*—Type of interface and its ID. |

**Step 8** Configure Media Inactivity feature.

**Example:**
Active and standby Cisco UBE configuration

```
CUBE(config)#ip rtcp report interval 3000
!
CUBE(config)#gateway
CUBE(config-gateway)#media-inactivity-criteria all
```
timer receive-rtcp 5
timer receive-rtp 86400

The following table provides details of the CLIs used in the configuration.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip rtp report interval time in milliseconds</td>
<td>Configures the average reporting interval between subsequent RTCP report transmissions.</td>
</tr>
<tr>
<td>gateway</td>
<td>Enters the gateway configuration mode.</td>
</tr>
<tr>
<td>media-inactivity-criteria all</td>
<td>Specifies the use of both RTCP and RTP for detecting the silence on a voice call.</td>
</tr>
</tbody>
</table>
| timer receive-rtcp timer        | Enable the Real-Time Control Protocol (RTCP) timer and configures a multiplication factor for the RTCP timer interval for Session Initiation Protocol (SIP) or H.323.  
  • timer—Multiples of the RTCP report transmission interval. Range is 0–1000. Default value is 0.  
  Recommended value is 5. |

The Media Inactivity Timer enables the active/standby router pair to monitor and disconnect calls, if the router pair does not receive Real-Time Protocol (RTP) packets within a configurable time period.

When the active or the standby router does not receive RTP packets for a call, the SIP Media Inactivity Timer releases the session. The Media Inactivity Timer guards against any hung sessions resulting from the failover when a normal call disconnect does not clear the call.

You must configure the same duration for the Media Inactivity Timer on both routers.

**Step 9**
Reload the routers.

After completing all the preceding configuration steps, save and reload both the active and standby router.

**Step 10**
Point the attached devices to the Cisco UBE HSRP Virtual IP (VIP) address.

The IP-PBX, Cisco Unified SIP Proxy, or service provider must route the calls to Cisco UBE’s virtual IP address. This HA configuration does not handle SIP/H.323 messages to Cisco UBE’s physical IP addresses.

---

### Configuration Examples

#### Example Configuration for Dual-Attached Cisco UBE HSRP Redundancy

This section provides sample configurations for both the active and standby Cisco UBE routers. In these configurations, the HSRP Hello and Hold timers use their default values of 3 and 8 seconds respectively, and are not shown explicitly in the CLI output.

**Active Router Configuration**

```
ipc zone default
association 1
no shutdown

Example Configuration for Single-Attached Cisco UBE HSRP Redundancy

Although a dual-attached Cisco UBE is the most common configuration, especially for SP SIP trunk connections, it is also possible to configure Cisco UBE HSRP box-to-box redundancy with a single-attached Cisco UBE deployment. The sample configurations for both the active and standby Cisco UBE routers are as follows:

**Active Router Configuration**

```plaintext
ipc zone default
  association 1
    no shutdown
  protocol sctp
    local-port 5000
  local-ip 203.0.113.10
  remote-port 5000
  remote-ip 203.0.113.11

voice service voip
  mode border-element
  allow-connections sip to sip
  redundancy
    sip
      bind control source-interface GigabitEthernet0/0
      bind media source-interface GigabitEthernet0/0

redundancy inter-device
  scheme standby SB

interface GigabitEthernet0/0
```

**Standby Router Configuration**

```plaintext
standby 100 priority 50

! track 1 interface Gig0/0 line-protocol
track 2 interface Gig0/1 line-protocol
track 3 interface Gig0/2 line-protocol
!
dial-peer voice 100 voip
  description TO SERVICE PROVIDER
  destination-pattern 9T
  session protocol sipv2
  session target ipv4:y.y.y.y
  voice-class sip bind control source-interface GigabitEthernet0/1
  voice-class sip bind media source-interface GigabitEthernet0/1
!
dial-peer voice 200 voip
  description TO CUCM
  destination-pattern 555....
  session protocol sipv2
  session target ipv4:203.0.113.1

Verify Your Configurations

Verify Redundancy State

Use the `show redundancy inter-Router` and `show redundancy state` commands to verify the redundancy state.

The following are sample outputs for the commands `show redundancy inter-Router` and `show redundancy state` before inter-router configuration:

```
Router#show redundancy inter-Router

Redundancy inter-Router state: RF_INTERDEV_STATE_PNC_NO_HSRP
Scheme: Standby
Groupname: b2bha Group State: Init
Protocol: <NOT CONFIGURED>

Router# show redundancy states
my state = 3 -NEGOTIATION
peer state = 1 -DISABLED
Mode = Simplex
Unit ID = 0

Maintenance Mode = Disabled
Manual Swact = disabled (system is simplex (no peer unit))
Communications = Down Reason: Simplex mode

client count = 14
client_notification_TMR = 30000 milliseconds
RF debug mask = 0x0
```

The following is a sample output for the command `show redundancy inter-Router` after the inter-router configuration, and before router reload:

```
standby 0 preempt
standby 0 name SB
standby 0 track 1 decrement 10

ip rtcp report interval 3000

! dial-peer voice 5 voip
description to-SIP-application
destination-pattern 9T
session protocol sipv2
session target ipv4:x.x.x.x
!
dial-peer voice 9 voip
description to-CUCM
destination-pattern 555....
session protocol sipv2
session target ipv4:y.y.y.y
!
gateway
media-inactivity-criteria all
timer receive-rtcp 5
timer receive-rtp 86400
```

Verify Redundancy State

Use the `show redundancy inter-Router` and `show redundancy state` commands to verify the redundancy state.

The following are sample outputs for the commands `show redundancy inter-Router` and `show redundancy state` before inter-router configuration:

```
Router#show redundancy inter-Router

Redundancy inter-Router state: RF_INTERDEV_STATE_PNC_NO_HSRP
Scheme: Standby
Groupname: b2bha Group State: Init
Protocol: <NOT CONFIGURED>

Router# show redundancy states
my state = 3 -NEGOTIATION
peer state = 1 -DISABLED
Mode = Simplex
Unit ID = 0

Maintenance Mode = Disabled
Manual Swact = disabled (system is simplex (no peer unit))
Communications = Down Reason: Simplex mode

client count = 14
client_notification_TMR = 30000 milliseconds
RF debug mask = 0x0
```

The following is a sample output for the command `show redundancy inter-Router` after the inter-router configuration, and before router reload:

```
standby 0 preempt
standby 0 name SB
standby 0 track 1 decrement 10

ip rtcp report interval 3000

! dial-peer voice 5 voip
description to-SIP-application
destination-pattern 9T
session protocol sipv2
session target ipv4:x.x.x.x
!
dial-peer voice 9 voip
description to-CUCM
destination-pattern 555....
session protocol sipv2
session target ipv4:y.y.y.y
!
gateway
media-inactivity-criteria all
timer receive-rtcp 5
timer receive-rtp 86400
```
Router# `show redundancy inter-Router`

Redundancy inter-Router state: RF_INTERDEV_STATE_INIT
Pending Scheme: Standby (Will not take effect until next reload)
Pending Groupname: b2bha
Scheme: <NOT CONFIGURED>
Peer present: UNKNOWN
Security: Not configured

The following are sample outputs for the commands `show redundancy inter-Router` and `show redundancy state` after the router reload:

Router# `show redundancy inter-Router`

Redundancy inter-Router state: RF_INTERDEV_STATE_PNC_NO_HSRP
Scheme: Standby
Groupname: b2bha Group State: Init
Peer present: UNKNOWN
Security: Not configured

Router# `show redundancy states`

my state = 3 -NEGOTIATION
peer state = 13 -ACTIVE
Mode = Duplex
Unit ID = 0

Maintenance Mode = Disabled
Manual Swact = disabled (this unit is still initializing)
Communications = Up

client count = 14
client_notification_TMR = 30000 milliseconds
RF debug mask = 0x0

The following are sample outputs for the commands `show redundancy inter-Router` and `show redundancy state` during a switch over:

Router# `show redundancy inter-Router`

Redundancy inter-Router state: RF_INTERDEV_STATE_ACT
Scheme: Standby
Groupname: b2bha Group State: Active
Peer present: RF_INTERDEV_PEER_NO_COMM
Security: Not configured

Router# `show redundancy states`

my state = 13 -ACTIVE
peer state = 1 -DISABLED
Mode = Simplex
Unit ID = 0

Maintenance Mode = Disabled
Manual Swact = disabled (system is simplex (no peer unit))
Communications = Up

client count = 14
client_notification_TMR = 30000 milliseconds
RF debug mask = 0x0
The following are sample outputs for the commands `show redundancy inter-Router` and `show redundancy state` after a switch over, but before the routers exchange Hello status messages:

```
Router#show redundancy inter-Router
Redundancy inter-Router state: RF_INTERDEV_STATE_ACT
Scheme: Standby
Groupname: b2bha Group State: Active
Peer present: RF_INTERDEV_PEER_NO_COMM
Security: Not configured
```

```
Router#show redundancy inter-Router
Redundancy inter-Router state: RF_INTERDEV_STATE_HSRP_STDBY_PNC
Scheme: Standby
Groupname: b2bha Group State: Standby
Peer present: RF_INTERDEV_PEER_NO_COMM
Security: Not configured
```

The following are sample outputs for the commands `show redundancy inter-Router` and `show redundancy state` after the exchange of Hello status messages:

```
Router#show redundancy inter-Router
Redundancy inter-Router state: RF_INTERDEV_STATE_ACT
Scheme: Standby
Groupname: b2bha Group State: Active
Peer present: RF_INTERDEV_PEER_COMM
Security: Not configured
```

```
Router#show redundancy states
my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
Mode = Duplex
Unit ID = 0
Maintenance Mode = Disabled
Manual Swact = disabled (peer unit not yet in terminal standby state)
Communications = Up
client count = 14
client_notification_TMR = 30000 milliseconds
RF debug mask = 0x0
```

```
Router#show redundancy inter-Router
Redundancy inter-Router state: RF_INTERDEV_STATE_STDBY
Scheme: Standby
Groupname: b2bha Group State: Standby
Peer present: RF_INTERDEV_PEER_COMM
Security: Not configured
```

```
Router#show redundancy states
my state = 8 -STANDBY HOT
peer state = 13 -ACTIVE
Mode = Duplex
Unit ID = 0
Maintenance Mode = Disabled
Manual Swact = cannot be initiated from this the standby unit
Communications = Up
```
Verify the HSRP State

Use the `show standby brief` command to verify the HSRP state. This command displays brief output on HSRP including HSRP interfaces, standby group numbers, priorities, active IP addresses, standby IP addresses, and virtual IP addresses. The `show standby` command provides detailed information.

**Active Router:**

```
Router# show standby brief
  P indicates configured to preempt.

<table>
<thead>
<tr>
<th>Interface</th>
<th>Grp</th>
<th>Pri</th>
<th>P</th>
<th>State</th>
<th>Active</th>
<th>Standby</th>
<th>Virtual IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi0/0</td>
<td>0</td>
<td>50</td>
<td>P</td>
<td>Active</td>
<td>local</td>
<td>203.0.113.11</td>
<td>203.0.113.12</td>
</tr>
</tbody>
</table>
```

**Standby Router:**

```
Router# show standby brief

**Verify Call State After a Switchover**

Use the `show voice high-availability summary` command to verify the following:

- The checkpointing of calls on the standby router after a switchover
- The media-inactivity count on the active router when the calls are over
- To check for native and nonnative (for example, preserved) calls when both types of calls are present
- To identify the presence of leaked RTP, HA, SPI sessions

**Verify checkpointing of calls on the standby router after a switchover**

In this example, 800 calls were checkpointed from active to standby after the switchover.

```
Router# show voice high-availability summary

---------- Voice HA DB INFO ----------

**Verify native and non-native (preserved) calls when both are present**

The numbers of calls on the system are shown as follows:

- Total number of calls = "Number of calls in HA DB" + "Number of calls in HA sync pending DB". This is 100 + 50 = 150 in the example output below.

- Total number of preserved (nonnative) calls = "Number of calls in HA preserved session DB". This is 70 in the example output below.

- Total number of native calls (calls set up since the failover and therefore not preserved over the failover) is the difference in the previous two numbers. In this example, it is 150 - 70 = 80.

```
Router# show voice high-availability summary

-------- Voice HA DB INFO --------
Number of calls in HA DB: 100
Number of calls in HA sync pending DB: 50
Number of calls in HA preserved session DB: 70
```

**Identify the presence of leaked RTP, HA, SPI Sessions**

The total number of preserved (non-native) calls cleared by Media Inactivity is equal to the total CREATE received on standby router minus total DELETE received on standby router. Compare this number with the
Verify SIP IP Address Bindings

Use the `show sip-ua status` command to verify the SIP binding status.

```
Router# show sip-ua status
```

SIP User Agent Status
SIP User Agent for UDP : ENABLED
SIP User Agent for TCP : ENABLED

SIP User Agent for TLS over TCP : ENABLED
SIP User Agent bind status(signaling): DISABLED
SIP User Agent bind status(media): DISABLED
Snapshot of SIP listen sockets : 2
Local Address Listen Port Secure Listen Port
---------------------------------------- ----------- -----------
192.0.2.1 5060 5061
192.0.2.1 5060 5061
SIP early-media for 180 responses with SDP: ENABLED
SIP max-forwards : 70

Verify Current CPU Use

Use the `show process cpu history` command to verify the CPU utilization percentage at regular intervals.

Check CPU utilization before performing a switchover and proceed with a forced failover only when the CPU utilization is less than 70%. The `show process cpu sorted` command can also be used repeatedly to understand the CPU utilization for a particular process.

Verify the Call Processing During a Switchover

Use the `show sip-ua statistics` command to verify the call drops during the switchover by checking the number of BYE messages. Calls in progress during the switchover are dropped. Only established calls are preserved.

Use the `show interface accounting` command to verify the media path confirmation during a switchover.

```
Router# show interfaces g0/0 accounting
```

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Pkts In</th>
<th>Chars In</th>
<th>Pkts Out</th>
<th>Chars Out</th>
<th>Other</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>58</td>
<td>6</td>
<td>360</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Media Inactivity event count and the number of media down events, as shown in the output of the `show voip fpi stats` command.

```
Router# show voice high-availability summary

-------- Voice HA DB INFO --------
Number of calls in HA DB: 0
Number of calls in HA sync pending DB: 0
Number of calls in HA preserved session DB: 0

-------- Voice HA COUNTERS --------
Total number of checkpoint requests sent (Active): 971
Total number of checkpoint requested received (Standby): 800
Total CREATE received on Standby: 800
Total MODIFY received on Standby: 0
Total DELETE received on Standby: 0
Media Inactivity event count: 800
```
Check **IP Pkts In** and **Pkts Out** counters. These counters must be increasing at a reasonable rate. For example, if you are using G.711 20ms packetization and no VAD, you must see the packet counters increase by around 50 every second.

---

**Note**

---

**Force a Manual Failover for Testing**

Box-to-box redundancy using HSRP supports the stateful switchover of calls which means both media (RTP) and call signaling are preserved. Therefore, during the switchover, only calls in the active state (media path in "sendrecv" connection mode) are preserved while calls in the transient state (non-active state, media path not in "sendrecv" connection mode) are not.

You can expect that switchovers occurring in real environments, where there is a constant mixture of calls in transient (call setup or being modified) and established state, result in some dropped calls during a failover. You can estimate the number of dropped calls by using the following formula: \((0.3 + \text{HSRP hold-timer}) \times \text{CPS}\).

To check that your configuration is correct, you can force a manual switchover.

You can achieve manual switchovers in various ways:

1. Initiate the manual switchover by using the `redundancy switch-activity force` command on the active router.
2. Reload of the active router
3. Hard restart of the active router
4. Pull out the HSRP interface or power cable of the active router.
5. Shut down the HSRP interface of the active router.
6. Change in any parameter of the HSRP interface of the active/standby router without shutting down the association under IPC mode leads to a router reload. Therefore, you must shut down the interface before you make any changes, unless you are using this as a trigger to force a switchover.

The `show voip rtp connections` command shows the number of active connections on both the active and standby routers after a switchover.

The `show call active voice brief` command does not show any output on the standby router after a switchover because the signaling information is not checkpointed.

**Before you begin**

Before you start a manual switchover, take note of the following:

1. Monitor the CPU utilization % on the active and standby pair. The active router has a higher CPU utilization as it is actively handling the calls, while the standby router shows 0 CPU utilization as it is idle until a switchover occurs.
- Ensure that you perform a manual switchover when the CPU utilization of the active router is no more than 70%. All switchovers lead to a spike in CPU utilization.

- Use the `show voip rtp connection` and `show voice high-availability summary` commands to make sure that the existing calls across the active and standby router pair are in sync.

Perform the following steps to configure and verify a single switch over:

**SUMMARY STEPS**

1. Configure HSRP Box-to-box redundancy as explained in the Configuration section.
2. Reload and keep both routers in rommon.
3. Boot up one router. After the router comes up, execute the `show redundancy state` command and make sure it displays `my state` as active and peer state as Disabled. This can take a while after boot up.
4. Boot up the second router. After the router comes up, execute the `show redundancy state` command and make sure it displays `my state` as standby-Hot and `peer state` as active.
5. Start one or more calls across the system. Execute the `show voice high-availability summary` and `show voip rtp connection` commands on both the active and standby routers to make sure that the calls are up and checkpointed.
6. Test switchover by reloading the active router. If you are using a phone to make calls, you can listen to the phone to make sure that the media path is preserved. If you are using test equipment, you can use the packet displays to determine if media for the calls are flowing.
7. Test Media Inactivity: Stop the call. Repeat `show voip rtp connection`. After the media-inactivity timer expiry, there must be no more active RTP connections. You can also check this using the `show voice high-availability summary` command.

**DETAILED STEPS**

**Step 1** Configure HSRP Box-to-box redundancy as explained in the Configuration section.

**Step 2** Reload and keep both routers in rommon.

**Step 3** Boot up one router. After the router comes up, execute the `show redundancy state` command and make sure it displays `my state` as active and peer state as Disabled. This can take a while after boot up.

**Example:**

```
Router#show redundancy states

my state = 13 ~ACTIVE
peer state = 1 ~DISABLED
```

**Step 4** Boot up the second router. After the router comes up, execute the `show redundancy state` command and make sure it displays `my state` as standby-Hot and `peer state` as active.

**Example:**

```
Router#show redundancy states

my state = 8 ~STANDBY HOT
peer state = 13 ~ACTIVE
```

**Step 5** Start one or more calls across the system. Execute the `show voice high-availability summary` and `show voip rtp connection` commands on both the active and standby routers to make sure that the calls are up and checkpointed.
Step 6
Test switchover by reloading the active router. If you are using a phone to make calls, you can listen to the phone to make sure that the media path is preserved. If you are using test equipment, you can use the packet displays to determine if media for the calls are flowing.

Example:
```
Router# show interfaces g0/0 accounting
```

<table>
<thead>
<tr>
<th></th>
<th>Pkts In</th>
<th>Chars In</th>
<th>Pkts Out</th>
<th>Chars Out</th>
</tr>
</thead>
<tbody>
<tr>
<td>Other</td>
<td>1</td>
<td>58</td>
<td>6</td>
<td>360</td>
</tr>
<tr>
<td>IP</td>
<td>406</td>
<td>178841</td>
<td>201</td>
<td>16394</td>

<td>0</td>
</tr>
<tr>
<td>CDP</td>
<td>116</td>
<td>31672</td>
<td>22</td>
<td>7304</td>
</tr>
</tbody>
</table>

Step 7
Test Media Inactivity: Stop the call. Repeat `show voip rtp connection`. After the media-inactivity timer expiry, there must be no more active RTP connections. You can also check this using the `show voice high-availability summary` command.

Example:
```
Router# show voice high-availability summary | include media
```

Media Inactivity event count: 1

---

**Troubleshoot High Availability Issues**

Use the following show and debug commands to troubleshoot any issues:

- `show redundancy state`
- `show redundancy inter-device`
- `show standby brief`
- `show standby internal`
- `show sip-ua status`
- `show sip-ua statistics`
- `show voice high-availability summary`
- `show voip rtp connection | include connection`
- `show arp`
- `debug voip ccapi all`
- `debug voip ccapi error`
- `debug voip rtp session`
- `debug voip rtcp session`
- `debug voip rtp error`
- `debug voip rtcp error`
- debug voice high-availability all
- debug voice high-availability error
- debug ccsip info
- debug ccsip messages
- debug ccsip media
- debug ccsip error
- debug standby terse

**Note**

Do not turn on a large number of debugs on a system carrying high volume of active call traffic.

**Note**

On every switchover, after router reload, you must re-enable the debugs on the new standby router.

Each router in an HSRP group participates in the protocol by implementing a simple state machine. All routers begin in the Initial state.

The following table illustrates the different router states.

<table>
<thead>
<tr>
<th>States</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial</td>
<td>This is the starting state and indicates that HSRP is not running. This state is entered through configuration change or when an Interface first comes up.</td>
</tr>
<tr>
<td>Learn</td>
<td>The router has not determined the virtual IP address, and not yet seen an authenticated Hello message from the active router. In this state, the router is still waiting to hear from the active router.</td>
</tr>
<tr>
<td>Listen</td>
<td>The router knows the virtual IP address, but is not the active or standby router. It listens for Hello messages from those routers.</td>
</tr>
<tr>
<td>Speak</td>
<td>The router sends periodic Hello messages and is actively participating in the election of the active and standby router. A router cannot enter the Speak state unless it has the virtual IP address.</td>
</tr>
<tr>
<td>Standby</td>
<td>The router is a candidate to become the next active router and sends periodic Hello messages. Excluding transient conditions, there MUST be at most one router in the group in Standby state.</td>
</tr>
<tr>
<td>States</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Active</td>
<td>The router is currently forwarding packets that are sent to the group's virtual MAC/IP address. The router sends periodic Hello messages. Besides transient conditions, there MUST be at most one router in Active state in the group.</td>
</tr>
</tbody>
</table>

**Troubleshooting Tip - Why Are There Two Active Routers?**

This scenario occurs when both routers fail to see the HSRP Hellos from each other.

- Check if each router can ping the other's IP interface address. If not, then communication between the routers is down.

- Use the `debug standby` command to see if the routers are sending and receiving HSRP Hello packets. If the peer is sending Hellos, but they are not being received then check `show interface` or `show controller` commands to see if the interface is listening to the HSRP multicast address.
DSP High Availability Support

Cisco Unified Border Element (CUBE) DSP High Availability support for SIP-to-SIP calls is added for Box-to-Box and Inbox configurations. Earlier, calls that required DSP resources were not checkpointed. As a result, both the media and signaling sessions were not preserved after switchover resulting in call failure.

Note

DSP HA is supported only for SIP-to-SIP calls.

• Feature Information for DSP High Availability Support on CUBE, on page 749
• Prerequisites for DSP High Availability, on page 750
• Features Supported with DSP High Availability, on page 750
• Restrictions for DSP High Availability, on page 750
• Troubleshooting DSP HA Support on CUBE, on page 751
• How to Configure High Availability, on page 751
• Configuration Examples for DSP HA, on page 751

Feature Information for DSP High Availability Support on CUBE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 78: Feature Information for DSP HA Support on CUBE

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSP HA Support on CUBE</td>
<td>Cisco IOS 15.5(2)T</td>
<td>Provides DSP High availability support for SIP-to-SIP calls on Box-to-Box and Inbox redundancies.</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS XE 3.15S</td>
<td></td>
</tr>
</tbody>
</table>
Prerequisites for DSP High Availability

• LTI Transcoding
• DSP HA is supported only on the following routers and its corresponding modules:
  • Cisco ISR G2 series (PVDM3)
  • Cisco ASR 1000 series (SPA-DSP)
  • Cisco ISR 4000 series (PVDM4)
• The same type and capacity DSP modules must be used in the Active and Standby CUBE devices (box-to-box)
• The DSP modules must be installed in the same slot and subslot in the Active and Standby CUBE devices (box-to-box)
• The Active and Standby CUBE devices must have the same DSPFARM configurations (box-to-box)

Features Supported with DSP High Availability

• Transcoding with Supplementary Services
• Voice Class Codec
• G.711 in-band -> RFC2833 (RTP-NTE) DTMF interworking variant
• SRTP-RTP Interworking (ISR-G2 only)
• Fax calls with transcoder invoked for codec mis-match

Restrictions for DSP High Availability

• Media flow-around calls are not supported.
• SDP passthrough calls are not supported.
• Audio Transrating is not supported.
• Call Progress Analysis is not supported.
• Dolby Noise Reduction (NR) and Acoustic Shock Protection (ASP) are not supported.
• All SCCP-based media resources (Conference bridge, Transcoding, HW MTP, and SW MTP) are not supported with Cisco Unified Border Element High Availability.
Troubleshooting DSP HA Support on CUBE

You can use the following debug commands to troubleshoot DSP HA:

- debug voip dsm all
- debug voip dsmp all
- debug ccsip message
- debug voip ipipgw
- debug voip ipipgw high-availability
- debug voip high-availability all
- debug media resource provisioning all
- debug dsp-resource-manager flex dspfarm
- debug dsp-resource-manager flex function
- debug dsp-resource-manager flex error

How to Configure High Availability

The Cisco Unified Border Element (CUBE) provides high availability (HA) through box-to-box redundancy configurations when implemented on a Cisco Integrated Services Router Generation 2 router (ISR G2) platform. CUBE box-to-box redundancy is achieved using the router-based Hot Standby Routing Protocol (HSRP) router technology.

To configure DSP HA, follow the general configuration procedure for HA at Cisco Unified Border Element High Availability (HA) Using HSRP Configuration Example.

Configuration Examples for DSP HA

Active Configuration

-------------
voice-card 0
dsp services dspfarm
dspfarm profile 2 transcode universal
codec g711ulaw
codec g711alaw
codec g729ar8
codec g729abr8
maximum sessions 100

Stateful Switchover Between Redundancy Paired Intra- or Inter-box Devices

Stateful switchover provides protection for network edge devices with dual Route Processors (RPs) that represent a single point of failure in the network design, and where an outage might result in loss of service for customers.

## Prerequisites for Stateful Switchover Between Redundancy Paired Intra- or Inter-box Devices

### Cisco Unified Border Element (Enterprise)

- Cisco IOS XE Release 3.2 or a later release must be installed and running on your Cisco ASR 1000 Series Router.

### Cisco Unified Border Element

- Cisco IOS Release 15.2(3)T or a later release must be installed and running on your Cisco Unified Border Element.
Restrictions for Stateful Switchover Between Redundancy Paired Intra- or Inter-box Devices

- Call escalation and de-escalation are not supported in REFER consumption mode.
- Session Description Protocol (SDP) passthru calls are not supported.
- Resource Reservation Protocol (RSVP) is not supported.
- Alternative Network Address Types (ANAT) for IPv4 or IPv6 interworking is not supported.
- SDP passthrough calls are not supported for media forking.
- Media flow-around fork calls are not checkpointed.
- For high availability PROTECTED mode, redundancy group (RG) is not supported on cross-over cable. However, if cross-over cable is used and the connection flaps or if the RG link is connected using a switch and the switch resets, or if there is a switchover, then both the devices will go into PROTECTED mode resulting in no VoIP functionality.

Information About Stateful Switchover Between Redundancy Paired Intra- or Inter-box Devices

In specific Cisco networking devices that support dual RPs, stateful switchover takes advantage of Route Processor redundancy to increase network availability. When two route processors (RPs) are installed, one RP acts as the active RP, and the other acts as a backup, or standby RP. Following an initial synchronization between the two processors if the active RP fails, or is manually taken down for maintenance or removed, the standby RP detects the failure and initiates a switchover. During a switchover, the standby RP assumes control of the router, connects with the network interfaces, and activates the local network management interface and system console. Stateful switchover dynamically maintains Route Processor state information between them.

The following conditions and restrictions apply to the current implementation of SSO:

- Calls that are handled by nondefault session application (TCL/VXML) will not be checkpointed prebridge.
- Flow-through calls whose state has not been accurately checkpointed will be cleared with media inactivity-based clean up. This condition could occur if active failure happens when:
  - Some check point data has not yet been sent to the standby.
  - The call leg was in the middle of a transaction.
  - Flow around calls whose state has not been accurately checkpointed (due to either of the reasons mentioned above) can be cleared with the `clear call voice causecode` command.

For more information about the Stateful Switchover feature and for detailed procedures for enabling this feature, see the "Configuring Stateful Switchover" chapter of the Cisco IOS High Availability Configuration Guide, Release 12.2SR.
Call Escalation with Stateful Switchover

The call escalation workflow is as follows:

1. The call starts as an audio call between Phone A (video-capable) and Phone B (only audio-capable) registered to two different Cisco Unified Communications Manager (CUCM) clusters connected using Cisco Unified Border Element (Cisco UBE).
2. The call is then transferred to Phone C, which is a video-capable phone.
3. The media parameters within the reinvite are renegotiated end-to-end.
4. The call is escalated to a video call.

Note

If the Cisco UBE switchover happens at any instance, then audio calls will be preserved before escalation and video calls will be preserved after escalation.

Figure 76: Call Escalation

Call De-escalation with Stateful Switchover

The call de-escalation workflow is as follows:

1. The call starts as a video call between Phone A and Phone B registered to two different Cisco Unified Communications Manager (CUCM) clusters connected using Cisco Unified Border Element (Cisco UBE).
2. The call is then transferred to Phone C, which is an audio-only phone.
3. The media parameters within the reinvite are renegotiated end-to-end.
4. The call is de-escalated to an audio-only call.
If the Cisco UBE switchover happens at any instance, then video calls will be preserved before de-escalation and audio calls will be preserved after de-escalation.

**Media Forking with High Availability**

Media forking with high availability is supported on ISR G2, ISR G3 and ASR platforms. When a primary call is connected and a forked call-leg is established on an active Cisco UBE device, both the primary and the forked call-leg will be checkpointed in the standby Cisco UBE device. If the active device goes down, the standby device ensures that the forking call is active and is able to exchange further transactions with the recording server with preserved calls such as hold/resume, transfer, conference, and so on. A recording server is a Session Initiation Protocol (SIP) user agent that archives media for extended durations, providing search and retrieval of the archived media. The recording server is a storage place of the recorded session metadata.

The active and standby devices must have the same configurations for checkpointing to happen correctly. The recorder can be configured both ways with a media profile and directly on a media class. The media profile can be associated under media class, and the media class can be applied to the incoming or outgoing dial-peer to start recording.

For more information, see the “Network-based Recording Using Cisco UBE” module in the *Cisco Unified Border Element Protocol-Independent Features and Setup Configuration Guide*.

**High Availability Protected Mode and Box-to-Box Redundancy for ASR**

To configure box-to-box high availability (HA) support for ASRs, use the `mode rpr` command (rpr is route processor redundancy) in `redundancy` configuration mode.
• Use the same hardware for both the ASR boxes in the active or standby pair to ensure compatibility before and after failover.
• A separate physical interface must be used for checkpointing calls between the active and standby devices.

Self-reload in a voice HA-enabled device helps to recover the box-to-box HA pair from out-of-sync conditions. Instead of self-reload, you can configure the device to transition into protected mode. In protected mode:
• Bulk sync request, call checkpointing, and incoming call processing are disabled.
• The device in protected mode needs to be manually reloaded to come out of this state.

To enabled the protected mode, use the no redundancy-reload command under “voice service voip” configuration mode. The default is redundancy-reload, which reloads control when the redundancy group (RG) fails.

Support for Box-to-Box High Availability with Virtual IP Addresses

The OPTIONS ping with CUBE high availability feature adds the ability to match the incoming dial-peer in the context of the OPTIONS message, allowing response with the virtual IP address shared between the active and standby CUBEs. Box-to-box high availability is supported using virtual IP addresses for the signaling and media, by enhancing the CUBE response to an inbound OPTIONS ping message. This is possible because dial-peer matching of a request URI that does not have a user part is supported.

Important
When OPTIONS Ping SIP Trunk (from CUCM) is configured to CUBE that is running in HA mode, the SIP Trunk goes down whenever the active interface goes down. The SIP Trunk comes back in service, when the OPTIONS Ping next retry happens to CUBE HA node. The default retry time is 60 seconds.

Note
For configuration examples, see the Examples section about configuring interfaces (ISR and ASR) and configuring SIP binding.

Monitoring Call Escalation and De-escalation with Stateful Switchover

Perform this task to monitor calls before and after escalation or de-escalation and before and after stateful switchover on active and standby Cisco UBE devices. The show commands can be entered in any order.

SUMMARY STEPS

1. enable
2. show call active voice compact
3. show call active video compact
4. show call active voice stats
5. show call active video stats
**DETAILED STEPS**

**Step 1**  
**enable**  
Enables privileged EXEC mode.  
**Example:**  
Device> enable

**Step 2**  
**show call active voice compact**  
Displays a compact version of call information for the voice calls in progress.  
**Example:**  
Device# show call active voice compact

<table>
<thead>
<tr>
<th>&lt;callID&gt;</th>
<th>A/O</th>
<th>FAX</th>
<th>T&lt;sec&gt;</th>
<th>Codec</th>
<th>type</th>
<th>Peer Address</th>
<th>IP</th>
<th>R&lt;ip&gt;:&lt;udp&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>512</td>
<td>ANS</td>
<td>T1</td>
<td>g711ulaw</td>
<td>VOIP</td>
<td>Psipp</td>
<td>9.45.38.39:6016</td>
<td></td>
<td></td>
</tr>
<tr>
<td>513</td>
<td>ORG</td>

<td>g711ulaw</td>
<td>VOIP</td>
<td>P123</td>
<td>10.104.46.222:6000</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**  
**show call active video compact**  
Displays a compact version of call information for the video calls in progress.  
**Example:**  
Device# show call active video compact

<table>
<thead>
<tr>
<th>&lt;callID&gt;</th>
<th>A/O</th>
<th>FAX</th>
<th>T&lt;sec&gt;</th>
<th>Codec</th>
<th>type</th>
<th>Peer Address</th>
<th>IP</th>
<th>R&lt;ip&gt;:&lt;udp&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>512</td>
<td>ANS</td>
<td>T19</td>
<td>H263</td>
<td>VOIP-VIDEO</td>
<td>Psipp</td>
<td>9.45.38.39:1699</td>
<td></td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**  
**show call active voice stats**  
Displays information about digital signal processing (DSP) voice quality metrics.  
**Example:**  
Device# show call active voice stats

dur 00:00:16 tx:2238/85044 rx:1618/61484 dscp:0 media:0 audio tos:0xB8 video tos:0x0

Monitoring Media Forking with High Availability

Perform this task to monitor media forking calls with high availability on active and standby Cisco UBE devices. The `show` commands can be entered in any order.

**SUMMARY STEPS**

1. `enable`
2. `show call active voice compact`
3. `show voip rtp connections`
4. `show voip recmsp session`
5. `show voip rtp forking`
6. `show voip rtp forking`

**DETAILED STEPS**

**Step 1**  `enable`
Enables privileged EXEC mode.

**Example:**

```
Device> enable
```

**Step 2**  `show call active voice compact`
Displays a compact version of call information for the voice calls in progress. In the output shown, the first and second connections are for the basic call and the third connection is for the forked leg.

**Example:**

```
Device# show call active voice compact
<callID> A/O FAX T<sec> Codec type Peer Address IP R<ip>:<udp>
Total call-legs: 3
4423 ANS T28 g711ulaw VOIP 9538390040 173.39.67.102:22792
4424 ORG T28 g711ulaw VOIP 708090 9.42.30.189:26300
4426 ORG T27 g711ulaw VOIP 9876 10.104.46.201:56356
```

**Step 3**  `show voip rtp connections`
Displays real-time transport protocol (RTP) named event packets. In the output shown, two additional call legs are shown on the Cisco UBE device. Both the active and standby devices will have the same number of connections.

**Example:**

```
Device# show voip rtp connections
VoIP RTP active connections :
No. CallId dstCallId LocalRTP RmtRTP LocalIP RemoteIP
1 4439 4440 16646 19022 10.104.46.251 173.39.67.102
2 4440 4439 16648 22950 9.42.30.213 9.42.30.189
```
Step 4  show voip recmsp session

Displays active recording Media Service Provider (MSP) session information. In the output shown, the fork leg details and the number of forking calls are displayed. Both the active and standby devices will have the same call information.

Example:

Device# show voip recmsp session

RECMSP active sessions:
MSP Call-ID  AnchorLeg Call-ID  ForkedLeg Call-ID
4441        4440            4442
Found 1 active sessions

Step 5  show voip rtp forking

Displays the RTP media-forking connections. In the output shown, on the active device, packets will be sent.

Example:

Device# show voip rtp forking

VoIP RTP active forks :
Fork 1
  stream type voice-only (0): count 0
  stream type voice+dtmf (1): count 0
  stream type dtmf-only (2): count 0
  stream type voice-nearend (3): count 1
    remote ip 10.104.46.201, remote port 36840, local port 16650
codec g711ulaw, logical ssrc 0x53
    packets sent 0, packets received 0
  stream type voice+dtmf-nearend (4): count 0
  stream type voice-farend (5): count 1
    remote ip 10.104.46.201, remote port 54754, local port 16652
codec g711ulaw, logical ssrc 0x55
    packets sent 0, packets received 0
  stream type voice+dtmf-farend (6): count 0
  stream type video (7): count 0
  stream type application (8): count 0

Step 6  show voip rtp forking

Displays the RTP media-forking connections. In the output shown, on the standby device, packets will not be sent. After the switchover happens, packets will be sent from the new active device.

Example:

Device# show voip rtp forking

VoIP RTP active forks :
Fork 1
  stream type voice-only (0): count 0
  stream type voice+dtmf (1): count 0
  stream type dtmf-only (2): count 0
  stream type voice-nearend (3): count 1
    remote ip 10.104.46.201, remote port 36840, local port 16650
codec g711ulaw, logical ssrc 0x53
  packets sent 0, packets received 0
  stream type voice+dtmf-nearend (4): count 0
  stream type voice-farend (5): count 1
    remote ip 10.104.46.201, remote port 54754, local port 16652
codec g711ulaw, logical ssrc 0x55
    packets sent 0, packets received 0
  stream type voice+dtmf-farend (6): count 0
  stream type video (7): count 0
  stream type application (8): count 0
Verifying the High Availability Protected Mode

Perform this task to verify the configuration for high availability protected mode, assuming the local device is ACTIVE and the peer device went into PROTECTED mode.

**SUMMARY STEPS**

1. enable
2. show voice high-availability rf-client (active device)
3. show voice high-availability rf-client (standby device)

**DETAILED STEPS**

**Step 1** enable

Example:

Router> enable

Enables privileged EXEC mode.

**Step 2** show voice high-availability rf-client (active device)

Example:

Device# show voice high-availability rf-client

FUNCTIONING RF DOMAIN: 0x2

-----
RF Domain: 0x0
Voice HA Client Name: VOIP RF CLIENT
Voice HA RF Client ID: 1345
Voice HA RF Client SEQ: 128
My current RF state ACTIVE (13)
Peer current RF state DISABLED (1)

Current VOIP HA state [LOCAL / PEER] :
[(ACTIVE (13) / UNKNOWN (0))]

-----
RF Domain: 0x2 [RG: 1]
Voice HA Client Name: VOIP RG CLIENT
Voice HA RF Client ID: 4054
Voice HA RF Client SEQ: 448
My current RF state ACTIVE (13)
Peer current RF state STANDBY HOT (8)

Current VOIP HA state [LOCAL / PEER] :
Step 3  show voice high-availability rf-client (standby device)

Example:

Device# show voice high-availability rf-client

RF Domain: 0x0
Voice HA Client Name: VOIP RF CLIENT
Voice HA RF Client ID: 1345
Voice HA RF Client SEQ: 128
My current RF state ACTIVE (13)
Peer current RF state DISABLED (1)

Current VOIP HA state [LOCAL / PEER] :
[(ACTIVE (13) / PROTECTED (0)]

-----
RF Domain: 0x2 [RG: 1]
Voice HA Client Name: VOIP RG CLIENT
Voice HA RF Client ID: 4054
Voice HA RF Client SEQ: 448
My current RF state STANDBY HOT (8)
Peer current RF state ACTIVE (13)

Current VOIP HA state [LOCAL / PEER] :
[PROTECTED (7) / ACTIVE (13)]

Support for REFER and BYE/Also after Stateful Switch-Over

REFER based supplementary services with high availability is supported post-stateful switchover on CUBE. Support is also provided for SIP-to-SIP BYE/Also calls.

Use the show sip-ua handoff stats command to display the call handoff statistics for calls handed off successfully after switchover. Following are the statistics displayed:

- Total number of calls handed off
- Total number of successful call handoffs
- Total numbers of unsuccessful call handoffs

The following sample output displays the call handoff statistics:

2951-CUBE# show sip-ua handoff stats
Total Calls Handed Off = 1
Successful Call Hand offs = 1
Un-Successful Call Hand offs = 0
2951-CUBE#

Troubleshooting Tips

Use the following commands to troubleshoot call escalation and de-escalation with stateful switchover:
• debug voip ccapi all
• debug voip ccapi service
• debug voice high-availability all
• debug voip rtp error
• debug voip rtp inout
• debug voip rtp high-availability
• debug voip rtp function
• debug ccsip all

Use the following commands to troubleshoot media forking support on high availability:
• debug ccsip all
• debug voip high-availability all
• debug voip ccapi inout
• debug voip recmsp all

Use the following commands to troubleshoot PROTECTED mode on high availability:
• debug voice high-availability rf
• debug voice high-availability inout
• debug redundancy progression
• debug redundancy application group faults all
• debug redundancy application group protocol all
• debug voip ccapi inout
• debug cch323 session
• debug cch323 function
• debug cch323 error
• debug ccsip all

Use the following debug commands to troubleshoot issues related to handling of REFER based supplementary services:
• debug ccsip verbose
• debug voip application all
• debug voip ccapi all
• debug voice high-availability all
Example: Configuring the Interfaces for ISR-G2 Devices

ISR-G2 (HSRP-based)

interface GigabitEthernet0/0/0
  ip address 10.10.25.14 255.255.255.0
duplex auto
keepalive
speed auto
standby delay minimum 30 reload 60
standby version 2
standby 0 ip 10.10.25.1
  standby 0 preempt
standby 0 priority 50
standby 0 track 2 decrement 10
standby 0 name SB

Example: Configuring the Interfaces for ASR Devices

ASR (RG Infra-based)

interface GigabitEthernet0/0/0
  ip address 10.13.25.190 255.255.0.0
negotiation auto
redundancy rii 1
redundancy group 1 ip 10.13.25.123 exclusive

Example: Configuring SIP Binding

dial-peer voice inbound-dial-peer-tag voip
  session protocol sipv2
  incoming uri from mydesturi
  voice-class sip call-route url
  voice-class sip bind control source-interface GigabitEthernet 0/0/0

! voice class uri mydesturi
  host abc.com
Example: Configuring SIP Binding
CVP Survivability TCL support with High Availability

Call survivability features are supported in Cisco Unified Border Element (CUBE) high availability mode for all active calls handled by Cisco Voice Portal (CVP).

• Feature Information for CVP Survivability TCL support with High Availability, on page 767
• Prerequisites, on page 768
• Restrictions, on page 768
• Recommendations, on page 768
• CVP Survivability TCL support with High Availability, on page 768
• Configuring CVP Survivability TCL support with High Availability, on page 768

Feature Information for CVP Survivability TCL support with High Availability

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| CVP Survivability TCL support with High Availability | Cisco IOS 15.6(2)T  
Cisco IOS XE Denali 16.3.1 | This feature enables CUBE support call survivability features in CUBE high availability mode for all active calls handled by CVP. |
Prerequisites

- CVP survivability TCL application is configured on incoming dial-peer

Restrictions

- If there is a courtesy callback (CCB) registered with CVP, then post switchover, CCB is not supported.
- Only call survivability TCL script is supported with CUBE high availability. Other TCL based services are not supported.
- Only the active calls will be check pointed. (Calls which are connected - 200OK / ACK transaction completed). Calls in transition state will not be check pointed.

Recommendations

- Configure TCP session transport for the SIP trunk between CUBE and CVP.

CVP Survivability TCL support with High Availability

Contact Center Deployments use call survivability TCL script on CUBE to provide basic Call survivability services when downstream CVP nodes are not reachable. From Cisco IOS Release 15.6(2)T onwards, call survivability features are supported in CUBE High Availability mode. Post switchover, all events received on the calls handled by CVP are posted to Call Survivability TCL application for further processing. Thus, call survivability features are supported in CUBE high availability mode for all active calls handled by CVP.

Configuring CVP Survivability TCL support with High Availability

Existing configuration of applying the survivability TCL application on incoming dial-peer is sufficient. No additional configuration required.
PART XV

ICE-Lite Support on CUBE

- ICE-Lite Support on CUBE, on page 771
ICE-Lite Support on CUBE

Interactive Connectivity Establishment (ICE) is a protocol for Network Address Translator (NAT) traversal for UDP-based multimedia sessions established with the offer-answer model. ICE makes use of the Session Traversal Utilities for NAT (STUN) protocol and its extension, Traversal Using Relay NAT (TURN), and can be used by any protocol utilizing the offer-answer model, such as the Session Initiation Protocol (SIP).

The ICE-Lite Support on CUBE feature enables the remote peers of CUBE (that may be behind a NAT and doing ICE) to use the ICE semantics in the session description protocol (SDP) and perform an offer-answer exchange of SDP messages. The CUBE can also interwork with endpoints that support or do not support ICE. ICE agents (devices) that are always attached to the public Internet have a special type of implementation called Lite. CUBE will be in ICE-lite mode only. CUBE supports the ICE-lite feature from Cisco IOS Release 15.5(2)S.

- Feature Information for ICE-Lite Support on CUBE, on page 771
- Restrictions for ICE-lite Support on CUBE, on page 772
- Information About ICE-Lite Support on CUBE, on page 772
- How to Configure ICE-Lite Support on CUBE, on page 774
- Additional References, on page 783

Feature Information for ICE-Lite Support on CUBE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 80: Feature Information for ICE-Lite Support on CUBE

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| ICE-Lite Support on CUBE | Cisco IOS 15.5(3)M Cisco IOS XE 3.16S | The ICE-Lite Support on CUBE feature enables the remote peers of CUBE (that may be behind a NAT and doing ICE) to use the ICE semantics in the session description protocol (SDP) and perform an offer-answer exchange of SDP messages. The CUBE can also interwork with endpoints that support or do not support ICE. ICE agents (devices) that are always attached to the public Internet have a special type of implementation called Lite. CUBE will be in ICE-lite mode only. The following commands were introduced or modified: `debug voip icelib`, `show voip ice global-stats`, `show voip ice instance call-id call-id`, `show voip ice summary`, and `stun usage ice`

Restrictions for ICE-lite Support on CUBE

The following features are not supported with ICE:

- IPv6
- Alternative Network Address Types (ANAT)
- ANAT-ICE interworking
- Media anti-trombone
- High availability support for video calls
- Codec Transparent
- SDP passthrough
- Media flow-around
- Resource Reservation Protocol (RSVP)
- SIP-to-TDM gateway support
- Media Termination Point (MTP)
- VXML and TCL Scripts

Information About ICE-Lite Support on CUBE

Characteristics

The following are some of the key characteristics of ICE-lite:

- A CLI configured for ICE-lite.
- Support for ICE-lite in the contact header with a media-tag option of REGISTER message (as per RFC 5768).

- ICE-lite feature is in compliance with section 4.2 of RFC 7584, with CUBE acting as ICE termination Back-to-Back UA.

- CUBE accepts Full ICE Offer and responds in ICE-lite mode.

- CUBE responds to mid call updates or early dialog updates with changes to SDP parameters, and which requires ICE to restart.

- For outbound offer from CUBE, a Session Description Protocol (SDP) with ICE-lite semantics is sent.

- ICE protocol verifies all types of media streams (audio, video, application media lines) and components (RTP, RTCP), wherever applicable.

**ICE Candidate**

To execute ICE, an agent has to identify all of its address candidates. A candidate is a transport address—a combination of IP address and port for a transport protocol, such as UDP. A candidate can be derived from physical or logical network interfaces, or discoverable using STUN and TURN. A viable candidate is a transport address obtained directly from a local interface; such a candidate is called a host candidate. The local interface could be ethernet or WiFi, or it could be one that is obtained through a tunnel mechanism, such as a Virtual Private Network (VPN) or Mobile IP (MIP). In all cases, such a network interface appears to the agent as a local interface from which ports (and thus candidates) can be allocated.

*Note* Refer to RFC 5245 for more information about ICE candidates.

**ICE Lite**

ICE agents (devices) that are always attached to the public Internet have a special type of implementation called Lite. For ICE to be used in a call, both the endpoints (agents) must support it. An ICE agent that supports Lite neither gathers ICE candidates nor triggers ICE connectivity checks; however, the agent responds to connectivity checks and includes only host candidates for any media stream. An ICE agent that supports the lite mode is called an ICE-lite endpoint.

*Note* Refer to RFC 5245 for more information about ICE-lite implementation and connectivity checks.

**High Availability Support with ICE**

High availability (HA) is supported only for audio calls that use ICE. For video calls, as the size of SDP is larger, HA will not work. Some of the design considerations are the following:

- No new checkpoint module for ICE instance.

- ICE instance will be re-created on the standby device from SIP HA re-creation path by using source SDP, destination SDP, and configuration profile.
As no information related to ICE is checkpointed, in the standby device, the ICE valid list (created after connectivity checks are done) is populated from currently used media address.

How to Configure ICE-Lite Support on CUBE

Configuring ICE on the CUBE

ICE lite can be configured under STUN, and the decision to use ICE for a session is based on the offer/answer. This configuration is used for outbound dial-peers of CUBE to decide whether to offer ICE in SDP or not. For an incoming offer, the decision to do ICE is based on what the remote end offers in SDP.

SUMMARY STEPS

1. enable
2. configure terminal
3. voice class stun-usage tag
4. stun usage ice lite
5. end

DETAILED STEPS

<table>

</table>
Verifying ICE-Lite on the CUBE (Success Flow Calls)

The following `show` commands can be used to verify ICE for success flow calls. The `show` commands can be entered in any order.

**SUMMARY STEPS**

1. `show call active video compact`
2. `show voip rtp connections`
3. `show voip ice instance call-id call-id-1`
4. `show voip ice instance call-id call-id-2`
5. `show voip ice summary`
6. `show voip ice global-stats`

**DETAILED STEPS**

**Step 1**

`show call active video compact`

**Example:**

```
Device# show call active video compact
<Response>
Total call-legs: 4
<callID> A/O FAX T<sec> Codec type Peer Address  IP R<ip>:<udp>
25  ANS  T189  H264  VOIP-VIDEO P8181  72.163.212.137:2328
30  ORG  T189  H264  VOIP-VIDEO P9191  9.45.46.16:8028
35  ANS  T189  H264  VOIP-VIDEO P8181  9.45.46.16:8008
36  ORG  T189  H264  VOIP-VIDEO P9191  72.163.212.163:2328
</Response>
```

**Step 2**

`show voip rtp connections`

The following sample output displays the VoIP RTP usage information and RTP active connections.

**Example:**

```
Device# show voip rtp connections
<VoiceRTPPortUsage>
VoIP RTP Port Usage Information:
<table>
<thead>
<tr>
<th>Media-Address Range</th>

Total Rx STUN Bind Req 0
Total Tx STUN Bind Succ Resp 0
Total Tx STUN Bind failure resp 0

**Step 5**

**show voip ice summary**

The following sample output displays a summary of active ICE sessions.

**Example:**

Device# show voip ice summary

<table>
<thead>
<tr>
<th>CALL-ID</th>
<th>ICE-STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>25</td>
<td>COMPLETED</td>
</tr>
<tr>
<td>30</td>
<td>RUNNING</td>
</tr>
<tr>
<td>35</td>
<td>RUNNING</td>
</tr>
<tr>
<td>36</td>
<td>COMPLETED</td>
</tr>
</tbody>
</table>

**Step 6**

**show voip ice global-stats**

The following sample output displays the global ICE statistics.

**Example:**
ICE-Lite on CUBE (Error Flow Calls)

The following are the show command sample outputs followed by the system logs for error flow calls. The show commands can be entered in any order.

SUMMARY STEPS

1. show call active voice compact
2. show voip rtp connections
3. show voip ice instance call-id call-id
4. show voip ice instance call-id call-id
5. show voip ice summary
6. show voip ice global-stats

DETAILED STEPS

Step 1  show call active voice compact

Example:

Device# show call active video compact
<callID> A/O FAX T<sec> Codec type Peer Address IP R<ip>:<udp>
Total call-legs: 2
57 ANS T4 g711ulaw VOIP Padithyam 173.39.64.79:7078
58 ORG T4 g711ulaw VOIP F9191 72.163.212.163:2336

Step 2  show voip rtp connections

The following sample output displays the VoIP RTP usage information and RTP active connections.

Example:

Device# show voip rtp connections
VoIP RTP Port Usage Information:
Max Ports Available: 19999, Ports Reserved: 101, Ports in Use: 2
Media-Address Range Min Max Ports Ports Ports
Port Port Available Reserved In-use
-----------------------------------------
Global Media Pool 8000 48198 19999 101 2
-----------------------------------------
VoIP RTP active connections:
No. CallId dstCalllocalRTP RmtRTP LocalIP RemoteIP MPSS
1  57  58  8040  7078  10.104.45.107 173.39.64.79 NO
Step 3  `show voip ice instance call-id call-id`

The following sample output displays the ICE sessions.

Example:

```
Device# show voip ice instance call-id 57

Interactive Connectivity Check(ICE) Instance details:
Call-ID is 57
Instance is 0x7FC617FC03F8
Overall ICE-State is RUNNING
LocalAgent's mode is ICE-CONTROLLED
RemoteAgent's mode is ICE-CONTROLLING
m-line:1
-------
ICE-State: IDLE
No candidate has been nominated
Total Rx STUN Bind Req 2
Total Tx STUN Bind Succ Resp 0
Total Tx STUN Bind failure resp 2
```

Step 4  `show voip ice instance call-id call-id`

The following sample output displays the ICE sessions.

Example:

```
Device# show voip ice instance call-id 58

Interactive Connectivity Check(ICE) Instance details:
Call-ID is 58
Instance is 0x7FC617FC0508
Overall ICE-State is RUNNING
LocalAgent's mode is ICE-CONTROLLED
RemoteAgent's mode is ICE-CONTROLLING
m-line:1
-------
ICE-State: IDLE
No candidate has been nominated
Total Rx STUN Bind Req 2
Total Tx STUN Bind Succ Resp 0
Total Tx STUN Bind failure resp 2
```

Step 5  `show voip ice summary`

The following sample output displays a summary of active ICE sessions.

Example:

```
Device# show voip ice summary

CALL-ID | ICE-STATE
---------|----------
  57     | RUNNING  
  58     | RUNNING  
Total number of sessions: 2
```
Step 6: show voip ice global-stats

The following sample output displays the global ICE statistics.

Example:

Device# show voip ice global-stats

Interactive Connectivity Establishment (ICE) global stats:
Total Rx Stun BindingRequests : 47
Total Tx Stun BindingSuccessResponses : 43
Total Tx Stun BindingErrorResponses : 4

The following are the sys logs for invalid message integrity and for sending ICE-controlled parameter.

ICE-Lite Support on CUBE (Error Flow Calls)

ICE-Lite on CUBE (Error Flow Calls)
Troubleshooting ICE-Lite Support on CUBE

You can use the following `debug` commands to troubleshoot the ICE-lite support on CUBE feature. Use these commands to enable ICE debugs for each call.

- `debug voip icelib all`
- `debug voip icelib default`
- `debug voip icelib detail`
- `debug voip icelib error`
- `debug voip icelib event`
- `debug voip icelib inout`
- `debug voip stun all`
- `debug voip stun default`
- `debug voip stun detail`
- `debug voip stun error`
- `debug voip stun event`
- `debug voip stun inout`
- `debug voip stun message`
- `debug voip stun packet`

PART XVI

SIP Protocol Handling

• Mid-call Signaling Consumption, on page 787
• Early Dialog UPDATE Block, on page 797
• Consumption of Forked 18x Responses with SDP During Early Dialog, on page 803
• Support for Pass-Through of Unsupported Content Types in SIP INFO Messages, on page 809
• Support for PAID PPID Privacy PCPID and PAURI Headers on the Cisco Unified Border Element, on page 811
Mid-call Signaling Consumption

The Cisco Unified Border Element BE Mid-call Signaling support aims to reduce the interoperability issues that arise due to consuming mid-call RE-INVITES/UPDATES.

Mid-call Re-INVITES/UPDATEs can be consumed in the following ways:

- Mid-call Signaling Passthrough - Media Change
- Mid-call Signaling Block
- Mid-call Signaling Codec Preservation

---

**Note**

This feature should be used as a last resort only when there is no other option in CUBE. This is because configuring this feature can break video-related features. For Delay-offer Re-INVITE, the configured codec will be passed as an offer in 200 message to change the codec, the transcoder is added in the answer.

---

**Feature Information for Mid-call Signaling**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

<td></td>
</tr>
</tbody>
</table>

Prerequisites

- Enable CUBE application on a device
- Cisco IOS Release 15.2(1)T or later, or Cisco IOS-XE Release 15.2(2)S or later must be installed.
- **supplementary-service media-renegotiate** must be configured in global voice service voip mode.
Mid-call Signaling Passthrough - Media Change

Passthrough media change method optimizes or consumes mid-call, media-related signaling within the call. Mid-call signaling changes will be passed through only when bidirectional media like T.38 or video is added. The command `midcall-signaling passthru media-change` needs to be configured to enable passthrough media change.

Restrictions for Mid-Call Signaling Passthrough - Media Change

- SIP-H.323 calls are not supported.
- TDM Gateways are not supported.
- Session Description Protocol (SDP) -passthrough is not supported.
- When codec T is configured, the offer from CUBE has only audio codecs, and so the video codecs are not consumed.
- Re-invites are not consumed if media flow-around is configured.
- Re-invites are not consumed if media anti-tromboning is configured.
- De-escalation re-invites are consumed. So, one call leg might be de-escalated to audio only while the other call leg continues to support audio and video.
- Re-invites with media direction changes are consumed.
- Video transcoding is not supported.
- Multicast Music On Hold (MMOH) is not supported.
- When the `midcall-signaling passthru media-change` command is configured and high-density transcoder is enabled, there might be some impact on Digital Signal Processing (DSP) resources as the transcoder might be used for all the calls.
- Session timer is handled leg by leg whenever this feature is configured.
- More than two m-lines in the SDP is not supported.
- Alternative Network Address Types (ANAT) is not supported.
- Video calls and Application streams are not supported when mid-call signaling block is configured.
- In the SRTP-RTP scenario, re-invites are not consumed.

Behavior of Mid-call Re-INVITE Consumption

- If mid-call signaling block is enabled on either of call-legs, video parameters and application streams are not negotiated, and are rejected in the answer.
- When flow around and offer-all is configured, CUBE performs codec renegotiation even if mid-call signaling block is configured globally.
- Below behavior is for refer consume scenario:
  - REFER consume is supported for blind, alert and consult call transfers.
• Existing codecs or DTMF is used for local bridging of new call legs. No Re-INVITE or UPDATE is sent for media re-negotiation after REFER.
• Call gets dropped when DSP is required but not available.
• A call can be escalated to video only if transfer-to dial-peers do not have mid-call signaling block configured.
• Video calls are de-escalated if mid-call signaling block configuration on transfer-to dial-peer.
• For Re-INVITE based call-transfer involving Cisco Unified Communications Manager, all Re-INVITE are locally answered and transcoder is invoked if negotiated codecs are different than the codecs before call-transfer.

• The following table provides the details of the behavior when the initial call is establish without 'sendrecv' parameter, that means, the initial call is established with 'sendonly', 'recvonly' or 'inactive'.

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>If an Offer is received with 'sendonly' and mid-call block is configured on any or both call legs</td>
<td>Offer is sent with 'sendrecv'.</td>
</tr>
<tr>
<td>If an Answer is received with 'sendonly' and the peer leg supports mid-call signaling</td>
<td>Answer is sent with 'sendonly'. Resume transaction is end-to-end.</td>
</tr>
<tr>
<td>If an Answer is received with 'sendonly' and the peer leg does not supports mid-call signaling</td>
<td>Answer is sent with 'sendrecv'. Resume transaction is consumed.</td>
</tr>
<tr>
<td>If Offer as well as Answer is received with 'sendonly' and Offering leg does not support mid-call signaling</td>
<td>Answer is sent with 'recvonly'. Resume from Offering leg is end-to-end. Resume from answering leg is consumed.</td>
</tr>
<tr>
<td>If Offer as well as Answer is received with 'sendonly' and Answering leg does not support mid-call signaling</td>
<td>Answer is sent with 'inactive'. Resume from Offering leg is consumed. Resume from answering leg is end-to-end.</td>
</tr>
<tr>
<td>If Offer as well as Answer is received with 'sendonly' and both legs do not support mid-call signaling</td>
<td>Answer is sent with 'recvonly'. Resume transaction is consumed.</td>
</tr>
</tbody>
</table>

**Configuring Passthrough of Mid-call Signalling**

Perform this task to configure passthrough of mid-call signaling (as Re-invites) only when bidirectional media is added.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. Configure passthrough of mid-call signaling changes only when bidirectional media is added.
   - In Global VoIP SIP configuration mode
     
     ```
     midcall-signaling passthru media-change
     ```
   - In dial-peer configuration mode
### Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1. **Step 1** | `enable` | Enables privileged EXEC mode.  
Example: `Device> enable` |
| 2. **Step 2** | `configure terminal` | Enters global configuration mode.  
Example: `Device# configure terminal` |
| 3. **Step 3** | Configure passthrough of mid-call signaling changes only when bidirectional media is added.  
- In Global VoIP SIP configuration mode  
  `midcall-signaling passthru media-change`  
- In dial-peer configuration mode  
  `voice-class sip mid-call signaling passthru media-change` |
| | Example: In Global VoIP SIP configuration mode:  
  `Device(config)# voice service voip`  
  `Device(conf-voi-serv)# sip`  
  `Device(conf-serv-sip)# midcall-signaling passthru media-change`  
| | Example: In Dial-peer configuration mode:  
  `Device(config)# dial-peer voice 2 voip`  
  `Device(config-dial-peer)# voice-class sip mid-call signaling passthru media-change` |
| 4. **Step 4** | `end` | Exits to privileged EXEC mode. |

#### Example Configuring Passthrough SIP Messages at Dial Peer Level

The following example shows how to passthrough SIP messages at the dial peer Level:

dial-peer voice 600 voip  
destination-pattern 2222222222  
session protocol sipv2  
session target ipv4:9.45.38.39:9001  
voice-class sip mid-call signaling passthru media-change  
incoming called-number 1111111111  
voice-class codec 2 offer-all  
dial-peer voice 400 voip  
destination-pattern 1111111111
Example Configuring Passthrough SIP Messages at the Global Level

The following example shows how to passthrough SIP messages at the global level:

```
Device(config)# voice service voip
Device(config-voi-serv)# no ip address trusted authenticate
Device(config-voi-serv)# allow-connections sip to sip
Device(config-voi-serv)# sip
Device(config-voi-serv)# midcall-signaling passthru media-change
```

Mid-call Signaling Block

The Block method blocks all mid-call media-related signaling to the specific SIP trunk. The command `midcall-signaling block` needs to be configured to enable this behavior. Video escalation and T.38 call flow are rejected when the `midcall-signaling block` command is configured. This command should be configured only when basic call is the focus and mid-call can be consumed.

Restrictions for Mid-Call Signaling Block

- SIP-H.323 calls are not supported.
- TDM Gateways are not supported.
- Session Description Protocol (SDP) -passthrough is not supported
- Video calls and Application streams are not supported.
- When media flow-around is configured, Mid-call INVITE is rejected with 488 error message.
- Re-invites are not consumed if media anti-tromboning is configured.
- Multicast Music On Hold (MMOH) is not supported.
- When the `midcall-signaling passthru media-change` command is configured and high-density transcoder is enabled, there might be some impact on Digital Signal Processing (DSP) resources as the transcoder might be used for all the calls.
- Session timer is handled leg by leg whenever this feature is configured.
- More than two m-lines in the SDP is not supported.
- Alternative Network Address Types (ANAT) is not supported.
- When mid-call signaling block is configured, you can either configure REFER consume or enable TCL script. Mid-call signaling block is not supported if both REFER consume and TCL script are enabled. We also recommend not to configure supplementary-service media-renegotiate command.
- In the SRTP-RTP scenario, re-invites are not consumed.
Blocking Mid-Call Signaling

Perform this task to block mid-call signaling:

**SUMMARY STEPS**

1. `enable`
2. `configureterminal`
3. Configure blocking of mid-call signaling changes:
   - In Global VoIP SIP configuration mode
     `midcall-signaling block`
   - In dial-peer configuration mode
     `voice-classsip mid-call signaling block`
4. `end`

**DETAILED STEPS**

Example Blocking SIP Messages at Dial Peer Level

dial-peer voice 107 voip
destination-pattern 74000
session protocol sipv2
session target ipv4:9.45.36.9
incoming called-number 84000
voice-class codec 1 offer-all
!
dial-peer voice 110 voip
destination-pattern 84000
session protocol sipv2
session target ipv4:9.45.35.2
incoming called-number 74000
voice-class codec 1 offer-all
voice-class sip mid-call signaling block
!

Example: Blocking SIP Messages at the Global Level

The following example shows how to block SIP messages at the global Level

Device(config)#voice service voip
Device(config-voi-serv)#no ip address trusted authenticate
Device(config-voi-serv)#allow-connections sip to sip
Device(config-voi-serv)#sip
Device(config-serv-sip)#midcall-signaling block

Mid Call Codec Preservation

Mid call codec preservation defines whether a codec can be negotiated after a call has been initiated. You can enable or disable codec negotiation in the middle of a call.

Note

In the SRTP-RTP scenario, re-invites are not consumed.

Configuring Mid Call Codec Preservation

This task disables codec negotiation in the middle of a call and preserves the codec negotiated before the call.

SUMMARY STEPS

1. enable
2. configure terminal
3. Enter one of the following to disable midcall codec renegotiation:

   • In Global VoIP SIP configuration mode
     midcall-signaling preserve-codec
   • In dial-peer configuration mode
     voice-class sip midcall-signaling preserve-codec
## Example: Configuring Mid Call Codec Preservation at the Dial Peer Level

```plaintext
dial-peer voice 107 voip
    destination-pattern 74000
    session protocol sipv2
    session target ipv4:9.45.36.9
    incoming called-number 84000
    voice-class codec 1 offer-all
! 
dial-peer voice 110 voip
    destination-pattern 84000
    session protocol sipv2
    session target ipv4:9.45.35.2
```
incoming called-number 74000
voice-class codec 1 offer-all
voice-class sip midcall-signaling preserve-codec

Example: Configuring Mid Call Codec Preservation at the Global Level

Example: Configuring Mid Call Codec Preservation at the Global Level
Device(config)# voice service voip
Device(conf-voi-serv)# no ip address trusted authenticate
Device(conf-voi-serv)# allow-connections sip to sip
Device(conf-voi-serv)# sip
Device(conf-serv-sip)# midcall-signaling preserve-codec
Early Dialog UPDATE Block

This feature enables CUBE to consume UPDATE requests with SDP, received during an early dialog. UPDATE requests are blocked at CUBE and are not passed through from one leg to the other leg.

If the UPDATE request contains changes in caller-ID, transcoder insertion or deletion, or video escalation or de-escalation, then, CUBE can renegotiate the capabilities by sending a DO invite after the call is established.

Feature Information for Early Dialog UPDATE Block

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<table>
<thead>
<tr>

<tr>
<td>Early Dialog UPDATE Block</td>
<td>Cisco IOS 15.5(3)M</td>
<td>This feature allows CUBE to consume the UPDATE requests with SDP received during an early dialog.</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS XE 3.16S</td>
<td>The following command is introduced: early-media update block.</td>
</tr>
</tbody>
</table>
Prerequisites

• `rel1xx require "100rel"` command needs to be configured in global voice service voip sip configuration mode.

Restrictions

• Switch over to fax calls are not supported.
• Session Description Protocol (SDP) passthrough is not supported.
• Alternative Network Address Types (ANAT) is not supported.

Information about Early Dialog UPDATE Block

UPDATE request with SDP received during an early dialog is consumed by CUBE and hence is not passed from one leg to the other leg. This feature can be configured only for the UPDATE requests with SDP.

To pass through the information in UPDATE requests containing changes in caller-ID, transcoder insertion or deletion, or video escalation or de-escalation, CUBE can renegotiate the capabilities by sending a DO invite after the call is established. Thus both the user agents are synchronized and this helps in effective utilization of resources.

Renegotiation can be configured only for the UPDATE requests containing the following changes:

• Caller ID
• Transcoder insertion or deletion
• Video escalation or de-escalation

'Early Dialog UPDATE Block' and 'Early Dialog UPDATE Block Renegotiate' can be configured at dial peer level and also at global voice service voip sip configuration level.

Important Characteristics of Early Dialog UPDATE Block

The following are a few important characteristics of Early Dialog UPDATE block:

• If vcc codec is offered by the user agent through an UPDATE, first codec common between received and configured in in-leg at dial-peer is sent in 200OK.

• UPDATE request is consumed, if an UPDATE request with SDP is received after CUBE sends out 200 OK for an INVITE and before ACK is received.

• A 200 Ok is sent for an UPDATE even if there is no transcoder available ONLY for DTMF (rtp-nte to inband). CUBE falls back to inband.

• If Transcoder is unavailable, only the first codec received in the UPDATE request is sent in 200OK.

• CUBE sends 488 message if transcoder is required but unavailable for codec changes, SRTP-RTP inter-working, and transrating.
• When a video escalation is received via UPDATE, CUBE sends 200 OK with video port as ZERO. No Video RTP or DP sessions are created.

• When a video de-escalation is received via UPDATE, CUBE sends 200 ok with video port as ZERO. RTP or DP sessions for video are made as INACTIVE instead of deleting. So, effectively there will be four RTP connections or 2 DP connections present with remote video port as ZERO.

• Early-media UPDATE renegotiation takes precedence over DO-EO renegotiation.

• If an early dialog UPDATE is received from one leg to change the caller-ID and the other leg supports UPDATE method, CUBE sends across the caller-id UPDATE to other side and there wont be any renegotiation.

• If Re-Invite is received before triggering DO invite, then DO is not triggered.

• If no update-callerid command is enabled and UPDATE request contains only caller-ID changes, then re-negotiation does not happen for any early dialog caller-ID changes. If UPDATE request contains transcoder changes or video escalation or de-escalation, re-negotiation happens even if no update-callerid command is enabled.

• If mid-call signaling block is configured, DO invite is not triggered.

Configuring Early Dialog UPDATE Block

Configuring early dialog UPDATE Block enables CUBE to block all early dialog UPDATE requests from passing through to the user agents.

SUMMARY STEPS

1. enable
2. configure terminal
3. Enter one of the following commands to block early dialog UPDATE requests:
   - In the dial-peer configuration mode
     voice-class sip early-media update block
   - In the global VoIP SIP configuration mode
     early media update block
4. end

DETAILED STEPS

### Configuring Early Dialog UPDATE Block Renegotiate

Configuring Early Dialog UPDATE Block Renegotiate enables CUBE to renegotiate the call if UPDATE request with SDP contains changes caller-ID, transcoder insertion or deletion, or video escalation or deletion. CUBE renegotiates by sending a DO invite after the call is established.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
   - In the dial-peer configuration mode
     
     ```
     voice-class sip early-media update block re-negotiate
     ```
   - In the global VoIP configuration mode
     
     ```
     early media update block re-negotiate
     ```
4. **end**

| **Example:**                                                                     |                                                                         |
| In global VoIP SIP configuration mode                                           |                                                                         |
| ```
! Applying Early Dialog UPDATE block globally
Device(config)# voice service voip
Device (config-voi-serv)# sip
Device (config-voi-sip)# early media update block
Device (config-voi-sip)# end
``` |                                                                         |
| **Step 4**                                                                       | Exits VoIP SIP configuration mode and enters privileged EXEC mode. |
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**        | **enable** Enables privileged EXEC mode.  
|                   | • Enter your password if prompted. |
| **Step 2**        | **configure terminal** Enters global configuration mode. |
| **Step 3**        | Enter one of the following commands:  
|                   | • In the dial-peer configuration mode  
|                   | voice-class sip early-media update block re-negotiate  
|                   | • In the global VoIP configuration mode  
|                   | early media update block re-negotiate  
| Example:  
| In dial-peer configuration mode  
| ! Applying Early Dialog UPDATE block re-negotiate to one dial peer only  
| Device (config)# dial-peer voice 10 voip  
| Device (config-dial-peer)# voice-class sip  
| early-media update block re-negotiate  
| Device (config-dial-peer)# end  
| Example:  
| In global VoIP SIP configuration mode  
| ! Applying Early Dialog UPDATE block re-negotiate globally  
| Device(config)# voice service voip  
| Device (config-voi-serv)# sip  
| Device (config-voi-sip)# early media update block re-negotiate  
| Device (config-voi-sip)# end  
| **Step 4**        | **end** Exits VoIP SIP configuration mode and enters privileged EXEC mode. |

**Troubleshooting Tips**

Use the following command for debugging information:  

• `debug ccsip all`  
• `debug voip ccapi inout`  
• `show voip rtp connections`
Consumption of Forked 18x Responses with SDP During Early Dialog

The Cisco Unified Border Element supports consumption of forked 18x responses with SDP, under certain conditions during an early dialog, to reduce the interoperability issues that arise due to signaling forking.

When CUBE receives forked 18x responses with SDP, the media negotiation by default is end-to-end. This means that CUBE has to send an UPDATE with SDP on the inbound leg to renegotiate the new media offer. Under certain conditions, the inbound leg may not be able to support sending UPDATE messages with SDP for media renegotiation. This results in CUBE consuming the forked 18x responses with SDP and may result in DSP resources being used for media interworking. Media parameters such as direction change, and call escalation or de-escalation is not propagated end-to-end. If required, these media changes can be renegotiated end-to-end, after the calls are connected, using a DO re-INVITE.

- Feature Information for Consumption of Multiple Forked 18x Responses with SDP During Early Dialog, on page 803
- Prerequisites, on page 804
- Restrictions, on page 804

</tr>
</thead>
<tbody>
<tr>
<td>Support for Forked 18x Responses with SDP during Early Dialog</td>
<td>Cisco IOS 15.6(3)M</td>
<td>This feature allows CUBE to consume multiple forked 18x responses with SDP received during an early dialog.</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS XE Denali 16.3.1</td>
<td></td>
</tr>
</tbody>
</table>

## Prerequisites

- Re-negotiation is triggered only if the renegotiate `early media update block re-negotiate` CLI is enabled.

## Restrictions

The following features or call-flows are not supported:

- SIP Delayed-Offer to Delayed-Offer call flows
- Session Description Protocol (SDP) passthrough mode
- Secure Real-Time Transport Protocol (SRTP) passthrough calls
- Alternative Network Address Types (ANAT)
- Media flow-around
- Media anti-trombone
- Early-dialog UPDATE block

## Information About Consumption of Forked 18x Responses with SDP During Early Dialog

Forked 18x responses for INVITE requests with SDP during early dialog will be consumed by CUBE to reduce interoperability issues between user agents.

## Characteristics of Forked 18x Responses with SDP during Early Dialog

- If PRACK or UPDATE is not supported on the inbound leg, by default, CUBE consumes the forked 18x responses.
- If PRACK or UPDATE is not supported and CUBE has to initiate renegotiation after call connect, then the `early media update block re-negotiate` CLI must be enabled.
- When PRACK and UPDATE are supported on the inbound leg and CUBE has to consume the forked 18x responses, the `early media update block` CLI must be enabled.
• If PRACK and UPDATE are supported and CUBE has to consume the forked 18x responses and initiate renegotiation after call connect, then the `early media update block renegotiate` CLI must be enabled.

• If mid-call signaling block or mid-call signaling passthrough media changes are configured, DO invite is not triggered.

Note
CUBE utilizes the EARLY UPDATE BLOCK functionality to configure the forked 18x responses with SDP during early dialog. The `early media update block` command is used to consume the forked 18x responses and the `early media update block renegotiate` command is used to renegotiate the forked 18x responses after the call connect.

Renegotiation (when enabled via configuration) is triggered for the forked 18x responses containing the following changes:

• DSP Transcoder insertion
• Video escalation or de-escalation
• Media directional changes

Note
It is recommended to configure the `early media update block re-negotiate` command whenever there are transcoding, DTMF interworking, or video changes.

Configuring Consumption of Forked 18x Responses with SDP During Early Dialog

Perform the following procedure to enable CUBE to block all early dialog forked 18x requests from passing through to the user agents.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. Enter one of the following commands to block the forked 18x responses with SDP during early dialog:
   • In the dial-peer configuration mode
     `voice-class sip early-media update block`
   • In the global VoIP SIP configuration mode
     `early media update block`
4. `end`
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| Step 2 | configure terminal | Enters global configuration mode. |
| Step 3 | Enter one of the following commands to block the forked 18x responses with SDP during early dialog:  
• In the dial-peer configuration mode  
  voice-class sip early-media update block  
• In the global VoIP SIP configuration mode  
  early media update block  
**Example:**  
In dial-peer configuration mode  

```  
!Applying Early Dialog UPDATE block to one dial peer only  
Device (config)# dial-peer voice 10 voip  
Device (config-dial-peer)# voice-class sip early-media update block  
Device (config-dial-peer)# end  
```

**Example:**  
In global VoIP SIP configuration mode  

```  
! Applying Early Dialog UPDATE block globally  
Device(config)# voice service voip  
Device (config-voi-serv)# sip  
Device (config-voi-sip)# early media update block  
Device (config-voi-sip)# end  
```
| Step 4 | end | Exits VoIP SIP configuration mode and enters privileged EXEC mode. |

**Configuring Consumption of Forked 18x Responses with SDP During Early Dialog Renegotiate**

Perform the following procedure to enable CUBE to renegotiate forked 18x calls with SDP during early dialog after consumption of these forked 18x responses. CUBE renegotiates by sending a DO invite after the call is established.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. Enter one of the following commands:
   • In the dial-peer configuration mode
     `voice-class sip early-media update block re-negotiate`
   • In the global VoIP configuration mode
     `early media update block re-negotiate`
4. end

Troubleshooting Tips

Use the following command for debugging information:

- `debug ccsip verbose`
- `show voip rtp connections detail`
- `show call active voice brief`
- `show dspfarm dsp active`
- `show voice dsmp stream brief`
- `show platform hardware qfp active feature sbc global`
CHAPTER 63

Support for Pass-Through of Unsupported Content Types in SIP INFO Messages

This feature allows the CUBE to pass-through all unsupported content types in a SIP INFO message.

- Feature Information for Support for Pass-Through of Unsupported Content Types in SIP INFO Messages, on page 809
- Prerequisites, on page 809
- Information About Pass-Through of Unsupported Content Types in SIP INFO Messages, on page 810

Feature Information for Support for Pass-Through of Unsupported Content Types in SIP INFO Messages

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Support for pass-through of unsupported content types in SIP INFO messages | Cisco IOS 15.5(3)M  
Cisco IOS XE 3.16S | This feature allows CUBE to pass-through SIP INFO methods or request message types with unsupported content types. Media negotiation and media exchange is completely end-to-end. |

Prerequisites

You must enable the pass-thru content unsupp command to pass-through all unsupported content types in a SIP INFO message. There is no additional configuration task required for this feature.
Information About Pass-Through of Unsupported Content Types in SIP INFO Messages

The Support for Pass-Through of Unsupported Content Types in SIP INFO Messages feature allows the CUBE to pass-through all unsupported content types in a SIP INFO message.

Upon receipt of a SIP INFO message with unsupported content type, CUBE triggers a SIP INFO message on the outgoing peer call leg. The response received for this SIP INFO message is triggered on the incoming peer call leg and information flows end-to-end. Prior to releases 15.5(3)M and 3.16S, on reception of SIP INFO message with unsupported content type, CUBE will respond with the “415 Unsupported Media Type” error response.

Supported content types include the following:

- application/sdp
- application/qsig
- application/media-control+xml
- application/x-q931
- application/gtd
- application/simple-message-summary
- application/kpml-response+xml
- application/dtmf-relay
- application/broadsoft
- message/sipfrag
- audio/telephone-event
- multipart/mixed
Support for PAID P PID Privacy PCPID and PAURI Headers on the Cisco Unified Border Element

The figure below shows a typical network topology where the Cisco Unified Border Element is configured to route messages between a call manager system (such as the Cisco Unified Call Manager) and a Next Generation Network (NGN).

Figure 78: Cisco Unified Border Element and Next Generation Topology

Devices that connect to an NGN must comply with the User-Network Interface (UNI) specification. The Cisco Unified Border Element supports the NGN UNI specification and can be configured to interconnect NGN with other call manager systems, such as the Cisco Unified Call Manager.

The Cisco Unified Border Element supports the following:

- the use of P-Preferred Identity (PPID), P-Asserted Identity (PAID), Privacy, P-Called Party Identity (PCPID), in INVITE messages
- the translation of PAID headers to PPID headers and vice versa
- the translation of RPID headers to PAID or PPID headers and vice versa
- the configuration and/or pass through of privacy header values
- the use of the PCPID header to route INVITE messages
- the use of multiple PAURI headers in the response messages (200 OK) it receives to REGISTER messages

**P-Preferred Identity and P-Asserted Identity Headers**

NGN servers use the PPID header to identify the preferred number that the caller wants to use. The PPID is part of INVITE messages sent to the NGN. When the NGN receives the PPID, it authorizes the value, generates a PAID based on the preferred number, and inserts it into the outgoing INVITE message towards the called party.
However, some call manager systems, such as Cisco Unified Call Manager 5.0, use the Remote-Party Identity (RPID) value to send calling party information. Therefore, the Cisco Unified Border Element must support building the PPID value for an outgoing INVITE message to the NGN, using the RPID value or the From: value received in the incoming INVITE message. Similarly, CUBE supports building the RPID and/or From: header values for an outgoing INVITE message to the call manager, using the PAID value received in the incoming INVITE message from the NGN.

In non-NGN systems, the Cisco Unified Border Element can be configured to translate between PPID and PAID values, and between From: or RPID values and PAID/PPID values, at global and dial-peer levels.

In configurations where all relevant servers support the PPID or PAID headers, the Cisco Unified Border Element can be configured to transparently pass the header.

*Note*

If the NGN sets the From: value to anonymous, the PAID is the only value that identifies the caller.

The table below describes the types of INVITE message header translations supported by the Cisco Unified Border Element. It also includes information on the configuration commands to use to configure P-header translations.

The table below shows the P-header translation configuration settings only. In addition to configuring these settings, you must configure other system settings (such as the session protocol).

*Table 84: P-header Configuration Settings*

<table>
<thead>
<tr>
<th>Incoming Header</th>
<th>Outgoing Header</th>
<th>Configuration Notes</th>
</tr>
</thead>
</table>
| From:            | RPID            | To enable the translation to RPID headers in the outgoing header, use the `remote-party-id` command in SIP user-agent configuration mode. For example: `Router(config-sip-ua)# remote-party-id` This is the default system behavior.  
*Note* If both, `remote-party-id` and `asserted-id` commands are configured, then the `asserted-id` command takes precedence over the `remote-party-id` command. |
| PPID             | PAID            | To enable the translation to PAID privacy headers in the outgoing header at a global level, use the `asserted-id pai` command in voice service VoIP SIP configuration mode. For example: `Router(conf-serv-sip)# asserted-id pai` To enable the translation to PAID privacy headers in the outgoing header on a specific dial peer, use the `voice-class sip asserted-id pai` command in dial peer voice configuration mode. For example: `Router(config-dial-peer)# voice-class sip asserted-id pai` |
| PPID             | RPID            | To enable the translation to RPID headers in the outgoing header, use the `remote-party-id` command in SIP user-agent configuration mode. For example: `Router(config-sip-ua)# remote-party-id` This is the default system behavior. |
### Configuration Notes

<table>
<thead>
<tr>
<th>Incoming Header</th>
<th>Outgoing Header</th>
<th>Configuration Notes</th>
</tr>
</thead>
</table>
| PAID            | PPID            | To enable the translation to P PID privacy headers in the outgoing header at a global level, use the `asserted-id ppi` command in voice service VoIP SIP configuration mode. For example: `Router(config-serv-sip)# asserted-id ppi`  
To enable the translation to P PID privacy headers in the outgoing header on a specific dial peer, use the `voice-class sip asserted-id ppi` command in dial peer voice configuration mode. For example: `Router(config-dial-peer)# voice-class sip asserted-id ppi` |
| PAID            | RPID            | To enable the translation to R PID headers in the outgoing header, use the `remote-party-id` command in SIP user-agent configuration mode. For example: `Router(config-sip-ua)# remote-party-id`  
This is the default system behavior. |
| RPID            | PPID            | To enable the translation to P PID privacy headers in the outgoing header at a global level, use the `asserted-id ppi` command in voice service VoIP SIP configuration mode. For example: `Router(config-serv-sip)# asserted-id ppi`  
To enable the translation to P PID privacy headers in the outgoing header on a specific dial peer, use the `voice-class sip asserted-id ppi` command in dial peer voice configuration mode. For example: `Router(config-dial-peer)# voice-class sip asserted-id ppi` |
| RPID            | PAID            | To enable the translation to PAID privacy headers in the outgoing header at a global level, use the `asserted-id pai` command in voice service VoIP SIP configuration mode. For example: `Router(config-serv-sip)# asserted-id pai`  
To enable the translation to PAID privacy headers in the outgoing header on a specific dial peer, use the `voice-class sip asserted-id pai` command in dial peer voice configuration mode. For example: `Router(config-dial-peer)# voice-class sip asserted-id pai` |
| RPID            | From:           | By default, the translation to R PID headers is enabled and the system translates P PID headers in incoming messages to R PID headers in the outgoing messages. To disable the default behavior and enable the translation from P PID to From: headers, use the `no remote-party-id` command in SIP user-agent configuration mode. For example: `Router(config-sip-ua)# no remote-party-id` |

---

**Note**

Privacy functions are not initialized on Unified Border Element without configuring `asserted-id pai` or `asserted-id ppi`. Ensure that you configure `asserted-id pai` or `asserted-id ppi` to support privacy functions on Unified Border Element.

---

The CUBE can be configured to transparently pass the PAID and P PID headers in the incoming and outgoing Session Initiation Protocol (SIP) requests or response messages from end-to-end.

- Requests include: INVITEs and UPDATEs
- Responses include: 18x and 200OK
The priority of P-headers are in the following order: PAID, PPID, and RPID.

Privacy

If the user is subscribed to a privacy service, the Cisco Unified Border Element can support privacy using one of the following methods:

- Using prefixes

The NGN dial plan can specify prefixes to enable privacy settings. For example, the dial plan may specify that if the caller dials a prefix of 184, the calling number is not sent to the called party.

The dial plan may also specify that the caller can choose to send the calling number to the called party by dialing a prefix of 186. Here, the Cisco Unified Border Element transparently passes the prefix as part of the called number in the INVITE message.

The actual prefixes for the network are specified in the dial plan for the NGN, and can vary from one NGN to another.

- Using the Privacy header

If the Privacy header is set to None, the calling number is delivered to the called party. If the Privacy header is set to a Privacy:id value, the calling number is not delivered to the called party.

- Using Privacy values from the peer call leg

If the incoming INVITE has a Privacy header or a RPID with privacy on, the outgoing INVITE can be set to Privacy: id. This behavior is enabled by configuring `privacy pstn` command globally or `voice-class sip privacy pstn` command on the selected dial-per.

Incoming INVITE can have multiple privacy header values, id, user, session, and so on. Configure the `privacy-policy passthru` command globally or `voice-class sip privacy-policy passthru` command to transparently pass across these multiple privacy header values.

Some NGN servers require a Privacy header to be sent even though privacy is not required. In this case the Privacy header must be set to none. The Cisco Unified Border Element can add a privacy header with the value None while forwarding the outgoing INVITE to NGN. Configure the `privacy-policy send-always` globally or `voice-class sip privacy-policy send-always` command in dial-peer to enable this behavior.

If the user is not subscribed to a privacy service, the Cisco Unified Border Element can be configured with no Privacy settings.

---

**Note**

For the Privacy functions to work as intended, the command `asserted-id {pai|ppi}` must be configured.

---

P-Called Party Identity

The Cisco Unified Border Element can be configured to use the PCPID header in an incoming INVITE message to route the call, and to use the PCPID value to set the To: value of outgoing INVITE messages.

The PCPID header is part of the INVITE messages sent by the NGN, and is used by Third Generation Partnership Project (3GPP) networks. The Cisco Unified Border Element uses the PCPID from incoming INVITE messages (from the NGN) to route calls to the Cisco Unified Call Manager.

---

**Note**

The PCPID header supports the use of E.164 numbers only.
P-Associated URI

The Cisco Unified Border Element supports the use of PAURI headers sent as part of the registration process. After the Cisco Unified Border Element sends REGISTER messages using the configured E.164 number, it receives a 200 OK message with one or more PAURIs. The number in the first PAURI (if present) must match the contract number. The Cisco Unified Border Element supports a maximum of six PAURIs for each registration.

Note

The Cisco Unified Border Element performs the validation process only when a PAURI is present in the 200 OK response.

The registration validation process works as follows:

- The Cisco Unified Border Element receives a REGISTER response message that includes PAURI headers that include the contract number and up to five secondary numbers.

- The Cisco Unified Border Element validates the contract number against the E.164 number that it is registering:
  - If the values match, the Cisco Unified Border Element completes the registration process and stores the PAURI value. This allows administration tools to view or retrieve the PAURI if needed.
  - If the values do not match, the Cisco Unified Border Element unregisters and then reregisters the contract number. The Cisco Unified Border Element performs this step until the values match.

Random Contact Support

The Cisco Unified Border Element can use random-contact information in REGISTER and INVITE messages so that user information is not revealed in the contact header.

To provide random contact support, the Cisco Unified Border Element performs SIP registration based on the random-contact value. The Cisco Unified Border Element then populates outgoing INVITE requests with the random-contact value and validates the association between the called number and the random value in the Request-URI of the incoming INVITE. The Cisco Unified Border Element routes calls based on the PCPID, instead of the Request-URI which contains the random value used in contact header of the REGISTER message.

The default contact header in REGISTER messages is the calling number. The Cisco Unified Border Element can generate a string of 32 random alphanumeric characters to replace the calling number in the REGISTER contact header. A different random character string is generated for each pilot or contract number being registered. All subsequent registration requests will use the same random character string.

The Cisco Unified Border Element uses the random character string in the contact header for INVITE messages that it forwards to the NGN. The NGN sends INVITE messages to the Cisco Unified Border Element with random-contact information in the Request URI. For example: INVITE sip:FefhH3zIHe9i8ImcGjDD1PEc5Xffy51G@10.12.1.46:5060.

The Cisco Unified Border Element will not use the To: value of the incoming INVITE message to route the call because it might not identify the correct user agent if supplementary services are invoked. Therefore, the Cisco Unified Border Element must use the PCPID to route the call to the Cisco Unified Call Manager. You can configure routing based on the PCPID at global and dial-peer levels.

- Feature Information for PAID PPID Privacy PCPID and PAURI Headers on the Cisco Unified Border Element, on page 821
Feature Information for PAID PPID Privacy PCPID and PAURI Headers on the Cisco Unified Border Element

| PAID, PPID, Privacy, PCPID, and PAURI Headers on the Cisco Unified Border Element | 12.4(22)YB 15.0(1)M Cisco IOS XE Release 3.1S | This feature enables CUBE platforms to support:  
- P-Preferred Identity (PPID), P-Asserted Identity (PAID), Privacy, P-Called Party Identity (PCPID), in INVITE messages  
- Translation of PAID headers to PPID headers and vice versa  
- Translation of From: or RPID headers to PAID or PPID headers and vice versa  
- Configuration and/or pass through of privacy header values  
- PCPID header to route INVITE messages  
- Multiple PAURI headers in the response messages (200 OK) it receives to REGISTER messages  
- P-Preferred Identity and P-Asserted Identity Headers  

The following commands were introduced: **call-route**, **p-called-party-id**, **privacy-policy**, **random-contact**, **random-request-uri** validate, **voice-class sip call-route**, **p-called-party-id**, **voice-class sip privacy-policy**, **voice-class sip random-contact**, and **voice-class sip random-request-uri validate**.

---

## Prerequisites for Support for PAID PPID Privacy PCPID and PAURI Headers on the Cisco Unified Border Element

### Cisco Unified Border Element

- Cisco IOS Release 12.4(22)YB or a later release must be installed and running on your Cisco Unified Border Element.

### Cisco Unified Border Element (Enterprise)

- Cisco IOS XE Release 3.1S or a later release must be installed and running on your Cisco ASR 1000 Series Router.
Restrictions for Support for PAID PPID Privacy PCPID and PAURI Headers on the Cisco Unified Border Element

- To enable random-contact support, you must configure the Cisco Unified Border Element to support SIP registration with random-contact information. In addition, you must configure random-contact support in VoIP voice-service configuration mode or on the dial peer.

- If random-contact support is configured for SIP registration only, the system generates the random-contact information, includes it in the SIP REGISTER message, but does not include it in the SIP INVITE message.

- If random-contact support is configured in VoIP voice-service configuration mode or on the dial peer only, no random contact is sent in either the SIP REGISTER or INVITE message.

- Passing of “+” is not supported with PAID PPID Privacy PCPID and PAURI Headers.

Configuring P-Header and Random-Contact Support on the Cisco Unified Border Element

To enable random contact support you must configure the Cisco Unified Border Element to support Session Initiation Protocol (SIP) registration with random-contact information, as described in this section.

To enable the Cisco Unified Border Element to use the PCPID header in an incoming INVITE message to route the call, and to use the PCPID value to set the To: value of outgoing INVITE messages, you must configure P-Header support as described in this section.

Configuring P-Header Translation on a Cisco Unified Border Element

To configure P-Header translations on a Cisco Unified Border Element, perform the steps in this section.

SUMMARY STEPS

1. enable
2. configure terminal
3. voice service voip
4. sip
5. asserted-id header-type
6. exit

### Configuring P-Header Translation on an Individual Dial Peer

To configure P-Header translation on an individual dial peer, perform the steps in this section.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dial-peer voice tag voip

## Configuring P-Called-Party-Id Support on a Cisco Unified Border Element

To configure P-Called-Party-Id support on a Cisco Unified Border Element, perform the steps in this section.

### SUMMARY STEPS

1. enable
2. configure terminal
3. voice service voip
4. sip
5. call-route p-called-party-id
6. random-request-uri validate
7. exit

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
---|---
**Step 2** | configure terminal
- Example:
  - Router# configure terminal
Enters global configuration mode.

**Step 3** | voice service voip
- Example:
  - Router(config)# voice service voip
Enters VoIP voice-service configuration mode.

**Step 4** | sip
- Example:
  - Router(config-voi-serv)# sip
Enters voice service VoIP SIP configuration mode.

**Step 5** | call-route p-called-party-id
- Example:
  - Router(config-serv-sip)# call-route p-called-party-id
Enables the routing of calls based on the PCID header.

**Step 6** | random-request-uri validate
- Example:
  - Router(config-serv-sip)# random-request-uri validate
Enables the validation of the random string in the Request URI of the incoming INVITE message.

**Step 7** | exit
- Example:
  - Router(config-serv-sip)# exit
Exits the current mode.

---

**Configuring P-Called-Party-Id Support on an Individual Dial Peer**

PART XVII

SIP Supplementary Services

- Dynamic Refer Handling, on page 835
- Cause Code Mapping, on page 841
Dynamic Refer Handling

When a dial-peer match occurs, CUBE passes the REFER message from an in leg to an out leg. Also, the host part of the Refer-to header is modified with the IP address.

The Dynamic REFER handling feature provides configurations to pass across or consume the REFER message. When an endpoint invokes a supplementary service such as a call transfer, the endpoint generates and sends an in-dialog REFER request towards the Cisco UBE. If the REFER message is consumed, an INVITE is sent towards refer-to dial-peer

- Feature Information for Dynamic REFER Handling, on page 835
- Prerequisites, on page 836
- Restrictions, on page 836
- Configuring REFER Passthrough with Unmodified Refer-to, on page 836
- Configuring REFER Consumption, on page 838
- Troubleshooting Tips, on page 840

Feature Information for Dynamic REFER Handling

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<table>

</thead>
<tbody>
<tr>
<td>Dynamic REFER Handling</td>
<td>IOS 15.2(1)T</td>
<td>The Dynamic REFER handling feature provides configurations to pass across or consume the REFER message. The following commands were introduced: <code>refer-to-passing</code>, <code>voice-class sip refer-to-passing</code>.</td>
</tr>
<tr>
<td></td>
<td>IOS XE Release 3.7S</td>
<td></td>
</tr>
</tbody>
</table>

Prerequisites

- Transcoding configuration is required on the CUBE for midcall transcoder insertion, deletion, or modification during call transfers.

Restrictions

- Only Session Initiation Protocol (SIP)-to-SIP call transfers are supported.
- Call escalation and de-escalation are not supported.
- Video transcoding is not supported.
- Session Description Protocol (SDP) pass-through is not supported.
- In REFER consume scenario, if TCL script is enabled, then `supplementary-service media-renegotiate` command should not be configured.

Configuring REFER Passthrough with Unmodified Refer-to

This task configures the passthrough of REFER message from the in leg to the out leg on a dial-peer match. A REFER is sent towards inbound dial peer. This task also ensures that the host part of the Refer-to header is unmodified and not changed to the IP address during passthrough.

<table>
<thead>
<tr>
<th>supplementary service refer</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>yes</td>
<td>REFER is passed through from the in leg to the out leg</td>
</tr>
<tr>
<td>no</td>
<td>INVITE is sent towards refer-to dial-peer</td>
</tr>
</tbody>
</table>

Note

This configuration in this task can be overridden by the `refer consume` command. Refer to the Configuring REFER Consumption task for more information.
SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. Configure REFER passthrough:
   - `supplementary-service sip refer` in global VoIP configuration mode.
   - `supplementary-service sip refer` in dial-peer configuration mode.
4. (Optional) Configure unmodified Refer-to:
   - `refer-to-passing` in Global VoIP SIP configuration mode.
   - `voice-class sip refer-to-passing [system]` in dial-peer configuration mode.
5. `end`

<tr>
<td><strong>Step 6</strong></td>
<td><code>end</code></td>
<td>Exits to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Troubleshooting Tips

Use any of the following debug commands:

- `debug ccsip all`
- `debug voip ccapi inout`
- `debug sccp messages`
- `debug voip application supplementary-service`
- `debug voip application state`
- `debug voip application media negotiation`
CHAPTER 66

Cause Code Mapping

With the Cause Code Mapping feature, the NOTIFY message sent by CUBE to a Customer Voice Portal (CVP) contains a proper reason for failure of call transfer based on the information received by CUBE from the caller instead of a 503 Service Unavailable message for all scenarios.

- Feature Information for Cause Code Mapping, on page 841
- Cause Code Mapping, on page 842
- Configuring Cause Code Mapping, on page 843
- Verifying Cause Code Mapping, on page 844

Feature Information for Cause Code Mapping

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 90: Feature Information for Cause Code Mapping

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cause Code Mapping</td>
<td>Cisco IOS 15.5(1)T</td>
<td>With the Cause Code Mapping feature, the NOTIFY message sent by CUBE to a Customer Voice Portal (CVP) contains a proper reason for failure of call transfer based on the information received by CUBE from the caller. Following are the cause codes supported:</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS XE 3.14S</td>
<td>• 17—486 Busy Here</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS 15.5(1)T3</td>
<td>• 19—503 Service Unavailable</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS 15.5(1)S3</td>
<td>• 21—403 Forbidden</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS 15.5(2)T1</td>
<td>• 31—480 Temporarily Unavailable</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS 15.5(2)S1</td>
<td>• 102—504 Server Time-out</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS 15.4(3)M4</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Cisco IOS 15.4(3)S4</td>
<td></td>
</tr>
</tbody>
</table>
With the Cause Code Mapping (Enhancement) feature, additional NOTIFY messages are introduced to inform CVP the proper reason for call failures based on the information received by CUBE from the caller instead of a 503 Service Unavailable message for all scenarios.

The following cause codes were introduced:

- **1**—404 Not Found
- **20**—480 Temporarily Unavailable
- **27**—502 Bad Gateway
- **28**—484 Address Incomplete
- **38**—503 Service Unavailable

---

## Cause Code Mapping

If CUBE is configured to consume REFERs that it receives, the following actions occur:

1. CUBE consumes the REFER that it receives from a Customer Voice Portal (CVP).
2. CUBE sends an INVITE (instead of a REFER) to the outbound leg (towards the caller).
3. CUBE receives a status from the caller.
4. CUBE sends a NOTIFY message to the CVP.

*Figure 79: Refer Consume in CUBE*

Previously, the NOTIFY message sent in step 4 included a 503 Service Unavailable message irrespective of the reason for failure of call transfer in step 3.

With the Cause Code Mapping feature, the NOTIFY message contains proper reason for failure of call transfer so that the CVP can take an appropriate action.

*Table 91: Cause Code Mappings*

<table>

- SUBSCRIBE-NOTIFY Passthrough, on page 889
Hosted and Cloud Services Delivery with Cisco UBE

Cisco Unified Border Element (Cisco UBE) delivers hosted and cloud based communication services at customer sites by managing registration traffic and ensuring uninterrupted service, when the remote call control platform becomes unreachable.

*Figure 80: Cisco UBE in Hosted and Cloud Services*
Cisco UBE SIP Registration Proxy

The Cisco UBE SIP Registration Proxy feature allows service providers to control the flow of registration messages between a customer's private network and their hosted communications platform.

By controlling routine registration traffic at the customer site, service providers can ensure service availability to local endpoints, while protecting core services from high message loads.

- Registration Pass-Through Modes, on page 851
- Registration Overload Protection, on page 856
- Registration Rate-limiting, on page 857
- Prerequisites for SIP Registration Proxy on Cisco UBE, on page 859
- Restrictions, on page 859
- Configuring Cisco UBE SIP Registration Proxy, on page 859
- Configuration Example—Cisco UBE SIP Registration Proxy, on page 868
- Feature Information for Cisco UBE SIP Registration Proxy, on page 868

Registration Pass-Through Modes

Cisco UBE uses the following two modes for registration pass-through:

End-to-End Mode

In the end-to-end mode, Cisco UBE collects the registrar details from the Uniform Resource Identifier (URI) and passes the registration messages to the registrar. The registration information contains the expiry time for rate-limiting, the challenge information from the registrar, and the challenge response from the user.

Cisco UBE also passes the challenge to the user if the register request is challenged by the registrar. The registrar sends the 401 or 407 message to the user requesting for user credentials. This process is known as challenge.

Cisco UBE ignores the local registrar and authentication configuration in the end-to-end mode. It passes the authorization headers to the registrar without the header configuration.

End-to-End Mode—Call Flows

This section explains the following end-to-end pass-through mode call flows:
Register Success Scenario

The figure below shows an end-to-end registration pass-through scenario where the registration request is successful.

*Figure 81: End-to-End Registration Pass-through Mode—Register Success Scenario*

1. The user sends the register request to Cisco UBE.
2. Cisco UBE matches the request with a dial peer and forwards the request to the registrar.
3. Cisco UBE receives a success response message (200 OK message) from the registrar and forwards the message to the endpoint (user).
4. The registrar details and expiry value are passed to the user.

Registrar Challenging the Register Request Scenario

The figure below shows an end-to-end registration pass-through scenario where the registrar challenges the register request.
The following scenario explains how the registrar challenges the register request:

1. The user sends the register request to Cisco UBE.
2. Cisco UBE matches the register request with a dial peer and forwards it to the registrar.
3. The registrar challenges the register request.
4. Cisco UBE passes the registrar response and the challenge request, only if the registrar challenges the request to the user.
5. The user sends the register request and the challenge response to the Cisco UBE.
6. Cisco UBE forwards the response to the registrar.
7. Cisco UBE receives success message (200 OK message) from the registrar and forwards it to the user.

**Peer-to-Peer Mode**

In the peer-to-peer registration pass-through mode, the outgoing register request uses the registrar details from the local Cisco UBE configuration. Cisco UBE answers the challenges received from the registrar using the configurable authentication information. Cisco UBE can also challenge the incoming register requests and authenticate the requests before forwarding them to the network.

In this mode, Cisco UBE sends a register request to the registrar and also handles register request challenges. That is, if the registration request is challenged by the registrar (registrar sends 401 or 407 message), Cisco UBE forwards the challenge to the user and then passes the challenge response sent by the user to the registrar. In the peer-to-peer mode, Cisco UBE can use the **authentication** command to calculate the authorization header and then challenge the user depending on the configuration.
The registrar command must be configured in peer-to-peer mode. Otherwise, the register request is rejected with the 503 response message.

Peer-to-Peer Mode--Call Flows

This section explains the following peer-to-peer pass-through mode call flows:

**Register Success Scenario**

The figure below shows a peer-to-peer registration pass-through scenario where the registration request is successful.

*Figure 83: Peer-to-Peer Registration Pass-through Mode--Register Success Scenario*

The register success scenario for a peer-to-peer registration pass-through mode is as follows:

1. The user sends the register request to Cisco UBE.
2. Cisco UBE matches the register request with a dial peer and forwards the register request to the registrar.
3. Cisco UBE receives a success message (200 OK message) from the registrar and forwards it to the endpoint (user). The following functions are performed:
   - Cisco UBE picks up the details about the registrar from the configuration.
   - Cisco UBE passes the registrar details and expiry value to the user.

**Registrar Challenging the Register Request Scenario**

The figure below shows a peer-to-peer registration pass-through scenario where the registration request is challenged by the registrar.
The following scenario explains how the registrar challenges the register request:

1. The user sends the register request to Cisco UBE.
2. Cisco UBE matches the register request with a dial peer and forwards the register request to the registrar.
3. The user responds to the challenge request.
4. Cisco UBE validates the challenge response and forwards the register request to the registrar.
5. Cisco UBE receives a success message from the registrar and forwards it to the endpoint (user).

**Registration in Different Registrar Modes**

This section explains SIP registration pass-through in the following registrar modes:

**Primary-Secondary Mode**

In the primary-secondary mode the register message is sent to both the primary and the secondary registrar servers simultaneously.

The register message is processed as follows:

- The first successful response is passed to the phone as a SUCCESS message.
- All challenges to the request are handled by Cisco UBE.
- If the final response received from the primary and the secondary servers is an error response, the error response that arrives later from the primary or the secondary server is passed to the phone.
- If only one registrar is configured, a direct mapping is performed between the primary and the secondary server.
- If no registrar is configured, or if there is a Domain Name System (DNS) failure, the "503 service not available" message is sent to the phone.
**DHCP Mode**

In the DHCP mode the register message is sent to the registrar server using DHCP.

**Multiple Register Mode**

In the multiple register mode, you can configure a dial peer to select and enable the indexed registrars. Register messages must be sent only to the specified index registrars.

The response from the registrar is mapped the same way as in the primary-secondary mode.

---

**Registration Overload Protection**

The registration overload protection functionality enables Cisco UBE to reject the registration requests that exceed the configured threshold value.

To support the registration overload protection functionality, Cisco UBE maintains a global counter to count all the pending outgoing registrations and prevents the overload of the registration requests as follows:

- The registration count is decremented if the registration transaction is terminated.
- The outgoing registrations are rejected if the count goes beyond a configured threshold.
- The incoming register request is rejected with the 503 response if the outgoing registration is activated by the incoming register request.
- A retry timer set for a random value is used for attempting the registration again if the registrations are originated from Cisco UBE or a gateway.

The registration overload protection functionality protects the network from the following:

- **Avalanche Restart**—All the devices in the network restart at the same time.
- **Component Failures**—Sudden burst of load is routed through the device due to a device failure.

---

**Registration Overload Protection--Call Flow**

The figure below shows the call flow when the register overload protection functionality is configured on Cisco UBE:
**Figure 85: Register Overload Protection**

The call flow for the DNS query on the Out Leg is the same for the end-to-end and peer-to-peer mode.

**Registration Rate-limiting**

The registration rate-limiting functionality enables you to configure different SIP registration pass-through rate-limiting options. The rate-limiting options include setting the expiry time and the fail count value for a Cisco UBE. You can configure the expiry time to reduce the load on the registrar and the network. Cisco UBE limits the reregistration rate by maintaining two different timers—**in-registration timer** and **out-registration timer**.

The initial registration is triggered based on the incoming register request. The expiry value for the outgoing register is selected based on the Cisco UBE configuration. On receiving the 200 OK message (response to the BYE message) from the registrar, a timer is started using the expiry value available in the 200 OK message. The timer value in the 200 OK message is called the out-registration timer. The success response is forwarded to the user. The expiry value is taken from the register request and the timer is started accordingly. This timer is called the in-registration timer. There must be a significant difference between the in-registration timer and the out-registration timer values for effective rate-limiting.

**Registration Rate-limiting Success--Call Flow**

The figure below shows the call flow when the rate-limiting functionality is successful:
The following steps explain a scenario where the rate-limiting functionality is successful:

1. The user sends the register request to Cisco UBE.
2. Cisco UBE matches the registration request with a dial peer and forwards it to the registrar. The outgoing register request contains the maximum expiry value if the rate-limiting functionality is configured.
3. The registrar accepts the registration.
4. Cisco UBE forwards the success response with the proposed expiry timer value.
5. The user sends the reregistration requests based on the negotiated value. Cisco UBE resends the register requests until the out-leg expiry timer value is sent.
6. Cisco UBE forwards the subsequent register request to the registrar, if the reregister request is received after the out-leg timer is reached.
Prerequisites for SIP Registration Proxy on Cisco UBE

- You must enable the local SIP registrar. See Enabling Local SIP Registrar, on page 859.
- You must configure dial peers manually for call routing and pattern matching.

Restrictions

- IPv6 support is not provided.

Configuring Cisco UBE SIP Registration Proxy

Enabling Local SIP Registrar

Perform this task to enable the local SIP registrar.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `voice service voip`
4. `sip`
5. `registrar server [expires [max value] [min value]]`
6. `end`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>

</table>
### Configuring SIP Registration Proxy at the Global Level

Perform this task to configure SIP registration proxy at the global level.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. sip
5. registration passthrough [system | [static | dynamic [ local-fallback value] ] [rate-limit [expires value] [fail-count value]] [reg-sync value] [registrar-index index]]
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  enable
  Example:
  ```
  Device(conf-serv-sip)# enable
  ``` | Enables privileged EXEC mode.
  - Enter your password if prompted. |

---

### Purpose

**Command or Action**

**Step 4**

| sip  
<table>
<thead>
<tr>
<th>Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(conf-voi-serv)# sip</td>
</tr>
</tbody>
</table>

**Step 5**

| registrar server [expires [max value] [min value]]  
<table>
<thead>
<tr>
<th>Example:</th>
</tr>
</thead>
</table>
| Device(conf-serv-sip)# registrar server | Enables the local SIP registrar.  
- Optionally you can configure the expiry time of the registrar using the following keywords: |
  - `expires`—Configures the registration expiry time.  
  - `max`—Configures the maximum registration expiry time.  
  - `min`—Configures the minimum registration expiry time. |

**Note**

The `registrar` command must be configured in peer-to-peer mode. Otherwise, the register request is rejected with the 503 response message.

**Step 6**

| end  
<table>
<thead>
<tr>

### EXIT TENANT CONFIGURATION MODE AND RETURN TO GLOBAL CONFIGURATION MODE

**Step 6**

**exit**

**Example:**

```
Device(config-class)# exit
```

Exits tenant configuration mode and returns to global configuration mode.

**Step 7**

**dial-peer voice tag voip**

**Example:**

```
Device(config)# dial-peer voice 444 voip
```

Enables dial peer voice configuration mode.

**Step 8**

**voice-class sip tenant tag**

**Example:**

```
Device(config-dial-peer)# voice-class sip tenant 1
```

Associates the dial-peer with the tenant.

**Step 9**

**exit**

**Example:**

```
Device(config-class)# exit
```

Exits dial-peer configuration mode and returns to global configuration mode.

### Configuring SIP Registration Proxy at the Dial Peer Level

Perform this task to configure SIP registration proxy at the dial peer level.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **dial-peer voice tag voip**
4. **voice-class sip registration passthrough [system [static | dynamic [local-fallback value]]] [rate-limit [expires value] [fail-count value]] [reg-sync value] [registrar-index index]]**

5. **exit**

### DETAILED STEPS

<table>

| **Step 4** voice-class sip registration passthrough [system [static | dynamic [local-fallback value]]] [rate-limit [expires value] [fail-count value]] [reg-sync value] [registrar-index index]] | Configures SIP registration pass-through options on a dial peer on a dial peer.  
• You can specify different SIP registration pass-through options using the following keywords:  
  • **dynamic**—SIP Registration uses the dynamic registrar details (default).  
  • **local-fallback**—Configures Local Fallback - (e2e).  
  • **rate-limit**—Enables rate-limiting.  
  • **reg-sync**—Sends REGISTER messages when registrar up (p2p).  
  • **registrar-index**—Configures a list of registrars to be used for registration. For detailed information, see Configuring Multiple Registrars on SIP Trunks.  
  • **static**—SIP Registration Use static Registrar Details.  
  • **system**—Use system registration passthrough configuration. |
| Example: Device(config-dial-peer)# voice-class sip registration passthrough static |
| **Step 5** exit | Exits dial peer voice configuration mode and returns to global configuration mode. |
| Example: |
### Configuring Registration Overload Protection Functionality

Perform this task to configure registration overload protection functionality on Cisco UBE.

#### SUMMARY STEPS

1. `enable`  
2. `configure terminal`  
3. `sip-ua`  
4. `registration spike max-number`  
5. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable` | Enables privileged EXEC mode.  
Example:  
Device> enable |  
| **Step 2** | `configure terminal` | Enters global configuration mode.  
Example:  
Device# configure terminal |  
| **Step 3** | `sip-ua` | Enters SIP user-agent configuration mode.  
Example:  
Device(config)# sip-ua |  
| **Step 4** | `registration spike max-number` | Configures registration overload protection functionality on Cisco UBE.  
Example:  
Device(config-sip-ua)# registration spike 100 |  
| **Step 5** | `end` | Exits SIP user-agent configuration mode and returns to privileged EXEC mode.  
Example:  
Device(config-sip-ua)# end |
Configuring Cisco UBE to Route a Call to the Registrar Endpoint

Perform this task to configure Cisco UBE to route a call to the registrar endpoint.

**Note**

You must perform this configuration on a dial peer that is pointing towards the endpoint.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `dial-peer voice tag {pots | voatm | vofr | voip}`
4. `session target registrar`
5. `exit`

**DETAILED STEPS**

</table>
Verifying the SIP Registration on Cisco UBE

Perform this task to verify the configuration for SIP registration on Cisco UBE. The `show` commands need not be entered in any specific order.

**SUMMARY STEPS**

1. `enable`
2. `show sip-ua registration passthrough status`
3. `show sip-ua registration passthrough status  detail`

**DETAILED STEPS**

**Step 1**  
`enable`  
Enables privileged EXEC mode.  

**Example:**

Device> `enable`

**Step 2**  
`show sip-ua registration passthrough status`  
Displays the SIP user agent (UA) registration pass-through status information.  

**Example:**

Device# `show sip-ua registration passthrough status`

<table>
<thead>
<tr>
<th>CallId</th>
<th>Line</th>
<th>peer</th>
<th>mode</th>
<th>In-Exp</th>
<th>reg-I</th>
<th>Out-Exp</th>

Feature Information for Cisco UBE SIP Registration Proxy

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support for Cisco UBE SIP Registration Proxy</td>
<td>Cisco IOS XE Fuji 16.9.1</td>
<td>Cisco UBE SIP Registration Proxy supports sending outbound registrations from Cisco UBE based on incoming registrations. This feature enables direct registration of SIP endpoints with the SIP registrar in hosted Unified Communications deployments. This feature also provides various benefits for handling Cisco UBE deployments with no IPPBX support. The following commands were introduced or modified: <strong>authentication</strong> (dial peer), <strong>registrar server</strong>, <strong>registration passthrough</strong>, <strong>registration spike</strong>, <strong>show sip-ua registration passthrough status</strong>, <strong>voice-class sip registration passthrough static rate-limit</strong>.</td>
</tr>
</tbody>
</table>

Table 92: Feature Information for Support for SIP Registration Proxy on Cisco UBE
Survivability for Hosted and Cloud Services

The Survivability for Hosted and Cloud Services on the Cisco UBE is used to:

- Monitor the WAN status periodically from the Cisco UBE.
- Route calls and handle line-side subscriptions locally when the WAN link is down.
- Synchronize the registrations with the server when the WAN link is up.

Information About Survivability for Hosted and Cloud Services

Advantages of Using Cisco UBE Survivability Feature

The survivability feature on Cisco UBE addresses the following issues by providing local fallback or registration synchronization:

1. When a WAN link or registrar server comes up, it waits until each SIP phone sends the REGISTER message to the server, so that outside phones can reach that phone.
2. If the phone register timer setting is too large, the outside phone waits that much time to reach that phone, after a link flap.
3. If the phone register timer setting is too small, it floods the WAN link.
4. When the WAN link or registrar server is down, you cannot make any local calls.

Local Fallback

- Cisco UBE does not need to configure credentials, as the phones trigger registration. Although Cisco UBE receives REGISTER messages for each phone every 5 minutes; for example, it throttles and sends REGISTER messages every 1 hour to the registrar server, avoiding high WAN bandwidth usage. This addresses the issues 1, 2, and 3.
• In normal operation when the WAN link or registrar server is up, the phone’s primary server URL is the registrar server (E2E) registration.

• "OPTIONS ping" is used to monitor the registrar server link status. When the detected link is down, Cisco UBE replies with a 500 message and when the phone receives this message, it sends the REGISTER message to Cisco UBE, which is the secondary server (P2P registration). Cisco UBE replies with a 200 OK message to P2P registration when the link is down. The dial-peer keeps the dynamic registrar session target and the local call does not fail. This addresses issue 4.

Registration Synchronization

• If you configure the phones to send REGISTER messages every 1 hour (to help alleviate the WAN link), the Cisco UBE uses the credentials that were configured to respond to registrar server authentication challenge. This addresses issue 3.

• When the WAN link or registration server is down (detected by OPTIONS ping), the Cisco UBE keeps the registration database of the SIP phones that were previously registered successfully, and it does not send REGISTER messages out; Cisco UBE replies with a 200 OK message and dial-peer keeps the dynamic registrar session target. The local call does not fail, addressing issue 4.

• When the registrar link is up after a link flap, the Cisco UBE sends REGISTER message for each phone that was earlier successfully registered to the registrar server. This is throttled to avoid bulk REGISTER messages flooding WAN link and the registrar. This addresses issues 1 and 2.

Registration Through Alias Mapping

The following illustration shows how a phone (with alias mapping) registers to the service provider through Cisco UBE.

Figure 87: SIP Phone Registration

The addresses-of-record (AOR) sent in the REGISTER is an alias which is mapped to an extension and (or) phone number by the service provider. The service provider returns the mapping details in the 200 OK response sent to the REGISTER. Cisco UBE has the ability to cache the alias mapping details in its call routing database. When a call is made from the phone, the Request-URI of the INVITE contains the dialed number (short extension or phone number).

If WAN is up, Cisco UBE always routes the INVITE sent from the phone to the service provider without looking up at the alias mapping cache.
If WAN or the service provider is down, that is, in survivability mode, Cisco UBE routes the INVITE locally by looking up at the alias mapping cache.

**Alias Mapping—Supported Methods**

1. When the service provider returns the mapping details in the 200 OK message of the REGISTER in the following predefined format:

<table>
<thead>
<tr>
<th>Alias</th>
<th>Extension</th>
<th>Phone</th>
</tr>
</thead>
<tbody>
<tr>
<td>alice10000189_1111</td>
<td>1111</td>
<td>10000189</td>
</tr>
</tbody>
</table>

2. The short extension or phone number is embedded in the AOR of the REGISTER. For example, AOR is `alice10000189_1111` and the short extension is `1111`.

An inbound sip profile can be applied to the REGISTER which extracts the extension part from the AOR and adds an X-CISCO-EXTENSION header.

**Cisco UBE when WAN is UP**

The following illustration provides an example as to how a typical phone makes a call to another local phone registered in the same server when WAN or the registrar server is up in a typical hosted deployment. The circled numbers in the image indicate the numerical order in which the sequence occurs.

*Figure 88: WAN Link is UP - Cisco UBE Deployment*

The call flow scenario is as follows: Phone A initiates a call to the Phone B registered to the same server.

1. Phone A sends an initial INVITE request to Phone B to participate in a call session through Cisco UBE.
2. Cisco UBE sends this INVITE to the service provider.
3. The service provider in turn sends the INVITE to Cisco UBE. Since the WAN link is up, the service provider maps details of the user from the register server and provides details of the user, for example, alias of the user, short extension number, and phone number.
4. Cisco UBE sends INVITE with all the above mentioned information to Phone B.
5. Phone B sends a 200 OK response to Cisco UBE for the received INVITE.
6. Cisco UBE sends a 200 OK answer to the service provider.
7. The service provider responds to Cisco UBE with a 200 OK answer.
8. A final 200 OK response is sent to Phone A by Cisco UBE and the call is established between Phone A and Phone B.

Example: Normal Mode (WAN is Up in P2P Mode)

```
CUBE# show sip-ua registration passthrough status
+--------+----------------+-----+---+-------+------+
<table>
<thead>
<tr>
<th>CallId</th>
<th>DirectoryNum</th>
<th>peer</th>
<th>mode</th>
<th>In-Exp</th>

<td></td>
<td>117 /120</td>
<td>--</td>
<td>normal</td>
</tr>
</tbody>
</table>
```

Cisco UBE Survivability When WAN Is Down

In survivability mode, Cisco UBE provides end-to-end telephony services when access to the centralized servers is interrupted because of a WAN outage or other factors, like the server being down.

The following illustration shows how a call is established between two endpoints when WAN link is down during survivability by directly dialing into an extension.

Figure 89: Cisco UBE Survivability When WAN Is Down

Earlier, when WAN was down, User A could only contact User B using either the alias or the user-id of User B, and not using their extensions or phone numbers.

Now, in the event the WAN link or registration server is down, when a local call is made, INVITE is sent to Cisco UBE. Cisco UBE maps the details of the user like the extension number and phone-number stored during registration. Local phones can now be reached on their short extensions or phone numbers by similar phones that are subscribed to the server through the same Cisco UBE.
It is possible to register multiple contacts for a single AOR; however, if multiple contacts are registered for a single subscriber, the Cisco UBE uses only the topmost registered contact to deliver the call to that subscriber. For this reason, multiple contacts are not supported.

A few phone models, such as Cisco IP Phone 7800 Series with Multiplatform Firmware and Cisco IP Phone 8800 Series with Multiplatform Firmware, sends register request to primary registrar only and do not send secondary REGISTER request to the secondary registrar (Cisco UBE) in E2E mode when primary registrar could not be reached. In such scenarios, phone service goes down after it receives 500 response from Cisco UBE for REGISTER request toward primary registrar.

To avoid phones getting into such error condition, Cisco UBE checks for the response from the primary registrar side. When Cisco UBE receives request timeout on WAN side or responses other than 200, 4XX, and 3XX from primary registrar, survivability will be enabled.

To enable survivability on such phones, refer Configuring Survivability for Phones Sending Single Register Request, on page 877.

Survivability Support for Public Switched Telephone Network Access When WAN Is Down

If WAN link going down or registrar service unavailable, you can access the phones in the Public Switched Telephone Network (PSTN) through FXO or PRI cards that are configured on Cisco Unified Border Element.

Survivability support for Public Switched Telephone Network (PSTN) access is supported only for Cisco UBE running on Cisco 4000 Series Integrated Services Router.

**Figure 90: Survivability Support for PSTN Access When WAN Is Down**

Example: Survivability Mode in P2P (regsync mode) when WAN is Down

```
CUBE# show sip-ua registration passthrough status
CallId DirectoryNum peer mode In-Exp reg-I Out-Exp survival
------- --------- ----- ----- ---- ------ ----- --------
 38 NCPhone1008 1 p2p 3595 /3600 1 3600 regsync
```

Note: Survivability Support for PSTN Access When WAN Is Down
Example: Survivability Mode in E2E (local fallback mode) when WAN is Down

```bash
CUBE# show sip-ua registration passthrough status
CallId DirectoryNum peer mode In-Exp reg-I Out-Exp survival
--- ------- ----- ---- ----- ------ ------ ------ -------
70 NCPhone1006 1 e2e 35 /70 -- 0 locfall
```

How to Configure Survivability for Hosted and Cloud Services

Configuring Local Fallback or Registration Synchronization Globally

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. sip
5. registration passthrough local-fallback  *tag*
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| Step 2   | configure terminal | Enters global configuration mode. |
| Example: | Device# configure terminal | |

| Step 3   | voice service voip | Enters voice service VoIP configuration mode. |
| Example: | Device(config)# voice service voip | |

| Step 4   | sip               | Enters voice service SIP configuration mode. |
| Example: |                   | |

**Hosted and Cloud Services**
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(conf-voi-serv)# sip</td>
<td></td>
</tr>
</tbody>
</table>

#### Step 5

**registration passthrough local-fallback tag**

**Example:**

```
Device(conf-serv-sip)# registration passthrough local-fallback 10
```

Configures SIP registration passthrough for local fallback mode; this will locally respond to REGISTER in p2p mode when WAN is down. The tag is the WAN link or registrar server dial-peer tag.

- To configure the registration sync mode, you can use the `registration passthrough reg-sync tag` command.

**Example:**

```
Device(conf-serv-sip)# registration passthrough reg-sync 10
```

- Use the `static` keyword to set the phone URL to p2p registration.

#### Step 6

**end**

**Example:**

```
Device(conf-serv-sip)# end
```

Returns to privileged EXEC mode.

---

### Configuring Local Fallback or Registration Synchronization at the Tenant Level

#### SUMMARY STEPS

1. enable
2. configure terminal
3. voice class tenant *tag*
4. registration passthrough local-fallback *tag*
5. exit
6. dial-peer voice *tag* voip
7. voice-class sip tenant *tag*
8. exit

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.
| Example: Device> enable | |

*Enter your password if prompted.*

| **Step 2** configure terminal | Enters global configuration mode. |
| Example: Device# configure terminal | |

| **Step 3** voice class tenant *tag* | Enters voice class tenant configuration mode. |
| Example: | |
Configuring Local Fallback or Registration Synchronization on a Dial Peer

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice** *tag voip*
4. **voice-class sip tenant** *tag reg-sync local-fallback**
5. **end**

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Device(config)# voice class tenant 1</strong></td>
<td><strong>Purpose</strong> Congratulations! You've successfully configured SIP registration passthrough for local fallback mode; this locally responds to REGISTER in p2p mode when WAN is down. The <em>tag</em> is the WAN link or registrar server dial-peer tag.</td>
</tr>
</tbody>
</table>

**Step 4**

registration passthrough local-fallback *tag*

**Example:**

Device(config-class)# registration passthrough local-fallback 10

- To configure the registration sync mode, you can use the **registration passthrough reg-sync *tag*** command. Use the **static** keyword to set the phone URL to p2p registration.

**Step 5**

exit

**Example:**

Device(config-class)# exit

Exits tenant configuration mode and returns to global configuration mode.

**Step 6**

dial-peer voice *tag voip*

**Example:**

Device(config)# dial-peer voice 444 voip

Enters dial peer voice configuration mode.

**Step 7**

voice-class sip tenant *tag*

**Example:**

Device(config-dial-peer)# voice-class sip tenant 1

Associates the dial-peer with the tenant.

**Step 8**

exit

**Example:**

Device(config-class)# exit

Exits dial-peer configuration mode and returns to global configuration mode.
### DETAILED STEPS

<table>
<thead>

### Configuring the Class of Restrictions (COR) List

Class of Restrictions (COR) provides the ability to deny certain call attempts based on the incoming and outgoing class of restrictions that are provisioned on the dial peers.

COR specifies which incoming dial peer can use which outgoing dial peer to make a call. You can provision each dial peer with an incoming and an outgoing COR list. The incoming COR list indicates the capability of the dial peer to initiate certain classes of calls. The outgoing COR list indicates the capability that is required for an incoming dial peer to deliver a call through this outgoing dial peer.
Before you begin

You must configure COR Groups. For more information, see Dial Peer Configuration Guide.

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice tag voip
4. corlist incoming dial-peer
5. corlist outgoing dial-peer
6. description string
7. destination-pattern number
8. session protocol sipv2
9. session target registrar
10. voice-class sip registration passthrough local-fallback tag
11. end

**Verifying Survivability for Hosted and Cloud Services**

The **show** commands can be entered in any order.

**SUMMARY STEPS**

1. enable
2. show dial-peer voice summary
3. show sip-ua registration passthrough status
4. show sip-ua register status
5. show voip rtp connections
6. show call active voice compact
DETAILED STEPS

Step 1  
**enable**
Enables privileged EXEC mode.

**Example:**
```
Device> enable
```

Step 2  
**show dial-peer voice summary**
Displays the summary information for each voice dial peer.

**Example:**
```
Device# show dial-peer voice summary
```
```
dial-peer hunt 0
   TAG TYPE MIN OPER PREFIX DEST-PATTERN FER THRU SESS-TARGET STAT PORT KEEPALIVE
   1 voip up up 1111... 0 syst registrar
   2 voip up down 1...... 0 syst ipv4:10.104.45.253 busyout
   1000 voip down down 9900... 0 syst ipv4:9.0.0.174:30601
   101 voip down down 1...... 0 syst ipv4:10.104.45.31
   102 voip down down 11..... 0 syst ipv4:10.104.45.253
   300 voip down down .T 0 syst
   400 voip down down 11110... 0 syst registrar
```

Step 3  
**show sip-ua registration passthrough status**
Displays information about the SIP user agent registration passthrough status. In the sample output shown below, the parameter In-Exp shows the remaining expiry time and the survival field parameters can be regsync, locfall, or normal.

**Example:**
```
Device# show sip-ua registration passthrough status
```
```
CallId Line peer mode In-Exp reg-I Out-Exp survival
---------- ============ ============ === =========== =========== ===========
5300 1111008 1 e2e 1041 /1200 ----- 1200 normal *
5305 1111002 1 e2e 2847 /3000 ----- 3000 normal *
5311 1111020 1 e2e 1070 /1200 ----- 1200 normal *
```

Step 4  
**show sip-ua register status**
Displays information about the SIP user agent register status.

**Example:**
```
Device# show sip-ua register status
```
```
Line peer expires(sec) reg survival P-Associ-URI
---------- ----- ----------- ------ ============ ===========
11123 23 59 yes regsync
```

Step 5  
**show voip rtp connections**
Displays Real-Time Transport Protocol (RTP) named event packets.
Example:

Device# show voip rtp connections

VoIP RTP Port Usage Information:
Max Ports Available: 8091, Ports Reserved: 101, Ports in Use: 2
Port range not configured, Min: 16384, Max: 32767

<table>
<thead>
<tr>
<th>Default Address-Range</th>
<th>Available Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td>2</td>
</tr>
</tbody>
</table>

VoIP RTP active connections:

</thead>
<tbody>
<tr>
<td>1</td>
<td>5324</td>
<td>5325</td>
<td>16410</td>
<td>16464</td>
<td>9.40.1.168</td>
<td>9.40.1.173</td>
</tr>
<tr>
<td>2</td>
<td>5324</td>
<td>5324</td>
<td>16412</td>
<td>16528</td>
<td>9.40.1.168</td>
<td>9.40.1.174</td>
</tr>
</tbody>
</table>

Found 2 active RTP connections

Step 6  show call active voice compact

Displays the compact version of the call information for voice calls in progress.

Example:

Device# show call active voice compact

<table>
<thead>
<tr>
<th>&lt;callID&gt;</th>
<th>A/O</th>
<th>FAX</th>
<th>T&lt;sec&gt;</th>
<th>Codec</th>
<th>type</th>
<th>Peer Address</th>
<th>IP</th>
<th>R&lt;ip&gt;:&lt;udp&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>5324</td>
<td>ANS</td>
<td>T9</td>
<td>g711ulaw</td>
<td>VOIP</td>
<td>P1111008</td>
<td>9.40.1.173:16464</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5325</td>
<td>ORG</td>
<td>T9</td>
<td>g711ulaw</td>
<td>VOIP</td>
<td>P1111020</td>
<td>9.40.1.174:16528</td>

<td></td>
</tr>
</tbody>
</table>

Total call-legs: 2

Configuration Examples—Survivability for Hosted and Cloud Services

Example: Configuring Local Fallback Globally

In the following example, local fallback is configured at global level:

Device> enable
Device# configure terminal
Device(config)# voice service voip
Device(config-voip)# sip
Device(config-serv-sip)# registration passthrough local-fallback 10
Device(config-serv-sip)# end
Example: Configuring Local Fallback at the Tenant Level

In the following example, local fallback is configured for tenant 1 and is applied for dial-peer 444:

```
Device>enable
Device#configure terminal
Device(config)#voice class tenant 1
Device(config-class)#registration passthrough local-fallback 10
Device(config-class)#exit
Device(config)#dial-peer voice 444 voip
Device(config-dial-peer)#voice-class sip tenant 1
Device(config-class)# exit
```

Example: Configuring Local Fallback on a Dial Peer

In the following example, local fallback is configured on dial-peer 2.

```
Device> enable
Device# configure terminal
Device(config)# dial-peer voice 2 voip
Device(config-dial-peer)# voice-class sip registration passthrough local-fallback 10
Device(config-dial-peer)# end
```

Example: Configuring Survivability for Phones Sending Single Register Request

In the following example, survivability is configured for phones sending single register request:

```
Device> enable
Device# configure terminal
Device(config)# voice service voip
Device(conf-voi-serv)# sip
Device(conf-serv-sip)# survivability single-register
Device(config-serv-sip)# end
```

Example: Configuring OPTIONS Ping

In the following example, OPTIONS Ping is configured on dial-peer 3:

```
Device> enable
Device# configure terminal
Device(config)# dial-peer voice 3 voip
Device(config-dial-peer)# voice-class sip options-keepalive up-interval 120 down-interval 120
Device(config-dial-peer)# end
```

Example: Configuring the Registration Timer

In the following example, registration timer is configured with an expiration value of minimum 200 and maximum 300 seconds.
Example: Configuring REGISTER Message Throttling

In the following example, REGISTER message throttling is configured:

```
Device> enable
Device# configure terminal
Device(config)# voice service voip
Device(config-voi-serv)# sip
Device(config-serv-sip)# registrar server expires max 300 min 200
Device(config-serv-sip)# end
```

Example: Configuring the COR List

In the following example, "FromPhone" and "FromSP" COR groups are configured and applied to dial-peer 2:

```
Device> enable
Device# configure terminal
Device(config)# dial-peer cor list FromPhone
Device(config-dp-corlist)# member 911
Device(config-dp-corlist)# member 1800
Device(config)# dial-peer cor list FromSP
Device(config-dp-corlist)# member 911
Device(config-dp-corlist)# member 1800
Device(config)# exit
Device(config)# dial-peer voice 2 voip
Device(config-dial-peer)# corlist incoming FromPhone
Device(config-dial-peer)# corlist outgoing FromSP
Device(config-dial-peer)# description registration
Device(config-dial-peer)# destination-pattern 1111
Device(config-dial-peer)# session protocol sipv2
Device(config-dial-peer)# session target registrar
Device(config-dial-peer)# voice-class sip registration passthrough local-fallback 5
Device(config-dial-peer)# end
```

Feature Information for Survivability for Hosted and Cloud Services

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

SUBSCRIBE-NOTIFY Passthrough

The SUBSCRIBE-NOTIFY mechanism is used for implementation of features such as Message Waiting Indication (MWI), Shared Call Appearance, Multiple Caller Appearance, Busy Lamp Field, and so on.

In Cisco UBE, the SUBSCRIBE-NOTIFY framework on Unified Communications (UC) products supports the following:

- Configurable and Selective Passthrough of SUBSCRIBE and NOTIFY transactions from phones with the normalization that is required for address or topology hiding and dialog content updates for “dialog” event subscription.

- Survivability mode handling of incoming SUBSCRIBE request for critical events.

Restrictions for SUBSCRIBE-NOTIFY Passthrough

- The SUBSCRIBE-NOTIFY passthrough framework can only pass through events when there is a one-to-one association between the incoming request and the outgoing location to which the request has been sent out. This means that either:
  - There should be an outbound dial-peer identified for the request received.
  - or
  - The outbound target for the request could be only a single registrar.

- The following use cases are not supported:
  - SUBSCRIBE-NOTIFY passthrough with hunting of outbound dial-peers to which the subscribe or notify requests need to be sent.
  - SUBSCRIBE-NOTIFY passthrough where an inbound dial-peer has peer-to-peer mode of registration passthrough enabled with more than one registrar (there will be no forking of Subscribe-Notify Requests)
• Local subscribe handling of unsupported events when the remote registrar is unavailable. Local subscribe handling is only applicable to cases where the inbound dial-peer matching the subscribe has registration passthrough enabled with “local-fallback.”

Information About SUBSCRIBE-NOTIFY Passthrough

The key attributes of the SUBSCRIBE-NOTIFY Passthrough feature are as follows:

• Message Passthrough Application (MPA)—The SIP MPA handles SUBSCRIBE-NOTIFY passthrough. This application maintains subscribe dialogs, and references the dial-peer database and registration passthrough configurations to route the initial SUBSCRIBE and unsolicited NOTIFY requests.

• Header Passthrough—All the non-mandatory headers in SUBSCRIBE-NOTIFY requests and responses are passed through from one endpoint to the other.

• Content Passthrough—The content bodies in SUBSCRIBE-NOTIFY requests are passed through transparently from one endpoint to the other.

• “Dialog” Event Content Manipulation—The content in the NOTIFY body for a dialog event is updated before passthrough when the dialog is maintained by the Cisco UBE.

• Passthrough Configuration and Filtering—SUBSCRIBE-NOTIFY passthrough is configurable globally as well as under dial-peer, and can be configured for selected events using the configuration of an event list.

• Error Passthrough for SUBSCRIBE-NOTIFY Requests—When an error is received for a SUBSCRIBE-NOTIFY request, the error is passed through to the peer with the relevant headers.

• Backward Compatibility—The SIP MPA has the highest priority when SUBSCRIBE-NOTIFY passthrough is enabled. If passthrough is not enabled (either for all events or for a specific event), the current applications will control the incoming requests and responses.

• 401/407 Error Message Passthrough—SIP message 401/407 is sent by the user-agent server (UAS) or end device to challenge messages like INVITE/REFER/SUBSCRIBE and request for endpoint credentials information. Cisco UBE does not store endpoint credential information to act on behalf of phone or endpoint. To enable the passthrough of 401/407, you can enable the error passthru command at the global level. The messages 401/407 are in passthru mode for INVITE/REFER/SUBSCRIBE.

SUBSCRIBE-NOTIFY Passthrough Request Routing

The first step of request or response routing is for Cisco UBE to determine whether or not the request has to be passed through. When a new SUBSCRIBE or unsolicited NOTIFY request arrives, its headers are used to match an incoming dial-peer. If the incoming dial-peer has SUBSCRIBE-NOTIFY Passthrough (SNPT) enabled or if there is no incoming dial-peer and global SNPT is enabled for that event, then the request is handed off to be passed through. For solicited subscriptions, the passthrough check is applicable only to the initial SUBSCRIBE request; subsequent requests or responses are not checked and will be routed based on updated dialog parameters.

The second step is to determine the outbound destination of the SUBSCRIBE or unsolicited NOTIFY request.
• First Pass: Outbound dial-peer match—An outbound VoIP dial-peer is first matched based on the request headers (From, To, and Via), the Subscriber Number (userid in the To header), and the incoming dial-peer Class of Restrictions (CoR) if any. If there is a match, the request is routed to the session target.

• Second Pass: Configured registrar for registration passthrough in peer-to-peer mode—If no outbound dial-peer is found and the incoming dial-peer has registration passthrough enabled in static (peer-to-peer) mode with a single registrar configured, then the request is routed to the registrar address.

• Third Pass: Configured registrar for registration passthrough in end-to-end mode—If no outbound dial-peer is found and the incoming dial-peer has registration passthrough enabled in dynamic (end-to-end) mode:
  • If the request Uniform Resource Identifier (URI) has the CUBE IP address, the request is routed to the configured registrar if only a single registrar is configured.
  • If the request URI has a non-CUBE IP address, then the request is routed to that IP address.

• Fourth Pass: Request URI-based routing—If no outbound dial-peer is found and no registration passthrough is configured, the request URI is used to route the request if it does not point to the CUBE’s IP address.

**SUBSCRIBE-NOTIFY Passthrough Survivability Mode**

In survivability mode, the CUBE could encounter the following scenarios:

• When the CUBE receives a line-seize (event) subscribe in survivability mode, it checks the line-seize queue to see if another phone has already seized the same line; if not, CUBE accepts the subscription, sends a NOTIFY response with State = Active, and starts the timer for expiration. In survivability mode, SUBSCRIBE received for any event other than line-seize is rejected.

• If another phone has already subscribed for the line, CUBE sends a 200 OK (request successful) response for the new subscribe, but a final NOTIFY to indicate that the subscription has been terminated.

• If the subscription timer expires without re-subscription from the phone, CUBE sends a final NOTIFY to remove the subscription.

• If a subscription is created in active mode, but re-subscriptions or unsubscriptions are received in survivability mode, then CUBE returns an error for this subscription.

**How to Configure SUBSCRIBE-NOTIFY Passthrough**

**Configuring an Event List**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice class sip-event  number
4. event  name
5. end
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal | Enters global configuration mode.                                      |
| Example:                   |                                                                         |
| Device# configure terminal |                                                                         |

| **Step 3** voice class sip-event number | Enters voice class configuration mode and configures the list of events to be passed through. |
| Example:                           |                                                                         |
| Device(config)# voice class sip-event 1 |                                                                         |

| **Step 4** event name | Adds the name of the event to be added to the event list.               |
| Example:              |                                                                         |
| Device(config-class)# event message-summary |                                                                         |

| **Step 5** end | Returns to privileged EXEC mode.                                         |
| Example:       |                                                                         |
| Device(config-class)# end |                                                                         |

---

**Configuring SUBSCRIBE-NOTIFY Event Passthrough Globally**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice service voip
4. sip
5. pass-thru subscribe-notify-events tag
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

### Step 2

**configure terminal**

*Example:*

Device# configure terminal

### Step 3

**voice service voip**

*Example:*

Device(config)# voice class voip

### Step 4

**sip**

*Example:*

Device(conf-voi-serv)# sip

### Step 5

**pass-thru subscribe-notify-events tag**

*Example:*

Device(conf-serv-sip)# pass-thru subscribe-notify-events 1

- You can use the **pass-thru subscribe-notify-events all** command to configure passthrough for all SUBSCRIBE-NOTIFY events.

### Step 6

**end**

*Example:*

Device(conf-serv-sip)# end

---

### Configuring SUBSCRIBE-NOTIFY Event Passthrough at the Dial-Peer Level

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dial-peer voice *tag* voip
4. voice-class sip pass-thru subscribe-notify-events *tag*

  *Example:*
  
  - Enter your password if prompted.
## Verifying SUBSCRIBE-NOTIFY Passthrough

Perform this task to verify the configuration for SUBSCRIBE-NOTIFY Passthrough and to verify the subscriptions created. The `show` commands can be entered in any order.

### SUMMARY STEPS

1. `enable`
2. `show dial-peer voice number | inc pass`
3. `show subscription ascn session active`
4. `show subscription sip`

### DETAILED STEPS

#### Step 1

`enable`

Enables privileged EXEC mode.

**Example:**

```
Device> enable
```
Step 2  
**show dial-peer voice number | inc pass**

Displays the information for voice dial peers. The following sample output shows the configured SUBSCRIBE-NOTIFY passthrough event for a particular dial peer.

**Example:**
```
Device# show dial-peer voice 123 | inc pass
```

```text
ip media DSCP = ef, ip media rsvp-pass DSCP = ef
ip video rsvp-none DSCP = af41, ip video rsvp-pass DSCP = af41
voice class sip pass-thru headers - system,
voice class sip pass-thru subscribe-notify-events - system,
voice class sip pass-thru content unsupp = system,
voice class sip pass-thru content sdp = system,
voice class sip privacy-policy passthru = system,
voice class sip registration passthrough - System
voice class sip refer-to-passing = system
```

Step 3  
**show subscription asnl session active**

Displays information about Application Subscribe/Notify Layer (ASNL)-based and non-ASNL-based SIP subscriptions.

**Example:**
```
Device# show subscription asnl session active
```

```text
ASNL Active Subscription Records Details:
Number of active subscriptions: 1
URL: sip:user@10.7.104.88
Event Name : stress
Session ID : 8
Expiration Time : 50 seconds
Subscription Duration : 5 seconds
Protocol: ASNL_PROTO_SIP
Remote IP address : 10.7.104.88
Port : 5060
Call ID : 5
Total Subscriptions Sent : 1
Total Subscriptions Received: 0
Total Notifications Sent : 0
Total Notifications Received : 2
Last response code: ASNL_NOTIFY_RCVD
Last error code : ASNL_NONE
First Subscription Time : 10:55:12 UTC Apr 9 2000
Last Subscription Time : 10:55:12 UTC Apr 9 2000
First Notify Time : 10:55:12 UTC Apr 9 2000
Last Notify Time : 10:55:17 UTC Apr 9 2000
Application that subscribed : stress
Application receiving notification: stress
```

Step 4  
**show subscription sip**

Displays information about ASNL-based and non-ASNL-based SIP subscriptions.

**Example:**
```
Device# show subscription sip
```

```text
ASNL Active Subscription Records Summary:
```
Troubleshooting Tips

Use the following commands to troubleshoot SUBSCRIBE-NOTIFY Passthrough:

- `debug mpa events`
- `debug mpa error`
- `debug ccsip messages`
- `debug asnl events`
- `debug asnl error`
- `debug ccsip all`

Configuration Examples for SUBSCRIBE-NOTIFY Passthrough

Example: Configuring an Event List

The following example shows how to configure an event list and add an event to the list of events that have to be passed through.

```
Device> enable
Device# configure terminal
Device(config)# voice class sip-event-list 1
Device(config-class)# event 1 message-summary
Device(config-class)# end
```

Example: Configuring SUBSCRIBE-NOTIFY Event Passthrough Globally

The following example shows how to configure the SUBSCRIBE-NOTIFY passthrough event and link the SIP event list tag number globally.
Example: Configuring SUBSCRIBE-NOTIFY Event Passthrough under a Dial Peer

The following example shows how to configure the SUBSCRIBE-NOTIFY passthrough event and link the SIP event list tag number under a dial peer.

Device> enable
Device# configure terminal
Device(config)# voice service voip
Device(conf-voi-serv)# sip
Device(conf-serv-sip)# pass-thru subscribe-notify-events 1
Device(conf-serv-sip)# end

Feature Information for SUBSCRIBE-NOTIFY Passthrough

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

PART XIX

Cisco Unified Communications Manager Line-Side Support

- Cisco Unified Communications Manager Line-Side Support, on page 901
Cisco Unified Communications Manager
Line-Side Support

Note

The Cisco Unified Communications Manager (Unified Communications Manager) Lineside feature is no longer supported. The feature is deprecated for Cisco Unified Border Element on Cisco IOS 15.5(2)T Release and later releases. To support this feature, you must configure Cisco Unified Border Element on Cisco IOS 15.4(2)T or prior releases.

Cisco Unified Communications Manager is an enterprise-class IP communications processing system. It extends enterprise telephony features and capabilities to IP phones, media processing devices, VoIP gateways, mobile devices, and multimedia applications. Cisco Unified Border Element (Cisco UBE) provides line-side support for Cisco Unified Communications Manager. This support enables communication between devices (such as phones) used by remote users on different logical networks, in both cloud-based and premise-based deployments.

- Feature Information for Cisco Unified Communications Manager Line-Side Support, on page 901
- Restrictions for Cisco Unified Communications Manager Line-Side Support, on page 902
- Information About Cisco Unified Communications Manager Line-Side Support, on page 903

Feature Information for Cisco Unified Communications Manager Line-Side Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 95: Feature Information for Cisco Unified Communications Manager Line-Side Support

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Unified Communications Manager Line-Side Support</td>
<td>15.5(2)T</td>
<td>The Cisco Unified Communications Manager (CUCM) Line-Side Support feature was supported until the release 15.4(2)T. This feature has been deprecated from 15.5(2)T release onwards.</td>
</tr>
<tr>
<td>Simplified Line-Side Support of CUCM on CUBE</td>
<td>15.4(2)T, Cisco IOS XE Release 3.12S</td>
<td>The Simplified Line-Side Support of CUCM on CUBE feature simplifies the complex CUBE configurations required for registering IP Phones on a CUCM through CUBE using a single CLI that automatically applies all the necessary configurations. The following commands were modified by this feature: <code>extension cucm</code> and <code>voice-class sip extension cucm</code>.</td>
</tr>
<tr>
<td>Cisco Unified Communications Manager Line-Side Support</td>
<td>15.3(3)M, Cisco IOS XE Release 3.10S</td>
<td>The Cisco Unified Communications Manager Line-Side Support feature provides line-side support for Cisco Unified Communications Manager and IP phones deployed on different logical networks, in both cloud-based and premise-based deployments. The following commands were introduced or modified: <code>access-secure</code>, <code>capf-address</code>, <code>clear voice phone-proxy all-sessions</code>, <code>complete (ctl file)</code>, <code>ctl-file (phone proxy)</code>, <code>debug voice phone-proxy</code>, <code>description (ctl file)</code>, <code>description (phone proxy)</code>, <code>disable service-settings</code>, <code>max-concurrent-sessions</code>, <code>phone-proxy (dial peer)</code>, <code>port-range</code>, <code>record-entry</code>, <code>show voice class ctl-file</code>, <code>show voice class phone-proxy</code>, <code>service-map</code>, <code>session-timeout</code>, <code>tftp-server address</code>, <code>voice-ctl-file</code>, <code>voice-phone-proxy</code>.</td>
</tr>
</tbody>
</table>

Restrictions for Cisco Unified Communications Manager Line-Side Support

- In Cisco Unified Communications Manager Line-Side Support deployments, Cisco Unified Border Element does not support TFTP encrypted configuration files.
Information About Cisco Unified Communications Manager Line-Side Support

Cisco UBE Line-Side Deployment

In a typical deployment Cisco Unified Border Element (Cisco UBE) is placed between the Cisco Unified Communications Manager and the endpoint. Before invoking a service the phone contacts the CUBE Trivial File Transfer Protocol (TFTP) server to get configuration information such as the Certificate Trust List (CTL) file and phone-specific configuration settings. The phone then registers with Cisco Unified Communications Manager. In the deployment shown below, Cisco Unified Communications Manager and the phone configuration operate in unsecured mode (TCP to Real-Time Transport Protocol). The phone configuration can be changed to operate in a secure mode (Transport Layer Security Secure to Real-Time Transport Protocol) if needed. When the phone registration is completed the phone can invoke all normal call services.

Figure 91: Cisco UBE Line-Side Deployment

Line-Side Deployment Scenarios

Cisco Unified Call Manager Line-Side support can be deployed in the following ways:

- **Line-Side Secure Deployment** -
  
  CUCM line-side secure deployment, provides secure access between phone and CUBE. CUBE terminates the TLS connection from phone and initiates a TCP connection to CUCM to perform TLS-TCP inter-working. Refer to 'Example: Configuring CUCM Secure Line-Side' section for the steps involved in configuring secure deployment.

- **Line-Side Non-Secure Deployment** -
  
  CUCM line-side non-secure deployment, provides a non-secure connection between phone and CUBE. Refer to 'Example: Configuring CUCM Non-Secure Line-Side' section for the steps involved in configuring non-secure deployment.
Line-Side Support for CUCM on CUBE

For an IP phone to register on a CUCM through CUBE, CUBE must be configured to do the following requirements.

- TCP must be used for registration.
- The MAC address of the device (device ID) and the device name, present in the CONTACT header of the REGISTER message, need to be copied to the outgoing messages and passed to the CUCM intact.

Table 96: Command for Line-Side Support for CUCM on CUBE

<table>
<thead>
<tr>
<th>Dial-Peer Configuration Mode (config-dial-peer)</th>
<th>Global VoIP Configuration mode (config-voi-serv)</th>
</tr>
</thead>
<tbody>
<tr>
<td>voice-class sip extension cucm</td>
<td>sip</td>
</tr>
<tr>
<td></td>
<td>extension cucm</td>
</tr>
</tbody>
</table>

When Line Side Support for CUCM on CUBE feature is configured, the following supported, nonmandatory headers are passed through automatically without the need for further configuration:

- Call-Info
- Content-ID
- Allow-Events
- Supported
- Remote-Party-ID
- Require
- Referred-By

Figure 92: Predefined Supported NonMandatory Headers

When Line Side Support for CUCM on CUBE is configured, predefined SIP profiles automatically remove the Cisco-Guide header from the outgoing INVITE.

Figure 93: Predefined SIP Profile

Note

If a user explicitly configures the above configurations, ensure that the configurations are merged with the above automatic configurations.
# Configuring a PKI Trustpoint

## SUMMARY STEPS

1. crypto key generate rsa [label key-label] [modulus modulus-size] general-keys
2. crypto pki trustpoint name
3. enrollment selfsigned
4. subject-name [x.500-name]
5. subject-alt-name sip-security-profile-name
6. revocation-check method1 [method2 [method3]]
7. rsakeypair key-label

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>crypto key generate rsa [label key-label] [modulus modulus-size] general-keys</td>
<td>Generates a RSA key pair.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# crypto key generate rsa label pp_rsa modulus 1024 general-keys</td>
<td>Note: A self-signed key can only support a modulus-size value of 1024 bits.</td>
</tr>
<tr>
<td>Step 2</td>
<td>crypto pki trustpoint name</td>
<td>Declares the trustpoint that the device should use and enters ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# crypto pki trustpoint callmg23</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>enrollment selfsigned</td>
<td>Specifies self-signed enrollment for a trustpoint.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-ca-trustpoint)# enrollment selfsigned</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>subject-name [x.500-name]</td>
<td>Specifies the subject name in the certificate request.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-ca-trustpoint)# subject-name CN=ASR1006-CCN-4</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>subject-alt-name sip-security-profile-name</td>
<td>Specifies the alternative subject name in the certificate request.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-ca-trustpoint)# subject-alt-name 6961_SEC.cisco.com 8941_SEC.cisco.com 8945_SEC.cisco.com 7975_SEC.cisco.com 7970_SEC.cisco.com</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Use the subject-alt-name command only when Cisco UBE is interacting with CUCM in secure mode.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The value of subject-alt-name must be the SIP security profile name under CUCM.</td>
<td></td>
</tr>
</tbody>
</table>
Importing the CUCM and CAPF Key

What to do next
Import the CUCM and CAPF key.

**Importing the CUCM and CAPF Key**

**Before you begin**
Download the CUCM key (the CallManager.pem file) from the Cisco Unified Communications Manager Operating System Administration web page.

Login to Cisco Unified OS Administration and Security and Certificate Management, download the CUCM key (the CallManager.pem file), and copy and paste the CUCM key to CUBE

**SUMMARY STEPS**

1. crypto pki trustpoint name
2. revocation-check method1[method2 [method3]]
3. enrollment terminal
4. crypto pki authenticate name

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto pki trustpoint name</td>
<td>Creates a trustpoint for the CUCM key and enters ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# crypto pki trustpoint</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ccm_trustpoint</td>
</tr>
<tr>
<td>Step 2 revocation-check method1[method2 [method3]]</td>
<td>Checks the revocation status of a certificate.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-ca-trustpoint)# revocation-check none</td>
<td></td>
</tr>
</tbody>
</table>
### Creating a CTL File

#### SUMMARY STEPS

1. `voice-ctl-file ctl-filename`
2. `record-entry selfsigned trustpoint trustpoint-name`
3. `record-entry capf trustpoint trustpoint-name`
4. `record-entry cucm-tftp trustpoint trustpoint-name`
5. `complete`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>voice-ctl-file ctl-filename</code></td>
<td>Creates a CTL file and enters CTL file configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)#voice-ctl-file ct1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>record-entry selfsigned trustpoint trustpoint-name</code></td>
<td>Configures the trustpoints to be used for creating the CTL file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config-ctl-file)#record-entry selfsigned trustpoint self-trustpoint6s</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Phone Proxy

#### SUMMARY STEPS

1. `voice-phone-proxy phone-proxy-name`
2. `voice-phone-proxy file-buffer size`
3. `tftp-server-address [ipv4 server-ip-address | domain-name]`
4. `ctl-file ctl-filename`
5. `access-secure`
6. `complete`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | **voice-phone-proxy phone-proxy-name**  
  Example:  
  Device(config)# voice-phone-proxy pp | Configures a phone proxy and enters phone-proxy configuration mode. |
| **Step 2** | **voice-phone-proxy file-buffer size**  
  Example:  
  Device(config)# voice-phone-proxy file-buffer 30 | Configures the phone-proxy file buffering parameter, in MB. |
| **Step 3** | **tftp-server-address [ipv4 server-ip-address | domain-name]**  
  Example: | Configures the TFTP server address. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-phone-proxy)# tftp-server-address ipv4 172.110.36.2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>ctl-file  ctl-filename</td>
<td>Configures the CTL filename.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-phone-proxy)# ctl-file ct1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>access-secure</td>
<td>Specifies that the secure (encrypted) mode is to be used for access.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-phone-proxy)# access-secure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>complete</td>
<td>Completes the phone-proxy configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-phone-proxy)# complete</td>
<td></td>
</tr>
</tbody>
</table>

### Attaching a Phone Proxy to a Dial Peer

**SUMMARY STEPS**

1. `dial-peer voice tag voip`
2. `phone-proxy phone-proxy-name signal-addr ipv4 ipv4-address cucm ipv4 ipv4-address`
3. `session protocol sipv2`
4. `session target registrar`
5. `session transport {udp | tcp [tls]}
6. `incoming url {from | request | to | via} tag`
7. `destination uri tag`
8. `voice-class sip call-route url`
9. `voice-class sip profiles number`
10. `voice-class sip registration passthrough [registrar-index index]`
11. `voice-class sip pass-thru headers`
12. `voice-class sip copy-list {tag | system}`
13. `codec transparent`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>dial-peer voice tag voip</td>
<td>Defines a particular dial peer, specifies the method of voice encapsulation, and enters dial peer configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# dial-peer voice 10 voip</td>
<td></td>

<tr>
<td>4</td>
<td><strong>session target registrar</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device(config-dial-peer)# session target registrar</td>
</tr>
<tr>
<td>5</td>
<td><strong>session transport</strong> {udp</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device(config-dial-peer)# session transport tcp tls</td>
</tr>
<tr>
<td>6</td>
<td><strong>incoming uri</strong> {from</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device(config-dial-peer)# incoming uri request 11</td>
</tr>
<tr>
<td>7</td>
<td><strong>destination uri</strong> tag</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device(config-dial-peer)# destination uri 12</td>
</tr>
<tr>
<td>8</td>
<td><strong>voice-class sip call-route url</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device(config-dial-peer)# voice-class sip call-route url</td>
</tr>
<tr>
<td>9</td>
<td><strong>voice-class sip profiles</strong> number</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device(config-dial-peer)# voice-class sip profiles 10</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 10</strong></td>
<td>voice-class sip registration passthrough [registrar-index index]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-dial-peer)# voice-class sip registration passthrough registrar-index 1</td>
</tr>
</tbody>
</table>

| **Step 11** | voice-class sip pass-thru headers | Configures a list of headers for pass through by referring to a globally configured list. |
| **Example:** | Device(config-dial-peer)# voice-class sip pass-thru headers 10 |

| **Step 12** | voice-class sip copy-list {tag | system} | Configures the list of entities to be sent to the peer call leg. |
| **Example:** | Device(config-dial-peer)# voice-class sip copy-list 10 |

| **Step 13** | codec transparent | Enables codec capabilities to be passed transparently between endpoints in a Cisco Unified Border Element. |
| **Example:** | Device(config-dial-peer)# codec transparent |

### Verifying CUCM Lineside Support

The `show` commands can be entered in any order.

**SUMMARY STEPS**

1. enable
2. show dial-peer voice dial-peer-id | section voice class sip extension
3. show dial-peer voice
4. show voice class phone-proxy
5. show voice class phone-proxy sessions

**DETAILED STEPS**

**Step 1** enable

Enables privileged EXEC mode.

- Enter your password if prompted.

**Example:**

Device> enable
Step 2  
show dial-peer voice dial-peer-id | section voice class sip extension

Example:
CUBE# show dial-peer voice 5678 | section voice class sip extension

voice class sip extension = system,

Displays if extension cucm has not been configured for the dial peer.

Example:
CUBE# show dial-peer voice 5678 | section voice class sip extension

voice class sip extension = cucm,

Displays if extension cucm has been configured for the dial peer.

Example:
CUBE# show dial-peer voice 5678 | section voice class sip extension

voice class sip extension = none,

Displays if extension cucm has been removed for the dial peer using the no form of the command.

Step 3  
show dial-peer voice

Example:

Device# show dial-peer voice 100

voice class sip extension = system,
voice class sip contact-passing = system,
voice class sip require-passing = system,
voice class phone proxy name: phone_proxy_secure
voice class phone proxy config: complete

Step 4  
show voice class phone-proxy

Example:

Device# show voice class phone-proxy

Phone-Proxy 'phone_proxy':
Description:
Access Secure: non-secure (default)
Tftp-server address: 20.21.27.146
Capf server address: 20.21.27.146
CUCM service settings: preserve (default)
CTL file name: ctl_file
Session-timeout: 180 seconds
Max-concurrent-sessions: 30
Current sessions: 0
TFTP sessions: 0
HTTP download sessions: 0
HTTP application sessions: 0
CAPF sessions: 0
Config status: complete
SIP dial-peers associated:
Name
-------------
1
-------------------------------------------------------------
Phone-Proxy 'phone_proxy_secure':
Description:
  Access Secure: secure
Tftp-server address: 20.21.27.146
Capf server address: 20.21.27.146
CUCM service settings: preserve (default)
CTL file name: ctl_file
Session-timeout: 180 seconds
Max-concurrent-sessions: 30
Current sessions: 0
TFTP sessions: 0
HTTP download sessions: 0
HTTP application sessions: 0
CAPF sessions: 0
Config status: complete
SIP dial-peers associated:
  Name
  ---------------
  3
dialpeer4

Step 5  
show voice class phone-proxy sessions

Example:

Device# show voice class phone-proxy sessions

Phone-Proxy 'phone_proxy_ipad':

<table>
<thead>
<tr>
<th>Source</th>
<th>Sessions of Dial-peer 5</th>
<th>Destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access: 10.74.9.219 :45232</td>
<td>10.74.9.209 :6970</td>
<td></td>
</tr>
<tr>
<td>Core : 20.21.29.209 :45300</td>
<td>20.21.27.146 :6970</td>
<td></td>
</tr>
</tbody>
</table>

Example: Configuring a PKI Trustpoint

Device(config)# crypto key generate rsa label pp_rsa modulus 1024 general-keys
Device(config)# crypto pki trustpoint callmg23
Device(config-ca-trustpoint)# enrollment selfsigned
Device(config-ca-trustpoint)# subject-name CN=ASR1006-CCN-4
Device(config-ca-trustpoint)# subject-alt-name 6961_SEC.cisco.com 8941_SEC.cisco.com 8945_SEC.cisco.com 7975_SEC.cisco.com 7970_SEC.cisco.com
Device(config-ca-trustpoint)# revocation-check crl
Device(config-ca-trustpoint)# rsakeypair pp1
Example: Importing the CUCM and CAPF Key

The following example shows how to import the CUCM and CAPF key after you have downloaded the CUCM key (the CallManager.pem file) and the CAPF key (the CAPF.pem file) from the Cisco Unified Communications Manager Operating System Administration web page.

```
Device(config)# crypto pki trustpoint cucm_trustpoint
Device(config-ca-trustpoint)# revocation-check none
Device(config-ca-trustpoint)# enrollment terminal
Device(config-ca-trustpoint)# crypto pki authenticate cucm_trustpoint
```

Example: Creating a CTL File

```
Device(config)# voice-ctl-file ct1
Device(config-ctl-file)# record-entry selfsigned trustpoint self-trustpoint6s
Device(config-ctl-file)# record-entry capf trustpoint capf-trustpoint6s
Device(config-ctl-file)# record-entry cucm-tftp trustpoint cucm-trustpoint
Device(config-ctl-file)# complete
```

Example: Configuring a Phone Proxy

```
Device(config)# voice-phone-proxy pp
Device(config-phone-proxy)# voice-phone-proxy pp
Device(config-phone-proxy)# voice-phone-proxy file-buffer size 30
Device(config-phone-proxy)# tftp-server address ipv4 172.110.36.2
Device(config-phone-proxy)# ctl-file ct1
Device(config-phone-proxy)# access-secure
Device(config-phone-proxy)# complete
```

Example: Attaching a Phone Proxy to a Dial Peer

```
Device(config)# dial-peer voice 10 voip
Device(config-dial-peer)# phone-proxy pp1 signal-addr ipv4 10.0.0.8 cucm ipv4 198.51.100.1
Device(config-dial-peer)# session-protocol sipv2
Device(config-dial-peer)# session target registrar
Device(config-dial-peer)# session transport tcp tls
Device(config-dial-peer)# incoming uri request 11
Device(config-dial-peer)# destination uri 12
Device(config-dial-peer)# voice-class sip call-route url
Device(config-dial-peer)# voice-class sip profiles 10
Device(config-dial-peer)# voice-class sip registration passsthrough registrar-index 1
Device(config-dial-peer)# voice-class sip passthrough headers 10
Device(config-dial-peer)# voice-class sip copy-list 10
Device(config-dial-peer)# codec transparent
```

Cisco Unified Border Element Configuration Guide
Example: Configuring CUCM Secure Line-Side

The details of the IP address used in the below example are as follows:

- CUBE IP address facing phone: 172.18.110.120
- CUBE IP address facing CUCM: 10.50.209.100
- CUCM IP address: 10.50.209.215

Generate and Import Certificate on CUBE

```
Device(config)# crypto pki trustpoint selfsign
Device(config)# enrollment selfsigned
Device(config)# subject-name CN=CUBE, O=CISCO
Device(config)# revocation-check none
Device(config)# rsakeypair selfsign

Device(config)# crypto pki trustpoint ccm1
Device(config)# enrollment terminal
Device(config)# revocation-check none

Device(config)# crypto pki trustpoint Cisco_Manufacturing_CA
Device(config)# enrollment terminal
Device(config)# revocation-check none

Device(config)# crypto pki trustpoint selfsignx
Device(config)# enrollment terminal
Device(config)# subject-name cn=3925_pod5
Device(config)# revocation-check none
Device(config)# rsakeypair selfsignx

Device(config)# crypto pki certificate chain ccm1
Device(config)# certificate ca 55C2FCBF86C552B7C6CED497D4AD3F8
[Certificate data omitted]

Device(config)# crypto pki certificate chain Cisco_Manufacturing_CA
Device(config)# certificate ca 6A6967B300000000000003
[Certificate data omitted]

Device(config)# crypto pki certificate chain selfsignx
Device(config)# certificate self-signed 01
[Certificate data omitted]
```

Add the Cube Service, Call Flow and Message manipulation configuration.

```
Device(config)# voice service voip
Device(config)# no ip address trusted authenticate

Security

• SIP TLS Support on CUBE, on page 923
CHAPTER 72

SIP TLS Support on CUBE

The Cisco Unified Border Element (CUBE) supports SIP-to-SIP calls with Transport Layer Security (TLS). TLS provides privacy and data integrity of SIP signaling messages between two applications that communicate. CUBE uses TLS to secure SIP signaling messages. TLS is layered on top of a reliable transport protocol such as TCP. CUBE can be configured at both the global and dial-peer levels for allowing TLS to establish sessions with remote endpoints.

- Feature Information for SIP TLS Support on CUBE, on page 923
- Restrictions, on page 924
- Information About SIP TLS Support on CUBE, on page 924
- How to Configure SIP TLS Support on CUBE, on page 926
- Configuration Examples for SIP TLS Support on CUBE, on page 934

Feature Information for SIP TLS Support on CUBE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

</tbody>
</table>
| SIP TLS Version 1.2 Support on CUBE | Cisco IOS 15.6(1)T / Cisco IOS XE 3.17S | Support is provided for SIP-to-SIP calls with Transport Layer Security (TLS) version 1.2. The following cipher suites are introduced for release Cisco IOS 15.6(1)T:  
  • TLS_DHE_RSA_WITH_AES_128_CBC_SHA1  
  • TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256  
  • TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256  
  • TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384  
  • TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384  
The following commands were introduced or modified: `transport tcp tls`, `crypto signaling default trustpoint cube`, and `srtp (voice)`. |
| SIP TLS Version 1.0 Support on CUBE | Cisco IOS 12.4(6)T | Support is provided for SIP-to-SIP calls with Transport Layer Security (TLS) version 1.0. The following cipher suites are introduced for release Cisco IOS 12.4(6)T:  
  • SSL_RSA_WITH_RC4_128_MD5  
  • TLS_RSA_WITH_AES_128_CBC_SHA  
The following commands were introduced or modified: `transport tcp tls` and `crypto signaling default trustpoint cube`. |

### Restrictions

- ECDSA ciphers are not supported on TLS version 1.0.

### Information About SIP TLS Support on CUBE

#### Deployment

The following figure illustrates an example of CUBE with SIP TLS connections.
In a typical deployment, CUBE is placed between CUCM and the service provider. These devices are authenticated and enrolled with a Certificate Authority (CA) server that issues certificates. It can be Cisco or a third party entity. When a call is made, a TLS handshake is initiated between CUCM and CUBE, and the IOS PKI infrastructure is used to exchange certificates signed by a common trusted CA during the handshake. During the TLS handshake, a dynamically generated symmetric key and cipher algorithms are negotiated between the devices. After the successful TLS handshake, the devices establish a SIP session between the service provider and CUBE. Keys exchanged during the TLS handshake process are used to encrypt or decrypt all SIP signaling messages.

Note

The use of PKI on the Cisco IOS software requires that the clock on the devices be synchronized with the network time to ensure proper validation of certificates.

### TLS Cipher Suite Category

Prior to release Cisco IOS15.6(1)T, CUBE supported TLS v1.0 with the following cipher suites:

- SSL_RSA_WITH_RC4_128_MD5
- TLS_RSA_WITH_AES_128_CBC_SHA

CUBE supports only the mandatory cipher suites for TLS implementation. From Cisco IOS15.6(1)T release onwards, CUBE supports TLS v1.2 which is backward compatible. Following are the cipher suites added:

- TLS_DHE_RSA_WITH_AES_128_CBC_SHA1
- TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
- TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384

Use the `srtppass-thru` command to globally enable the transparent passthrough of all (supported and unsupported) crypto suites. If SRTP pass-thru feature is enabled, media interworking will not be supported. Ensure that you have symmetric configuration on both the incoming and outgoing dial-peers to avoid media-related issues.
How to Configure SIP TLS Support on CUBE

Configuring SIP TLS on CUBE

Starting from IOS XE version 16.6.1 release, in the Cisco 4000 Series ISR devices the key-pairs information is encrypted.

When you downgrade the Cisco 4000 Series ISR from IOS XE version 16.6.1 or a later release to a pre-16.6.1 release, ensure that you disable the key encryption before the downgrade. Otherwise, the downgrade discards the encrypted keys. To disable the encryption, use the command `no service private-config-encryption` in global configuration mode.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto key genera{eral-keys | usage-keys}label key-label[exportable ][[modulus modulus-size][storage device:]]`
4. `crypto key generate{ckey-key-size[256 | 384][label][ ec key-label]}`
5. `crypto pki trustpoint name`
6. `rsakeypair key-label [key-size [encryption-key-size]]`
7. `eckeypair keyname` ! Applicable only for TLS version 1.2.
8. `serial-number [none]`
9. `ip-address {ip-address|interface|none}`
10. `subject-name [x.500-name]`
11. `enrollment [mode][retry period minutes][retry count number][url url][pem]`
12. `crl optional` or `revocation-check method1[method2[method3]]`
13. `password string`
14. `exit`
15. `crypto ca authenticate name` or `crypto pki authenticate name`
16. `crypto ca enroll name` or `crypto pki enroll name`
17. `sip-ua`
18. `transport tcp tls [v1.0 | v1.1 | v1.2 ]`
19. `crypto signaling [remote-addr ip address subnet mask | default]trustpoint trustpoint-name` ![ECDSA ciphers are not supported on TLS version 1.0.]
20. `voice service {pots| voatm |vofr|voip}`
21. `transport tcp tls`
22. `url {sip | sips |tel}`
23. `end`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto key generate rsa {general-keys</td>
<td>usage-keys}</td>
</tr>
<tr>
<td>key-label</td>
<td></td>
</tr>
<tr>
<td>[exportable]</td>
<td>• general-keys—Specifies that the general-purpose key pair should be generated.</td>
</tr>
<tr>
<td>[modulus modulus-size]</td>
<td>• usage-keys—Specifies that two RSA special-usage key pairs should be generated (that is, one encryption pair and one signature pair) instead of one general-purpose key pair.</td>
</tr>
<tr>
<td>[storage device:]</td>
<td>• label key-label—(Optional) Name that is used for an RSA key pair when they are being exported. If a key label is not specified, the fully qualified domain name (FQDN) of the router is used.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto key generate rsa general-keys label kp1 exportable</td>
<td>• exportable—(Optional) Specifies that the RSA key pair can be exported to another Cisco device, such as a router.</td>
</tr>
<tr>
<td><strong>Step 4</strong> crypto key generate eckey-size {256</td>
<td>384}</td>
</tr>
<tr>
<td>[key-label]</td>
<td>• modulus modulus-size—(Optional) IP size of the key modulus in a range from 350 to 2048. If you do not enter the modulus keyword and specify a size, you will be prompted.</td>
</tr>
<tr>
<td>[label label]</td>
<td>• storage device—(Optional) Specifies the key storage location. The name of the storage device is followed by a colon (:).</td>
</tr>
<tr>
<td>eckey-label</td>
<td>• kp1— kp1 is a label name that you select.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto key generate rsa general-keys label kp1 exportable</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Required: crypto pki trustpoint name</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# crypto pki trustpoint cube1</td>
</tr>
<tr>
<td></td>
<td>Declares the trustpoint that your router should use. Argument is as follows:</td>
</tr>
<tr>
<td></td>
<td>• name—Creates a name for the trustpoint that you created.</td>
</tr>
<tr>
<td></td>
<td>• cube1—Represents the trustpoint name that the user specifies.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>rsakeypair key-label [key-size [encryption-key-size]]</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# rsakeypair kp1</td>
</tr>
<tr>
<td></td>
<td>Specifies which key pair to associate with the certificate. Arguments are as follows:</td>
</tr>
<tr>
<td></td>
<td>• key-label—Name of the key pair, which is generated during enrollment if it does not already exists or if the auto-enroll regenerate command is configured.</td>
</tr>
<tr>
<td></td>
<td>• key-size—(Optional) Size of the desired RSA key. If not specified, the existing key size is used.</td>
</tr>
<tr>
<td></td>
<td>• encryption-key-size—(Optional) Size of the second key, which is used to request separate encryption, signature keys, and certificates.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>eckeypair keyname ! Applicable only for TLS version 1.2.</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# eckeypair mykey</td>
</tr>
<tr>
<td></td>
<td>Generates EC keys for ECDSA cipher suites.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>serial-number [none]</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(ca-trustpoint)# serial-number</td>
</tr>
<tr>
<td></td>
<td>Specifies whether the router serial number should be included in the certificate request. Keyword is as follows:</td>
</tr>
<tr>
<td></td>
<td>• none—(Optional) Specifies that a serial number will not be included in the certificate request.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>ip-address {ip-address}[interface][none]</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(ca-trustpoint)# ip-address 172.18.197.154</td>
</tr>
<tr>
<td></td>
<td>Specifies a dotted IP address or an interface that will be included as &quot;unstructuredAddress&quot; in the certificate request. Arguments and keyword are as follows:</td>
</tr>
<tr>
<td></td>
<td>• ip-address—Specifies a dotted IP address that will be included as &quot;unstructuredAddress&quot; in the certificate request.</td>
</tr>
<tr>
<td></td>
<td>• interface—Specifies an interface, from which the router can get an IP address, that will be included as &quot;unstructuredAddress&quot; in the certificate request.</td>
</tr>
<tr>
<td></td>
<td>• none—Specifies that an IP address is not to be included in the certificate request.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 10**  
subject-name \[x.500-name\]  
Example:  
Router (ca-trustpoint) \# subject-name  
CN=172.18.197.154 | Specifies the subject name in the certificate request.  
Argument is as follows:  
- \x.500-name\—(Optional) Specifies the subject name used in the certificate request. |
| **Step 11**  
enrollment \[mode][retry period minutes][retry count number][url url][pem]  
Example:  
Router (ca-trustpoint) \# enrollment url  
http://172.18.193.103 | Specifies the enrollment parameters of a certificate authority (CA). Arguments and keywords are as follows:  
- \mode\—(Optional) Registration authority (RA) mode, if your CA system provides an RA. By default, RA mode is disabled.  
- \retry period minutes\—(Optional) Specifies the period in which the router will wait before sending the CA another certificate request. The default is 1 minute between retries. (Specify from 1 through 60 minutes.)  
- \retry count number\—(Optional) Specifies the number of times a router will resend a certificate request when it does not receive a response from the previous request. The default is 10 retries. (Specify from 1 through 100 retries.)  
- \url url\—URL of the file system where your router should send certificate requests. For enrollment method options, see the enrollment url command.  
- \pem\—(Optional) Adds privacy-enhanced mail (PEM) boundaries to the certificate request. |
| **Step 12**  
crl optional or revocation-check  
method1[method2[method3]]  
Example:  
Router (ca-trustpoint) \# crl optional  
or  
Router (ca-trustpoint) \# revocation-check none | Allows the certificates of other peers to be accepted without trying to obtain the appropriate CRL or checks the revocation status of a certificate. Arguments are as follows:  
- \method1 [method2 [method3]]\—Method used by the router to check the revocation status of the certificate.  
Available methods are as follows:  
- \crl\—Certificate checking is performed by a certificate revocation list (CRL). This is the default behavior.  
- \none\—Certificate checking is not required.  
- \ocsp\—Certificate checking is performed by an online certificate status protocol (OCSP).  
**Note** If the second and the third methods are specified, each method will be used only if the previous method returns an error, such as the server being down. |
### Purpose

**Step 13**

**Command or Action:** `password string`  
**Example:**  
Router(ca-trustpoint)# password password  
Specifies the revocation password for the certificate.  
Argument is as follows:  
- *string*—Name of the password

**Step 14**

**Command or Action:** `exit`  
**Example:**  
Router# exit  
Exits the current mode.

**Step 15**

**Command or Action:** `crypto ca authenticate name` or `crypto pki authenticate name`  
**Example:**  
Router(config)# crypto ca authenticate cube1  
or  
Router(config)# crypto pki authenticate cube1  
Authenticates the CA (by getting the certificate of the CA).  
Argument is as follows:  
- *name*—Specifies the name of the CA. This is the same name used when the CA was declared with the `crypto ca identity` command.  

**Note**

This is where you paste the remote root CA certificate (PEM file format).

**Step 16**

**Command or Action:** `crypto ca enroll name` or `crypto pki enroll name`  
**Example:**  
Router(config)# crypto ca name cube1  
or  
Router(config)# crypto pki name cube1  
Obtains the certificates of your router from the certificate authority. The CA server issues two certificates to the trustpoint (CUBE): one to certify the CA server and the other to certify the trustpoint (CUBE). Argument is as follows:  
- *name*—Specifies the name of the CA. Use the same name when you declared the CA using the `crypto pki trustpoint` command.

**Step 17**

**Command or Action:** `sip-ua`  
**Example:**  
Router(config)# sip-ua  
Enteres SIP user-agent configuration mode.

**Step 18**

**Command or Action:** `transport tcp tls [v1.0 | v1.1 | v1.2]`  
**Example:**  
Router(config-sip-ua)# transport tcp tls v1.2  
Configures the specified TLS version.  

**Note**

TLS v1.1 and TLS v1.2 are the default TLS versions that are configured. TLS v1.0 is also supported. However, to configure TLS v1.0, you must explicitly specify the TLS version.  
For more information on the TLS version configuration, see Transport command.

**Step 19**

**Command or Action:** `crypto signaling {remote-addr ip address subnet mask | default} trustpoint trustpoint-name { [ecdsa-cipher [curve-size 384] | strict-cipher] | cn-san-validate [server [{ecdsa-cipher [curve-size 384] | strict-cipher} ] ] / ECDSA ciphers are not supported on TLS version 1.0.`  
Configures the SIP gateway to use its trustpoint when it establishes or accepts TLS connection with a remote device with an IP address.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>The trustpoint label refers to the CUBE’s certificate that is generated with the Cisco IOS PKI commands as part of the enrollment process. <strong>strict-cipher</strong> means that the SIP TLS process uses only those cipher suites that are mandated by the SIP RFC. When you use the <strong>strict-cipher</strong> command argument, avoids changes to the configuration if SIP should mandate newer ciphers. The SSL layer in Cisco IOS does not support TLS_RSA_WITH_3DES_EDE_CBC_SHA. Therefore, CUBE actively uses only the TLS_RSA_WITH_AES_128_CBC_SHA suite in strict mode.</td>
</tr>
</tbody>
</table>
### Command or Action

**Step 20**

`voice service {pots|voatm|vofr|voip}`

**Example:**

```
Router(config)# voice service voip
```

**Purpose:** Specifies a voice encapsulation type and enters voice service VoIP configuration mode.

**Step 21**

`transport tcp tls`

**Example:**

```
Router(config-voi-sip)# transport tcp tls
```

**Purpose:** Enters this command in SIP configuration mode to enable the TLS port on TCP 5061 to listen.

**Step 22**

`url {sip|sips|tel}`

**Example:**

```
Router(config-serv-sip)# url sips
```

**Purpose:** Configures URLs to either the SIP, SIPS, or TEL format for your VoIP SIP calls. Keywords are as follows:

- **sip**—Generate URLs in SIP format for VoIP calls. This is the default.
- **sips**—Generate URLs in SIPS format for VoIP calls.
- **tel**—Generate URLs in TEL format for VoIP calls.

**Note** This SIP gateway is now configured to use TLS with endpoints sharing the same CA.

**Step 23**

`end`

**Example:**

```
Router(conf-serv-sip)# end
```

**Purpose:** Ends the current mode.

### Verifying SIP TLS Support on CUBE

After a call is made, the **show sip-ua connections tcp tls** command is used to verify whether the transport used for the call is TLS.

Sample output for this command when TLS version is 1.0:
Verifying SIP TLS Support on CUBE

Detail Output

```
router# show sip-ua connections tcp tls detail
Total active connections : 1
No. of send failures : 0
No. of remote closures : 3
No. of conn. failures : 0
No. of inactive conn. ageouts : 0
Max. tls send msg queue size of 0, recorded for 0.0.0.0:0
TLS client handshake failures : 0
TLS server handshake failures : 0

---------Printing Detailed Connection Report---------
Note:

PART XXI

Voice Quality in CUBE

• CUBE Call Quality Statistics Enhancement, on page 943
• Voice Quality Monitoring, on page 949
CUBE Call Quality Statistics Enhancement

Call quality statistics in CUBE, such as packet loss, jitter, and round trip delay can be added to the call detail record (CDR), and these voice metrics can be calculated in IOS. For more information, refer to Voice Quality Enhancements on Cisco Unified Border Element.

The call quality statistics feature is enhanced to provide the following capabilities:

- Enable or disable Quality of Service (QoS) for CUBE.
- Enable or disable Real-time Transport Protocol (RTP) Control Protocol (RTCP) passthrough.
- Configure call quality criteria parameters.

---

Feature Information for Call Quality Statistics Enhancement

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 97: Feature Information for Call Quality Statistics Enhancement

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Call Quality Statistics Enhancement | Cisco IOS XE 3.14S | Call quality statistics in CUBE, such as packet loss, jitter, and round trip delay can be added to the call detail record (CDR), and these voice metrics can be calculated in IOS. For more information, refer to Voice Quality Enhancements on Cisco Unified Border Element. The call quality statistics feature is enhanced to provide the following capabilities:  
  • Enable or disable Quality of Service (QoS) for CUBE.  
  • Enable or disable Real-time Transport Protocol (RTP) Control Protocol (RTCP) passthrough.  
  • Configure call quality criteria parameters. |

Restrictions for Call Quality Statistics Enhancement

• Only SIP-to-SIP call quality statistics calculation is supported.
• The RTCP field is not recalculated, as it is end-to-end statistics.
• The round trip delay is only retrieved by RTCP, which means the round trip delay is not calculated if there is no related RTCP.
• Only three codec types are supported for one media flow to calculate the jitter; considering the data path performance, these three codecs would be the maximum number in one cache line.
• Only one RTP synchronization source (SSRC) is supported concurrently per media flow, which is indicated in the m-line of the session description protocol (SDP).
• Round trip delay calculation for transcoding calls is not supported.

Information About Call Quality Statistics Enhancement

Call quality configuration parameters include max_dropout, max_reorder, and clock_rate. A maximum of three codecs (codec_number, payload_type, clock_rate) per media flow is collected by the PI and sent to CPP, which uses these values in statistics calculation. Calculated statistics such as Jitter, Packet Loss, and Delay are then fetched from the CPP to the CDR. These statistics can be viewed in the command line interface.

The CDR has the following data per call leg of the call:
• Packet Loss—Calculated based on methods shown in RFC3550. The RTCP sender/receiver reports are recalculated, and not just copied from the inbound leg to the outbound leg.
• Delay—Calculated based on timestamp received or timestamp of packets sent.
• Jitter—Variation of delay.
For more information on how to calculate the voice quality metrics related to media (voice) quality, such as conversational mean opinion score (MOS), jitter, and so on, see http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/voice/cube/configuration/cube-book/voi-cube-call-monitoring.html.

How to Configure Call Quality Parameters

Configuring Call Quality Criteria Parameters

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `voice service voip`
4. `call-quality`
5. `max-dropout number-of-packets`
6. `max-reorder number-of-packets`
7. `clock-rate payload-type-number frequency`
8. `clock-rate dynamic-default frequency`
9. `exit`
10. `rtcp all-pass-through`
11. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>voice service voip</code></td>
<td>Enters global VoIP configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# voice service voip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>call-quality</code></td>
<td>Enters call quality configuration mode; this is the global call quality of service setup.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(conf-voi-serv)# call-quality</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>max-dropout number-of-packets</code></td>
<td>Configures the acceptable out of sequence future packets to drop. The range is from 2 to 2000 packets. The default value is 100.</td>

<tr>
<td><strong>Step 8</strong></td>
<td>(Optional) Changes the default clock rate for all the dynamic payload types. The frequency range (in Hz) is from 1000 to 192000.</td>
</tr>
<tr>
<td><strong>clock-rate dynamic-default frequency</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(conf-serv-call-quality)# clock-rate dynamic-default 10000</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Exits to global VoIP configuration mode.</td>
</tr>
<tr>
<td><strong>exit</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(conf-serv-call-quality)# exit</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>(Optional) Passes through all RTCP in data path.</td>
</tr>
<tr>
<td><strong>rtcp all-pass-through</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(conf-voi-serv)# rtcp all-pass-through</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>end</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(conf-voi-serv)# end</td>
</tr>
</tbody>
</table>

**Troubleshooting Call Quality Statistics**

Use the following `debug` and `show` commands to enable the logs, which helps in debugging:

- `debug csip verbose`
- `debug voip fpi all`
- `debug platform hardware qfp active feature sbc dbe datapath all`
- `debug platform hard qfp act feature sbc dbe client all`
- `debug csip message`
- `debug csip info`
- `show call active voice`
- `show platform hardware qfp active feature sbc data path call call-id`

The following are some show command outputs that would be useful in troubleshooting:

- `Device# show call active voice | include LostPackets`
LostPackets=0

LostPackets=36 ----> //Lost packets detail present in show call active voice output. View the complete command output based on the filters such as call-id to check the packet loss for a particular call leg. //

• Device# show call active voice | include PlayDelayJitter

PlayDelayJitter=0

PlayDelayJitter=38 ----> //Jitter detail present in show call active voice output. View the complete command output based on the filters such as call-id to check the Jitter for a particular call leg. //

CHAPTER 74

Voice Quality Monitoring

The Voice Quality Monitoring (VQM) feature gives information on the voice quality metrics related to media (voice) quality, such as conversational mean opinion score (MOS), packet loss rate, and so on. VQM enables you to monitor the quality of calls traversing your VoIP network, and you can diagnose the cause of voice quality issues and troubleshoot them.

The Voice Quality Statistics feature provides information about the quality of the Time-Division Multiplexing Internet Protocol (TDM-IP) voice call.

- Feature Information for Voice Quality Monitoring, on page 949
- Prerequisites for Voice Quality Monitoring, on page 950
- Restrictions for Voice Quality Monitoring and Voice Quality Statistics, on page 950
- Information About Voice Quality Monitoring, on page 951
- How to Configure Voice Quality Monitoring, on page 952
- Configuration Examples for Voice Quality Monitoring, on page 955

Feature Information for Voice Quality Monitoring

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voice Quality Statistics</td>
<td>Cisco IOS XE Everest 16.5.1b</td>
<td>Voice quality statistics provides information about the quality of the voice TDM-IP call. This feature is already implemented on ISR-G2, and the feature gap is filled in ISR 4000 series.</td>
</tr>
</tbody>
</table>
Prerequisites for Voice Quality Monitoring

The following commands must be executed to configure the voice quality metrics:

- callmonitor
- rtcp all-pass-through
- media statistics
- media bulk-stats
- call-quality
  - max-dropout 2
  - max-reorder 2

Restrictions for Voice Quality Monitoring and Voice Quality Statistics

- Only SIP-to-SIP call quality statistics calculation is supported.
- The RTCP field is not recalculated, as it is end-to-end statistics.
- The round trip delay is only retrieved by RTCP, which means the round trip delay is not calculated if there is no related RTCP.
- Only three codec types are supported for one media flow to calculate the jitter; considering the data path performance, these three codecs would be the maximum number in one cache line.
- Only one RTP synchronization source (SSRC) is supported concurrently per media flow, which is indicated in the m-line of the session description protocol (SDP).
- Round trip delay calculation for transcoding calls is not supported.
- VQM MOS values are not calculated for DSP based calls.
• MOS value shows 0 if endpoint does not send RTCP packets.
• The voice quality statistics covers only the TDM-IP call. The implementation focuses on filling the following statistics based on query response from DSP for TDM-SIP and TDM-H323 call:
  • RoundTripDelay
  • GapFillWithSilence
  • GapFillWithPrediction
  • GapFillWithInterpolation
  • GapFillWithRedundancy
  • HiWaterPlayoutDelay
  • LoWaterPlayoutDelay
  • PlayDelayJitter

Information About Voice Quality Monitoring

The VQM (Voice Quality Monitor) gives information on the voice quality metrics. The VQM on Cisco IOS XE platforms enables statistics gathering based on the received RTCP packets. From these statistics, a voice quality measurement is developed to show the quality of the call. The output is in a simple format, using a system of good, poor, and bad types of ratings.

The following metrics exists in Call Detail Record (CDR) and Management Information Base (MIB) in CUBE, indicating voice quality:

1. MOSQe (conversational quality MOS)
2. Round-trip-delay.
4. Packet-Loss-Rate.

The CDR is sent at the end of a call if AAA accounting is configured.
A CDR example is as follows:
<mos-con>4.4072</mos-con>
<round-trip-delay>1 ms</round-trip-delay>
<receive-delay>64 ms</receive-delay>
<voice-quality-total-packet-loss>0.0000 %</voice-quality-total-packet-loss>

VQM Metrics

The following are the metrics exported by VQM:
### How to Configure Voice Quality Monitoring

#### Enabling Media Statistics Globally

Perform this task to globally enable media statistics in voice-service configuration mode to estimate the values for packet loss, jitter, and round-trip time.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `voice service voip`
4. `media statistics`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>voice service voip</code></td>
<td>Enters voice service VoIP configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>

#### Description

<table>
<thead>
<tr>
<th>Description Quality Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOS-Con</td>
<td>The conversational quality MOS. Conversational quality indicates the impact of the quality of the transmission on the dynamics of conversational exchanges between two parties; such metrics take into account delay, echo, and recency.</td>
</tr>
<tr>
<td>round-trip-delay</td>
<td>The instantaneous round-trip delay. This may be obtained from the RTCP SR reports.</td>
</tr>
<tr>
<td>receive-delay</td>
<td>The minimum delay that will be applied to the packets received when using an adaptive jitter buffer.</td>
</tr>
<tr>
<td>voice-quality-total-packet-loss</td>
<td>The total number of packets lost by the jitter buffer in the RTP stream.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# voice service voip</td>
<td>Enables media statistics to estimate the values of packet loss, jitter, and Round Trip Time (RTT) statistics.</td>
</tr>
</tbody>
</table>

#### Step 4

**media statistics**

**Example:**

Device(conf-voi-serv)# media statistics

- The statistics are displayed using the **show voice history** and **show call active voice** commands.
- If the **media statistics** command is disabled, the values will be zero.

#### Step 5

**end**

**Example:**

Device(conf-voi-serv)# end

Returns to privileged EXEC mode.

---

**Verifying Voice Quality Monitoring**

Perform this task to verify the configuration for voice quality monitoring. The **show** commands can be entered in any order.

**SUMMARY STEPS**

1. **enable**
2. **show call active voice** | **include LostPackets**
3. **show call active voice** | **include ReceiveDelay**
4. **show call active voice brief** | **sec RTT**
5. **show call active voice stats** | **sec MC**

**DETAILED STEPS**

#### Step 1

**enable**

Enables privileged EXEC mode.

**Example:**

Device> **enable**

#### Step 2

**show call active voice** | **include LostPackets**

Displays statistics on the CUBE if the Voice Quality Metrics feature is configured.

**Example:**

Device# **show call active voice** | **include LostPackets**

LostPackets=0
LostPackets=0

#### Step 3

**show call active voice** | **include ReceiveDelay**
Displays statistics on the CUBE if the Voice Quality Metrics feature is configured.

**Example:**

```
Device# show call active voice | include ReceiveDelay
ReceiveDelay=0
ReceiveDelay=0
```

**Step 4**  
**show call active voice brief | sec RTT**

Displays a truncated version of call information for voice calls in CUBE if the Voice Quality Metrics feature is configured.

**Note** This command is not applicable for TDM-IP voice calls.

**Example:**

```
Device# show call active voice brief | sec RTT
IP 173.39.65.81:7078 SRTP: off rtt:12ms pl:0/0ms lost:0/0/0 delay:0/0/0ms g711ulaw
TextRelay: off Transcoded: No ICE: Off
IP 10.127.17.141:18920 SRTP: off rtt:12ms pl:0/0ms lost:0/0/0 delay:0/0/0ms g711ulaw
TextRelay: off Transcoded: No ICE: Off
```

**Step 5**  
**show call active voice stats | sec MC**

Displays R-Factor Statistics (G.107 MOS) on the CUBE if the Voice Quality Metrics feature is configured. A sample output is provided below for a voice call using G.711ulaw, VAD on, and at 5 percent packet loss rate.

**Example:**

```
Device# show call active voice stats | sec MC
DSP/RF: ML=, MC=, R1=, R2=, IF=, ID=, IE=, BL=, R0=, VR=
DSP/RF: ML=4.2346, MC=4.2346, R1=92, R2=92, IF=0, ID=0, IE=0, BL=0, R0=93, VR=2.0
DSP/RF: ML=4.2346, MC=4.2346, R1=92, R2=92, IF=0, ID=0, IE=0, BL=0, R0=93, VR=2.0
```

The following is an example output for the SNMP MIB:

```
cmqVoIPCallActiveRxPred107RMosConv.8520964.1 = 423 (MC)
```

For more information on the SNMP MIB "cmqVoIPCallActiveRxPred107RMosConv", see SNMP Object Navigator.

In the sample output, the following can be noted:

- ML for codec G.711ulaw is 4.2346.
- MC for codec G.711ulaw is 4.2346.
- IE for codec G.711 is 0.
- R0 is 93.

The following table defines the abbreviations used in the sample output.

<table>
<thead>
<tr>
<th>Type</th>
<th>Abbreviation</th>
<th>Definition</th>
</tr>
</thead>
</table>

Table 99: Router Output Definitions for the show call active voice stats command
### Troubleshooting Tips

Use the following debug commands to troubleshoot the Voice Quality Monitoring feature:

- `debug voip rtp packets`
- `debug performance monitor`
- `debug radius accounting`
- `debug aaa accounting`

### Configuration Examples for Voice Quality Monitoring

**Example: Configuring Media Statistics Globally**

```
Device> enable
Device# configure terminal
Device(config)# voice service voip
Device(config)# voice service voip
Device(config)# media statistics
Device(config)# end
```

**Example: CDR Enabled MOS Output**

At the end of a call, the MOSQe output is displayed in CDR only if the `debug radius accounting` is enabled.

The `show log | sec MOS-Con` command displays the MOS-Con value as shown below:

```
Device# show log | sec MOS-Con
```
Example: CDR Enabled MOS Output

PART XXII

Smart Licensing

• Cisco Smart Software Licensing, on page 959
Cisco Smart Software Licensing

Cisco Smart Software Licensing provides a simple cloud-based solution for managing and tracking the use of your licenses and entitlements across your business.

When purchased, licenses are automatically delivered to your company Smart Account, ready for use. Devices report license use by registering to your Smart Account either directly across the internet, through an internet proxy, or by using a Smart Software Manager satellite to mediate reporting from devices across the business.

Cisco Smart Software Manager (CSSM) is the secure, cloud-based portal used to:

- Assign licenses to business entities using Virtual Accounts.
- Register devices to Virtual Accounts.
- Manage license inventory and monitor use.
- Track device authorization for feature use.

For more information on Cisco Smart Licensing, see [http://www.cisco.com/go/smartlicensing](http://www.cisco.com/go/smartlicensing).

- Feature Information for CUBE Smart Licensing, on page 959
- Registration and License Compliance, on page 960
- Smart Software Licensing Task Flow for CUBE, on page 961
- Verify Smart License Operation for CUBE, on page 963
- CUBE High Availability (HA) Configurations, on page 967

Feature Information for CUBE Smart Licensing

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.
Registration and License Compliance

Devices are required to register with the Cisco Smart Software Manager or satellite to report feature usage and compliance with purchased entitlements. The Smart Agent running on the CUBE platform transitions between the following operational states to control the use of licensed features:

### Smart Agent Licensing States

- **Unregistered / Evaluation Mode**—When the platform is first used, the Smart Agent is in the unregistered state. In this state, licensed features may be used freely during a 90-day evaluation period.

- **Unregistered / Evaluation Expired**—If the Smart Agent has not successfully registered by the end of the evaluation period, licensed functionality, including CUBE features, are disabled.

- **Registered**—To enable licensed features, the platform must be registered to CSSM or satellite using a registration ID token. Once registered, the Smart Agent receives an Identity Certificate that is saved securely and used for all ongoing communications. The certificate is valid for one year and will be renewed automatically after six months to ensure continuous operation. While registered, the Smart Agent maintains one of the three authorization states relating to each license type by periodically reporting license usage to the CSSM or satellite:
  - **Authorized**—If the associated Smart Account has enough licenses to reserve for the platform, it indicates to the Smart Agent that the features are fully authorized for use. The Smart Agent renews the authorization every 30 days.
  - **Out of Compliance**—If the associated Smart Account does not have enough licenses to reserve for the platform, it will indicate to the Smart Agent that the current feature use is Out of Compliance. Currently, CUBE functionality is not limited in this state.
  - **Authorization Expired**—If the Smart Agent is not able to communicate with the CSSM or satellite for 90 days or more, authorization expires. Currently, CUBE functionality is not limited in this state.

- **Registration Expired**—If the Smart Agent is not able to contact the CSSM or satellite before the Identity Certificate expires, the platform returns to the unregistered state. The platform resumes the remaining evaluation period, only if available. After registration expires, registration to the CSSM or satellite using a new registration ID token is required.

---

**Note**

Each platform provides a single 90-day evaluation period. This period is persistent across the reloads and is based on the router's uptime.
Smart Software Licensing Task Flow for CUBE

The process for using and validating Smart Licensing for CUBE is common to the host platform. Tasks are summarized to highlight requirements specific to the CUBE application.

Task Flow:
1. Obtain a registration ID token from the Virtual Account to which you wish to register the platform. See Obtain the Registration ID Token, on page 961.
2. If using an internet proxy or Smart Software Manager satellite, update the Smart Licensing transport settings. See Configure Smart Licensing Transport Settings, on page 961.
3. Register the Host Platform with CSSM or Satellite, on page 962.
4. Configure CUBE Licensed Features, on page 963.

Obtain the Registration ID Token

Detailed Steps
1. Log in to your Smart Account in either CSSM or satellite.
2. Navigate to the Virtual Account with which you want to register the CUBE.
3. Generate a registration ID token.

Configure Smart Licensing Transport Settings

Step 1 hostname hostname

Example:
Device(config)# hostname cube
cube(config)#
Ensure that hostname and the PID of the platform are not the same. For example, if the hostname of an ASR1006 router is configured as "ASR1006", registration will be unsuccessful.

Step 2 ip name-server IP Address

Example:
cube(config)# ip name-server 10.0.0.1 10.0.0.10
Configures valid DNS servers to ensure the correct resolution of the CSSM or satellite hostname.

Step 3 ip http client source-interface interface name

Example:
cube(config)# ip http client source-interface GigabitEthernet0/0/0
Binds the platform HTTP client to the interface used to access the CSSM or satellite.
Register the Host Platform with CSSM or Satellite

To report license usage, the host platform must be registered to either CSSM or satellite. The platform remains in evaluation mode until registered.

Before you begin
1. Obtain the registration ID token from your Smart Account.
2. Configure Smart Licensing transport settings.

license smart register id_token id_token

Example:

Device# license smart register id_token XXXXXXXXXXXnVhaUZlRH0rQjJERT0%3D

Registers the CUBE with the CSSM or satellite using a registration ID token that you obtain from your Smart Account.
Configure CUBE Licensed Features

Step 1  voice service voip
Example:
cube(config)# voice service voip
Enters global VoIP configuration mode.

Step 2  mode border-element license capacity sessions
Example:
Device(config)# mode border-element license capacity 25
Enables the specified number of licenses for CUBE.

Verify Smart License Operation for CUBE

Use the following commands to verify the platform registration and license usage:

- **show cube status**—Displays CUBE license capacity and a count of calls that are blocked when the evaluation period has expired.

  ```
cube#show cube status
CUBE-Version : 12.5.0
SW-Version : 16.11.1, Platform CSR1000V
HA-Type : none
Licensed-Capacity : 10
Calls blocked (Smart Licensing Not Configured) : 0
Calls blocked (Smart Licensing Eval Expired) : 0
  ```

- **show license status**—Displays the platform registration and authorization status.

  ```
cube#show license status

Use the following commands to debug any issues that are related to your Smart License:
CUBE High Availability (HA) Configurations

Smart Licensing with CUBE Box-to-Box High Availability (HA)

Box-to-Box redundancy uses the Redundancy Group (RG) Infrastructure to form an Active/Standby pair of routers.

For Smart License configurations on the Active/Standby pair of router platforms, see Smart Software Licensing Task Flow for CUBE, on page 961. When reporting license usage, the Smart Agent includes details of its High Availability group and, if it is in the Active or Standby state. Thus allowing the CSSM or satellite to group license requirements for the High Availability pair.

CUBE Box-to-Box High Availability requires CUBE Trunk Redundant Session licenses.

Before Failover

- Register both the platforms in the High Availability configuration to the same Smart Virtual Account on CSSM or satellite.
- The CSSM or satellite authorizes license usage requests for both Active and Standby platforms.
- Only licenses that are requested by the Active server are reserved from the license pool.

After Failover

- The platform that switches to Active mode reports the license usage to the CSSM or satellite.
- The CSSM or satellite switches the license reservation to the new Active server, ensuring that no additional licenses are used from the Smart Account during failover.
- When the originally Active platform recovers, it is authorized as a Standby server without consuming more licenses from the Smart Account.

Verify Smart License Operation for Box-to-Box High Availability (HA)

You can use all the commands that are given in the section Verify Smart License Operation for CUBE, on page 963 to verify the licensing status in High Availability mode. The following commands specifically reflect Smart License information that is related to Box-to-Box High Availability (HA):

- **show cube status**—Displays CUBE license capacity and High Availability mode.

  ```
  cube-1# show cube status
  CUBE-Version : 12.5.0
  SW-Version : 16.11.1, Platform CSR1000V
  HA-Type : hot-standby-chassis-to-chassis
  Licensed-Capacity : 10
  Calls blocked (Smart Licensing Eval Expired) : 0
  ```

- **show license usage**—Displays license usage and authorization status
show license usage

**Smart Licensing with CUBE Inbox High Availability (HA)**

You can configure an ASR1000 router platform with two Route Processors for Inbox High Availability using Stateful Switchover (SSO). In this configuration, one Route Processor is active while the other is in standby mode.

For the Smart License configuration, see Smart Software Licensing Task Flow for CUBE, on page 961. Only the Active Route Processor in the SSO configuration reports license usage, so CSSM reserves one set of licenses for the platform.

CUBE Inbox High Availability requires CUBE Trunk Standard Session licenses.
Before Failover

- Smart License configuration is synchronized between the two Route Processors. Only the Active Route Processor registers with CSSM or satellite.
- The CSSM or satellite authorizes license usage requests for the Active Route Processor.

After Failover

- The Route Processor that switches to active mode, reports license usage to the CSSM or satellite.
- As the new report appears to come from the same device, the CSSM or satellite retains the original reservation for the platform.

Verify Smart License Operation for Inbox High Availability (HA)

You can use all the commands that are given in the section Verify Smart License Operation for CUBE, on page 963 to verify the licensing status in the High Availability mode. The following commands specifically reflect Smart License information that is related to Inbox High Availability (HA):

- **show cube status**—Displays CUBE license capacity and High Availability mode.

  ```
  cube-1# sh cube status
  CUBE-Version : 12.5.0
  SW-Version : 16.11.1, Platform Platform ASR1006
  HA-Type : hot-standby-card-to-card
  Licensed-Capacity : 10
  Calls blocked (Smart Licensing Not Configured) : 0
  Calls blocked (Smart Licensing Eval Expired) : 0
  ```

- **show redundancy states**—Displays the redundancy state of the route processors.

  ```
  cube-1# show redundancy states
  my state - 13 -ACTIVE

PART XXIII

Serviceability

• Support for Session Identifier, on page 975
Support for Session Identifier

Cisco Unified Border Element (CUBE) supports “Session Identifier” for end-to-end tracking of a SIP session in IP-based multimedia communication systems. Support for session identifier is in compliance with RFC 7206 and draft-ietf-insipid-session-id-15.

- Feature Information for Session Identifier Support, on page 975
- Restrictions, on page 976
- Information About Session Identifier, on page 976
- Configuring Support for Session Identifier, on page 977
- Troubleshooting Tips, on page 977

Feature Information for Session Identifier Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 100: Feature Information for Session Identifier Support

<tr>
<td>Support for Session Identifier</td>
<td>Cisco IOS 15.6(2)T</td>
<td>This feature enables CUBE to support “Session Identifier” for end-to-end tracking of a SIP session in IP-based multimedia communication systems in compliance with RFC 7206 and draft-ietf-insipid-session-id-15. A new keyword <code>session-id</code> is added to the following commands:</td>
</tr>
</tbody>

|                                  | Cisco IOS XE Denali 16.3.1       | • show call active voice  
• show call active video  
• show call history voice  
• show call history video  
• show call active voice brief  
• show call active video brief  |

**Restrictions**

- Session Identifier is not supported for SIP-H.323, H.323-SIP, and H.323-H.323 calls.

**Information About Session Identifier**

CUBE supports “Session Identifier” that overcomes the limitations with the existing call-identifiers and allows end-to-end tracking of a SIP session. To support session identifier, “Session-ID” header is added in the SIP request and response messages.

**Note**

"Session Identifier" refers to the value of the identifier, whereas "Session-ID" refers to the header field used to convey the identifier.

The Session-ID comprises of Universally Unique Identifier (UUID) for each user agent participating in a call. Each call consists of two UUID known as local UUID and remote UUID. Local UUID is the UUID generated from the originating user agent and remote UUID is generated from the terminating user agent. The UUID values are presented as strings of lower-case hexadecimal characters, with the most significant octet of the
UUID appearing first. Session Identifier comprises of 32 characters and remains same for the entire session. Refer to RFC 4122 for more information on UUID.

Example for Session ID header

```
Session-ID: ab30317f1a784dc48ff824d0d3715d86; remote=47755a9de7794ba387653f2099600ef2
```

In the above example:

Local UUID =

```
ab30317f1a784dc48ff824d0d3715d86
```

Remote UUID =

```
47755a9de7794ba387653f2099600ef2
```

Feature Behavior

• If all the user agents associated with CUBE support session-id, then CUBE allows pass-through of the Session ID header in all SIP request and response messages for the session.

• CUBE looks for the Session ID header present in the SIP messages and validates the SessionID header syntax as defined in draft-ietf-insipid-session-id-15. Session ID format earlier to draft-ietf-insipid-session-id-15 is considered as unsupported.

• If some of the user agents do not support session ID, CUBE generates local UUID on behalf of the user agent and sends the generated UUID in SIP request and response. CUBE generates UUID based on version 5 (SHA-1).

• If a Session ID is received in the format as defined in RFC 7329, CUBE considers it as unsupported. CUBE generates local UUID on behalf of the user agent and sends the generated UUID in SIP request and response.

• In a mid call scenario, where user a session is switched from supporting session identifier to non-supporting session identifier, CUBE saves the previous non-NULL session identifier and sends the saved non-NULL session identifier in re-invite messages as needed.

• For high availability, session ID is check pointed in active and re-created in standby.

Configuring Support for Session Identifier

Session Identifier support is enabled on CUBE by default. No additional configuration required.

Troubleshooting Tips

The following show commands helps you to troubleshoot any issues with session identifier.

- `show call active voice session-id WORD`
- show call active voice brief session-id
- show call active video session-id
- show call active video brief session-id

*WORD* can be complete session identifier (local, remote, or both), or wildcard pattern of local or remote UUID. The valid wildcard patterns for search are *, 0-9, a-f, A-F.

The following session identifier is considered in the below examples:

```
SessionIDLocaluuid=db248b6cbdc547bbc6c6fdef6916eeb
SessionIDRemoteuuid=4fd24d9121935531a7f8d750ad16e19
```

**Valid Search Patterns**

You can search for the session identifier using complete Session ID header as shown below:

```
Device# show call active voice session-id db248b6cbdc547bbc6c6fdef6916eeb;
remote=4fd24d9121935531a7f8d750ad16e19
```

Telephony call-legs: 0
SIP call-legs: 1
H323 call-legs: 0

```
SessionIDLocaluuid=db248b6cbdc547bbc6c6fdef6916eeb
SessionIDRemoteuuid=4fd24d9121935531a7f8d750ad16e19
```

SCCP call-legs: 0
Multicast call-legs: 0
Total call-legs: 1

You can search for the session identifier using complete local UUID as shown below:

```
Device# show call active voice session-id db248b6cbdc547bbc6c6fdef6916eeb
```

Telephony call-legs: 0
SIP call-legs: 1
H323 call-legs: 0

```
SessionIDLocaluuid=db248b6cbdc547bbc6c6fdef6916eeb
SessionIDRemoteuuid=4fd24d9121935531a7f8d750ad16e19
```

SCCP call-legs: 0
Multicast call-legs: 0
Total call-legs: 1

You can search for the session identifier using complete remote UUID as shown below:

```
Device# show call active voice session-id 4fd24d9121935531a7f8d750ad16e19
```

Telephony call-legs: 0
SIP call-legs: 1
H323 call-legs: 0

```
SessionIDLocaluuid=db248b6cbdc547bbc6c6fdef6916eeb
SessionIDRemoteuuid=4fd24d9121935531a7f8d750ad16e19
```

SCCP call-legs: 0
Multicast call-legs: 0
Total call-legs: 1
You can search for session id using wildcard pattern match as shown below:

**Device# show call active voice session-id 4fd2**
Telephony call-legs: 0
SIP call-legs: 2
H323 call-legs: 0

**Device# show call active voice session-id *f*16e**
Telephony call-legs: 0
SIP call-legs: 2
H323 call-legs: 0

**Device# show call active voice brief session-id ***
Telephony call-legs: 0
SIP call-legs: 2
H323 call-legs: 0
Device# show call active voice session-id *; remote=*  
Telephony call-legs: 0  
SIP call-legs: 2  
H323 call-legs: 0  

SessionIDLocaluuid=4fd24d9121935531a7f8d750ad16e19  
SessionIDRemoteuuid=db248b6c2c547bb8c66f6d6f6b6916eeb  

Device# show call active video session-id ;remote=*  
Incorrect format for Session-ID Wildcard Pattern regular expression must be of the form  
^\[0-9A-Fa-f*\]+$  
Invalid Pattern. Pattern can have a string with ^\[0-9a-fA-F*\]+$ only OR a string with  
^\[0-9a-fA-F*\];remote=\[0-9a-fA-F*\]+$.

Device# show call active voice session-id 4fd24d9*;remote=*16eeb  
Incorrect format for Session-ID Wildcard Pattern regular expression must be of the form  
^\[0-9A-Fa-f*\]+$  
Invalid Pattern. Pattern can have a string with ^\[0-9a-fA-F*\]+$ only OR a string with  
^\[0-9a-fA-F*\];remote=\[0-9a-fA-F*\]+$.

Invalid Search Patterns

The following wildcard search patterns are invalid:

Device# show call active voice session-id ;remote=  
Invalid Pattern. Pattern can have a string with ^\[0-9a-fA-F*\]+$ only OR a string with  
^\[0-9a-fA-F*\];remote=\[0-9a-fA-F*\]+$.

Device# show call active voice session-id *;remote=  
Invalid Pattern. Pattern can have a string with ^\[0-9a-fA-F*\]+$ only OR a string with  
^\[0-9a-fA-F*\];remote=\[0-9a-fA-F*\]+$.

Device# show call active video session-id ;remote=*  
Incorrect format for Session-ID Wildcard Pattern regular expression must be of the form  
^\[0-9A-Fa-f*\]+$  
Invalid Pattern. Pattern can have a string with ^\[0-9a-fA-F*\]+$ only OR a string with  
^\[0-9a-fA-F*\];remote=\[0-9a-fA-F*\]+$.

Device# show call active voice session-id 4fd24d9*remote=16eeb  
Incorrect format for Session-ID Wildcard Pattern regular expression must be of the form  
^\[0-9A-Fa-f*\]+$  
Invalid Pattern. Pattern can have a string with ^\[0-9a-fA-F*\]+$ only OR a string with  
^\[0-9a-fA-F*\];remote=\[0-9a-fA-F*\]+$.
Search using Null session identifier

If one of the session identifier is null, you can search for the session identifiers using 0 as wildcard pattern. The following session identifier is considered in the below example:

SessionIDLocaluuid=00000000000000000000000000000000
SessionIDRemoteuuid=4fd24d9121935531a7f8d750ad16e19

Device# show call active voice session-id 0
Telephony call-legs: 0
SIP call-legs: 2
H323 call-legs: 0
...
SessionIDLocaluuid=00000000000000000000000000000000
SessionIDRemoteuuid=4fd24d9121935531a7f8d750ad16e19
...
SCCP call-legs: 0
Multicast call-legs: 0
Total call-legs: 2

Correlation between Session Identifier and Call Identifier

The following session identifier is considered in the below examples:

SessionIDLocaluuid=db248b6cbdc547bbc6c6f6df6916eeb
SessionIDRemoteuuid=4fd24d9121935531a7f8d750ad16e19

You can search for session identifier using the local UUID as shown below:

Device# show call active voice session-id d82c680a3eacd5c29ac6ceea225061
Telephony call-legs: 0
SIP call-legs: 2
H323 call-legs: 0
Call agent controlled call-legs: 0
SCCP call-legs: 0
Multicast call-legs: 0
...
VOIP:
ConnectionId[0x8CDAC180 0x10000 0x1B7 0x5B56400A]
IncomingConnectionId[0x8CDAC180 0x10000 0x1B7 0x5B56400A]
CallID=1022
GlobalCallId=[0xC3DAB665 0x770C11E5 0x80318550 0x5A000ED7]
SessionIDLocaluuid=d82c680a3eacd5c29ac6ceea225061
SessionIDRemoteuuid=6497636d0b747785241cfbf5aa225064
CallReferenceId=0
CallServiceType=Unknown
RTP Loopback Call=FALSE
RemoteIPAddress=10.64.86.91
RemoteUDPPort=16614
RemoteSignallingIPAddress=10.64.86.91
RemoteSignallingPort=5060
RemoteMediaIPAddress=10.127.17.142
RemoteMediaPort=16614
CoderTypeRate=g711ulaw

GlobalCallId=[0xC3DAB665 0x770C11E5 0x80318550 0x5A000ED7]
SessionIDLocaluuid=6497636d0b747785241cfbf5aa225064
SessionIDRemoteuuid=d82c680a3eaeced5c29ac6ceeeaa225061
RemoteIPAddress=10.64.86.91
RemoteUDPPort=21978
RemoteSignallingIPAddress=10.64.86.91
RemoteSignallingPort=5060
RemoteMediaIPAddress=10.127.17.188
RemoteMediaPort=21978

From the above output, you get to know that 1022 (highlighted) is the call identifier associated with the local session identifier d82c680a3eaeced5c29ac6ceeeaa225061. You can now use this call identifier to get further details and debugging of the desired call as shown below:

Device# show sip-ua calls callid 1022

PART XXIV

Security Compliance

• Common Criteria (CC) and The Federal Information Processing Standards (FIPS) Compliance, on page 987
Common Criteria (CC) and The Federal Information Processing Standards (FIPS) Compliance

Cisco Unified Border Element is Common Criteria (CC) and The Federal Information Processing Standards (FIPS) certified. The certification is applicable to Cisco Unified Border Element on Cisco CSR 1000v Series Cloud Services Router platform only.

Common Criteria (CC)

Common Criteria (CC) is a global security to which security products are evaluated. Common Criteria product certifications are mutually recognized by 28 nations, thus an evaluation that is conducted in one country is recognized by the other countries.

The Common Criteria for Information Technology Security Evaluation is an international standard (ISO/IEC 15408) that guarantees product security. The organizations (Government or Enterprise IT) specify functional and assurance requirements, the vendors claim and develop specific product qualities. The testing facilities examine products to determine whether they meet those vendor claims. Common Criteria guarantees that the process of specification, execution and assessment of a product has been conducted in a stringent and standardized manner.

The Federal Information Processing Standards (FIPS)

The Federal Information Processing Standards (FIPS) Publication 140-2, Security Requirements for Cryptographic Modules, details the U.S. government requirements for cryptographic modules. FIPS 140-2 specifies that a cryptographic module should be a set of hardware, software, firmware, or some combination that implements cryptographic functions or processes, including cryptographic algorithms and, optionally, key generation, and is contained within a defined cryptographic boundary.

FIPS specifies certain crypto algorithms as secure, and it also identifies which algorithms should be used if a cryptographic module is to be called FIPS compliant.

- Feature Information for Common Criteria (CC) and The Federal Information Standards (FIPS) Compliance, on page 988
- Supported Hardware and Software for Virtual CUBE, on page 988
- Common Criteria Configuration on Cisco CSR 1000v, on page 988
- FIPS Configuration on Cisco CSR 1000v, on page 1000
Feature Information for Common Criteria (CC) and The Federal Information Standards (FIPS) Compliance

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Supported Hardware and Software for Virtual CUBE

For details on prerequisites for Virtual CUBE, see Supported Hardware and Software for Virtual CUBE.

Common Criteria Configuration on Cisco CSR 1000v

Enable Common Criteria Mode

Before you begin

- Delete existing certificates.
- Remove existing crypto keys.
- Remove existing TLS configuration (TLS version and Cipher Suites).

Step 1 enable

Example:

Router# enable

Enables privileged EXEC mode.
- Enter your password if prompted.

Step 2 configure terminal
Example:
Router# configure terminal
Enters global configuration mode.

Step 3  cc-mode
Example:
Router(config)# cc-mode
Enables common criteria configuration mode.

What to do next
Common Criteria (CC) mode enforces certain security checks for cryptographic protocols such as Transport Layer Security (TLS). CUBE uses TLS to secure signaling over SIP and HTTP client for XCC providers. Configure SIP TLS and HTTP TLS in the Common Criteria (CC) mode.

SIP TLS Configuration

SIP TLS Configuration Task Flow
Following are the steps to configure SIP TLS on your Cisco CSR 1000v router in Common Criteria mode.
1. Generate RSA Public Key, on page 989
2. Configure Certificate Authority Server, on page 990
3. Configure CSR Trustpoint, on page 991
4. Configure Peer Trustpoint, on page 992
5. Add Client Verification Trustpoint, on page 993
6. Enforce Strict SRTP, on page 994

Generate RSA Public Key

Step 1  enable
Example:
Router#enable
Enables privileged EXEC mode.
  • Enter your password if prompted.

Step 2  configure terminal
Example:
Router#configure terminal
Enters global configuration mode.
Step 3  
```bash
crypto key generate rsa label key-label modulus modulus-size
```

**Example:**
```
Router(config)#crypto key generate rsa general-keys label CUBE modulus 3072
```
Generates a public RSA key that is used with your CSR certificate.
- The `key-label` specifies the name that is used for an RSA key pair when they are exported.
- The `modulus-size` specifies the size of the key modulus. By default, the modulus of a Certification Authority (CA) key is 1024 bits. The size of the key modulus must be 2048 bits or higher, for it to be Common Criteria compliant.

Step 4  
```bash
exit
```

**Example:**
```
Router(config)#exit
```
Exits global configuration mode.

---

## Configure Certificate Authority Server

**Step 1**  
```bash
enable
```

**Example:**
```
Router# enable
```
Enables privileged EXEC mode.
- Enter your password if prompted.

**Step 2**  
```bash
configure terminal
```

**Example:**
```
Router# configure terminal
```
Enter global configuration mode.

**Step 3**  
```bash
crypto pki server cs-label
```

**Example:**
```
Router(config)# crypto pki server CUBE
```
Defines a label for the Certificate Server and enters the certificate server configuration mode.

**Note**  
If you have generated the RSA key pair manually using the command `crypto key generate rsa label key-label modulus modulus-size`, the `cs-label` must match with the `key-label`, otherwise a certificate with the default key size of 1024 bits is generated.

**Step 4**  
```bash
database level complete
```

**Example:**
```
Router(cs-server)# database level complete
```
Writes each issued certificate to the certificate enrollment database.
Step 5 **grant auto**

**Example:**

Router(cs-server)# grant auto

Automatically grants reenrollment requests for subordinate Certificate Authority (CA) server or Registration Authority (RA) mode Certificate Authority (CA).

Step 6 **hash sha384**

**Example:**

Router(cs-server)# hash sha384

Sets the hash function SHA-384 for the signature that the Cisco IOS Certificate Authority (CA) uses to sign all the certificates that are issued by the server.

Step 7 **no shut**

**Example:**

Router(cs-server)# no shut

%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key
% or type Return to exit

Password:

Re-enter password:

% Generating 3072 bit RSA keys, keys will be non-exportable...
[OK] (elapsed time was 0 seconds)

% Certificate Server enabled.

Enables or reenables the certificate server. If the subordinate certificate server is enabled for the first time, the certificate server generates the key and receives its signing certificate from the root certificate server.

After entering the passphrase (when prompted), the certificate server is enabled. This passphrase protects the private key.

Step 8 **exit**

**Example:**

Router(cs-server)# exit

Exits certificate server configuration mode.

---

**Configure CSR Trustpoint**

Step 1 **enable**

**Example:**

Router#enable

Enables privileged EXEC mode.

  * Enter your password if prompted.
Step 2  configure terminal

Example:
Router#configure terminal
Enters global configuration mode.

Step 3  crypto pki trustpoint name

Example:
Router(config)#crypto pki trustpoint CUBE-TLS
Declares the trustpoint with the name specified and enters trustpoint configuration mode. This trustpoint is used by your Router application for the TLS communication.

Step 4  hash sha384

Example:
Router(ca-trustpoint)#hash sha384
Sets the hash function SHA-384 for the signature that the Cisco IOS Certificate Authority (CA) uses to sign all the certificates that are issued by the server.

A trustpoint with sample CSR certificate with subject-name "CN=Secure-Router" and "rsakeypair Router" is given below. The "rsakeypair label" must match with the label of the RSA keys that are generated in the earlier steps.

crypto pki trustpoint CUBE-TLS
   enrollment url http://X.X.X.X:80
   serial-number none
   fqdn none
   ip-address none
   subject-name CN=Secure-CUBE
   revocation-check none
   rsakeypair Router

Step 5  exit

Example:
Router(ca-trustpoint)# exit
Exits trustpoint configuration mode.

---

Configure Peer Trustpoint

Step 1  enable

Example:
Router#enable
Enables privileged EXEC mode.

• Enter your password if prompted.

Step 2  configure terminal

Example:
Router#configure terminal
Enters global configuration mode.

**Step 3**  
crypto pki trustpoint *name*

**Example:**
Router(config)#crypto pki trustpoint xyzname

Declares the peer trustpoint with the name specified and enters trustpoint configuration mode.

**Step 4**  
enrollment terminal

**Example:**
Router(ca-trustpoint)#enrollment terminal

Specifies manual certificate enrollment via the cut-and-paste method for trustpoint peers. The certificate request displayed on the console terminal can be manually copied.

**Step 5**  
revocation-check none

**Example:**
Router(ca-trustpoint)#revocation-check none

Specifies that the certificate check is ignored.

**Step 6**  
exit

**Example:**
Router(ca-trustpoint)#exit

Exits trustpoint configuration mode.

---

### Add Client Verification Trustpoint

**Step 1**  
enable

**Example:**
Router#enable

Enables privileged EXEC mode.

- Enter your password if prompted.

**Step 2**  
configure terminal

**Example:**
Router#configure terminal

Enters global configuration mode.

**Step 3**  
sip-ua

**Example:**
Router(config)#sip-ua
Enters SIP User Agent configuration mode to configure SIP-UA related commands.

Step 4  
**crypto signaling remote-addr** remote ip address remote ip mask trustpoint CUBE's trustpoint label client-vtp verification trustpoint

Example:
Router(config-sip-ua)#crypto signaling remote-addr X.X.X.X 255.255.255.255 trustpoint CUBE-TLS client-vtp CUBE-VERIFY

Assigns a client verification trustpoint to SIP-UA. This client verification trustpoint is used to send Distinguished Name (DN) of the Certificate Authority (CA) server in the CUBE's client certificate request.

Step 5  
**exit**

Example:
Router(config-sip-ua)#exit

Exits sip-ua configuration mode.

---

**Enforce Strict SRTP**

Step 1  
**enable**

Example:
Router#enable

Enables privileged EXEC mode.
- Enter your password if prompted.

Step 2  
**configure terminal**

Example:
Router#configure terminal

Enters global configuration mode.

Step 3  
**voice service voip**

Example:
Router(config)#voice service voip

Enters voice service configuration mode and specifies the encapsulation method as VoIP.

Step 4  
**srtp**

Example:
Router(conf-voi-ser)#srtp

Enforces SRTP to secure the call flow through CUBE.

Step 5  
**exit**

Example:
Router(conf-voi-ser)#exit
Exits voice service configuration mode.

# HTTPS TLS Configuration

## HTTPS TLS Configuration Task Flow

Following are the steps to configure HTTPS TLS on your Cisco CSR 1000v router in Common Criteria mode.

1. Prepare Cisco CSR 1000v Router’s HTTP Server to Run in CC Mode, on page 995
2. Create Certificate Map for HTTPS Peer Trustpoint, on page 996
3. Configure HTTPS TLS Version, on page 997
4. Configure Supported Cipher Suites, on page 998
5. Apply Certificate Map to HTTPS Peer Trustpoint, on page 998

## Prepare Cisco CSR 1000v Router’s HTTP Server to Run in CC Mode

### Step 1

**enable**

**Example:**

```
Router#enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

### Step 2

**configure terminal**

**Example:**

```
Router#configure terminal
```

Enters global configuration mode.

### Step 3

**ip http server name**

**Example:**

```
Router(config)#ip http server
```

Enables the HTTP server on the Cisco CSR 1000v router, allowing the use of Cisco web browser UI to monitor the router and issue commands to it.

### Step 4

**ip http authentication local**

**Example:**

```
Router(config)#ip http authentication local
```

Specifies the authentication method for HTTP server users. The keyword `local` indicates that the username, password, and privilege level access combination that is specified in the local system configuration should be used for authentication and authorization.
Step 5  ip http secure-server

Example:
Router(config)#ip http secure-server
Enables a secure HTTP server on the Cisco CSR 1000v router.

Step 6  ip http secure-trustpoint trustpoint-name

Example:
Router(config)#ip http secure-trustpoint CUBE-TLS
Specifies the trustpoint that is used for obtaining signed certificates for a secure HTTP server on the Cisco CSR 1000v router.

Step 7  ip http secure-client-auth

Example:
Router(config)#ip http secure-client-auth
Configures the HTTP server to request an X.509v3 certificate from the client to authenticate the client during the connection process.

Step 8  ip http secure-peer-verify-trustpoint client's issuer

Example:
Router(config)#ip http secure-peer-verify-trustpoint secure-clientissuer
Configures the client verification trustpoint for the HTTP server on the Cisco CSR 1000v router. This peer verification trustpoint is used to send Distinguished Name (DN) of Certificate Authority (CA) in the client certificate request during the TLS handshake of HTTP.

Step 9  exit

Example:
Router(config)#exit
Exits the global configuration mode.

Create Certificate Map for HTTPS Peer Trustpoint

Step 1  enable

Example:
Router#enable
Enables privileged EXEC mode.

• Enter your password if prompted.

Step 2  configure terminal

Example:
Router#configure terminal
Enters global configuration mode.

**Step 3**  
**crypto pki certificate map label sequence-number**

**Example:**
```
Router(config)#crypto pki certificate map cubemap 10
```

Creates a certificate map that defines certificate-based Access Control Lists (ACLs) and enters the certificate map configuration mode. The *sequence-number* orders the ACLs with the same label. ACLs with the same label are processed from the lowest to the highest sequence number. When an ACL is matched, the processing stops with a successful result.

**Step 4**  
**alt-subject-name eq match-value**

**Example:**
```
Router(ca-certificate-map)#alt-subject-name peername
```

Specifies the certificate fields with their matching criteria in the certificate map configuration mode. The alternate subject name that is specified in the map must be present in SAN extension of the peer id certificate.

**Step 5**  
**exit**

**Example:**
```
Router(ca-certificate-map)#exit
```

Exits certificate map configuration mode.

---

### Configure HTTPS TLS Version

**Step 1**  
**enable**

**Example:**
```
Router#enable
```

Enables privileged EXEC mode.
- Enter your password if prompted.

**Step 2**  
**configure terminal**

**Example:**
```
Router#configure terminal
```

Enters global configuration mode.

**Step 3**  
**ip http tls-version version**

**Example:**
```
Router(config)#ip http tls-version TLSv1.2
```

Configures the specified TLS version for HTTPS. Configure TLSv1.1 or TLSv1.2 to be Common Criteria compliant.

**Step 4**  
**exit**

**Example:**
```
Router(config)#exit
```
Configure Supported Cipher Suites

Step 1  enable
Example:
Router#enable
Enables privileged EXEC mode.
  • Enter your password if prompted.

Step 2  configure terminal
Example:
Router#configure terminal
Enters global configuration mode.

Step 3  ip http secure-ciphersuite supported cipher suites
Example:
Specifies the cipher suites that are used for encryption over the secure HTTP connection between the client and the HTTP server. Common Criteria supports the cipher suites that are given in the preceding example. Configure all the cipher suites if you are not aware of the client cipher support.

Step 4  exit
Example:
Router(config)#exit
Exits global configuration mode.

Apply Certificate Map to HTTPS Peer Trustpoint

Step 1  enable
Example:
Router#enable
Enables privileged EXEC mode.
  • Enter your password if prompted.

Step 2  configure terminal
Example:
Router#configure terminal
Enters global configuration mode.

Step 3 crypto pki trustpoint name
Example:
Router(config)#crypto pki trustpoint CUBE-HTTPS
Declares the HTTPS peer trustpoint for the Cisco CSR 1000v router.

Step 4 match certificate map name
Example:
Router(ca-trustpoint)#match certificate cubemap
Associates the certificate map that is defined by using the crypto pki certificate map command with the HTTPS trustpoint. The map name argument in the match certificate command must match the label argument that is specified in the previously defined crypto pki certificate map command.

Step 5 match eku attribute
Example:
Router(ca-trustpoint)#match eku client-auth server-auth
Allows the HTTPS peer which acts as a client and a server to validate a peer certificate only if the specified Extended Key Usage (EKU) attribute is present in the certificate. If the Cisco CSR 1000v router is a client, then you must configure server-auth. If Cisco CSR 1000v router is a server, then you must configure client-auth.

Step 6 exit
Example:
Router(ca-trustpoint)#exit
Exits trustpoint configuration mode.

NTP Configuration Restrictions in Common Criteria Mode

In Common Criteria mode, the following restrictions are applicable to NTP configuration.

- Do not configure NTP version 1 and 2. Following are the NTP version commands.
  - ntp server ip-address prefer source interface version version
  - ntp peer ip-address version version

- Do not configure NTP broadcast. Following are the NTP broadcast commands.
  - ntp broadcast delay delay-timer
  - ntp broadcast client
  - ntp broadcast destination ip-address
  - ntp broadcast destination ip-address key key
• ntp broadcast destination ip-address key key version version
• ntp broadcast version version

• Do not configure NTP multicast command ntp multicast version version.

FIPS Configuration on Cisco CSR 1000v

Configuration Requirements for FIPS Compliance

There is no specific command to enable FIPS mode. For the Virtual CUBE on the Cisco CSR 1000v router to be FIPS-compliant, the following commands must be configured.

• crypto key generate rsa modulus modulus-size

  The modulus-size varies from 360 bits to 4096 bits. The size of the RSA key must be 2048 bit or higher for FIPS compliance.

• The Hash Algorithms that are configured using the command hash sha384 under the configured trustpoint and the crypto pki server on the CSR must use sha384 or greater, namely sha512.
PART XXV

</table>
AMR-NB — Adaptive Multi Rate codec - Narrow Band.

Allow header — Lists the set of methods supported by the UA generating the message.

bind — In SIP, configuring the source address for signaling and media packets to the IP address of a specific interface.

call — In SIP, a call consists of all participants in a conference invited by a common source. A SIP call is identified by a globally unique call identifier. A point-to-point IP telephony conversation maps into a single SIP call.

call leg — A logical connection between the router and another endpoint.

CLI — Command-line interface.

Content-Type header — Specifies the media type of the message body.

CSeq header — Serves as a way to identify and order transactions. It consists of a sequence number and a method. It uniquely identifies transactions and differentiates between new requests and request retransmissions.

delta — An incremental value. In this case, the delta is the difference between the current time and the time when the response occurred.

dial peer — An addressable call endpoint.

DNS — Domain Name System. Used to translate H.323 IDs, URLs, or e-mail IDs to IP addresses. DNS is also used to assist in locating remote gatekeepers and to reverse-map raw IP addresses to host names of administrative domains.

DNS SRV — Domain Name System Server. Used to locate servers for a given service.

DSP — Digital Signal Processor.

DTMF — Dual-tone multifrequency. Use of two simultaneous voice-band tones for dialing (such as touch-tone).

EFXS — IP phone virtual voice ports.

FQDN — Fully qualified domain name. Complete domain name including the host portion; for example, serverA.companyA.com.
FXS—analog telephone voice ports.

gateway—A gateway allows SIP or H.323 terminals to communicate with terminals configured to other protocols by converting protocols. A gateway is the point where a circuit-switched call is encoded and repackaged into IP packets.

H.323—An International Telecommunication Union (ITU-T) standard that describes packet-based video, audio, and data conferencing. H.323 is an umbrella standard that describes the architecture of the conferencing system and refers to a set of other standards (H.245, H.225.0, and Q.931) to describe its actual protocol.

iLBC—internet Low Bitrate Codec.

INVITE—A SIP message that initiates a SIP session. It indicates that a user is invited to participate, provides a session description, indicates the type of media, and provides insight regarding the capabilities of the called and calling parties.

IP—Internet Protocol. A connectionless protocol that operates at the network layer (Layer 3) of the OSI model. IP provides features for addressing, type-of-service specification, fragmentation and reassembly, and security. Defined in RFC 791. This protocol works with TCP and is usually identified as TCP/IP. See TCP/IP.

ISDN—Integrated Services Digital Network.

Minimum Timer—Configured minimum value for session interval accepted by SIP elements (proxy, UAC, UAS). This value helps minimize the processing load from numerous INVITE requests.

Min-SE—Minimum Session Expiration. The minimum value for session expiration.

multicast—A process of transmitting PDUs from one source to many destinations. The actual mechanism (that is, IP multicast, multi-unicast, and so forth) for this process might be different for LAN technologies.

originator—User agent that initiates the transfer or Refer request with the recipient.

PDU—protocol data units. Used by bridges to transfer connectivity information.

PER—Packed Encoding Rule.

proxy—A SIP UAC or UAS that forwards requests and responses on behalf of another SIP UAC or UAS.

proxy server—An intermediary program that acts as both a server and a client for the purpose of making requests on behalf of other clients. Requests are serviced internally or by passing them on, possibly after translation, to other servers. A proxy interprets and, if necessary, rewrites a request message before forwarding it.

recipient—User agent that receives the Refer request from the originator and is transferred to the final recipient.

redirect server—A server that accepts a SIP request, maps the address into zero or more new addresses, and returns these addresses to the client. It does not initiate its own SIP request or accept calls.

re-INVITE—An INVITE request sent during an active call leg.

Request URI—Request Uniform Resource Identifier. It can be a SIP or general URL and indicates the user or service to which the request is being addressed.

RFC—Request For Comments.

RTP—Real-Time Transport Protocol (RFC 1889)

SCCP—Skinny Client Control Protocol.

SDP—Session Description Protocol. Messages containing capabilities information that are exchanged between gateways.
**session** — A SIP session is a set of multimedia senders and receivers and the data streams flowing between the senders and receivers. A SIP multimedia conference is an example of a session. The called party can be invited several times by different calls to the same session.

**session expiration** — The time at which an element considers the call timed out if no successful INVITE transaction occurs first.

**session interval** — The largest amount of time that can occur between INVITE requests in a call before a call is timed out. The session interval is conveyed in the Session-Expires header. The UAS obtains this value from the Session-Expires header of a 2xx INVITE response that it sends. Proxies and UACs determine this value from the Session-Expires header in a 2xx INVITE response they receive.

**SIP** — Session Initiation Protocol. An application-layer protocol originally developed by the Multiparty Multimedia Session Control (MMUSIC) working group of the Internet Engineering Task Force (IETF). Their goal was to equip platforms to signal the setup of voice and multimedia calls over IP networks. SIP features are compliant with IETF RFC 2543, published in March 1999.

**SIP URL** — Session Initiation Protocol Uniform Resource Locator. Used in SIP messages to indicate the originator, recipient, and destination of the SIP request. Takes the basic form of `user@host`, where `user` is a name or telephone number, and `host` is a domain name or network address.

**SPI** — service provider interface.

**socket listener** — Software provided by a socket client to receives datagrams addressed to the socket.

**stateful proxy** — A proxy in keepalive mode that remembers incoming and outgoing requests.

**TCP** — Transmission Control Protocol. Connection-oriented transport layer protocol that provides reliable full-duplex data transmissions. TCP is part of the TCP/IP protocol stack. See also TCP/IP and IP.

**TDM** — time-division multiplexing.

**UA** — user agent. A combination of UAS and UAC that initiates and receives calls. See UAS and UAC.

**UAC** — user agent client. A client application that initiates a SIP request.

**UAS** — user agent server. A server application that contacts the user when a SIP request is received and then returns a response on behalf of the user. The response accepts, rejects, or redirects the request.

**UDP** — User Datagram Protocol. Connectionless transport layer protocol in the TCP/IP protocol stack. UDP is a simple protocol that exchanges datagrams without acknowledgments or guaranteed delivery, requiring that error processing and retransmission be handled by other protocols. UDP is defined in RFC-768.

**URI** — Uniform Resource Identifier. Takes a form similar to an e-mail address. It indicates the user’s SIP identity and is used for redirection of SIP messages.

**URL** — Universal Resource Locator. Standard address of any resource on the Internet that is part of the World Wide Web (WWW).

**User Agent** — A combination of UAS and UAC that initiates and receives calls. See UAS and UAC.

**VFC** — Voice Feature Card.

**VoIP** — Voice over IP. The ability to carry normal telephone-style voice over an IP-based Internet with POTS-like functionality, reliability, and voice quality. VoIP is a blanket term that generally refers to the Cisco standards-based approach (for example, H.323) to IP voice traffic.
