# **Dial-peer Based Recording**

The Dial-peer Based Recording feature supports software-based forking for Real-time Transport Protocol (RTP) streams. Media forking provides the ability to create midcall multiple streams (or branches) of audio and video associated with a single call and then send the streams of data to different destinations. To enable network-based recording using Cisco Unified Border Element (CUBE), you can configure specific commands or use a call agent. CUBE acts as a recording client and MediaSense Session Initiation Protocol (SIP) recorder acts a recording server.

### **Feature Information**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="https://www.cisco.com/go/cfn">www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

Table 1: Feature Information for Network-Based Recording

Feature Name	Releases	Feature Information
Enhanced support for serviceability in SIP recording	Cisco IOS XE 17.18.1a	Serviceability is enhanced to display consolidated information on forked and associated anchor call legs.  The following command is introduced or modified: show voip recmsp session detail forked call-id.

Feature Name	Releases	Feature Information
Security Readiness Criteria (SRC)—Modified the command show sip-ua calls		Command <b>show sip-ua calls</b> is modified to display local crypto key and remote cryto key.

## **Deployment Scenarios for CUBE-based Recording**

CUBE as a recording client has the following functions:

- Acts as a SIP user agent and sets up a recording session (SIP dialog) with the recording server.
- Acts as the source of the recorded media and forwards the recorded media to the recording server.
- Sends information to a server that helps the recording server associate the call with media streams and identifies the participants of the call. This information sent to the recording server is called metadata.

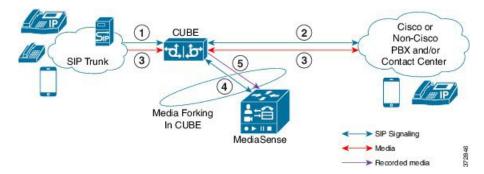

Note

CUBE simply forwards the RTP streams it receives to the SIP recorder. It does not support omitting any pre-agent VRU activity from the recording.

If you want to omit the VRU segment from a recording, you must use the Unified CVP to route the agent segment of the call back through CUBE. To do this, you need to separate ingress and media forking function from one another, which means you must either route the call through the ingress router a second time, or route it through a second router.

Given below is a typical deployment scenario of a CUBE-based recording solution. The information flow is described below:

Figure 1: Deployment Scenario for CUBE-based Recording Solution

- 1. Incoming call from SIP trunk.
- 2. Outbound call to a Contact Centre
- **3.** Media between endpoints flowthrough CUBE
- **4.** CUBE sets up a new SIP session with MediaSense based on policy.
- **5.** CUBE forks RTP media to MediaSense. For an audio call, audio is forked. For a video call, both audio and video are .forked. For an audio-only configuration in a audio-video call, only audio is forked. There will be two or four m-lines to the recording server, based on the type of recording

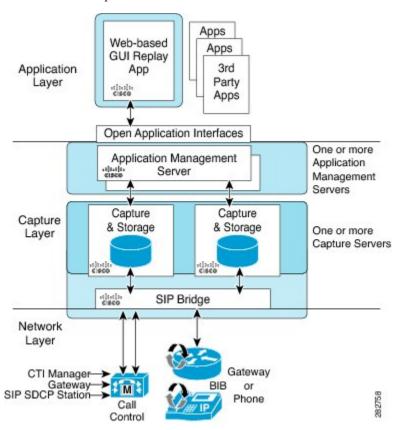

The metadata carried in the SIP session between the recording client and the recording server is to:

- Carry the communication session data that describes the call.
- Send the metadata to the recording server. The recording server uses the metadata to associate communication sessions involving two or more participants with media streams.

The call leg that is created between the recording client and the recording server is known as the recording session.

## **Open Recording Architecture**

The Open Recording Architecture (ORA) comprises of elements, such as application management server and SIP bridge, to support IP-based recording. The ORA IP enables recording by solving topology issues, which accelerates the adoption of Cisco unified communication solutions.

Following are the three layers of the ORA architecture:

### **Network Layer**

The ORA network layer is comprises call control systems, media sources, and IP foundation components, such as routers and switches.

### **Capture and Media Processing Layer**

The ORA capture and media processing layer includes core functions of ORA—terminating media streams, storage of media and metadata, and speech analytics that can provide real-time events for applications.

### **Application Layer**

The ORA application layer supports in-call and post-call applications through open programming interfaces.

In-call applications include applications that make real-time business decisions (for example, whether to record a particular call or not), control pause and resume from Interactive Voice Response (IVR) or agent desktop systems, and perform metadata tagging and encryption key exchange at the call setup.

Post-call applications include the following:

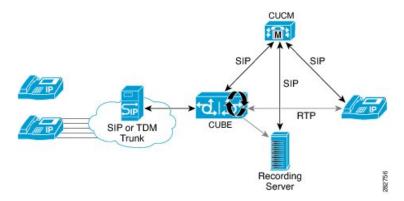

- Traditional compliance search, replay, and quality monitoring.
- Advanced capabilities, such as speech analytics, transcription, and phonetic search.
- Custom enterprise integration.
- Enterprise-wide policy management.

## **Media Forking Topologies**

The following topologies support media forking:

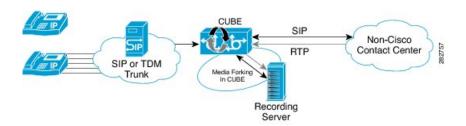

### **Media Forking with Cisco UCM**

The figure below illustrates media forking with Cisco Unified CallManager (Cisco UCM) topology. This topology supports replication of media packets to allow recording by the caller agent. It also enables CUBE to establish full-duplex communication with the recording server. In this topology, SIP recording trunk is enhanced to have additional call metadata.

### **Media Forking without Cisco UCM**

The topology below shows media forking without the Cisco UCM topology. This topology supports static configuration on CUBE and the replication of media packets to allow recording caller-agent and full-duplex interactions at an IP call recording server.

### **SIP Recorder Interface**

SIP is used as a protocol between CUBE and the MediaSense SIP server. Extensions are made to SIP to carry the recording session information needed for the recording server. This information carried in SIP sessions between the recording client and the recording server is called metadata.

#### Metadata

Metadata is the information that is passed by the recording client to the recording server in a SIP session. Metadata describes the communication session and its media streams.

Metadata is used by the recording server to:

- Identify participants of the call.
- Associate media streams with the participant information. Each participant can have one or more media streams, such as audio and video.
- Identify the participant change due to transfers during the call.

The recording server uses the metadata information along with other SIP message information, such as dialog ID and time and date header, to derive a unique key. The recording server uses this key to store media streams and associate the participant information with the media streams.

### Restrictions

- Dial-peer recording is not supported for the following calls:
  - Flow-around calls
  - Session Description Protocol (SDP) pass-through calls
  - Real-time Transport Protocol (RTP) loopback calls
  - High-density transcoder calls
  - IPv6-to-IPv6 calls
  - IPv6-to-IPv4 calls with IPv4 endpoint.
  - Secure Real-time Transport Protocol (SRTP) passthrough calls
  - SRTP-RTP calls with forking for SRTP leg (forking is supported for the RTP leg)
  - Resource Reservation Protocol (RSVP)

- Multicast music on hold (MOH)
- Any media service parameter change via Re-INVITE or UPDATE from Recording server is not supported Midcall renegotiation and supplementary services can be done through the primary call only.
- Recording is not supported if CUBE is running a TCL IVR application with the exception of survivability.tcl, which is supported with network based recording.
- Media mixing on forked streams is not supported
- Digital Signal Processing (DSP) resources are not supported on forked legs
- RecordTone insertion is not supported with SRTP calls.
- MediaForkingReason tag is to notify midcall stream events. Notification for codec change is not supported.
- Forking a single call on a CUBE using both dial-peer based recording and SIPREC is not supported.

#### **Restrictions for Video Recording**

- If the main call has multiple video streams (m-lines), the video streams other than the first video m-line are not forked.
- Application media streams of the primary call are not forked to the recording server.
- Forking is not supported if the anchor leg or recording server is on IPv6.
- High availability is not supported on forked video calls.
- Server Groups in outbound dial-peers towards recorders is not supported.

# **Configure Dial-peer Recording**

## **Configure Dial-peer Recording (with Media Profile Recorder)**

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. media profile recorder profile-tag
- 4. (Optional) media-type audio
- **5. media-recording** *dial-peer-tag* [*dial-peer-tag*2...*dial-peer-tag*5]
- 6. exit
- 7. media class tag
- 8. recorder profile tag
- 9. exit
- 10. dial-peer voice dummy-recorder-dial-peer-tag voip
- 11. media-class tag
- **12. destination-pattern** [+] *string* [T]

- 13. session protocol sipv2
- **14. session target ipv4:**[recording-server-destination-address | recording-server-dns]
- 15. session transport tcp
- **16**. end

### **DETAILED STEPS**

### **Procedure**

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	media profile recorder profile-tag	Configures the media profile recorder and enters media	
	Example:	profile configuration mode.	
	Device(config)# media profile recorder 100		
Step 4	(Optional) media-type audio	Configures recording of audio only in a call with both	
	Example:	audio and video. If this configuration is not done, both audio and video are recorded.	
	Device(cfg-mediaprofile) # media-type audio		
Step 5	media-recording dial-peer-tag	Configures the dial-peers that need to be configured.	
	[dial-peer-tag2dial-peer-tag5]	Note	
	Example:	You can specify a maximum of five dial-peer tags.	
	Device(cfg-mediaprofile) # media-recording 8000 8001 8002		
Step 6	exit	Exits media profile configuration mode.	
	Example:		
	Device(cfg-mediaprofile)# exit		
Step 7	media class tag	Configures a media class and enters media class	
	Example:	configuration mode.	
	Device(config)# media class 100		

	Command or Action	Purpose
Step 8	recorder profile tag	Configures the media profile recorder.
	Example:	
	Device(cfg-mediaclass)# recorder profile 100	
Step 9	exit	Exits media class configuration mode.
	Example:	
	Device(cfg-mediaclass)# exit	
Step 10	dial-peer voice dummy-recorder-dial-peer-tag voip	Configures a recorder dial peer and enters dial peer voice
	Example:	configuration mode.
	Device(config)# dial-peer voice 8000 voip	
Step 11	media-class tag	Configures media class on a dial peer.
	Example:	
	Device(config-dial-peer)# media-class 100	
Step 12	destination-pattern [+] string [T]	Specifies either the prefix or the full E.164 telephone
	Example:	number (depending on your dial plan) to be used for a dial peer.
	Device(config-dial-peer)# destination-pattern 595959	Note
	393939	The predefined valid entries for <i>string</i> are the digits 0 to 9, the letters A to F and, the following special characters:
		• The asterisk (*) and pound sign (#) that appear on standard touch-tone dial pads.
		• Plus sign (+), which indicates that the preceding digit occurred one or more times.
		Backslash symbol (\), which is followed by a single character, and matches that character.
		Media Forking functionality does not work with the wildcard entries other than the predefined set.
Step 13	session protocol sipv2	Configures the VoIP dial peer to use Session Initiation
	Example:	Protocol (SIP).
	Device(config-dial-peer)# session protocol sipv2	
Step 14	session target	Specifies a network-specific address for a dial peer.
	<b>ipv4:</b> [recording-server-destination-address   recording-server-dns]	Keyword and argument are as follows:
	Example:	• <b>ipv4:</b> destination address IP address of the dial peer in this format: xxx.xxx.xxx

	Command or Action	Purpose
	Device(config-dial-peer)# session target ipv4:10.42.29.7	
Step 15	Step 15 session transport tcp Configures a VoIP dial peer to us	Configures a VoIP dial peer to use Transmission Control
Example:	Protocol (TCP).	
	Device(config-dial-peer)# session transport tcp	
Step 16	end	Returns to privileged EXEC mode.
	Example:	
	Device(config-dial-peer)# end	

# **Configure Dial-peer Recording (without Media Profile Recorder)**

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. media class tag
- 4. recorder parameter
- 5. (Optional) media-type audio
- 6. media-recording dial-peer-tag
- 7. exit
- 8. exit
- 9. dial-peer voice dummy-recorder-dial-peer-tag voip
- 10. media-class tag
- 11. destination-pattern [+] string [T]
- 12. session protocol sipv2
- $\textbf{13.} \quad \textbf{session} \quad \textbf{target} \quad \textbf{ipv4:} [\textit{recording-server-destination-address} \mid \textit{recording-server-dns}]$
- 14. session transport tcp
- 15. end

#### **DETAILED STEPS**

#### **Procedure**

	Command or Action	Purpose	
Step 1 enable		Enables privileged EXEC mode.	
	Example:	Enter your password if prompted.	
	Device> enable		

	Command or Action	Purpose
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	media class tag	Configures the media class and enters media class
	Example:	configuration mode.
	Device(config)# media class 100	
Step 4	recorder parameter	Enters media class recorder parameter configuration mode
	Example:	to enable you to configure recorder-specific parameters.
	Device(cfg-mediaclass)# recorder parameter	
Step 5	(Optional) media-type audio	Configures recording of audio only in a call with both audio and video.
	Example:	Note
	Device(cfg-mediaprofile) # media-type audio	If this configuration is not done, both audio and video are recorded.
Step 6	media-recording dial-peer-tag	Configures voice-class recording parameters.
	Example:	Note You can specify a maximum of five dial-peer tags.
	Device(cfg-mediaclass-recorder)# media-recording 8000, 8001, 8002	
Step 7	exit	Exits media class recorder parameter configuration mode.
	Example:	
	Device(cfg-mediaclass-recorder)# exit	
Step 8	exit	Exits media class configuration mode.
	Example:	
	Device(cfg-mediaclass)# exit	
Step 9	dial-peer voice dummy-recorder-dial-peer-tag voip	Configures a recorder dial peer and enters dial peer voice
	Example:	configuration mode.
	Device(config)# dial-peer voice 8000 voip	
Step 10	media-class tag	Configures media class on a dial peer.
	Example:	
	Device(config-dial-peer)# media-class 100	

	Command or Action	Purpose
Step 11	destination-pattern [+] string [T]  Example:	Specifies either the prefix or the full E.164 telephone number (depending on your dial plan) to be used for a dial peer.
	Device(config-dial-peer)# destination-pattern 595959	Note The predefined valid entries for <i>string</i> are the digits 0 to 9, the letters A to F and, the following special characters:
		• The asterisk (*) and pound sign (#) that appear on standard touch-tone dial pads.
		• Plus sign (+), which indicates that the preceding digit occurred one or more times.
		Backslash symbol (\), which is followed by a single character, and matches that character.
		Media Forking functionality does not work with the wildcard entries other than the predefined set.
Step 12	session protocol sipv2  Example:	Configures the VoIP dial peer to use Session Initiation Protocol (SIP).
	Device(config-dial-peer)# session protocol sipv2	
Step 13	session target ipv4:[recording-server-destination-address	Specifies a network-specific address for a dial peer. Keyword and argument are as follows:
	recording-server-dns]  Example:	• <b>ipv4:</b> destination addressIP address of the dial peer, in this format: xxx.xxx.xxx
	Device(config-dial-peer)# session target ipv4:10.42.29.7	
Step 14	session transport tcp  Example:	Configures a VoIP dial peer to use Transmission Control Protocol (TCP).
	Device(config-dial-peer)# session transport tcp	
Step 15	end	Returns to privileged EXEC mode.
	Example:	
	Device(config-dial-peer)# end	

# **Verify the Dial-peer Recording**

Perform this task to verify the configuration of the Network-Based Recording using CUBE. The **show** and **debug** commands can be entered in any order.

#### **SUMMARY STEPS**

- 1. enable
- 2. show voip rtp connections
- 3. show voip recmsp session
- 4. show voip recmsp session detail call-id call-id
- 5. show voip recmsp session detail forked call-id call-id
- 6. show voip rtp forking
- 7. show call active voice compact
- 8. show call active video compact
- 9. show sip-ua calls
- 10. show call active video brief
- 11. debug ccsip messages (for audio calls)
- 12. debug ccsip messages (for video calls)
- debug ccsip messages (for audio-only recording in a call with both audio and video)
- **14.** Enter one of the following:
  - · debug ccsip all
  - · debug voip recmsp all
  - · debug voip ccapi all
  - debug voip fpi all (for ASR devices only)

#### **DETAILED STEPS**

#### **Procedure**

#### Step 1 enable

Enables privileged EXEC mode.

#### Example:

Device> enable

#### Step 2 show voip rtp connections

Displays Real-Time Transport Protocol (RTP) connections. Two extra connections are displayed for forked legs.

#### Example:

#### Device# show voip rtp connections

```
VoIP RTP Port Usage Information:
Max Ports Available: 8091, Ports Reserved: 101, Ports in Use: 8
Port range not configured, Min: 16384, Max: 32767
```

Media-Address Range	Ports Available	Ports Reserved	Ports In-use
Default Address-Range	8091	101	8
VoIP RTP active connections :			

No. CallId dstCallId LocalRTP RmtRTP LocalIP RemoteIP

1	1	2	16384	20918	10.104.45.191	10.104.8.94
2	2	1	16386	17412	10.104.45.191	10.104.8.98

6	7	5	16394	53828	10.104.45.191	10.104.105.232
7	8	5	16396	39318	10.104.45.191	10.104.105.232
8	9	5	16398	41114	10.104.45.191	10.104.105.232
Found	8 f	active RTP connec	ctions			

#### Step 3 show voip recmsp session

Displays active recording Media Service Provider (MSP) session information internal to CUBE.

#### Example:

```
Device# show voip recmsp session
RECMSP active sessions:
```

MSP Call-ID AnchorLeg Call-ID ForkedLeg Call-ID 143 141 145
Found 1 active sessions

#### Step 4 show voip recmsp session detail call-id call-id

#### **Example:**

Displays detailed information about the recording MSP Call ID.

```
Device# show voip recmsp session detail call-id 145
RECMSP active sessions:
Detailed Information
Recording MSP Leg Details:
Call ID: 143
GUID: 7C5946D38ECD
AnchorLeg Details:
Call ID: 141
Forking Stream type: voice-nearend
Participant: 708090
Non-anchor Leg Details:
Call ID: 140
Forking Stream type: voice-farend
Participant: 10000
Forked Leg Details:
Call ID: 145
Near End Stream CallID 145
Stream State ACTIVE
Far End stream CallID 146
Stream State ACTIVE
Found 1 active sessions
Device# show voip recmsp session detail call-id 5
RECMSP active sessions:
Detailed Information
_____
Recording MSP Leg Details:

Found 1 active sessions
```

The table below describes the fields shown in this output.

Table 2: show voip recmsp session detail call-id Field Descriptions

Output Field	Description
Stream State	Displays the state of the call. This can be ACTIVE or HOLD.
Msp Call-Id	Displays an internal Media service provider call ID and forking related statistics for an active forked call.
Anchor Leg Call-id	Displays an internal anchor leg ID, which is the dial peer where forking enabled. The output displays the participant number and stream type. Stream type voice-near end indicates the called party side.
Non-Anchor Call-id	Displays an internal non-anchor leg ID, which is the dial peer where forking is not enabled. The output displays the participant number and stream type. Stream type voice-near end indicates the called party side.
Forked Call-id	This forking leg call-id will show near-end and far-end stream call-id details with the state of the Stream.
	Displays an internal forked leg ID. The output displays near-end and far-end details of a stream.

#### Step 5 show voip recmsp session detail forked call-id call-id

#### Example:

The following is a sample output displaying anchor and forked call-id session details for dial-peer based recording:

```
Device# show voip recmsp session detail forked call-id 77
RECMSP active sessions:
CC Call-ID: 74 Anchor:
Dur: 00:00:56 Dialpeer-Tag: 9:
  Stream 1: voice-only
  tx: 1500/300000 rx: 1498/299600
  Remote-Addr: 10.10.10.162:6000, Local-Addr: 10.10.10.195:8124
  Status: ACTIVE
 Stream 2: video
   tx: 604/77704 rx: 611/78617
  Remote-Addr: 10.10.10.162:6002, Local-Addr: 10.10.10.195:8126
  Status: ACTIVE
CC Call-ID: 77 Forked:
Dur: 00:00:56 Dialpeer-Tag: 10:
 Stream 1: voice-nearend
  tx: 1500/300000
  Remote-Addr: 10.10.10.162:6000, Local-Addr: 10.10.10.195:8128
  Status: ACTIVE
  Stream 2: voice-farend
  tx: 1490/299600
  Remote-Addr: 10.10.10.162:6002, Local-Addr: 10.10.10.195:8130
  Status: ACTIVE
 Stream 3: video-nearend
  tx: 604/77704
  Remote-Addr: 10.10.10.162:6004, Local-Addr: 10.10.10.195:8132
   Status: ACTIVE
 Stream 4: video-farend
  tx: 611/78617
  Remote-Addr: 10.10.10.162:6006, Local-Addr: 10.10.10.195:8134
   Status: ACTIVE
Found 1 active sessions
```

The table below describes the fields shown in this output.

Table 3: show voip recmsp session detail forked call-id Field Descriptions

Output Field	Description
Msp Call-Id	Displays an internal Media Service Provider (MSP) call ID and forking related statistics for an active forked call.
Anchor Leg Call-id	Displays an internal anchor leg ID, which is the dial peer where forking enabled. The output displays the participant number and stream type. Stream type voice-near end indicates the called party side.
Forked Call-id	This forking leg call-id will show near-end and far-end stream call-id details with the state of the Stream.
	Displays an internal forked leg ID. The output displays near-end and far-end details of a stream.
CC Call-Id	Displays the call control call ID.
Duration	Duration of the call from the time of initiation of the call.
Tx/Rx	Displays the number of packets transmitted or received along with the byte count.
Remote Address/Local Address	Call destination and the originating terminal IP addresses.

Output Field	Description
Stream Type	Indicates the stream type. Supported types are - Voice-only, Video, Voice nearend/farend, and Video nearend/farend
Stream Status	Displays the state of the call. This can be ACTIVE or HOLD.

#### Step 6 show voip rtp forking

Displays RTP media-forking connections.

#### Example:

```
Device# show voip rtp forking
VoIP RTP active forks :
 Fork 1
  stream type voice-only (0): count 0
   stream type voice+dtmf (1): count 0
   stream type dtmf-only (2): count 0
   stream type voice-nearend (3): count 1
    remote ip 10.42.29.7, remote port 38526, local port 18648
      codec g711ulaw, logical ssrc 0x53
      packets sent 29687, packets received 0
   stream type voice+dtmf-nearend (4): count 0
   stream type voice-farend (5): count 1
     remote ip 10.42.29.7, remote port 50482, local port 17780
      codec g711ulaw, logical ssrc 0x55
      packets sent 29686, packets received 0
   stream type voice+dtmf-farend (6): count 0
   stream type video (7): count
```

Output Field	Description
remote ip 10.42.29.7, remote port 38526, local port 18648	Recording server IP, recording server port, and local CUBE device port where data for stream 1 was first sent from.
remote ip 10.42.29.7, remote port 50482, local port 17780	Recording server IP, recording server port, and local CUBE device port where data for stream 2 was first sent from.
packets sent 29686	Number of packets sent to the recorder
codec g711ulaw	Codec negotiated for the recording leg.

### **Step 7** show call active voice compact

Displays a compact version of voice calls in progress. An additional call leg is displayed for media forking.

#### **Example:**

```
Device# show call active voice compact
<callID> A/O FAX T<sec> Codec type
                                            Peer Address
                                                             IP R<ip>:<udp>
Total call-legs: 3
      140 ANS
               T644 g711ulaw VOIP
                                           P10000
                                                        10.42.30.32:18638
      141 ORG
                T644 g711ulaw VOIP
                                            P708090

```

#### Step 8 show call active video compact

Displays a compact version of video calls in progress.

#### Example:

Device# show call active video compact

<callid></callid>	A/O FAX	T <sec></sec>	Codec	type	Peer Addre	ess	<pre>IP R<ip>:<udp></udp></ip></pre>
Total cal	l-legs: 3						
	1 ANS	T14	H264	VOIP-VIDEO	P1777	10.104	.8.94:20036
:	2 ORG	T14	H264	VOIP-VIDEO	P1888	10.104	.8.98:29652
	6 ORG	T13	H264	VOIP-VIDEO	P1234 1	10.104.10	5.232:39318

#### Step 9 show sip-ua calls

Displays active user agent client (UAC) and user agent server (UAS) information on SIP calls.

#### **Example:**

```
Device# show sip-ua calls
Total SIP call legs:2, User Agent Client:1, User Agent Server:1
SIP UAC CALL INFO
