Dial Peer Overview

Configuring dial peers is the key to implementing dial plans and providing voice services over an IP packet network. Dial peers are used to identify call source and destination endpoints and to define the characteristics applied to each call leg in the call connection.

This chapter contains the following sections:

- Finding Feature Information, page 1
- Call Legs, page 1
- POTS Dial Peers, page 4
- Voice-Network Dial Peers, page 4
- Data Dial Peers, page 5
- Creating a Dial Peer Configuration Table, page 5
- Codecs, page 7
- Toll Fraud Prevention, page 9

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Call Legs

A traditional voice call over the public switched telephone network (PSTN) uses a dedicated 64K circuit end to end. In contrast, a voice call over the packet network is made up of discrete segments or call legs. A call leg is a logical connection between two routers or between a router and a telephony device. A voice call
comprises four call legs, two from the perspective of the originating router and two from the perspective of
the terminating router, as shown in the figure below.

*Figure 1: Dial Peer Call Legs*

A dial peer is associated with each call leg. Attributes that are defined in a dial peer and applied to the call
leg include the codec, quality of service (QoS), voice activity detection (VAD), and fax rate. To complete a
voice call, you must configure a dial peer for each of the four call legs in the call connection.

Depending on the call leg, a call is routed using one of the two types of dial peers:

- **Plain old telephone system (POTS)**—Dial peer that defines the characteristics of a traditional telephony
  network connection. POTS dial peers map a dialed string to a specific voice port on the local router,
  normally the voice port connecting the router to the local PSTN, PBX, or telephone.

- **Voice-network**—Dial peer that defines the characteristics of a packet network connection. Voice-network
dial peers map a dialed string to a remote network device, such as the destination router that is connected
to the remote telephony device.

Both POTS and voice-network dial peers are needed to establish voice connections over a packet network.
When a voice call comes into the router, the router must match dial peers to route the call. For inbound calls
from a POTS interface that are being sent over the packet network, the router matches a POTS dial peer for
the inbound call leg and a voice-network dial peer for the outbound call leg. For calls coming into the router
from the packet network, the router matches an outbound POTS dial peer to terminate the call and an inbound
voice-network dial peer for features such as codec, VAD, and QoS.

The figure below shows the call legs and associated dial peers necessary to complete a voice call.

*Figure 2: Matching Call Legs to Dial Peers*

The following configurations show an example of a call being made from 4085554000 to 3105551000. The
figure below shows the inbound POTS dial peer and the outbound voice over IP (VoIP) dial peer that are
configured on the originating router. The POTS dial peer establishes the source of the call (via the calling
number or voice port), and the voice-network dial peer establishes the destination by associating the dialed number with the network address of the remote router.

**Figure 3: Dial Peers from the Perspective of the Originating Router**

In this example, the dial string `14085554000` maps to telephone number `555-4000`, with the digit `1` plus the area code `408` preceding the number. When you configure the destination pattern, set the string to match the local dialing conventions.

The figure below shows the inbound VoIP dial peer and outbound POTS dial peer that are configured on the terminating router to complete the call. Dial peers are of local significance only.

**Figure 4: Dial Peers from the Perspective of the Terminating Router**

In the previous configuration examples, the last four digits in the VoIP dial peer's destination pattern were replaced with wildcards. Which means that from Router A, calling any telephone number that begins with the digits "1310555" will result in a connection to Router B. This behavior implies that Router B services all numbers beginning with those digits. From Router B, calling any telephone number that begins with the digits "1408555" will result in a connection to Router A. This behavior implies that Router A services all numbers beginning with those digits.
It is not always necessary to configure the inbound dial peers. If the router is unable to match a configured dial peer for the inbound call leg, it uses an internally defined default POTS or voice-network dial peer to match inbound voice calls. In the example shown in the figure above, dial peer 2 is required only when making a call from Router B to Router A.

The only exception to the previous example occurs when both POTS dial peers share the same router, as shown in the figure below. In this circumstance, you do not need to configure a voice-network dial peer.

_Diagram: Communication Between Dial Peers Sharing the Same Router_

This type of configuration is similar to the configuration used for hairpinning, which occurs when a voice call destined for the packet network is instead routed back over the PSTN because the packet network is unavailable.

**POTS Dial Peers**

POTS dial peers retain the characteristics of a traditional telephony network connection. POTS dial peers map a dialed string to a specific voice port on the local router, normally the voice port connecting the router to the local PSTN, PBX, or telephone.

**Voice-Network Dial Peers**

Voice-network dial peers are components on an IP network to which a voice gateway router points via the component’s IP address specified in the `session-target` command for a particular matching dial peer. The four types of voice-network dial peers (VoIP, voice over ATM (VoATM), voice over Frame Relay (VoFR), and multimedia mail over IP (MMoIP)) are determined according to the given packet network technology and are described as follows:

- VoIP—Points to the IP address of the destination router that terminates the call.
• VoFR--Points to the data-link connection identifier (DLCI) of the interface from which the call exits the router.
• VoATM--Points to the ATM virtual circuit for the interface from which the call exits the router.
• MMoIP--Points to the e-mail address of the simple mail transfer protocol (SMTP) server. This type of dial peer is used only for fax traffic.

Data Dial Peers

Before Cisco IOS Release 12.2(11)T, a Cisco voice gateway would try to match a voice dial peer before matching and processing a modem call. If a voice dial peer was matched, the call was processed as voice. If there was no voice dial peer match, only then was a call considered to be a modem call. Voice calls always received preference over modem calls. Also, there was no way to assign a subset of addresses in the numbering plan for data calls.

In Cisco IOS Release 12.2(11)T, an interim solution in the form of an application called "data_dialpeer" was introduced to enable gateways to identify dial peers. The application enabled the handling of certain matched calls as modem calls. Refer to the Fine-Grain Address Segmentation in Dial Peers feature documentation in Cisco IOS Release 12.2(11)T for more information.

In Cisco IOS Release 12.2(13)T, formal support for data dial peers was released in the form of the Dial-Peer Support for Data Calls feature, which enables the configuration and order assignment of dial peers so that the gateway can identify incoming calls as voice or data (modem). You can use the dial-peer data and dial-peer search commands to perform this configuration. Refer to the "Data Dial Peers" section on page 33 for configuration steps and examples.

Creating a Dial Peer Configuration Table

Before you can configure dial peers, you must obtain specific information about your network. One way to identify this information is to create a dial peer configuration table. This table should contain all the telephone numbers and access codes for each router that is carrying telephone traffic in the network. Because most installations require integrating equipment into an existing voice network, the telephone dial plans are usually preset.

The figure below shows an example of a network in which Router A, with an IP address of 10.1.1.1, connects a small sales branch office to the main office through Router B, with an IP address of 10.1.1.2.
The example in the figure below shows a VoIP configuration. The same concepts also apply to VoFR and VoATM applications. The only change is in the format of the session target.

Figure 6: Sample VoIP Network

Three telephone numbers in the sales branch office need dial peers configured for them. Router B is the primary gateway to the main office; as such, it needs to be connected to the company’s PBX. Four devices need dial peers, all of which are connected to the PBX, configured for them in the main office.

The table below shows the peer configuration table for the example in the figure above.

The term codec stands for coder-decoder. A codec is a particular method of transforming analog voice into a digital bit stream (and vice versa) and also refers to the type of compression used. Several different codecs have been developed to perform these functions, and each one is known by the number of the International Telecommunication Union Telecommunication Standardization Sector (ITU-T) standard in which it is defined. For example, two common codecs are the G.711 and the G.729 codecs.

Codecs use different algorithms to encode analog voice into digital bit streams and have different bit rates, frame sizes, and coding delays associated with them. Codecs also differ in the amount of perceived voice quality they achieve. Specialized hardware and software in the digital signal processors (DSPs) perform codec transformation and compression functions, and different DSPs may offer different selections of codecs.

Select the same type of codec at both ends of the call. For instance, if a call was coded with a G.729 codec, it must be decoded with a G.729 codec. Codec choice is configured on dial peers.

The table below lists the H.323, SIP, and MGCP codecs that are supported for voice.

For more information, refer to the "Dial Planning" chapter in this document and see the Cisco IOS Voice Port Configuration Guide.

### Clear Channel (G.Clear) Codec

G.Clear guarantees bit integrity when transferring a DS-0 through a gateway server, supports the transporting of nonvoice circuit data sessions through a Voice over IP (VoIP) network, and enables the VoIP networks to transport ISDN and switched 56 circuit-switched data calls. With the availability of G.Clear, ISDN data calls that do not require bonding can be supported.

In a transit application, because it is possible to have a mix of voice and data calls, not supporting G.Clear limits the solution to voice-only calls. The end-user application is in charge of handling packet loss and error recovery. This packet loss management precludes the use of clear channel with some applications unless the IP network is carefully engineered.

In an MGCP environment, the voice gateway backhauls the public switched telephony network (PSTN) signaling channel to the call agent. The call agent examines the bearer capability and determines when a G.Clear call should be established.

**Note**

G.Clear codecs cannot be configured on a T1 channel associated signaling (CAS) trunk for incoming traffic. T1 CAS trunks use least significant bit-robbing for signaling, which causes the data to be incorrect and re-sent from high level protocols. Traffic on an incoming E1 R2 trunk can be configured.

### Adaptive Differential PCM Voice Codec G.726

Adaptive differential pulse code modulation (ADPCM) voice codec operates at bit rates of 16, 24, and 32 kbps. ADPCM provides the following functionality:

- Voice mail recording and playback, which is a requirement for Internet voice mail.
- Voice transport for cellular, wireless, and cable markets.
- High voice quality voice transport at 32 kbps.

### iLBC Codec

The internet Low Bitrate Codec (iLBC) has the following benefits:

- Is designed specifically for packet-based communication.
- Is royalty free.

<td>iLBC</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

---
• Provides high-voice quality, even in conditions with high-packet loss.
• Has a sampling rate of 8 kHz, for narrow band speech.
• Supports two fixed bit-rate frame lengths:
  • Bit-rate of 13.3 kbps with an encoding frame length of 30 ms
  • Bit-rate of 15.2 kbps with an encoding frame length of 20 ms
• Is designed to be robust, even with packet loss. iLBC treats each packet independently and recovers from packet loss on the packet immediately following the lost one. By utilizing the entire available frequency band, this codec provides a high voice quality.

Platforms that iLBC Supports
iLBC is supported on Cisco AS5350XM and Cisco AS5400XM Universal Gateways with Voice Feature Cards (VFCs) and IP-to-IP gateways with no transcoding and conferencing.

Using iLBC with SIP
• For iLBC codecs using SIP, use RFC3952 as a reference for implementation.
• Mid-call codec parameter changes using SIP are supported. For example, iLBC 'mode' and 'ptime' changes are supported using SIP during the call.

Using iLBC with H.323
• For iLBC codecs using H.323, a new proposal is written and submitted for approval to ITU. The new proposal is added as 'Annex S' in H245, Version 12 which is used as reference for implementation.

• Mid-call codec parameter changes using H.323 are not supported.

Toll Fraud Prevention
When a Cisco router platform is installed with a voice-capable Cisco IOS software image, appropriate features must be enabled on the platform to prevent potential toll fraud exploitation by unauthorized users. Deploy these features on all Cisco router Unified Communications applications that process voice calls, such as Cisco Unified Communications Manager Express (CME), Cisco Survivable Remote Site Telephony (SRST), Cisco Unified Border Element (UBE), Cisco IOS-based router and standalone analog and digital PBX and public-switched telephone network (PSTN) gateways, and Cisco contact-center VoiceXML gateways. These features include, but are not limited to, the following:
• Disable secondary dial tone on voice ports--By default, secondary dial tone is presented on voice ports on Cisco router gateways. Use private line automatic ringdown (PLAR) for foreign exchange office (FXO) ports and direct-inward-dial (DID) for T1/E1 ports to prevent secondary dial tone from being presented to inbound callers.
• Cisco router access control lists (ACLs)--Define ACLs to allow only explicitly valid sources of calls to the router or gateway, and therefore to prevent unauthorized Session Initiation Protocol (SIP) or H.323 calls from unknown parties to be processed and connected by the router or gateway.
Close unused SIP and H.323 ports--If either the SIP or H.323 protocol is not used in your deployment, close the associated protocol ports. If a Cisco voice gateway has dial peers configured to route calls outbound to the PSTN using either time division multiplex (TDM) trunks or IP, close the unused H.323 or SIP ports so that calls from unauthorized endpoints cannot connect calls. If the protocols are used and the ports must remain open, use ACLs to limit access to legitimate sources.

Change SIP port 5060--If SIP is actively used, consider changing the port to something other than well-known port 5060.

SIP registration--If SIP registration is available on SIP trunks, turn on this feature because it provides an extra level of authentication and validation that only legitimate sources can connect calls. If it is not available, ensure that the appropriate ACLs are in place.

SIP Digest Authentication--If the SIP Digest Authentication feature is available for either registrations or invites, turn this feature on because it provides an extra level of authentication and validation that only legitimate sources can connect calls.

Explicit incoming and outgoing dial peers--Use explicit dial peers to control the types and parameters of calls allowed by the router, especially in IP-to-IP connections used on CME, SRST, and Cisco UBE. Incoming dial peers offer additional control on the sources of calls, and outgoing dial peers on the destinations. Incoming dial peers are always used for calls. If a dial peer is not explicitly defined, the implicit dial peer 0 is used to allow all calls.

Explicit destination patterns--Use dial peers with more granularity than .T for destination patterns to block disallowed off-net call destinations. Use class of restriction (COR) on dial peers with specific destination patterns to allow even more granular control of calls to different destinations on the PSTN.

Translation rules--Use translation rules to manipulate dialed digits before calls connect to the PSTN to provide better control over who may dial PSTN destinations. Legitimate users dial an access code and an augmented number for PSTN for certain PSTN (for example, international) locations.

Tcl and VoiceXML scripts--Attach a Tcl/VoiceXML script to dial peers to do database lookups or additional off-router authorization checks to allow or deny call flows based on origination or destination numbers. Tcl/VoiceXML scripts can also be used to add a prefix to inbound DID calls. If the prefix plus DID matches internal extensions, then the call is completed. Otherwise, a prompt can be played to the caller that an invalid number has been dialed.

Host name validation--Use the "permit hostname" feature to validate initial SIP Invites that contain a fully qualified domain name (FQDN) host name in the Request Uniform Resource Identifier (Request URI) against a configured list of legitimate source hostnames.

Dynamic Domain Name Service (DNS)--If you are using DNS as the "session target" on dial peers, the actual IP address destination of call connections can vary from one call to the next. Use voice source groups and ACLs to restrict the valid address ranges expected in DNS responses (which are used subsequently for call setup destinations).

For more configuration guidance, see the Cisco IOS Unified Communications Toll Fraud Prevention paper.
Dial Planning

A dial plan essentially describes the number and pattern of digits that a user dials to reach a particular telephone number. Access codes, area codes, specialized codes, and combinations of the number of digits dialed are all part of a dial plan. For instance, the North American public switched telephone network (PSTN) uses a 10-digit dial plan that includes a 3-digit area code and a 7-digit telephone number. Most PBXs support variable length dial plans that use 3 to 11 digits. Dial plans must comply with the telephone networks to which they connect. Only totally private voice networks that are not linked to the PSTN or to other PBXs can use any dial plan they choose.

Dial plans on Cisco routers are manually defined using dial peers. Dial peers are similar to static routes; they define where calls originate and terminate and what path the calls take through the network. Attributes within the dial peer configuration determine which dialed digits the router collects and forwards to telephony devices. Dial peer configuration allows you to implement both fixed- and variable-length dial plans for your existing voice network and enables you to adjust to future scalability needs that may arise as your voice network expands or contracts.

This chapter contains the following sections:

- Finding Feature Information, page 11
- Fixed-Length Dial Plans, page 12
- Variable-Length Dial Plans, page 12

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Fixed-Length Dial Plans

Fixed-length dialing plans, in which all the dial peer destination patterns have a fixed length, are sufficient for most voice networks because the telephone number strings are of known lengths. Some voice networks, however, require variable-length dial plans, particularly for international calls, which use telephone numbers of different lengths.

If you enter the timeout T-indicator at the end of the destination pattern in an outbound voice-network dial peer, the router accepts a fixed-length dial string and then waits for additional dialed digits. The timeout character must be an uppercase T. The following dial peer configuration shows how the T-indicator is set to allow variable-length dial strings:

```
dial-peer voice 1 voip
  destination-pattern 2222T
  session target ipv4:10.10.1.1
```

In the example, the router accepts the digits 2222, and then waits for an unspecified number of additional digits. The router can collect up to 31 additional digits, as long as the interdigit timeout has not expired. When the interdigit timeout expires, the router places the call.

The default value for the interdigit timeout is 10 seconds. Unless the default value is changed, using the T-indicator adds 10 seconds to each call setup because the call is not attempted until the timer has expired (unless the # character is used as a terminator). You should therefore reduce the voice-port interdigit timeout value if you use variable-length dial plans. You can change the interdigit timeout by using the `timeout inter-digit` command in voice-port configuration mode.

The calling party can immediately terminate the interdigit timeout by entering the # character. If the # character is entered while the router is waiting for additional digits, the # character is treated as a terminator; it is not treated as part of the dial string or sent across the network. But if the # character is entered before the router begins waiting for additional digits (meaning that the # is entered as part of the fixed-length destination pattern), then the # character is treated as a dialed digit.

For example, if the destination pattern is configured as 2222...T, then the entire dialed string of 2222#9999 is collected, but if the dialed string is 2222#99#99, the #99 at the end of the dialed digits is not collected because the final # character is treated as a terminator. You can change the termination character by using the `dial-peer terminator` command.

In most cases, you must configure the T-indicator only when the router uses two-stage dialing. If direct inward dialing (DID) is configured in the inbound plain old telephone system (POTS) dial peer, the router uses one-stage dialing, which means that the full dialed string is used to match outbound dial peers. The only exception is when the `isdn overlap-receiving` command is configured; the ISDN overlap-receiving feature requires the T-indicator.

Variable-Length Dial Plans

In most voice configurations, fixed-length dialing plans, in which all the dial peer destination patterns have the same length, are sufficient because the telephone number strings are all the same length. However, in some voice network configurations, variable-length dial plans are required, especially if the network connects two or more countries where telephone number strings could be different lengths.
If you enter the "T" timer character in the destination pattern for your dial peer, the router can be configured to accept a fixed-length dial string, and then wait for additional dialed digits. For example, the following dial peer configuration shows how the T character can be set to allow variable-length dial strings:

```
dial peer voice 1 pots
    destination-pattern 2222T
    port 1/1
```

In this example, the router accepts the digits 2222, and then waits for an unspecified number of dialed digits. If digits continue to be entered before the interdigit timeout expires, then the router will continue to gather up to 31 additional digits. Once the interdigit timeout expires, however, the router places the call. You can configure the interdigit timeout value by using the `timeouts inter-digit` command in voice-port configuration mode.

The interdigit timeout timer can be terminated by entering the "#" character. If the # character is entered while the router is waiting to accept additional digits, the # character is treated as an end-dial accelerator. The # character is not treated as an actual digit in the destination pattern and is not sent as part of the dialed string across the network.

However, if the # character is entered before the router is ready to accept additional digits (meaning before the "T" character is entered in the destination pattern), then the # character is treated as a dialed digit. For example, if a destination pattern is configured with the string 2222...T, then the digits 2222####1234567 can be gathered, but the digits 2222###1234#67 cannot be gathered because the final # character is treated as a terminator.

The default value for the interdigit timeout is 10 seconds. If the duration is not changed, using the "T" timer adds 10 seconds to each call setup time because the call is not attempted until the timer expires (unless the # character is used as a terminator). Because of this dependency, if a variable-length dial plan is used, the interdigit timeout should be reduced to reduce the call setup time. For more information, refer to the "Variable-Length Matching" section on page 37.
Modes for Dial-Peer Configuration

You can manipulate a dial peer by configuring relevant commands globally, at a dial-peer level, or in a voice class that is then applied to a dial peer.

- How to Configure Modes for Dial-Peer Configuration, page 15

How to Configure Modes for Dial-Peer Configuration

Entering Dial-Peer Configuration Mode

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice number voip
4. Enter a command to configure dial-peer behavior.
5. exit

DETAILED STEPS

Dial Peer Features and Configuration

Establishing voice communication over a packet network is similar to configuring a static route: You are establishing a specific voice connection between two defined endpoints. Call legs define the discrete segments that lie between two points in the call connection. A voice call over the packet network comprises four call legs, two on the originating router and two on the terminating router; a dial peer is associated with each of these four call legs.

The example configurations in this section show voice over IP (VoIP) dial peers; the same concepts also apply to voice over Frame Relay (VoFR) and voice over ATM (VoATM) dial peers.

- Finding Feature Information, page 19
- Common Practices, page 20
- Data Dial Peers, page 39
- Inbound and Outbound Dial Peers, page 41
- Additional Features, page 48
- Where to Go for Dial Peer Troubleshooting Information, page 72

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Common Practices

The following three sections cover the bare essential configuration steps necessary to support voice transmission and reception on a typical voice gateway router in your network:

Voice Ports

Your dial peer configuration cannot function until you have logically assigned a voice port to one or more dial peers. Assigning voice ports to dial peers identifies the physical hardware in the router that will be employed to complete voice communication to and from associated voice network endpoints.

Assigning Voice Ports

The purpose of this task is to assign a voice port to a plain old telephone system (POTS) dial peer.

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice number pots
4. port string

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enters privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> dial-peer voice number pots</td>
<td>Enters dial-peer voice configuration mode and defines a local POTS dial peer.</td>
</tr>
<tr>
<td>Example:</td>
<td>• The number argument identifies the dial peer. Valid entries are from 1 to 2147483647.</td>
</tr>
<tr>
<td>Router(config)# dial-peer voice 864 pots</td>
<td></td>
</tr>
</tbody>
</table>
**Command or Action**  | **Purpose**  
---|---
**Step 4** |  
**port string** | Specifies the voice port associated with the given dial peer. The `port` command syntax is platform-specific. For more information about the syntax of this command, refer to the `port` command in the *Cisco IOS Voice, Video, and Fax Command Reference*.  

**Example:**  
```
Router(config-dialpeer)# port 1/0:0
```  

---

**What to Do Next**

---

**Note**  
Voice port assignments are configured for POTS dial peers only.

---

**Session Targets**

The session target is the network address of the remote router to which you want to send a call once a local voice-network dial peer is matched. It is configured in voice-network dial peers by using the `session target` command. For outbound dial peers, the destination pattern is the telephone number of the remote voice device that you want to reach. The session target represents the path to the remote router that is connected to that voice device. The figure below illustrates the relationship between the destination pattern and the session target, as shown from the perspective of the originating router.

**Figure 7: Relationship Between Destination Pattern and Session Target**

![Diagram of relationship between destination pattern and session target](image)

The address format of the session target depends on the type of voice-network dial peer:

- **VoIP**--IP address, host name of the Domain Name System (DNS) server that resolves the IP address, `ras` for registration, admission, and status (RAS) if an H.323 gatekeeper resolves the IP address, or `settlement` if the settlement server resolves the IP address
- **VoFR**--Interface type and number and the data link connection identifier (DLCI)
- **VoATM**--Interface number, and ATM virtual circuit
- **MMoIP**--E-mail address
Configuring Session Targets

The purpose of this task is to assign a session target to a voice-network dial peer.

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice number voip | vofr | voatm
4. session-target ip-address

</table>
Destination Patterns

The destination pattern associates a dialed string with a specific telephony device. It is configured in a dial peer by using the destination-pattern command. If the dialed string matches the destination pattern, the call is routed according to the voice port in POTS dial peers, or the session target in voice-network dial peers. For outbound voice-network dial peers, the destination pattern may also determine the dialed digits that the router collects and then forwards to the remote telephony interface, such as a PBX, a telephone, or the public switched telephone network (PSTN). You must configure a destination pattern for each POTS and voice-network dial peer that you define on the router.

Configuring Destination Patterns

The purpose of this task is to configure a destination pattern for a dial peer.

SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice number pots | voip | vofr | voatm
4. destination-pattern + string[T]

<td>• T --(Optional) Control character indicating that the answer-address value is a variable-length dial string.</td>
</tr>
</tbody>
</table>

### Digit Manipulation

The router may need to manipulate digits in a dial string before it passes the dial string to the telephony device. Which can be necessary, for instance, when calling PBXs with different capabilities to accept digits, or for PSTN and international calls. You may need to consider different strategies for configuring digit manipulation within your dial peers depending on your existing dial plan, the digits users are expected to dial, and the capabilities of your PBX or key system unit (KSU). These digit-manipulation options, in conjunction with the destination pattern, determine the dial string that the router forwards to the telephony device.

### Wildcards

The destination pattern can be either a complete telephone number or a partial telephone number with wildcard digits, represented by a period (.) character. Each "." represents a wildcard for an individual digit that the originating router expects to match. For example, if the destination pattern for a dial peer is defined as "555....", then any dialed string beginning with 555, plus at least four additional digits, matches this dial peer.

In addition to the period (.), several other symbols can be used as wildcard characters in the destination pattern. These symbols provide additional flexibility in implementing dial plans and decrease the need for multiple dial peers in configuring telephone number ranges.

The table below shows the wildcard characters that are supported in the destination pattern.
Table 3: Wildcard Symbols Used in Destination Patterns

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>Indicates a single-digit placeholder. For example, 555... matches any dialed string beginning with 555, plus at least four additional digits.</td>
</tr>
<tr>
<td>[ ]</td>
<td>Indicates a range of digits. A consecutive range is indicated with a hyphen (-); for example, [5-7]. A nonconsecutive range is indicated with a comma (,); for example, [5,8]. Hyphens and commas can be used in combination; for example, [5-7,9].</td>
</tr>
<tr>
<td>()</td>
<td>Indicates a pattern; for example, 408(555). It is used in conjunction with the symbol ?, %, or +.</td>
</tr>
<tr>
<td>?</td>
<td>Indicates that the preceding digit occurred zero or one time. Enter ctrl-v before entering ? from your keyboard.</td>
</tr>
<tr>
<td>%</td>
<td>Indicates that the preceding digit occurred zero or more times. This functions the same as the &quot;*&quot; used in regular expression.</td>
</tr>
<tr>
<td>+</td>
<td>Indicates that the preceding digit occurred one or more times.</td>
</tr>
<tr>
<td>T</td>
<td>Indicates the interdigit timeout. The router pauses to collect additional dialed digits.</td>
</tr>
</tbody>
</table>

Note: Only single-digit ranges are supported. For example, [98-102] is invalid.

Note: Using a range of digits is the same as keying in each individual number in the dialed string.

The table below shows some examples of how these wildcard symbols are applied to the destination pattern and the dial string that results when dial string 4085551234 is matched to an outbound POTS dial peer. The wildcard symbols follow regular expression rules.

Table 4: Dial Peer Matching Examples Using Wildcard Symbols

<td>51234</td>
</tr>
<tr>
<td>40855[5-7].%</td>
<td>40855, followed by 5, 6, or 7, plus any digit repeated one or more times.</td>
<td>51234</td>
</tr>
<tr>
<td>40855[5-7]+1234</td>
<td>40855, followed by 5, 6, or 7 repeated one or more times, followed by 1234.</td>
<td>51234</td>
</tr>
<tr>
<td>408(555)+1234</td>
<td>408, followed by 555, which may repeat one or more times, followed by 1234.</td>
<td>5551234</td>
</tr>
</tbody>
</table>

³ These examples apply only to one-stage dialing, where direct inward dialing (DID) is enabled on the inbound POTS dial peer. If the router is using two-stage dialing and collecting digits one at a time as dialed, then the call is routed immediately after a dial peer is matched and any subsequent dialed digits are lost.

In addition to wildcard characters, the following characters can be used in the destination pattern:

- Asterisk (*) and pound sign (#)--These characters on standard touch-tone dial pads can be used anywhere in the pattern. They can be used as the leading character (for example, *650), except on the Cisco 3600 series.

- Dollar sign ($)--Disables variable-length matching. It must be used at the end of the dial string.
If you have an exact match that needs preference or demands preference on the dial-peer, you can add a $ at the end of that dial string. This method allows the exact match preferred over the other random wildcard, creating a consistent result wherein there are two dial-peers with an 'overlap' of destinations and one dial-peer being a range wildcard and the other being an exact match.

Note
- Circumflex symbol (^)—When used within brackets, allows you to eliminate a digit from consideration for dial peer matching purposes. For example, a destination pattern including [^7] would not match any string beginning with 7.

Multiple digits can also be called out within brackets to eliminate more than one initial digit from dial peer matching. For example, a destination pattern including [^4^6^8] would not match any digit string beginning with 4, 6, or 8.

Note
- A destination pattern including [^752] would allow matching only for digit strings beginning with 5 or 2, but would not match any digit strings beginning with 7. This destination pattern entry essentially behaves the same way as if you had simply included [52] in the destination pattern.

To eliminate a multiple digit string from dial peer matching consideration, you must represent each digit in the string as a succession of individual exceptions. For example, if you wanted to eliminate matching any digit string beginning with 537 from consideration for dial peer matching, you must ensure that your destination pattern includes [^5][^3][^7].

The same destination pattern can be shared across multiple dial peers to form hunt groups.

**Digit Stripping and Prefixes**

When a terminating router receives a voice call, it selects an outbound POTS dial peer by comparing the called number (the full E.164 telephone number) in the call information with the number configured as the destination pattern in the POTS dial peer. The access server or router then strips off the left-justified digits that match the destination pattern. If you have configured a prefix, the prefix is added to the front of the remaining digits, creating a dial string, which the router then dials. If all numbers in the destination pattern are stripped out, the user receives a dial tone.

For example, consider a voice call whose E.164 called number is 1(408) 555-2222. If you configure a destination-pattern of "1408555" and a prefix of "9," the router strips off "1408555" from the E.164 telephone number, leaving the extension number of "2222." It then appends the prefix, "9," to the front of the remaining numbers, so that the actual numbers dialed are "9, 2222." The comma in this example means that the router will pause for 1 second between dialing the "9" and dialing the "2" to allow for a secondary dial tone.

When the terminating router matches a dial string to an outbound POTS dial peer, by default the router strips off the left-justified digits that explicitly match the destination pattern. Any remaining digits, called **excess digits**, are forwarded to the telephony interface, such as a PBX or the PSTN.

Some telephony interfaces require that any digits stripped from the dial string be recovered to support a particular dial plan. You can strip these digits either by using the **no digit-strip** dial-peer voice configuration command to disable the default digit-stripping behavior or by using the **prefix** dial-peer voice configuration command to add digits to the beginning of the dial string before it is forwarded to the telephony interface. These commands are supported only in POTS dial peers.
The **no digit-strip** command disables the automatic digit-stripping function so that matching digits are not stripped from the dialed string before it is passed to the telephony interface. For example, in the following dial peer configuration, the entire seven-digit dialed string is passed to the telephony interface:

```plaintext
dial-peer voice 100 pots
  destination-pattern 555....
  no digit-strip
  port 1/0:1
```

Disabling digit stripping is useful when the telephony interface requires the full dialed string. With some dial plans, however, the dialed digits must be manipulated according to specific rules. The **prefix** command can be used to add specific digits to the beginning of the dialed string before it is forwarded to the telephony interface.

For example, consider a telephone whose E.164 called number is 1(408)555-1234. This telephone can be reached within the company by dialing its extension number, 51234. If you configure a destination pattern of "1408555...." (the periods represent wildcards) for the associated outbound POTS dial peer, the terminating gateway will strip off the digits "1408555" when it receives a call for 1(408)555-1234. For the terminating gateway to forward the call to the appropriate destination, the digit "5" needs to be prepended to the remaining digits. In this case, you would configure a prefix of 5, as shown in the following dial peer configuration.

```plaintext
dial-peer voice 100 pots
  destination-pattern 1408555....
  prefix 5
  port 1/0:1
```

A prefix can also include commas (,). Each comma indicates a 1-second pause in dialing. For example, consider a telephone whose E.164 called number is 1(408)555-1234; to reach this device, you must dial "9." In this case, you might configure "1408...." as the destination pattern, and "9" as the prefix. In this example, the terminating router will strip the digits "1408" from the called number and append the digit "9" to the front of the remaining digits, so that the actual number dialed is" 9,5551234." The router pauses for 1 second between dialing the "9" and the "5551234" to allow for a secondary dial tone. In this example, you would configure the router as follows:

```plaintext
dial-peer voice 100 pots
  destination-pattern 1408555....
  prefix 9,
  port 1/0:1
```

Using a comma with the **prefix** command is useful when the router must allow for a secondary dial tone; otherwise the router does not wait for the dial tone before playing out excess digits. Putting commas in the prefix makes the router pause 1 second per comma, allowing for a dial tone to occur before the router transmits the remaining digits.

The figure below shows an example of a network using the **no digit-strip** command. In this example, a central site (Site D) is connected to remote sites through routers (Sites A, B, and C), and through a Centrex system.
for sites still using the PSTN (Sites E and F). The Centrex service requires the full 7-digit dial string to complete calls. The dial peers are configured with a fixed-length 7-digit dial plan.

**Figure 8: Network with Digit Stripping Disabled or Prefixes Enabled**

When Site E (8204...) dials 8201999, the full 7-digit dialed string is passed through the Centrex to the router at Site D. Router D matches the destination pattern 8201... and forwards the 7-digit dial string to Router A. Router A matches the destination pattern 8201..., strips off the matching 8201, and forwards the remaining 3-digit dial string to the PBX. The PBX matches the correct station and completes the call to the proper extension.

Calls in the reverse direction are handled similarly, but because the Centrex service requires the full 7-digit dial string to complete calls, the POTS dial peer at Router D is configured with digit stripping disabled. Alternatively, digit stripping could be enabled and the dial peer could instead be configured with a 4-digit prefix, in this case 8204, which would result in forwarding the full dial string to the Centrex service.

**Forwarding Digits**

The `forward-digits` command controls the number of digits that are stripped before the dialed string is passed to the telephony interface. On outbound POTS dial peers, the terminating router normally strips off all digits...
that explicitly match the destination pattern in the terminating POTS dial peer. Only digits matched by the wildcard pattern are forwarded. The **forward-digits** command can be used to forward a fixed number of dialed digits, or all dialed digits, regardless of the number of digits that explicitly match the destination pattern.

For example, the **forward-digits 4** command tells the router to forward the last four digits in the dialed string. The **forward-digits all** command instructs the router to forward the full dialed string. If the length of the dialed string is longer than the length of the destination pattern, the **forward-digits extra** command forwards the extra trailing digits. Extra digits are not forwarded, however, if the dial peer destination pattern is variable length; for example, 123T, 123...T.

**Note**

The **forward-digits** command is supported only in POTS dial peers.

The figure below shows an example of routing voice calls through a PBX using forward digits. In this configuration, Routers T1 and T2 are tandem nodes that must support forward digits so that calls from Routers A, B, or C can make a call to extension 8208.

**Figure 9: Routing Voice Calls Through a PBX Using Forward Digits**

In this example, all digits matched with destination 8... are forwarded to the appropriate port. For a call from Router A to reach extension 8208, the call first terminates at Router T1, which transmits the digits 8208 to the voice port connected to the PBX. The PBX then routes the voice call to Router T2. The **forward-digits all** command is used here, but the **forward-digits 4** command could also be used in this example.
The following dial peer configurations are required on each router for this example:

<table>

**Number Expansion**

In most corporate environments, the telephone network is configured so that you can reach a destination by dialing only a portion (an extension number) of the full E.164 telephone number. You can define an extension number as the destination pattern for a dial peer. The router can be configured to recognize the extension number and expand it into its full E.164 dialed number when the `num-exp` global configuration command is used with the `destination-pattern` dial-peer voice configuration command.

Number expansion is a globally applied rule that enables you to define a set of digits for the router to prepend to the beginning of a dialed string before passing it to the remote telephony device. Automatically prepending digits in the dial peer configuration reduces the number of digits that a user must dial to reach a remote location. Number expansion is similar to using a prefix, except that number expansion is applied globally to all dial peers.

Using a simple telephony-based example, suppose that user A works in a company where employees extensions are reached by dialing the last four digits of the full E.164 telephone number. The E.164 telephone number is 555-2123; user A’s extension number is 2123. Suppose that every employee on user A’s floor has a telephone number that begins with the same first four digits: 5552. You could define each dial peer’s destination pattern using each extension number, and then use number expansion to prepend the first four digits onto the extension. In this example, the router could be configured as follows:

```
num-exp 2... 5552...
dial peer voice 1 pots
destination pattern 2123
```
Number expansion can also be used to replace a dialed number with another number, as in the case of call forwarding. Suppose that for some reason, user A needs to have all of his telephone calls forwarded to another number, 555-6611. In this example, you would configure the router as follows:

```
num-exp 2123 5556611
dial peer voice 1 pots
destination pattern 2123
```

In this example, every time the device receives a call for extension 2123, the dialed digits will be replaced with 555-6611 and the call will be forwarded to that telephone.

Before you configure the `num-exp` command, it is helpful to map individual telephone extensions to their full E.164 dialed numbers. This task can be done easily by creating a number expansion table.

**Creating a Number Expansion Table**

The figure below shows a network for a small company that wants to use VoIP to integrate its telephony network with its existing IP network. The destination patterns (or expanded telephone numbers) associated with Router A are 408 115-xxxx, 408 116-xxxx, and 408 117-xxxx, where xxxx identifies the individual dial peers by extension. The destination pattern (or expanded telephone number) associated with Router B is 729 555-xxxx.

![Figure 10: VoIP Example for Number Expansion](image)

The table below shows the number expansion table for this scenario. The information included in this example must be configured on both Router A and Router B.

**Table 5: Sample Number Expansion Table**

<table>
<thead>
<tr>
<th>Extension</th>
<th>Destination Pattern</th>
<th>Num-Exp Command Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>5....</td>
<td>408115....</td>
<td>num-exp 5.... 408115....</td>
</tr>
<tr>
<td>6....</td>
<td>408116....</td>
<td>num-exp 6.... 408116....</td>
</tr>
<tr>
<td>7....</td>
<td>408117....</td>
<td>num-exp 7.... 408117....</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>Example:</td>
<td>• <code>extension-number</code> -- Specifies the extension number to expand into the full telephone number that is specified by the <code>expanded-number</code> argument.</td>
</tr>
<tr>
<td>Router(config)# num-exp 2123 5556611</td>
<td>• <code>expanded-number</code> -- Specifies the full telephone number or destination pattern to which the extension number is expanded.</td>
</tr>
</tbody>
</table>

**Translation Rules**

Digit translation rules are used to manipulate the calling number (ANI) or called number (DNIS) digits for a voice call, or to change the numbering type of a call. Translation rules are used to convert a telephone number into a different number before the call is matched to an inbound dial peer or before the call is forwarded by the outbound dial peer. For example, within your company you may dial a 5-digit extension to reach an
If the call is routed through the PSTN to reach the other site, the originating gateway must use translation rules to convert the 5-digit extension into the 10-digit format that is recognized by the central office switch.

Translation rules are defined by using the `translation-rule` command. After you define a set of translation rules, you can apply the rules to all inbound VoIP calls, to all inbound calls that terminate at a specific voice port, and to individual inbound or outbound call legs according to the dial peer.

The following example shows a dial peer that is configured to use translation-rule set 1, which contains ten translation rules. The first rule defined is rule 0, in which 910 is the pattern that must be matched and replaced, and 0 is the pattern that is substituted for 910.

```plaintext
translation-rule 1
  rule 0 ^910 0
  rule 1 ^911 1
  rule 2 ^912 2
  rule 3 ^913 3
  rule 4 ^914 4
  rule 5 ^915 5
  rule 6 ^916 6
  rule 7 ^917 7
  rule 8 ^918 8
  rule 9 ^919 9

! 
dial-peer voice 2 voip
  destination-pattern 91..........
  translate-outgoing called 1
  session target ras
```

The configuration results in the stripping of the leading digits 91 from any called number that begins with 91 before the number is forwarded by the outbound VoIP dial peer. Use the caret (^) symbol to specify that the matched digits must occur at the start of a dial string.

Wildcard symbols such as the period (.), asterisk (*), percent sign (%), plus sign (+), and question mark (?) are not valid in translation rules. The router ignores these symbols when converting a number if they are used in a translation rule.

Translation rules can also be used to change the numbering type for a call. For example, some gateways may tag any number with more than 11 digits as an international number, even when the user must dial a 9 to reach an outside line. The following example shows a translation rule that converts any called number that starts with 91, and that is tagged as an international number, into a national number without the 9 before sending it to the PSTN:

```plaintext
translation-rule 20
  rule 1 91 1 international national
!

dial-peer voice 10 pots
  destination-pattern 91..........
  translate-outgoing called 20
  port 1:D
```

Using digit translation rules with the `num-exp` or `prefix` command is not recommended unless it is the only way to minimize confusion.

To create digit translation rules, perform the tasks in the following sections:
CreatingDigitTranslationRules, on page 35 (required)

To apply digit translation rules to VoIP calls, perform one or more of the following procedures:

- Applying Translation Rules to Inbound POTS Calls, on page 36 (optional)
- Applying Translation Rules to Inbound VoIP Calls, on page 37 (optional)
- Applying Translation Rules to Outbound Call Legs, on page 38 (optional)

CreatingDigitTranslationRules

The purpose of this task is to enter translation-rule configuration mode and specify a set of translation rules.

To create additional individual translation rules to include in the translation-rule set, repeat Step 4.

Note

Applying translation rules to more than one call leg in an end-to-end call is not recommended.

SUMMARY STEPS

1. enable
2. configure terminal
3. translation-rule name-tag
4. rule name-tag input-matched-pattern substituted-pattern [match-type substituted-type]

DETAILED STEPS

<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-translate)# rule 0 ^910 0</code></td>
<td></td>
</tr>
</tbody>
</table>

- **name-tag** --Specifies a unique number that identifies this individual translation rule. Valid entries are from 0 to 10.
- **input-matched-pattern** --Specifies the digit string that must be matched, and then replaced with the **substituted-pattern** value.
- **substituted-pattern** --Specifies the digit string that replaces the **input-matched-pattern** value.
- **match-type** --(Optional) Specifies the numbering type that you want to replace with the numbering type defined in the **substituted-type** value. Enter *any* for the **match-type** if you want to match on any numbering type.
- Otherwise, enter one of the following keywords for each of these arguments:
  - `abbreviated`
  - `international`
  - `national`
  - `network`
  - `reserved`
  - `subscriber`
  - `unknown`

### Applying Translation Rules to Inbound POTS Calls

The purpose of this task is to apply a translation rule set to all inbound POTS calls that terminate on the same voice port.

#### Note

When this method is used, the digit translation rules are executed before the inbound POTS dial peer is matched.

### SUMMARY STEPS

1. enable
2. `configure terminal`
3. `voice-port location`
4. `translate {called | calling} name-tag`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>

<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enters privileged EXEC mode.  
  - Enter your password if prompted.  |
| **Example:** | Router> enable | |

| Step 2 | configure terminal | Enters global configuration mode. |
| **Example:** | Router# configure terminal | |

| Step 3 | voice-port location | Specifies the voice port through which the call enters the router.  
  - The **voice-port** command syntax is platform-specific. For more information about the syntax of this command, refer to the *Voice Port Configuration Guide*.  |
| **Example:** | Router(config)# voice-port 1/0:1 | |

| Step 4 | translate {called | calling} name-tag | Specifies the translation rule set to apply to the called number or calling number. The keywords and argument are as follows:  
  - **called** --Applies the translation rule to the called party number.  
  - **calling** --Applies the translation rule to the calling party number.  
  - **name-tag** --Specifies the reference number of the translation rule. Valid entries are 1 through 2147483647. |
| **Example:** | Router(config-voiceport)# translate called 4 |

---

### Applying Translation Rules to Inbound VoIP Calls

The purpose of this task is to apply a translation rule set to all inbound VoIP calls that originate at an H.323 gateway.

---

**Note**  
When using this method, the digit translation rules are executed before the inbound VoIP dial peer is matched.

---

### SUMMARY STEPS

1. enable  
2. configure terminal  
3. voip-incoming translation-rule {called | calling} name-tag
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

</table>
| **Step 1** enable | Enters privileged EXEC mode.  
  * Enter your password if prompted.  
  Example:  
  Router> enable |
| **Step 2** configure terminal | Enters global configuration mode.  
  Example:  
  Router# configure terminal |
| **Step 3** voip-incoming translation-rule {called | calling} name-tag | Specifies the translation rule set to apply to all inbound VoIP call legs that originate from an H.323 gateway. The keywords and argument are as follows:  
  * called --Applies the translation rule to the called party number.  
  * calling --Applies the translation rule to the calling party number.  
  * name-tag --Specifies the reference number of the translation rule. Valid entries are 1 through 2147483647.  
  Example:  
  Router (config)  
  # voip-incoming translation-rule called 5 |

**Applying Translation Rules to Outbound Call Legs**

The purpose of this task is to apply a translation rule set to an outbound VoIP or POTS call leg.

**Note** Translation rules that are configured in a dial peer using the translate-outgoing command are not applied to inbound call legs. When two-stage dialing is used, the translation rules that are configured in the voice port using the translate command are applied twice: after the inbound dial peer is matched, and again after the digits are collected.

**Note** If the prefix command is also configured in the dial peer, the translate-outgoing command is executed first.

**SUMMARY STEPS**

1. enable  
2. configure terminal  
3. dial-peer voice number pots | voip | vofr | voatm  
4. translate-outgoing {called | calling} name-tag

## Data Dial Peers

In addition to standard voice-network and POTS dial peers, a newer type of dial peer has been introduced to service modem calls over POTS lines with automatic dial peer matching and priority assignment. These new dial peers are called data dial peers.

Traditionally, if a modem call came over a POTS line connected to a voice-network gateway, a procession of matching criteria was required to determine the nature of the incoming call. Only after it was determined that an incoming call was not a voice call could it then be assumed that the transmission was, in fact, a data-based modem call.

Now, however, you have the ability to specify particular daily peers as data dial peers and even assign them priority in relation to other dial peers in the system.
Configuring Data Dial Peers

The purpose of this task is to configure a POTS dial peer to be a data dial peer.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `dial-peer data tag pots`
4. `incoming called-number string`

**DETAILED STEPS**

Inbound and Outbound Dial Peers

Dial peers are used for both inbound and outbound call legs. It is important to remember that these terms are defined from the perspective of the router. An inbound call leg originates when an incoming call comes to the router. An outbound call leg originates when an outgoing call is placed from the router. The first figure below illustrates call legs from the perspective of the originating router; the second figure below illustrates call legs from the perspective of the terminating router.
The figures below apply to voice calls that are being sent across the packet network. If the originating and terminating POTS interfaces share the same router or if the call requires hairpinning, then two POTS call legs are sufficient.

**Figure 11: Call Legs from the Perspective of the Originating Router**

**Figure 12: Call Legs from the Perspective of the Terminating Router**

For inbound calls from a POTS interface that are destined for the packet network, the router matches a POTS dial peer for the inbound call leg and a voice-network dial peer, such as VoIP or VoFR, for the outbound leg. For inbound calls from the packet network, the router matches a POTS dial peer to terminate the call and a voice-network dial peer to apply features such as codec or QoS.

For inbound POTS call legs going to outbound voice-network dial peers, the router forwards all digits that it collects. On outbound POTS call legs, the router strips off explicitly matching digits and forwards any excess digits out the designated port.

The following examples show basic configurations for POTS and VoIP dial peers:

```
dial-peer voice 1 pots
  destination-pattern 555....
  port 1/0:1

dial-peer voice 2 voip
  destination-pattern 555....
  session target ipv4:192.168.1.1
```

The router selects a dial peer for a call leg by matching the string that is defined by using the `answer-address`, `destination-pattern`, or `incoming called-number` command in the dial peer configuration.
Matching Inbound Dial Peers

To match inbound call legs to dial peers, the router uses three information elements in the call setup message and four configurable dial peer attributes. The three call setup elements are:

- Called number or dialed number identification service (DNIS)--A set of numbers representing the destination, which is derived from the ISDN setup message or channel associated signaling (CAS) DNIS.
- Calling number or automatic number identification (ANI)--A set of numbers representing the origin, which is derived from the ISDN setup message or CAS ANI.
- Voice port--The voice port carrying the call.

The five configurable dial peer attributes are:

- Incoming called number--A string representing the called number or DNIS. It is configured by using the `incoming called-number` dial-peer voice configuration command in POTS or multimedia mail over IP (MMoIP) dial peers.
- Answer address--A string representing the calling number or ANI. It is configured by using the `answer-address` dial-peer voice configuration command in POTS or VoIP dial peers and is used only for inbound calls from the IP network.
- Destination pattern--A string representing the calling number or ANI. It is configured by using the `destination-pattern` dial-peer voice configuration command in POTS or voice-network dial peers.
- Application--A string representing the predefined application that you wish to enable on the dial peer. It is configured by using the `application` dial-peer voice configuration command on inbound POTS dial peers.
- Port--The voice port through which calls to this dial peer are placed.

The router selects an inbound dial peer by matching the information elements in the setup message with the dial peer attributes. The router attempts to match these items in the following order:

1. Called number with the `incoming called-number` command
2. Calling number with the `answer-address` command
3. Calling number with the `destination-pattern` command
4. Incoming voice port with the configured voice port

The router must match only one of these conditions. It is not necessary for all the attributes to be configured in the dial peer or that every attribute match the call setup information; only one condition must be met for the router to select a dial peer. The router stops searching as soon as one dial peer is matched and the call is routed according to the configured dial peer attributes. Even if there are other dial peers that would match, only the first match is used.

For a dial peer to be matched, its administrative state must be up. The dial peer administrative state is up by default when it is configured with at least one of these commands: `incoming called-number`, `answer-address`, or `destination-pattern`. If the `destination-pattern` command is used, the voice port or session target must also be configured.
Variable-Length Matching

When matching dial peers, the router defaults to variable-length matching, which means that as long as the left-justified digits in the dial string match the configured pattern in the dial peer, any digits beyond the configured pattern are ignored for the purposes of matching. For example, dial string 5551212 would match both of the following dial peers:

```
dial-peer voice 1 voip
destination-pattern 555
session target ipv4:10.10.1.1
dial-peer voice 2 voip
destination-pattern 5551212
session target ipv4:10.10.1.2
```

To disable variable-length matching for a dial peer, add the dollar sign ($) to the end of the destination pattern, as shown:

```
dial-peer voice 1 voip
destination-pattern 555$
session target ipv4:10.10.1.1
```

The $ character in the configuration prevents this dial peer from being matched for dial string 5551212 because the extra digits beyond 555 are considered in the matching.

With two-stage dialing, the router collects the dialed string digit by digit. It attempts to match a dial peer after each digit is received. As soon as it finds a match, it immediately routes the call. For example, given the following configurations, the router would immediately match dial string 5551212 to dial peer 1.

```
dial-peer voice 1 voip
destination-pattern 555
session target ipv4:10.10.1.1
dial-peer voice 2 voip
destination-pattern 5551212
session target ipv4:10.10.1.2
```

If the router is performing two-stage dialing and you want to make sure that the full dial string is collected before a dial peer is matched, you can use the timeout T-indicator as in variable-length dial plans. For example, after the router waits until the full dial string is collected, dial string 5551212 would match both of the following dial peers:

```
dial-peer voice 1 voip
destination-pattern 555T
session target ipv4:10.10.1.1
dial-peer voice 2 voip
destination-pattern 5551212T
session target ipv4:10.10.1.2
```

How the router selects a dial peer also depends on whether the dial peer is being matched for the inbound or outbound call leg.

Configuring the incoming called-number Command

When a Cisco router is handling both modem and voice calls, it needs to identify the service type of the call--that is, whether the incoming call to the router is a modem or a voice call. When the router handles only modem calls, the service type identification is handled through modem pools. Modem pools associate calls with modem resources based on the called number (DNIS). In a mixed environment, where the router receives both modem and voice calls, you need to identify the service type of a call by using the incoming called-number command.

If the incoming called-number command is not configured, the router attempts to resolve whether an incoming call is a modem or voice call on the basis of the interface over which the call comes. If the call comes in over
an interface associated with a modem pool, the call is assumed to be a modem call; if a call comes in over a
voice port associated with a POTS dial peer, the call is assumed to be a voice call.
The purpose of this task is to identify the service type of a call as voice.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. dial-peer voice number pots | voip | vofr | voatm
4. incoming called-number number

<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable`          | Enters privileged EXEC mode.  
  * Enter your password if prompted. |
| **Step 2** | `configure terminal` | Enters global configuration mode. |
| **Step 3** | `dial-peer voice number {pots | voip | vofr | voatm}` | Enters dial-peer voice configuration mode and defines a local dial peer.  
  * The `number` argument identifies the dial peer. Valid entries are from 1 to 2147483647. |
| **Step 4** | `answer-address [+ string [T]]` | Defines the telephone number that identifies voice calls associated with this dial peer. The keywords and argument are as follows:  
  * `+` --(Optional) Character indicating an E.164 standard number.  
  * `string` --A series of digits specifying the E.164 or private dial plan telephone number. Valid entries are as follows:  
    * Digits 0 through 9, letters A through D, pound sign (#), and asterisk (*), which represent specific digits that can be entered.  
    * Comma (,), which inserts a pause between digits.  
    * Period (.), which matches any entered digit.  
  * `T` --(Optional) Control character indicating that the `answer-address` value is a variable-length dial string. |
Configuring the destination-pattern Command

See the Configuring Destination Patterns, on page 23 for information on configuring the destination pattern for a dial peer.

Configuring the port Command

See the Assigning Voice Ports, on page 20 for information on associating a voice port with a dial peer.

Matching Outbound Dial Peers

The method a router uses to select an outbound dial peer depends on whether ISDN DID is configured in the inbound POTS dial peer. If DID is not configured in the inbound POTS dial peer, the router collects the incoming dialed string digit by digit. As soon as one dial peer is matched, the router immediately places the call using the configured attributes in the matching dial peer.

If DID is configured in the inbound POTS dial peer, the router uses the full incoming dial string to match the destination pattern in the outbound dial peer. With DID, the setup message contains all the digits necessary to route the call; no additional digit collection is required. If more than one dial peer matches the dial string, all of the matching dial peers are used to form a rotary group. The router attempts to place the outbound call leg using all of the dial peers in the rotary group until one is successful.

Using Default Routes

Default routes reduce the number of dial peers that must be configured when calls that are not terminated by other dial peers are sent to a central router, usually for forwarding to a PBX. A default route is a dial peer that automatically matches any call that is not terminated by other dial peers. For example, in the following configuration, the destination pattern 8... is a voice default route because all voice calls with a dialed string that starts with 8 followed by at least three additional digits will either match on 8208 or end with 8..., which is the last-resort voice route used by the router if no other dial peer is matched.

dial-peer voice 8 pots
   destination-pattern 8208
   port 1/1
!
dial-peer voice 1000 pots
   destination-pattern 8...
   port 1/1

A default route could also be defined by using a single wildcard character with the timeout T-indicator in the destination pattern, as shown in the following example:

dial-peer voice 1000 voip
   destination-pattern .T
   session-target ipv4:10.10.1.2

You should be careful, however, when using the T-indicator for default routes. Remember, when matching dial peers for outbound call legs, the router places the call as soon as it finds the first matching dial peer. The router could match on this dial peer immediately even if there were another dial peer with a more explicit match and a more desirable route.
The timeout T-indicator is appropriate only for two-stage dialing. If the router is configured for one-stage dialing, which means that DID is configured in the inbound POTS dial peer, then the timeout T-indicator is unnecessary.

Additional Features

One Stage and Two Stage Dialing

With two-stage dialing, when a voice call enters the network, the originating router collects dialed digits until it can match an outbound dial peer. As soon as the router matches a dial peer, it immediately places the call and forwards the associated dial string. No additional dialed digits are collected. The digits and wildcards that are defined in the destination pattern determine how many digits the originating router collects before matching the dial peer. Any digits dialed after the first dial peer is matched are dropped.

For example, if the dialed string is "1234599" and the originating router matches a dial peer with a destination pattern of 123.., then the digits "99" are not collected. The call is placed immediately after the digit "5" is dialed, and the dial string "12345" is forwarded to the next call leg.

On the terminating router, the left-justified digits that explicitly match the terminating POTS dial peer are stripped off. Any trailing wildcard digits are considered excess digits. The terminating router forwards these excess digits to the telephony interface. For example, if the dial string "1234599" is matched on a terminating router to a destination pattern of "123..," the digits "4599" are excess digits and are forwarded to the telephony interface.

The figure below illustrates how the originating router collects a dial string and the terminating router forwards the digits to the telephony device.

![Figure 13: Collecting and Forwarding Dialed Digits](image)

The examples in the table below demonstrate how the originating router collects dialed digits for a given destination pattern in the outbound voice-network dial peer.
Table 6: Digit Collection Based on Destination Pattern

<table>
<thead>
<tr>
<th>Dialed Digits</th>
<th>Destination Pattern</th>
<th>Dial String Collected&lt;sup&gt;4&lt;/sup&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>5551234</td>
<td>5…….</td>

<td>555</td>
</tr>
<tr>
<td>555123499</td>
<td>555….</td>
<td>5551234</td>
</tr>
</tbody>
</table>

<sup>4</sup> These examples apply only to two-stage dialing, in which the router collects the dialed string digit by digit. If DID is enabled in the inbound POTS dial peer, the router performs one-stage dialing, which means that the full dialed string is used regardless of the destination pattern that is matched.

**Direct Inward Dialing**

Unless otherwise configured, when a voice call comes into the router, the router presents a dial tone to the caller and collects digits until it can identify an outbound dial peer. This process is called two-stage dialing. After the outbound dial peer is identified, the router forwards the call through to the destination as configured in the dial peer.

The DID feature in dial peers enables the router to use the called number (DNIS) to directly match an outbound dial peer when receiving an inbound call from a POTS interface. When DID is configured on the inbound POTS dial peer, the called number (DNIS) is automatically used to match the destination pattern for the outbound call leg.

**Note**

DID for POTS dial peers, as described here, is for ISDN connections only. It is not the same as analog DID for Cisco routers, which supports analog DID trunk service. For more information about analog DID see Analog Direct Inward Dialing.

You may prefer that the router use the called number (DNIS) to find a dial peer for the outbound call leg—for example, if the switch connecting the call to the router has already collected all the dialed digits. DID enables the router to match the called number to a dial peer and then directly place the outbound call. With DID, the router does not present a dial tone to the caller and does not collect digits; it forwards the call directly to the configured destination. This is called one-stage dialing.
The figure below shows a call scenario using DID.

**Figure 14: VoIP Call Using DID**

![Diagram of VoIP call using DID](image)

In the figure above, the POTS dial peer that matches the incoming called-number has DID configured:

```console
dial-peer voice 100 pots
  incoming called-number 5552020
  direct-inward-dial
  port 0:D
```

The `direct-inward-dial` command in the POTS dial peer tells the gateway to look for a destination pattern in a dial peer that matches the DNIS. For example, if the dialed number is 5552020, the gateway matches the following VoIP dial peer for the outbound call leg:

```console
dial-peer voice 101 voip
  destination-pattern 5552020
  session target ipv4:10.1.1.2
```

The call is made across the IP network to 10.1.1.2, and a match is found in that terminating gateway:

```console
dial-peer voice 555 pots
  destination-pattern 5552020
  port 0:D
  prefix 5274200
```

This dial peer matches on the dialed number and changes that number to 5274200 with the `prefix` command. The result is that the user dials a number, gets connected, and never knows that the number reached is different from the number dialed.

### Configuring Direct Inward Dialing

The purpose of this task is to configure a POTS dial peer for DID.
SUMMARY STEPS

1. enable
2. configure terminal
3. dial-peer voice  number  pots
4. direct-inward-dial

<td></td>
</tr>
</tbody>
</table>

What to Do Next

Note

DID is configured for inbound POTS dial peers only.

Hunt Groups

The router supports the concept of hunt groups, sometimes called *rotary groups*, in which multiple dial peers are configured with the same destination pattern. Because the destination of each POTS dial peer is a single voice port to a telephony interface, hunt groups help ensure that calls get through even when a specific voice
port is busy. If the router is configured to hunt, it can forward a call to another voice port when one voice port is busy.

For example, in the following configuration for Router A, four POTS dial peers are configured with different destination patterns. Because each dial peer has a different destination pattern, no backup is available if the voice port mapped to a particular dial peer is busy with another call.

With a hunt group, if a voice port is busy, the router hunts for another voice port until it finds one that is available. In the following example for Router B, each dial peer is configured using the same destination pattern of 3000, forming a dial pool to that destination pattern.

<table>
<thead>
<tr>
<th>Router A (Without Hunt Groups)</th>

</tr>
<tr>
<td>!</td>
<td>preference 3</td>
</tr>
</tbody>
</table>

To give specific dial peers in the pool a preference over other dial peers, you can configure the preference order for each dial peer by using the `preference` command. The router attempts to place a call to the dial peer with the highest preference. The configuration example given for Router B shows that all dial peers have the same destination pattern, but different preference orders.

The lower the preference number, the higher the priority. The highest priority is given to the dial peer with preference order 0. If the same preference is defined in multiple dial peers with the same destination pattern, a dial peer is selected randomly.

By default, dial peers in a hunt group are selected according to the following criteria, in the order listed:

1. Longest match in phone number--Destination pattern that matches the greatest number of dialed digits. For example, if one dial peer is configured with a dial string of 345..., and a second dial peer is configured with 3456789, the router would first select 3456789 because it has the longest explicit match of the two dial peers.

2. Explicit preference--Priority configured by using the `preference` dial peer command.

3. Random selection--All destination patterns weighted equally.

You can change this default selection order or choose different methods for hunting dial peers by using the `dial-peer hunt` global configuration command. An additional selection criterion is "least recent use," which selects the destination pattern that has waited the longest since being selected.

You can mix POTS and voice-network dial peers when creating hunt groups. Mixing dial peer types can be useful if you want incoming calls to be sent over the packet network, except that if network connectivity fails,
you want to reroute the calls back through the PBX to the PSTN. This type of configuration is sometimes referred to as hairpinning. Hairpinning is illustrated in the figure below.

**Figure 15: Voice Call Using Hairpinning**

![Figure 15: Voice Call Using Hairpinning](image)

The following configuration shows an example of sending calls to the PSTN if the IP network fails:

```console
dial-peer voice 101 voip
   destination-pattern 472....
   session target ipv4:192.168.100.1
   preference 0
!
dial-peer voice 102 pots
   destination-pattern 472....
   prefix 472
   port 1/0:1
   preference 1
```

You cannot use the same preference numbers for POTS and voice-network dial peers within a hunt group. You can set a separate preference order for each dial peer type, but the preference order does not work on both at the same time. For example, you can configure preference order 0, 1, and 2 for POTS dial peers, and you can configure preference order 0, 1, and 2 for the voice-network dial peers, but the two preference orders are separate. The system resolves preference orders among POTS dial peers first.

### Configuring Dial Peer Hunting Options

Dial peer hunting is enabled by default. The purpose of this task is to disable dial peer hunting on an individual dial peer.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `dial-peer voice number {pots | voip | vofr | voatm}`
4. `huntstop`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<table>
<thead>
<tr>
<th>dial-peer hunt</th>
<th>hunt-order-number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Router(config)# dial-peer hunt 2</td>
</tr>
</tbody>
</table>

(Optional) Specifies the hunt selection order for dial peers in a hunt group. Valid entries are 0 through 7. The default is 0. The allowable values are as follows:

- 0--Specifies longest match in phone number, explicit preference, random selection.
- 1--Specifies longest match in phone number, explicit preference, least recent use.
- 2--Specifies explicit preference, longest match in phone number, random selection.
- 3--Specifies explicit preference, longest match in phone number, least recent use.
- 4--Specifies least recent use, longest match in phone number, explicit preference.
- 5--Specifies least recent use, explicit preference, longest match in phone number.
- 6--Specifies random selection.
- 7--Specifies least recent use.

**Step 4**

| voice hunt | { user-busy | invalid-number | unassigned-number } |
|------------|----------------|---------------------|
| Example:   | Router(config)# voice hunt user-busy |

(Optional) Defines how the originating or tandem router handles rotary dial peer hunting if it receives a disconnect cause code from the terminating router. The keywords are as follows:

- **user-busy** --Instructs the router to continue dial peer hunting if it receives a user-busy disconnect cause code from a destination router.
- **invalid-number** --Instructs the router to stop dial peer hunting if it receives an invalid-number disconnect cause code from a destination router.
- **unassigned-number** --Instructs the router to stop dial peer hunting if it receives an unassigned-number disconnect cause code from a destination router.

---

### Modem Pass Through

Like T.38 Fax Relay and Modem Relay, Modem Pass Through functionality can be enabled and configured on a per-dial peer basis. Modem Pass Through behavior enables you to take advantage of features such as the following:
• Repressing bandwidth- and resource-consuming functions like compression, echo cancellation, high-pass filtering, and voice activity detection (VAD).
• Automatically sending redundant packets to minimize the possibility of packet loss.
• Employing automatic static jitter buffers to protect against clock skew.
• Identifying signals that are for modem calls versus voice or fax calls.

The figure below illustrates a network featuring Modem Pass Through capability.

**Figure 16: Modem Pass Through Connection Example**

When a call over the network is identified as a modem call, both the originating and terminating voice gateway routers automatically "roll over" to using the G.711 codec for the duration of the modem call. Once the modem call has ceased, the digital signal processors (DSPs) in both the originating and terminating voice gateways revert to default operation, enabling fax and voice calls to be placed and received using those DSPs. The version of the G.711 codec you use (either a-law or u-law) is determined by the type of network on which your voice gateways are operating and the configuration you specify using the `modem passthrough` command in dial-peer voice configuration mode.

### Configuring Modem Pass Through Capability for Individual Dial Peers

The purpose of this task is to configure Modem Pass Through capability for individual dial peers.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **dial-peer voice number {pots | voip | vofr | voatm}
4. **modem passthrough {system | nse [payload-type number] codec {g711ulaw | g711alaw}[redundancy]}**

<td>Note</td>
<td>Be sure to use the same codec type for both the originating gateway and the terminating gateway. The g711ulaw codec is required for T1, and the g711alaw codec is required for E1.</td>
</tr>
</tbody>
</table>
Dual Tone Multifrequency Relay

Dual tone multifrequency (DTMF) tones are generated when a button on a touch-tone phone is pressed. When the tone is generated, it is compressed, transported to the other party, and then decompressed. If a low-bandwidth codec, such as G.729 or G.723, is used without a DTMF relay method, the tone may be distorted during compression and decompression.

DTMF relay sends DTMF tones out of band, or separately from the voice stream. Cisco gateways currently support the following methods of DTMF relay:

- Using a Cisco-proprietary Real-Time Transport Protocol (RTP). DTMF tones are sent in the same RTP channel as voice data. However, the DTMF tones are encoded differently from the voice samples and are identified by a different RTP payload type code. Use of this method accurately transports DTMF tones, but because it is proprietary, it requires the use of Cisco gateways at both the originating and terminating endpoints of the H.323 call.

- Using either the H.245 signal or H.245 alphanumeric method. These methods separate DTMF digits from the voice stream and send them through the H.245 signaling channel instead of through the RTP channel. The tones are transported in H.245 User Input Indication messages. The H.245 signaling channel is a reliable channel, so the packets that transport the DTMF tones are guaranteed to be delivered. However, because of the overhead of using a reliable protocol, and depending on network congestion conditions, the DTMF tones may be slightly delayed. All H.323 version 2-compliant systems are required to support the "h245-alphanumeric" method: support of the "h245-signal" method is optional.

- Using Named Telephone Events (NTEs). Using NTE to relay DTMF tones provides a standardized means of transporting DTMF tones in RTP packets according to section 3 of RFC 2833, RTP Payload for DTMF Digits, Telephony Tones and Telephony Signals, developed by the IETF Audio/Video Transport (AVT) working group. RFC 2833 defines formats of NTE RTP packets used to transport DTMF digits, hookflash, and other telephony events between two peer endpoints. With the NTE method, the endpoints perform per-call negotiation of the DTMF relay method. They also negotiate to determine the payload type value for the NTE RTP packets.

Cisco H.323 gateways advertise capabilities using the H.245 capabilities messages. By default, they advertise that they can receive all DTMF relay modes. If the capabilities of the remote gateway do not match, the Cisco H.323 gateway sends DTMF tones as in-band voice. Configuring DTMF relay on the Cisco H.323 gateway sets preferences for how the gateway handles DTMF transmission. If multiple methods are configured, the priority is as follows:

- Cisco RTP
- RTP NTE

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• redundancy -- (Optional) Enables packet redundancy (RFC 2198) for modem traffic.</td>
<td></td>
</tr>
<tr>
<td>• The default behavior for Modem Pass Through behavior in dial-peer voice configuration mode is <strong>modem passthrough system</strong>.</td>
<td></td>
</tr>
</tbody>
</table>
In addition to support for NTE, DTMF Relay provides support for asymmetrical payload types. Payload types can differ between local and remote endpoints. Therefore, the Cisco gateway can transmit one payload type value and receive a different payload type value.

### Configuring DTMF Relay and Payload Type

The purpose of this task is to configure DTMF Relay capability and the respective payload type for individual dial peers.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `dial-peer voice number {voip | vofr}`
4. `dtmf-relay [cisco-rtp][h245-alphanumeric] [h245-signal]`
5. `rtp payload-type nte number`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enters privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enters dial-peer voice configuration mode and defines a remote VoIP dial peer. The keywords and arguments are as follows:</td>
</tr>
<tr>
<td>`dial-peer voice number {voip</td>
<td>vofr}`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• The <code>voip</code> keyword indicates a VoIP peer that uses voice encapsulation on the IP network.</td>
</tr>
</tbody>
</table>

- H.245 signal
- H.245 alphanumeric
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td>dtmf-relay [cisco-rtp][h245-alphanumeric] [h245-signal]</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-dialpeer)# dtmf-relay cisco-rtp</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>rtp payload-type nte number</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-dialpeer)# rtp payload-type nte 100</td>
</tr>
</tbody>
</table>

- The `nte` keyword identifies the payload type as an NTE. Number values are 96 through 127. The default value is 101.
- The following numbers have preassigned values:
  - 96
  - 97
  - 100
  - 121 to 123
  - 125 to 127
- If you use these values for the NTE payload type, the command fails. You must first reassign the value in use to a different unassigned number, for example:
  - rtp payload-type nse 105
  - rtp payload-type nte 100

### Connection PLAR

You can configure dial peers on your Cisco voice gateway router to take advantage of one-way and two-way private-line automatic ringdown (PLAR) functionality. By using the `connection plar` command you can enhance your voice network to offer a number of useful features including the following:

- Providing an off-premises extension (OPX) from a PBX, thus simulating direct connections between FXS port users on a voice gateway router and the PBX.
- Providing dial-tone from a remote PBX in order to offer toll-bypass functionality. Instead of relying on the gateway routers in your voice network to provide dial-tone, you can employ PLAR behavior to enable remote sites to behave as though they have a direct connection to a PBX.
- Connection PLAR behavior eliminates the need for user dialing, because both of the endpoints for the VoIP call are statically configured.
In addition to the features described, connection PLAR behavior does not dedicate bandwidth to a call unless one or the other of the privately associated endpoints goes off-hook.

---

**Note**

The Connection PLAR and Connection Trunk feature behavior is configured on a per-voice-port basis. Therefore, you cannot employ the same voice port for both Connection PLAR or trunk mode and collect-dialed-digits mode.

---

**Configuring Connection PLAR**

The purpose of this task is to enable Connection PLAR on the specified dial peer.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice-port port-number
4. connection plar number
5. exit
6. dial-peer voice number {voip | pots}
7. port port-number

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enters privileged EXEC mode.  
**Example:**
Router> enable  
• Enter your password if prompted. |
| Step 2 | configure terminal | Enters global configuration mode.  
**Example:**
Router# configure terminal |
| Step 3 | voice-port port-number | Enters voice-port configuration mode for the voice port specified.  
**Example:**
Router(config)# voice-port 1/0/0 |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>connection plar number</strong>&lt;br&gt;&lt;br&gt;Example:&lt;br&gt;Router(config-voiceport)# connection plar 51234</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>exit</strong>&lt;br&gt;&lt;br&gt;Example:&lt;br&gt;Router(config-voiceport)# exit</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>**dial-peer voice number {voip</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>port port-number</strong>&lt;br&gt;&lt;br&gt;Example:&lt;br&gt;Router(config-dial-peer)# port 1/0/0</td>
</tr>
</tbody>
</table>

**Connection PLAR Design Considerations**

Take the following items into consideration when planning to configure Connection PLAR behavior on your VoIP network:

- Because Connection PLAR is a switched VoIP call (similar to a switched virtual circuit), calls are set up and torn down as needed--bandwidth is taken up only when a call is initiated.
- Connection PLAR will operate between any types of signaling endpoints--E&M, FXO, and FXS--and between any combination of analog and digital interfaces.
- Connection PLAR does not collect digits from the connected telephony device, so you can configure Connection PLAR without any subsequent changes to your dial plan.
- Connection PLAR can be enabled on one or both of the statically configured endpoints, thus allowing you the ability to use one-way or two-way Connection PLAR.
Because automatically forwarded digits can become distorted over the compressed VoIP audio path when low bit rate codecs like G.729 and G.723.1 are used, you can use the `dtmf relay` command to transport dual tone multifrequency (DTMF) tones out-of-band (separate from the compressed VoIP audio path) to avoid this potential problem. For more information regarding DTMF relay configuration, refer to Dual Tone Multifrequency Relay, on page 58.

### Connection Trunk

In addition to configuring Connection PLAR, you can configure your dial peers to employ the Connection Trunk feature using the `connection trunk` command. Connection Trunk functionality offers some of the same advantages as Connection PLAR, such as eliminating the need for user dialing because both of the endpoints for the VoIP call are statically configured. In addition, Connection Trunk behavior offers you the ability to pass supplemental call signaling capability like hookflash and point-to-point Hoot-n-Holler between endpoints on the trunk.

However, unlike Connection PLAR, Connection Trunk endpoints are always active (or off-hook) as far as the voice network is concerned, so bandwidth is always being allocated to a trunk that you have configured.

#### Configuring Connection Trunk

The purpose of this task is to enable Connection Trunk behavior on the specified dial peer.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `voice-port port-number`
4. `connection trunk number`
5. `exit`
6. `dial-peer voice number {voip | pots}`
7. `port port-number`

**DETAILED STEPS**

<table>
<thead>
<tr>

<td>Configures the dial peer from the previous step to contact the VoIP network using the specified voice port.</td>
</tr>
<tr>
<td><code>port port-number</code></td>
<td></td>
</tr>
</tbody>
</table>
What to Do Next

Because automatically forwarded digits can become distorted over the compressed VoIP audio path when low bit rate codecs like G.729 and G.723.1 are used, you can use the dtmf relay command to transport DTMF tones out-of-band (separate from the compressed VoIP audio path) to avoid this potential problem. For more information regarding DTMF relay configuration, refer to Dual Tone Multifrequency Relay, on page 58.

Class of Restrictions

The Class of Restrictions (COR) feature provides the ability to deny certain call attempts based on the incoming and outgoing class of restrictions provisioned on the dial peers. This functionality provides flexibility in network design, allows users to block calls (for example, to 900 numbers), and applies different restrictions to call attempts from different originators.

COR is used to specify which incoming dial peer can use which outgoing dial peer to make a call. Each dial peer can be provisioned with an incoming and an outgoing COR list. The incoming COR list indicates the capability of the dial peer to initiate certain classes of calls. The outgoing COR list indicates the capability required for an incoming dial peer to deliver a call via this outgoing dial peer. If the capabilities of the incoming dial peer are not the same or a superset of the capabilities required by the outgoing dial peer, the call cannot be completed using this outgoing dial peer.

A typical application of COR is to define a COR name for the number that an outgoing dial peer serves, then define a list that contains only that COR name, and assign that list as corlist outgoing for this outgoing dial peer. For example, dial peer with destination pattern 5T can have a corlist outgoing that contains COR 5x, as shown in the following configuration.

```
dial-peer cor custom
 name 5x
 name 6x
 name 1900x
!
dial-peer cor list listA
 member 5x
 member 6x
!
dial-peer cor list listB
 member 5x
 member 6x
 member 1900x
!
dial-peer cor list list5x
 member 5x
!
dial-peer cor list list6x
 member 6x
!
dial-peer cor list list1900x
 member 1900x
!
outgoing dialpeer 100, 200, 300
```

The next step, in the typical application, is to determine how many call permission groups are needed, and define a COR list for each group. For example, group A is allowed to call 5x and 6x, and group B is allowed to call 5x, 6x, and 1900x. Then, for each incoming dial peer, we can assign a group for it, which defines what number an incoming dial peer can call. Assigning a group means assigning a corlist incoming to this incoming dial peer.
To configure classes of restrictions for dial peers, use the following commands beginning in global configuration mode:

### SUMMARY STEPS

1. `Router(config)# dial-peer cor custom`
2. `Router(config-dp-cor)# name class-name`
3. `Router(config-dp-cor)# exit`
4. `Router(config)# dial-peer cor list list-name`
5. `Router(config-dp-corlist)# member class-name`
6. `Router(config-dp-corlist)# exit`
7. `Router(config)# dial-peer voice number {pots | voip}`
8. `Router(config-dial-peer)# corlist incoming cor-list-name`
9. `Router(config-dial-peer)# corlist outgoing cor-list-name`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Enter COR configuration mode to specify that named class of restrictions apply to dial peers.</strong></td>
</tr>
<tr>
<td><code>Router(config)# dial-peer cor custom</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Specifies a name for a custom class of restrictions.</strong></td>
</tr>
<tr>
<td><code>Router(config-dp-cor)# name class-name</code></td>
<td><strong>Note</strong> Enter the <code>name</code> (dial peer cor custom) command for additional class names, as needed. You can define a maximum of 64 COR names. These class names are used to define the COR lists configured in Step 4 and Step 5.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Exits COR configuration mode.</strong></td>
</tr>
<tr>
<td><code>Router(config-dp-cor)# exit</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Defines a COR list name.</strong></td>
</tr>
<tr>
<td><code>Router(config)# dial-peer cor list list-name</code></td>
<td></td>
</tr>
</tbody>
</table>
| **Step 5** | **Adds a COR class to this list of restrictions.**  
*The member is a class named in Step 2.* |
| `Router(config-dp-corlist)# member class-name` | |
**Purpose**

Command or Action | Purpose
---|---
| Enter the **dial-peer cor list** command and **member** (dial peer cor list) command (Step 4 and Step 5) to define another list and its membership, as needed.

**Step 6**

**Note**

Exits COR-list configuration mode.

**Step 7**

**Note**

Enters dial-peer configuration mode and defines a dial peer.

**Step 8**

**Note**

Specifies the COR list to be used when this is the incoming dial peer.

**Step 9**

**Note**

Specifies the COR list to be used when this is the outgoing dial peer.

Verifying Classes of Restrictions

To check the validity of your classes of restrictions configuration, perform the following tasks:

- Enter the **show dial-peer voice** command to learn whether the COR list fields are set as desired on a dial peer:

```
Router# show dial-peer voice 210
VoiceEncapPeer210
  information type = voice,
  tag = 210, destination-pattern = `221',
  answer-address = '', preference=0,
  numbering Type = 'unknown'
  group = 210, Admin state is up, Operation state is up,
  incoming called-number = `221', connections/maximum = 4/unlimited,
  DTMF Relay = disabled,
  Modem = system passthrough ,
  huntstop = disabled,
  application associated:
    permission :both
  incoming COR list:maximum capability
  outgoing COR list:minimum requirement
  type = pots, prefix = `221',
  forward-digits default
  session-target = '', voice-port = `1/0/8:D',
  direct-inward-dial = enabled,
  digit_strip = enabled,
```

- Enter the **show dial-peer cor** command to display the COR names and lists you defined:

```
Router# show dial-peer cor
Class of Restriction
  name:900block
  name:800_call
  name:CatChall
COR list <list1>
  member:900block
  member:800_call
```
Configuring an iLBC Codec

This section includes the following tasks:

Configuring an iLBC Codec on a Dial Peer

The internet Low Bit-rate Codec (iLBC) is intended for packet-based communication. Perform the following steps to configure the iLBC codec on a dial peer.

Before You Begin

iLBC is supported on the following:

- Cisco AS5350XM and Cisco AS5400XM Universal Gateways with Voice Feature Cards (VFCs)
- IP-to-IP gateways with no transcoding and conferencing.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `dial-peer voice  tag voip`
4. `rtp payload-type cisco-codec-ilbc [number`
5. `codec ilbc [mode frame_size[bytes payload_size]]`
6. `exit`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
**Step 3** | `dial-peer voice tag voip`  
Example:  
Router(config)# dial-peer voice 10 voip  
Enters dial-peer configuration mode for the VoIP dial peer designated by `tag`.  

**Step 4** | `rtp payload-type cisco-codec-ilbc`  
`number`  
Example:  
Router(config-dial-peer)# rtp payload-type cisco-codec-ilbc 100  
Identifies the payload type of a Real-Time Transport Protocol (RTP) packet. Keyword and argument are as follows:  
**Note** Do not use the following numbers because they have preassigned values: 96, 97, 100, 117, 121 to 123, and 125 to 127. If you use these values, the command will fail. You must first reassign the value in use to a different unassigned number, for example:  
  - `rtp payload-type nse 105`  
  - `rtp payload-type cisco-codec-ilbc 100`  

**Step 5** | `codec ilbc [mode frame_size[bytes payload_size]]`  
Example:  
Router(config-dial-peer)# codec ilbc mode 30 bytes 200  
Specifies the voice coder rate of speech for a dial peer. Keywords and arguments are as follows:  
- `mode frame_size` -- The iLBC operating frame mode that will be encapsulated in each packet. Valid entries are 20 (20ms frames for 15.2kbps bit rate) or 30 (30ms frames for 13.33 kbps bit rate). Default is 20.  
- `bytes payload_size` -- Number of bytes in an RTP packet. For mode 20, valid values are 38 (default), 76, 114, 152, 190, and 228. For mode 30, valid values are 50 (default), 100, 150, and 200.  

**Step 6** | `exit`  
Example:  
Router(config-dial-peer)# exit  
Exits the current mode.  

### Troubleshooting Tips  
You can use the following commands to check iLBC status:  
- `show voice call summary`  
- `show voice call status`  
- `show voice dsmp stream`  
- `show call active voice`
• show call history voice
• show voice dsp and its extensions
• show dial-peer voice
• show voice dsp channel operational-status

What to Do Next

To set the codec preference, see the "Configuring Multiple Codecs" section in the Cisco IOS H.323 Configuration Guide.

Configuring an iLBC Codec in the Voice Class

When using multiple codecs, you must create a voice class in which you define a selection order for codecs; then, you can apply the voice class to VoIP dial peers. The voice class codec global configuration command allows you to define the voice class that contains the codec selection order. Then, use the voice-class codec dial-peer configuration command to apply the class to individual dial peers.

To configure an iLBC codec in the voice class for multiple-codec selection order, perform the following steps. Follow these procedures to create a voice class. For the complete dial-peer configuration procedure, see the Common Practices, on page 20.

You can configure more than one voice class codec list for your network. Configure the codec lists and apply them to one or more dial peers based on which codecs (and the order) you want supported for the dial peers. Define a selection order if you want more than one codec supported for a given dial peer.

SUMMARY STEPS

1. enable
2. configure terminal
3. voice class codec tag
4. codec preference value ilbc [mode frame_size] [bytes payload_size]
5. exit
6. dial-peer voice tag voip
7. voice-class codec tag
8. exit

DETAILED STEPS

<table>
<thead>

Where to Go for Dial Peer Troubleshooting Information

Dial peer troubleshooting consists of a vast array of techniques applicable to a variety of dial peer configuration practices. This document does not cover the techniques necessary to effectively troubleshoot potential pitfalls relating to dial peer configuration. Instead, refer to the TAC Web Site at http://www.cisco.com/public/support/tac/technologies.shtml.
The PSTN Fallback feature monitors congestion in the IP network and redirects calls to the Public Switched Telephone Network (PSTN) or rejects calls on the basis of network congestion. This feature can also use the ICMP ping mechanism to detect loss of network connectivity and then reroute calls. The fallback subsystem has a network traffic cache that maintains the Calculated Planning Impairment Factor (ICPIF) or delay/loss values for various destinations. Performance is improved because each new call to a well-known destination does not have to wait on a probe to be admitted and the value is usually cached from a previous call.

ICPIF calculates an impairment factor for every piece of equipment along the voice path and then adds them up to get the total impairment value. Refer to International Telecommunication Union (ITU) standard G.113 for more information. The ITU assigns a value to the types of impairment, such as noise, delay, and echo.

Feature Information

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

- Finding Feature Information, page 73
- Information About PSTN Fallback, page 74
- Restrictions for PSTN Fallback, page 75
- How to Configure PSTN Fallback, page 75
- How to Verify and Monitor the PSTN Fallback Feature, page 89
- What To Do Next, page 90

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To
find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About PSTN Fallback

The VoIP Alternate Path Fallback SNMP Trap feature adds a Simple Network Management Protocol (SNMP) trap generation capability. This feature is built on top of the fallback subsystem to provide an SNMP notification trap when the fallback subsystem redirects or rejects a call because a network condition has failed to meet the configured threshold. The SNMP trap provides VoIP management status MIB information without flooding management systems with unnecessary messages about call status by triggering only when a call has been redirected to the public switched telephone network (PSTN) or the alternative IP port. A call can be rejected because of a network problem such as loss of WAN connection, delay, packet loss, or jitter. This feature supports only VoIP signaling protocol with H.323 in this release. This feature has to be configured on the originating gateway and the terminating gateway.

The call fallback map command option provides a target network summary/consolidation mode. For example, if there are four individual voice gateway routers connected together on a remote LAN via a separate LAN-to-WAN access router, the map option allows a single probe to be sent to the single remote WAN access router (instead of having to maintain separate probes for each of the four voice gateway routers' IP addresses). Because the remote access and voice gateway routers are connected together on the same remote LAN, the probes to the access router returns similar results to probes to the individual voice gateway routers.

Service Assurance Agent

Service Assurance Agent (SAA) is a network congestion analysis mechanism that provides delay, jitter, and packet loss information for the configured IP addresses. SAA is based on a client/server protocol defined on the User Datagram Protocol (UDP). UDP is a connectionless transport layer protocol in the IP protocol stack. UDP is a simple protocol that exchanges datagrams without acknowledgments or guaranteed delivery, requiring that error processing and retransmission be handled by other protocols. The SAA probe packets go out on randomly selected ports from the top end of the audio UDP port range.

The information that the SAA probes gather is used to calculate the ICPIF or delay/loss values that are stored in a fallback cache, where they remain until the cache ages out or overflows. Until an entry ages out, probes are sent periodically for that particular destination. This time interval is user configurable.

With this feature enhancement, you can also configure codes that indicate the cause of the network rejection; for example, packets that are lost or that take too long to be transmitted. A default cause code of 49 displays the message qos-unavail, which means Quality of Service is unavailable.

Note

The Cisco SAA functionality in Cisco IOS software was formerly known as Response Time Reporter (RTR). In the How to Configure PSTN Fallback, on page 75 section, note that the command-line interface still uses the keyword rtr for configuring RTR probes, which are now actually the SAA probes.
Application of PSTN Fallback

The PSTN Fallback feature and enhancement provide the following benefits:

- Automatically re-routes calls when the data network is congested at the time of the call setup.
- Enables the service provider to give a reasonable guarantee about the quality of the conversation to its Voice over IP (VoIP) users at the time of call admission.
- Provides delay, jitter, and packet loss information for the configured IP addresses.
- Caches call values from previous calls. New calls do not have to wait for probe results before they are admitted.
- Enables a user-configurable cause code display that indicates the type of call rejection.

Restrictions for PSTN Fallback

The PSTN Fallback feature has the following restrictions:

- When detecting network congestion, the PSTN fallback feature does nothing to the existing call. It affects only subsequent calls.
- Only a single ICPIF/delay-loss value is allowed per system.
- A small additional call setup delay can be expected for the first call to a new IP destination.

Caution

Configuring call fallback active in a gateway creates an SAA jitter probe against other (target) gateways to which the calls are sent. In order for the call fallback active to work properly, the target gateways must have the rtr responder command (in Cisco IOS releases prior to 12.3(14)T) or the ip sla monitor responder command (in Cisco IOS Release 12.3(14)T or later) in their configurations. If one of these commands is not included in the configuration of each target gateway, calls to the target gateway will fail.

How to Configure PSTN Fallback

Configuring Call Fallback to Use MD5 Authentication for SAA Probes

To configure call fallback to use MD5 authentication for SAA probes, use the following commands.

SUMMARY STEPS

1. enable
2. configure terminal
3. call fallback active
4. call fallback key-chain name-of-chain
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>

**Configuring Destination Monitoring without Fallback to Alternate Dial Peers**

To configure destination monitoring without fallback to alternate dial peers, use the following commands.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. call fallback monitor

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
### Purpose

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><code>Router(config)# call fallback monitor</code></td>
<td></td>
</tr>
</tbody>
</table>

### Configuring Call Fallback Cache Parameters

To configure the call fallback cache parameters, use the following commands.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `call fallback cache-size number`
4. `call fallback cache-timeout seconds`
5. `clear call fallback cache [ip-address]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**                 | Enters global configuration mode.    |
| `configure terminal`       |                                      |
| Example:                   |                                      |
| `Router# configure terminal` |                                      |

| **Step 3**                 | Specifies the call fallback cache size. |
| `call fallback cache-size number` |                                      |
| Example:                   |                                      |
| `Router(config)# call fallback cache-size 5` |                                      |
### Configuring Call Fallback Jitter-Probe Parameters

To configure call fallback jitter-probe parameters, use the following commands.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. call fallback jitter-probe num-packets number-of-packets
4. call fallback jitter-probe precedence precedence
5. call fallback jitter-probe priority-queue

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>call fallback jitter-probe num-packets number-of-packets</td>
<td>Specifies the number of packets for jitter. Default: 15.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Purpose
Command or Action | Purpose
---|---
**Example:**
Router(config)# call fallback jitter-probe num-packets 10

**Step 4**
call fallback jitter-probe precedence *precedence*

Example:
or

Example:
call fallback jitter-probe dscp *dscp-number*

Example:
Router(config)# call fallback jitter-probe precedence 2

Example:
or

Example:
Router(config)# call fallback jitter-probe dscp 2

**Step 5**
call fallback jitter-probe priority-queue

Example:
Router(config)# call fallback jitter-probe priority-queue

### Configuring Call Fallback Probe-Timeout and Weight Parameters

To configure call fallback probe-timeout and weight parameters, use the following commands.
**SUMMARY STEPS**

1. enable
2. configure terminal
3. call fallback probe-timeout *seconds*
4. call fallback instantaneous-value-weight *percent*

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> call fallback probe-timeout <em>seconds</em></td>
<td>Sets the timeout for an SAA probe, in seconds. Default: 30.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# call fallback probe-timeout</td>
<td>20</td>
</tr>
<tr>
<td><strong>Step 4</strong> call fallback instantaneous-value-weight <em>percent</em></td>
<td>Configures the call fallback subsystem to take an average from the last two probes registered in the cache for call requests:</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# call fallback instantaneous-value-weight</td>
<td>50</td>
</tr>
</tbody>
</table>

---

**Configuring Call Fallback Threshold Parameters**

To configure call fallback threshold parameters, use the following commands.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. call fallback threshold delay *delay-value* *loss* *loss-value*
**Detailed Steps**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies fallback threshold to use packet delay and loss values. No defaults.</td>
</tr>
<tr>
<td>call fallback threshold delay delay-value</td>
<td>Note: The amount of delay set by the <code>call fallback threshold delay loss</code> command should not be more than half the amount of the time-to-wait value set by the <code>call fallback wait-timeout</code> command; otherwise the threshold delay will not work correctly. Because the default value of the <code>call fallback wait-timeout</code> command is set to 300 milliseconds, you can configure a delay of up to 150 milliseconds for the <code>call fallback threshold delay loss</code> command. If you want to configure a higher threshold, the time-to-wait delay has to be increased from its default (300 milliseconds) using the <code>call fallback wait-timeout</code> command.</td>
</tr>
<tr>
<td>or</td>
<td>Specifies fallback threshold to use the Calculated Planning Impairment Factor (ICPIF) threshold for network traffic.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# call fallback threshold delay 100 loss 150</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>or</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# call fallback threshold icpif 100</td>
</tr>
</tbody>
</table>

**Configuring Call Fallback Wait-Timeout**

To configure the call fallback wait-timeout parameters, use the following commands:
SUMMARY STEPS

1. enable
2. configure terminal
3. call fallback wait-timeout milliseconds

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> call fallback wait-timeout milliseconds</td>
<td>Configures the waiting timeout interval for a response to a probe in milliseconds. Default: 300 milliseconds.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# call fallback wait-timeout 200</td>
<td>Note: The time-to-wait period set by the call fallback wait-timeout command should always be greater than or equal to twice the amount of the threshold delay time set by the call fallback threshold delay loss command; otherwise the probe will fail. The delay configured by the call fallback threshold delay loss command corresponds to a one-way delay, whereas the time-to-wait period configured by the call fallback wait-timeout command corresponds to a round-trip delay. The threshold delay time should be set at half the value of the time-to-wait value.</td>
</tr>
</tbody>
</table>

Configuring VoIP Alternate Path Fallback SNMP Trap

To configure the SNMP trap parameters, use the following commands:

SUMMARY STEPS

1. enable
2. configure terminal
3. call fallback active
4. snmp-server enable traps voice fallback
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> call fallback active</td>
<td>Enables the PSTN fallback feature to alternate dial peers in case of network congestion.</td>
</tr>
<tr>
<td>Example: Router(config)# call fallback active</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> snmp-server enable traps voice fallback</td>
<td>Configures the SNMP trap parameters.</td>
</tr>
<tr>
<td>Example: Router(config)# snmp-server enable traps voice fallback</td>
<td></td>
</tr>
</tbody>
</table>

What to Do Next

Configure the rtr responder command on the terminating voice gateway. If the rtr responder is enabled on the terminating gateway, the terminating gateway responds to the probe request when the originating gateway sends an Response Time Report (RTR) probe to the terminating gateway to check the network conditions.

Configuring Call Fallback Map Parameters

To configure call fallback map parameters, use the following commands.

SUMMARY STEPS

1. enable
2. configure terminal
3. Do one of the following:
   - call fallback map map target ip-address address-list ip-address1 ip-address2 ... ip-address7
   - call fallback map map target ip-address subnet ip-network netmask
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>Do one of the following:</td>
<td>Specifies the call fallback router to keep a cache table (by IP addresses) of distances for several destination peers sitting behind the router.</td>
</tr>
<tr>
<td>• call fallback map map target</td>
<td>• map --Fallback map. Range is from 1 to 16. There is no default.</td>
</tr>
<tr>
<td>ip-address address-list ip-address1 ip-address2 ... ip-address7</td>
<td>• target  ip-address --Target IP address.</td>
</tr>
<tr>
<td>• call fallback map map target</td>
<td>• ip-address1 ip-address2 ... ip-address7 --Lists the IP addresses that are kept in the cache table. The maximum number of IP addresses is seven.</td>
</tr>
<tr>
<td>ip-address subnet ip-network netmask</td>
<td></td>
</tr>
</tbody>
</table>

Configuring ICMP Pings to Monitor IP Destinations

This capability to monitor ICMP pings is enabled to monitor the IP destinations in a VoIP network, which may not support RTR. This monitoring is referred to as ICMP ping monitoring. Based on the RTR or ICMP ping monitoring, results change the operational state of the dial-peer. The configurations described in this section also provide support for monitoring the following session targets configured under a VoIP dial-peer:

- DNS
- IP version 4
- SIP-server
- enum

To configure call-fallback monitor probes to ping IP destinations, complete one of the following tasks:
### Dial Peer Configuration of the call fallback icmp-ping and monitor probe Commands

To configure dial-peer parameters to use ICMP pings to monitor IP destinations, complete this task. This configuration applies only to VoIP dial peers.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `dial-peer voice tag voip`
4. `call fallback [icmp-ping | rtr]`
5. `monitor probe {icmp-ping | rtr} [ip address]`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
| Example:          | • Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example:          | |
| **Step 3** dial-peer voice tag voip | Enters dial peer configuration mode, specifies the method of voice encapsulation, and defines a particular dial peer:  
tag --Digits that define a particular dial peer. Range is from 1 to 2147483647. |
| Example:          | Router(config)# dial-peer voice 10 voip |
| **Step 4** call fallback [icmp-ping | rtr] | Configures dial-peer parameters for pings to IP destinations:  
• `icmp-ping` --Uses ICMP pings to monitor the IP destinations.  
• `rtr` --Uses RTR probes to monitor the session target and update the status of the dial peer. RTR probes are the default. |
| Example:          | Router(config-dial-peer)# call fallback icmp-ping |

**Note**  
If this `call fallback icmp-ping` command is not entered, the `call fallback active` command in global configuration is used for measurements. If this `call fallback icmp-ping` command is entered, these values override the global configuration. One of these two commands must be in effect before the `monitor probe icmp-ping` command can be used. If neither of `call fallback` commands is in effect, the `monitor probe icmp-ping` command will not work properly.
### Purpose

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| monitor probe (icmp-ping | rtr) [ip address] | Enables dial-peer status changes based on the result of the probe:  
  - icmp-ping --Uses ICMP ping as the method for the probe.  
  - rtr --Uses RTR as the method for the probe.  
  - ip address --IP address of the destination to be probed. If no IP address is specified, the IP address is read from the session target. |

**Example:**

Router(config-dial-peer)# monitor probe icmp-ping

---

### Global Configuration of the call fallback icmp-ping Command

To configure global parameters to use ICMP pings to monitor IP destinations, complete this task.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **call fallback active (icmp-ping | rtr)**
4. **call fallback icmp-ping [count number] [codec type] [size bytes] interval seconds [loss number] [timeout milliseconds]**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Example:**
  
  Router> enable |

| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**
  
  Router# configure terminal |

| **Step 3** call fallback active (icmp-ping | rtr) | Configures global parameters for pings to IP destinations:  
  - icmp-ping --Uses ICMP pings to monitor the IP destinations.  
  - rtr --Uses RTR probes to monitor the IP destinations. RTR probes are the default. |
| **Example:**
  
  Router(config)# call fallback active icmp-ping |
### PSTN Fallback

#### Configuring ICMP Pings to Monitor IP Destinations

<table>
<thead>

<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# call fallback icmp-ping codec g729 interval 10 loss 10</td>
<td></td>
</tr>
</tbody>
</table>

### Voice Port Configuration of the busyout monitor probe icmp-ping Command

To configure voice-port parameters to use ICMP pings to monitor IP destinations, complete this task.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `voice-port slot / port`
4. `busyout monitor probe icmp-ping ip address [codec type | size bytes][loss percent]`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Purpose**

**Step 2**

*configure terminal*

Enters global configuration mode.

**Example:**

Router# configure terminal

**Step 3**

*voice-port slot/port*

Enters voice-port configuration mode and identifies the slot and port where the configuration parameters take effect.

**Note** The syntax for this command varies by platform. For more information, see the Cisco IOS Voice Command Reference.

**Example:**

Router(config)# voice-port 1/0

**Step 4**

*busyout monitor probe icmp-ping ip address [codec type | size bytes][loss percent]*

Specifies the parameters for ICMP pings for monitoring under voice-port configuration:

- *ip address* --IP address of the destination to which the ping is sent.
- *codec* --(Optional) Codec type for deciding the ping packet size.
- *type* --Acceptable codec types are `g711a`, `g711u`, `g729`, and `g729b`.
- *size* --(Optional) Size (in bytes) of the ping packet. Default is 32.
- *loss* --(Optional) Threshold packet loss, expressed as a percentage. Default is 20.

**Voice Class Configuration of the busyout monitor probe icmp-ping Command**

To configure voice-class parameters to use ICMP pings to monitor IP destinations, complete this task.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. voice class busyout tag
4. busyout monitor probe icmp-ping *ip address [codec type | size bytes][loss percent]*

**DETAILED STEPS**

**Command or Action**

**Purpose**

**Step 1**

*enable*

Enables privileged EXEC mode.

**Example:**

Router> enable

- Enter your password if prompted.
### How to Verify and Monitor the PSTN Fallback Feature

#### Verifying PSTN Fallback Configuration

The `show` commands in this section can be used to display statistics and configuration parameters to verify the operation of the PSTN Callback feature:

- **show running-config** -- Displays the contents of the currently running configuration file to see if the new feature is configured.
- **show call history voice** -- Displays the call history table for voice calls and verify call fallback, call delay, and call loss parameters.
- **show call fallback cache** -- Displays the current Calculated Planning Impairment Factor (ICPIF) estimates for all IP addresses in the call fallback cache.
- **show call fallback config** -- Displays the current configuration.
- **show call fallback stats** -- Displays the call fallback statistics.

#### Example Commands

**Step 2**

```
configure terminal
```

Example:

```
Router# configure terminal
```

**Purpose**

Enters global configuration mode.

**Step 3**

```
voice class busyout  tag
```

Example:

```
Router(config)# voice class busyout 10
```

**Purpose**

Creates a voice class for local voice busyout functions:

- *tag* -- Unique identification number assigned to one voice class. Range is 1 to 10000.

**Step 4**

```
busyout monitor probe icmp-ping  ip address [codec type | size bytes][loss percent]
```

Example:

```
Router(config-class)# busyout monitor probe icmp-ping 10.1.1.1 codec g729b size 32
```

**Purpose**

Configures the parameters for ICMP pings for monitoring under voice-port:

- *ip address* -- IP address of the destination to which the ping is sent.
- *codec* -- (Optional) Codec type for deciding the ping packet size.
- *type* -- Acceptable codec types are `g711a`, `g711u`, `g729`, and `g729b`.
- *size* -- (Optional) Size (in bytes) of the ping packet. Default is 32.
- *loss* -- (Optional) Threshold packet loss, expressed as a percentage. Default is 20.
Monitoring and Maintaining PSTN Fallback

Use the following commands to monitor and maintain the PSTN Fallback feature:

- `clear call fallback cache` -- Clears the current ICPIF estimates for all IP addresses in the cache.
- `clear call fallback stats` -- Clears the call fallback statistics.
- `debug call fallback detail` -- Displays details of VoIP call fallback.
- `debug call fallback probes` -- Displays details of voice fallback probes.
- `test call fallback probe ip-address` -- Tests a probe to a particular IP address and displays the ICPIF SAA values.
- `debug snmp packets` -- Displays information about every Simple Network Management Protocol (SNMP) packet sent or received by the router.

What To Do Next

The Configuring ICMP Pings to Monitor IP Destinations, on page 84 describes the mechanism whereby a dial-peer becomes temporarily disabled because of poor SAA/RTR probe results (for example, ICPIF, jitter, or loss), or because of failure of the ICMP ping test. When this occurs, the normal alternate dial-peer selection process (hunting) is triggered to search for an alternate dial-peer that represents an alternate route.

The global configuration `voice hunt` command controls whether hunting (continue to look or "hunt" for an alternate dial-peer match) occurs, based on the specific cause code that describes why the initial dial-peer path failed. Hunting is usually appropriate if the cause code indicates network congestion, but usually inappropriate if the failure cause code indicates that the called user is actually busy. Even if an alternate path is taken to reach the called user, and if the user is actually busy, the user will be busy regardless of which path is used.

For more information about the `voice hunt` command, see the Cisco IOS Voice Command Reference.
Dial Peer Configuration Examples

This appendix contains a series of configuration examples featuring the minimum required components and critical Cisco IOS command lines extracted from voice gateway configuration files necessary to complete an endpoint-to-endpoint call. Each example is designed to focus on a specific combination of components or configuration concept essential to voice over IP (VoIP) communication. This appendix covers the following topics:

- Finding Feature Information, page 91
- Two Analog Phones, page 91
- Two Fax Machines, page 94
- An Analog Phone and an IP Phone Connected over an IP Network, page 95
- Two IP Phones Connected via a Voice over Frame Relay Network, page 96
- Using Digit Manipulation to Overcome the Obstacle of an IP Network Failure, page 97

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Two Analog Phones

The simplest and most ubiquitous implementation of dial peer configuration involves connecting two standard analog telephones over an IP network. The following two examples illustrate the minimum required configurations necessary to connect two analog phones, where they are attached to the same voice gateway router and where each phone is attached to its own voice gateway router via FXS ports installed in the voice gateway routers in question.
Both Connected to the Same Voice Gateway Router

Figure 17: Two analog phones connected to the same voice gateway router

Voice Gateway Router Configuration File

```
voice-port 1/0/0
!
voice-port 1/0/1
!
dial-peer voice 1 pots
  destination-pattern 5551234
  port 1/0/0
!
dial-peer voice 2 pots
  destination-pattern 5555678
  port 1/0/1
```

Each Connected to Their Own Voice Gateway Routers Using the G.711 Codec

session target ipv4:10.2.3.4
Two Fax Machines

Once the connection between two analog phones over the IP network can be set up, you can then alter the configuration slightly to enable fax communication over the IP network. The figure below illustrates the configuration files necessary to establish T.38 Fax Relay functionality over the IP network.

Figure 19: Two fax machines connected via T.38 Fax Relay

An Analog Phone and an IP Phone Connected over an IP Network

Once you are able to establish the connection of two analog phones over an IP network, you can then expand the scope of configuration coverage to include an analog phone and an IP phone connected over the IP network. The configuration for each of the voice gateway routers is essentially the same as if you were connecting two analog phones; you will need to ensure that you have allowed for a Cisco CallManager server connection to the appropriate Cisco voice gateway router to accommodate the introduction of the IP phone.

Note
A CallManager server has been used in this configuration to manage the Cisco IP phone. However, this document does not address Cisco CallManager configuration. For more information on Cisco CallManager setup and configuration, refer to the Cisco CallManager documentation available on Cisco.com.

Figure 20: An analog phone and an IP phone each connected to their own voice gateway router

Two IP Phones Connected via a Voice over Frame Relay Network

The examples thus far in this appendix have described connecting endpoints over an IP network based primarily on Ethernet connections. However, you may find that you must configure a Frame Relay WAN to effectively serve the voice communications demands for your system. The figure below and the subsequent Cisco voice gateway router configuration examples illustrate the dial peer configuration and Frame Relay Cisco IOS commands necessary to enable Frame Relay communication across your IP network.

Although it is an essential portion of the configuration of this system, and the following configuration files contain the Cisco IOS commands necessary to establish Frame Relay connectivity, Frame Relay configuration is not addressed in this document. For more information on Frame Relay configuration, refer to the appropriate documentation available on Cisco.com.

```

Using Digit Manipulation to Overcome the Obstacle of an IP Network Failure

The figure below and the subsequent Cisco voice gateway router configuration examples illustrate the dial peer configuration necessary to automatically route an outgoing voice call over the PSTN in the event of a temporary IP network outage. An advantage to this method of setting up and connecting the call over the PSTN (while still originating the transmission from a voice gateway router) is more commonly known as "toll bypass."

**Figure 22: Using the PSTN in the event of an IP network failure**

CHAPTER 7

Matching Inbound Dial Peers by URI

The Matching Inbound Dial Peers by URI feature allows you to configure selection of inbound dial peers by matching parts of the URI sent by remote (neighboring) SIP entity. The match can be done on different parts of the URI like hostname, IP address, DNS name. This feature can be used to configure configuration policies, enforcement of specific call-treatment, security, and routing policies on each SIP trunk by originating SIP entity.

In a scenario where multiple SIP hops are involved in a call, there would be multiple via headers involved, and the topmost via header of an incoming SIP invite represents the last hop that forwarded the SIP request, and the bottom-most via header would represent the originator of the SIP request. This feature supports matching by the last hop that forwarded the request (neighboring SIP entity), which is the topmost via header.

Note

For incoming dial-peer match based on URI, if there are multiple dial-peer matches, then the longest matching dial-peer is chosen (similar to multiple dial-peer match based on incoming called number). However for URI pattern match, there is no match length and hence this is the least preferred.

- Feature Information for Matching Inbound Dial Peers by URI, page 101
- Configuring an Inbound Dial Peer to Match on URI, page 102
- Examples for Configuring an Inbound Dial Peer to Match on a URI, page 104

Feature Information for Matching Inbound Dial Peers by URI

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

### Configuring an Inbound Dial Peer to Match on URI

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `voice class uri voice-class-uri-tag`
4. Specify a URI field for the voice class:
   - `host hostname-pattern`
   - `host ipv4: ipv4-address`
   - `host ipv6: ipv6-address`
   - `host dns: dns-address`
   - `pattern uri-pattern`
   - `user-id username-pattern`
5. `exit`
6. `dial-peer voice tag voip`
7. `session protocol sipv2`
8. `incoming uri { from | request | to | via} voice-class-uri-tag`
9. `end`

### Examples for Configuring an Inbound Dial Peer to Match on a URI

#### Matching Against IPv4 Address and VIA

CUBE is configured to use incoming dial-peer 101 for incoming SIP calls from remote SIP endpoint having an IP address of 10.10.10.1

```plaintext
voice class uri 201 sip
host ipv4:10.10.10.1

dial-peer voice 101 voip
session protocol sipv2
incoming uri via 201
```

Incoming INVITE that can be matched against this dial peer.

```plaintext
INVITE sip:123@1.2.3.4:5060 SIP/2.0
Via: SIP/2.0/TCP 10.10.10.1:5093;branch=z9hG4bK-17716-1-0
Via: SIP/2.0/TCP 10.10.14.20:5093;branch=z9hG4bK-28280-1-0
```
Matching Against DNS Name and VIA

CUBE is configured to use incoming dial-peer 102 for incoming SIP calls from sample.com or an IP address that represents one of the resolved IP address of sample.com.

```plaintext
voice class uri 202 sip
dns sample.com

dial-peer voice 101 voip
session protocol sipv2
incoming uri via 202
```

Incoming INVITE that can be matched against this dial peer.

```
INVITE sip:10.10.10.25:5060 SIP/2.0
Via: SIP/2.0/TCP sample.com;branch=z9hG4bK-17716-1-0
INVITE sip:10.10.10.25:5060 SIP/2.0
Via: SIP/2.0/TCP xxx.yyy.com;branch=z9hG4bK-17716-1-0
```

Matching Against Multiple Attributes and VIA

CUBE is configured to use incoming dial-peer 103 for incoming SIP calls from xxx.yyy.com, abc.def.com and IP addresses 10.10.10.10, 10.9.10.11 and 10.10.10.10.

```plaintext
voice class uri 203 sip
dns xxx.yyy.com
dns abc.def.com
ipv4 10.10.10.10
ipv4 10.9.10.11
ipv4 10.10.10.10

dial-peer voice 103 voip
session protocol sipv2
incoming uri via 203
```

Incoming INVITE that can be matched against this dial peer.

```
INVITE sip:123@1.2.3.4:5060 SIP/2.0
Via: SIP/2.0/TCP sample.com;branch=z9hG4bK-17716-1-0
INVITE sip:123@1.2.3.4:5060 SIP/2.0
Via: SIP/2.0/TCP 10.10.10.25:5093;branch=z9hG4bK-17716-1-0
```

10.10.10.25 is a resolved IP address of sample.com.
Multiple Pattern Support on a Voice Dial Peer

The Multiple Pattern Support on a Voice Dial Peer feature enables you to configure multiple patterns on a VoIP dial peer using an E.164 pattern map. A dial peer can be configured to match multiple patterns to an incoming calling or called number or an outgoing destination number.

- Feature Information for Multiple Pattern Support on a Voice Dial Peer, page 107
- Restrictions for Multiple Pattern Support on a Voice Dial Peer, page 108

- Configuring Multiple Pattern Support on a Voice Dial Peer, page 109
- Verifying Multiple Pattern Support on a Voice Dial Peer, page 111
- Configuration Examples for Multiple Pattern Support on a Voice Dial Peer, page 112

Feature Information for Multiple Pattern Support on a Voice Dial Peer

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Table 7: Feature Information for Multiple Pattern Support on a Voice Dial Peer

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuring Multiple Pattern Support on a Voice Dial Peer (Inbound Calls)</td>
<td>Cisco IOS 15.4 (1)T, Cisco IOS XE 3.11S</td>
<td>This feature was extended for inbound VoIP dial peers for incoming calling and called numbers. The following commands were introduced or modified: incoming called e164-pattern-map, incoming calling e164-pattern-map</td>
</tr>
<tr>
<td>Configuring Multiple Pattern Support on a Voice Dial Peer (Outbound Calls)</td>
<td>Cisco IOS 15.2(4)M, Cisco IOS XE 3.7S</td>
<td>This feature allows you to add more than one E.164 destination pattern inside a pattern map and configure that pattern map for one or more VoIP dial peers. This feature is supported for outbound peers only. The following commands were introduced or modified: destination e164-pattern-map, e164, show voice class e164-pattern-map, url, voice class e164-pattern-map load, voice class e164-pattern-map.</td>
</tr>
</tbody>
</table>

Restrictions for Multiple Pattern Support on a Voice Dial Peer

- This feature is supported only on a VoIP dial peer.
- Duplicate patterns cannot be added to a pattern map.

Information About Multiple Pattern Support on a Voice Dial Peer

Matching an incoming or outgoing call using a pattern defined in a VoIP dial peer is an existing feature on the Cisco Unified Border Element (Enterprise) and Session Initiation Protocol (SIP) Gateway. You can now support multiple patterns on a VoIP dial peer using an E.164 pattern map. You can create an E.164 pattern map and then link it to one or more VoIP dial peers.

When a pattern is the only source to enable a dial peer, a valid E.164 pattern map enables the linked dial peers, whereas an invalid E.164 pattern map disables the linked dial peers. Additionally, whenever an E.164 pattern
map is created or reloaded, one or more dial peers linked with an E.164 pattern map is enabled or disabled based on the validation of a pattern map.

You can match a pattern map to an incoming calling or called number or an outgoing destination number.

When a dial peer has multiple patterns, the pattern with the longest prefix is considered as the matching criteria.

### Configuring Multiple Pattern Support on a Voice Dial Peer

#### SUMMARY STEPS

1. enable
2. configure terminal
3. voice class e164-pattern-map pattern-map-id
4. Do one of the following:
   - e164 pattern-map-tag
   - url url
5. (Optional) description string
6. exit
7. dial-peer voice dial-peer-id voip
8. \{destination | incoming called | incoming calling\} e164-pattern-map pattern-map-group-id
9. end
10. (Optional) voice class e164-pattern-map load pattern-map-group-id
11. show dial-peer voice [summary | dial-peer-id]

#### DETAILED STEPS

## Purpose

Command or Action | Purpose |
--- | --- |
**Step 3** voice class e164-pattern-map pattern-map-id | Creates a pattern map for configuring one or multiple E.164 patterns on a dial peer and enters voice class configuration mode. |

**Example:**
```
Device(config)# voice class e164-pattern-map 1111
```

**Step 4** Do one of the following:  
• e164 pattern-map-tag  
• url url | Configure one or more E.164 telephone number prefix match patterns for the pattern map.  
  • Repeat this step for each pattern if you are using the e164 command.  
  • You can specify a file URL containing the patterns for this dial peer using the url url command. You must then load the E.164 telephone prefixes using Step 10. The file can be internal (on the device) or external. |

**Example:**
```
Using URL text file:
Device(voice-class)# url http://http-host/config-files/pattern-map.cfg

Directly specifying match patterns:
Device(voice-class)# e164 5557123
```

**Step 5** description string | (Optional) Provides a description for the pattern map. |

**Example:**
```
Device(voice-class)# description It has 1 entry
```

**Step 6** exit | Exits voice class configuration mode and enters global configuration mode. |

**Example:**
```
Device(voice-class)# exit
```

**Step 7** dial-peer voice dial-peer-id voip | Defines a VoIP dial peer and enters dial peer configuration mode. |

**Example:**
```
Device(config)# dial-peer voice 2222 voip
```

**Step 8**  
<table>

</table>
| e164-pattern-map pattern-map-group-id | Links a pattern-map group with a dial peer.  
  • Use the destination keyword for outbound dial peers.  
  • Use the incoming called or incoming calling keywords for inbound dial peers using called or calling numbers. |

**Example:**
```
Device(config-dial-peer)# incoming calling e164-pattern-map 1111
```
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-dial-peer)# <strong>end</strong></td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Exits dial peer configuration mode and enters privileged EXEC mode.</td>
</tr>
</tbody>
</table>

| **Step 10**       | **voice class e164-pattern-map load pattern-map-group-id** |
| **Example:**      | Device# **voice class e164-pattern-map load 1111** |
| **Purpose**       | (Optional) Loads the specified pattern map with E.164 match patterns from a text file configured in the pattern map. |
|                   | • This step is required only if patterns have been defined for the specified pattern map using a file URL in Step 4. |

| **Step 11**       | **show dial-peer voice [summary | dial-peer-id]** |
| **Example:**      | Device# **show dial-peer voice 1111** |
| **Purpose**       | Displays the status of a pattern map when the pattern map is associated with a dial peer. |

### Verifying Multiple Pattern Support on a Voice Dial Peer

#### SUMMARY STEPS

1. **show voice class e164-pattern-map [summary | pattern-map-id]**
2. **show dial-peer voice [summary | dial-peer-id]**
3. **show dialplan incall {sip | h323} {calling | called} e164-pattern**

#### DETAILED STEPS

**Step 1**

**show voice class e164-pattern-map [summary | pattern-map-id]**

Displays the status and contents of a specified pattern map or a status summary of all pattern maps.

**Example:**

```
Device# show voice class e164-pattern-map 200
```

```
e164-pattern-map 200
-----------------------------
  It has 1 entries
  It is not populated from a file.
  Map is valid.

E164 pattern
```
Step 2  
show dial-peer voice [summary | dial-peer-id]
Displays the status of pattern maps associated with all or a specified dial peer.

Example:
Device# show dial-peer voice | include e164-pattern-map
incoming calling e164-pattern-map tag = '200' status = valid,
destination e164-pattern-map tag = 3000 status = valid,
Device# show dial-peer voice 2222 | include e164-pattern-map
incoming calling e164-pattern-map tag = '200' status = valid,

Step 3  
show dialplan incall {sip | h323} {calling | called} e164-pattern
Displays inbound dial peer details and associated pattern maps based on an incoming calling or called number.

Example:
Device# show dialplan incall voip calling 23456
VoiceOverfPeer1234567
 peer type = voice, system default peer = FALSE, information type = voice,
description = '',
tag = 1234567, destination-pattern = '',
destination e164-pattern-map tag = 200 status = valid,
destination dpg tag = 200 status = valid,
voice reg type = 0, corresponding tag = 0,
allow watch = FALSE
answer-address = '', preference=0,
incoming calling e164-pattern-map tag = '200' status = valid,
CLID Restriction = None

Configuration Examples for Multiple Pattern Support on a Voice Dial Peer

Example: Configuring Multiple Patterns for Outbound Dial Peers Using a File URL

Device# voice class e164-pattern-map 1111
Device(voice-class)# url http://http-host/config-files/pattern-map.cfg
Device(voice-class)# description For Outbound Dial Peer
Device(voice-class)# exit
Device(config)# dial-peer voice 2222 voip
Device(voice-dial-peer)# destination e164-pattern-map 1111
Device(voice-dial-peer)# exit
Device(config)# voice class e164-pattern-map load 1111
Device(config)# end

Example: Configuring Multiple Patterns for Outbound Dial Peers by Specifying Each E164 Pattern

Device# voice class e164-pattern-map 1112
Device(voice-class)# e164 5557456
Device(voice-class)# e164 5557455
Device(voice-class)# e164 5557454
Device(voice-class)# e164 5557453
Device(voice-class)# e164 5557452
Device(voice-class)# description For Outbound Dial Peer
Device(voice-class)# exit
Device(config)# dial-peer voice 2222 voip
Device(voice-dial-peer)# destination e164-pattern-map 1112
Device(voice-dial-peer)# end
!

Example: Configuring Multiple Patterns for Inbound Dial Peer

Device# voice class e164-pattern-map 1113
Device(voice-class)# url http://http-host/config-files/pattern-map.cfg
Device(voice-class)# description For Inbound Dial Peer
Device(voice-class)# exit
Device(config)# dial-peer voice 2222 voip
Device(voice-dial-peer)# incoming calling e164-pattern-map 1113
Device(voice-dial-peer)# exit
Device(config)# voice class e164-pattern-map load 1113
Device(config)# end
Outbound Dial-Peer Group as an Inbound Dial-Peer Destination

This feature can group multiple outbound dial peers into a dial-peer group and configure this dial-peer group as the destination of an inbound dial peer.

• Feature Information for Outbound Dial-Peer Group as an Inbound Dial-Peer Destination, page 115
• Restrictions, page 116
• Information About Outbound Dial-Peer Group as an Inbound Dial-Peer Destination, page 116
• Configuring Outbound Dial-Peer Group as an Inbound Dial-Peer Destination, page 117
• Verifying Outbound Dial-Peer Groups as an Inbound Dial-Peer Destination, page 120
• Troubleshooting Tips, page 120
• Configuration Examples for Outbound Dial Peer Group as an Inbound Dial-Peer Destination, page 122

Feature Information for Outbound Dial-Peer Group as an Inbound Dial-Peer Destination

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 8: Feature Information for Outbound Dial-Peer Group as an Inbound Dial-Peer Destination

<td>Cisco IOS XE 3.14S</td>
<td>can have a dial-peer group as the destination.</td>
</tr>
</tbody>
</table>
### Feature Information

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outbound Dial-Peer Group as an Inbound Dial-Peer Destination</td>
<td>Cisco IOS 15.4(1)T Cisco IOS XE 3.11S</td>
<td>This feature groups multiple outbound dial-peers into a dial-peer group and configures this dial-peer group as a destination of an inbound dial peer. The following commands were introduced or modified: voice class dpg, description, dial-peer preference, destination dpg, show voice class dpg.</td>
</tr>
</tbody>
</table>

### Restrictions

- If a dial-peer group is in the shutdown state, regular dial-peer search occurs.
- If all dial peers in an active dial-peer group are unavailable, call is disconnected.
- The number of matched digits is zero.
- The destination-pattern command is required on the outbound dial peer even matching is not done based on this command.
- The outgoing call setup is deferred until inter-digit timer expires or a terminator is entered.

**For POTS dial peers:**

- Two-stage dialing is not supported.
- Overlapping dialing is not supported.
- TCL and VXML routing changes are not supported.
- Digit-stripping is not supported.

### Information About Outbound Dial-Peer Group as an Inbound Dial-Peer Destination

You can group up to 20 outbound (H.323, SIP or POTS) dial peers into a dial-peer group and configure this dial-peer group as the destination of an inbound dial peer. Once an incoming call is matched by an inbound dial peer with an active destination dial-peer group, dial peers from this group are used to route the incoming call. No other outbound dial-peer provisioning to select outbound dial peers is used.

A preference can be defined for each dial peer in a dial-peer group. This preference is used to decide the order of selection of dial peers from the group for the setup of an outgoing call.

You can also specify various dial-peer hunt mechanism using the existing **dial-peer hunt** command.
Configuring Outbound Dial-Peer Group as an Inbound Dial-Peer Destination

Perform this task to configure a dial-peer group with multiple outbound peers and an inbound dial peer referencing this dial-peer group as a destination.

**Before You Begin**

- Configure SIP, H.323 or POTS outbound dial peers to be associated with a dial-peer group.
- For an outbound POTS dial peer, ensure that `destination-pattern .T` and `no digit-strip` are configured to avoid unexpected dialed digit strip.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `dial-peer voice outbound-dial-peer-id [voip | pots]`
4. `destination-pattern pattern`
5. `no digit-strip` for POTS dial peers.
6. `exit`
7. (Optional) `dial-peer hunt hunt-order-number`
8. `voice class dpg dial-peer-group-id`
9. `dial-peer outbound-dial-peer-id [preference preference-order]`
10. (Optional) `description string`
11. `exit`
12. `dial-peer voice inbound-dial-peer-id [voip | pots]`
13. `destination dpg dial-peer-group-id`
14. `end`

| Device(config-dial-peer)# end |
Verifying Outbound Dial-Peer Groups as an Inbound Dial-Peer Destination

SUMMARY STEPS

1. show voice class dpg dial-peer-group-id
2. show dial-peer voice inbound-dial-peer-id

DETAILED STEPS

Step 1  
**show voice class dpg dial-peer-group-id**
Displays the configuration of an outbound dial-peer group.

**Example:**
```
Device# show voice class dpg 200
Voice class dpg: 200  AdminStatus: Up
Description: Boston Destination
Total dial-peer entries: 4

<table>
<thead>
<tr>
<th>Peer Tag</th>
<th>Pref</th>
</tr>
</thead>
<tbody>
<tr>
<td>1001</td>
<td>1</td>
</tr>
<tr>
<td>1002</td>
<td>2</td>
</tr>
<tr>
<td>1004</td>
<td>0</td>
</tr>
<tr>
<td>1003</td>
<td>1</td>
</tr>
</tbody>
</table>
```

Step 2  
**show dial-peer voice inbound-dial-peer-id**
Displays the referencing of destination dial-peer group from an inbound dial peer.

**Example:**
```
Device# show dial-peer voice 100 | include destination dpg

destination dpg tag = 200 status = valid,
```

Troubleshooting Tips

SUMMARY STEPS

1. Enter the following:
   - `debug voip dialpeer inout`
   - `debug voip ccapi inout`
DETAILED STEPS

Enter the following:

- debug voip dialpeer inout
- debug voip ccapi inout

Displays the configuration of an outbound dial-peer group.

Example:

* Jul 19 10:15:53.310 IST: //1/ED647BD1B0F9/DPM/dpMatchCore:
  Dial String=4001, Expanded String=4001, Calling Number=

destination dpg tag = 200 status = valid,

Device# show dial-peer voice 600 | include destination dpg

destination dpg tag = 200 status = valid,
Inbound Leg Headers for Outbound Dial-Peer Matching

The Inbound Leg Headers for Outbound Dial-Peer Matching feature allows you to match and provision an outbound dial peer for an outbound call leg using the headers from an inbound call leg. The following headers of an incoming call leg can be used for outbound dial-peer matching:

- VIA (SIP Header)
- FROM (SIP Header)
- TO (SIP Header)
- DIVERSION (SIP Header)
- REFERRED BY (SIP Header)
- Called Number
- Calling Number
- Carrier ID

- Feature Information for Inbound Leg Headers for Outbound Dial-Peer Matching, page 126
- Prerequisites for Inbound Leg Headers for Outbound Dial-Peer Matching, page 126
- Restrictions for Inbound Leg Headers for Outbound Dial-Peer Matching, page 127
- Information About Inbound Leg Headers for Outbound Dial-Peer Matching, page 127
- Configuring Inbound Leg Headers for Outbound Dial-Peer Matching, page 128
- Verifying Inbound Leg Headers for Outbound Dial-Peer Matching, page 131
- Configuration Example: Inbound Leg Headers for Outbound Dial-Peer Matching, page 133
Feature Information for Inbound Leg Headers for Outbound Dial-Peer Matching

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 9: Feature Information for Inbound Leg Headers for Outbound Dial-Peer Matching

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inbound Leg Headers for Outbound Dial-Peer Matching</td>
<td>15.4(2)T, Cisco IOS XE Release 3.12S</td>
<td>The Inbound Leg Headers for Outbound Dial-Peer Matching feature allows you to match and provision an outbound call leg using the headers of an inbound call leg. The following commands were introduced by this feature: destination provision-policy, destination uri-via, destination uri-to, destination uri-from, destination uri-diversion, destination uri-referred-by, show voice class dial-peer provision-policy. The following commands were modified: show command incall, show dialplan dialpeer.</td>
</tr>
</tbody>
</table>

Prerequisites for Inbound Leg Headers for Outbound Dial-Peer Matching

- CUBE or Voice Gateway must be configured.
Restrictions for Inbound Leg Headers for Outbound Dial-Peer Matching

- The existing header-passing command supports modification of SIP headers of INVITE message by the Tool Command Language (TCL) application. If the above SIP headers are modified by the TCL application, they cannot be used for outbound dial-peer provisioning.

- If multiple SIP via headers and diversion headers are found in an incoming INVITE or REFER message, only the top-most via header and top-most diversion header of an incoming INVITE or REFER message are used for outbound dial-peer provisioning.

- When an incoming call is matched to an inbound dial peer with an associated provision profile without rules, outbound dial-peer provisioning is disabled and the incoming call is disconnected by CUBE or voice gateway with cause code "unassigned number (1)".

Information About Inbound Leg Headers for Outbound Dial-Peer Matching

This feature allows you to match headers of an inbound call leg and provision an outbound dial peer for an outbound call leg. The following SIP headers of an incoming call leg can be used for outbound dial-peer matching:

- VIA (SIP Header)
- FROM (SIP Header)
- TO (SIP Header)
- DIVERSION (SIP Header)
- REFERRED BY (SIP Header)
- Called Number
- Calling Number
- Carrier ID

The above headers are retrieved from an incoming INVITE or REFER message and used for outbound dial-peer provisioning.

SIP headers of an INVITE message are saved to an associated call leg. For example, an INVITE message is received for a new call leg A. Then, SIP headers are saved to call leg A itself for outbound dial-peer lookup.

On the other hand, SIP headers of a REFER message are saved to the peer call leg of the associated call leg. For example, call leg A and call leg B are connected in CUBE. The party at Call Leg B makes a blind transfer to the party at Call Leg C. A REFER message is received in CUBE for call leg B (transferor). But, SIP headers of the REFER message are saved under call leg A (transferee) for an outbound dial-peer lookup for Party C.
Configuring Inbound Leg Headers for Outbound Dial-Peer Matching

Before You Begin
Necessary pattern maps have been configured.

SUMMARY STEPS

1. enable
2. configure terminal
3. voice class dial-peer provision-policy tag
4. (Optional) description string
5. preference preference-order first-attribute second-attribute
6. exit
7. dial-peer voice inbound-dial-peer-tag voip
8. destination provision-policy tag
9. exit
10. dial-peer voice outbound-dial-peer-tag voip
11. Configure a match command for an outbound dial peer according to the provision policy rule attribute configured.
12. end

**Example:**

Device(config)# dial-peer voice 300 voip
Device(config-dial-peer)# destination uri-from 200
Device(config)# exit

**Step 12**

End

**Example:**

Device(config-dial-peer)# end

### Purpose

Exits dial peer configuration mode and enters privileged EXEC mode.
Verifying Inbound Leg Headers for Outbound Dial-Peer Matching

SUMMARY STEPS

1. show dialplan incall {sip | h323} {calling | called} e164-pattern | include voice
2. show dialplan dialpeer inbound-dial-peer-id number e164-pattern [timeout] | include Voice
3. show voice class dial-peer provision-policy

DETAILED STEPS

Step 1
show dialplan incall {sip | h323} {calling | called} e164-pattern | include voice
Displays inbound dial peers based on an incoming calling or called number. Once you have the dial peer number, you can use it to search for the complete dial-peer details in the running-config.

Example:
Device# show dialplan incall sip calling 3333 | include Voice
VoiceOverIpPeer1
Device# show dialplan incall sip calling 4444 | include Voice
VoiceOverIpPeer1
Device# show running-config | section dial-peer voice 1 voip
dial-peer voice 1 voip
  destination dpg 10000
  incoming calling e164-pattern-map 100
dtmf-relay rtp-nne
  codec g711ulaw
Device# show dialplan incall sip called 6000 timeout | include Voice
VoiceOverIpPeer100
Device# show running-config | section dial-peer voice 100 voip
dial-peer voice 100 voip
  incoming called e164-pattern-map 1
  incoming calling e164-pattern-map 1
  dtmf-relay rtp-nne
  codec g711ulaw
Device# show dialplan incall voip calling 23456
VoiceOverIpPeer1234567
  peer type = voice, system default peer = FALSE, information type = voice,
  description = '',
  tag = 1234567, destination-pattern = '',
  destination e164-pattern-map tag = 200 status = valid,
  destination dpg tag = 200 status = valid,
  voice reg type = 0, corresponding tag = 0,
  allow watch = FALSE
  answer-address = '', preference-0,
  incoming calling e164-pattern-map tag = `200' status = valid,
  CLID Restriction = None

Step 2
show dialplan dialpeer inbound-dial-peer-id number e164-pattern [timeout] | include Voice
Displays a list of outbound dial peers based on a specified inbound dial peer. This command line will be helpful find a list of outbound dial peer of a destination dial-peer group.

**Example:**
Device# `show dialplan dialpeer 1 number 23457 timeout | include Voice`

VoiceOverIpPeer100013
VoiceOverIpPeer100012

**Example:**
voice class dial-peer provision-policy 2000
   preference 2 diversion to
   ...
   ...
   dial-peer voice 32555 voip
   session protocol sipv2
   session target ipv4:1.5.14.9
   destination uri-diversion 1
   destination uri-to test2
   !
   dial-peer voice 32991 voip
   destination provision-policy 2000
   incoming called-number 1234
   !
Device# `show dialplan dialpeer 32991 number 2234 timeout`

Macro Exp.: 2234
Enter Diversion header:sip:1234@cisco.com
Enter To header:sip:2234@10.0.0.0
VoiceOverIpPeer32134
   peer type = voice, system default peer = FALSE, information type = voice,
   description = ``,

**Step 3**

**show voice class dial-peer provision-policy**
Displays a list of configured provision policies and associated rules.

**Example:**
Device# `show voice class dial-peer provision-policy`

Voice class dial-peer provision-policy: 100 AdminStatus: Up
   Description: match only called
   Pref Policy Rule
   ----  -----------
   1 called

Voice class dial-peer provision-policy: 101 AdminStatus: Up
   Description: match both calling and called
   Pref Policy Rule
   ----  -----------
   1 called calling

Voice class dial-peer provision-policy: 102 AdminStatus: Up
   Description: match calling first; if no match then match called
   Pref Policy Rule
   ----  -----------
   1 calling
   2 called

Voice class dial-peer provision-policy: 200 AdminStatus: Up
   Description: match referred-by and via uri; if no match then match request- uri

Inbound Leg Headers for Outbound Dial-Peer Matching
Pref Policy Rule
--- -----------
1 referred-by via
2 uri

voice class dial-peer provision-policy: 300 AdminStatus: Up
Description: match only request-uri

Pref Policy Rule
--- -----------
1 uri

Voice class dial-peer provision-policy: 400 AdminStatus: Up
Description: match only request uri; if no match then match called

Pref Policy Rule
--- -----------
1 uri
2 called

Configuration Example: Inbound Leg Headers for Outbound Dial-Peer Matching

Example: Configuring Inbound Called or Calling Numbers Used for Outbound Dial-Peer Matching

Device> enable
Device# configure terminal

Device(config)# voice class dial-peer provision-policy 200
Device(voice-class)# description match both calling and called
Device(voice-class)# preference 2 calling called
Device(voice-class)# exit

Device(config)# voice class e164-pattern-map 300
Device(voice-class)# description patterns
Device(voice-class)# e164 5557123
Device(voice-class)# e164 5558123
Device(voice-class)# e164 5559123
Device(voice-class)# exit

!Associating the Provision Policy with an Inbound Dial Peer
Device(config)# dial-peer voice 100 voip
Device(config-dial-peer)# destination provision-policy 200
Device(config-dial-peer)# end

!Associates a Pattern Map with an Outbound Dial Peer.
! The called number in the SIP headers of the inbound leg is matched to select the below
outbound dial peer.
Device(config)# dial-peer voice 200 voip
Device(config-dial-peer)# destination e164-pattern-map 300
Device(config-dial-peer)# end

Example: Configuring Inbound SIP Headers for Outbound Dial-Peer Matching

Device> enable
Device# configure terminal

Device(config)# voice class dial-peer provision-policy 200
Device(voice-class)# description match both calling and called
Device(voice-class)# preference 2 via from
Device(voice-class)# exit

!Associating the Provision Policy with an Inbound Dial Peer
Device(config)# dial-peer voice 100 voip
Device(config-dial-peer)# destination provision-policy 200
Device(config-dial-peer)# end

Device(config)# voice class uri 200 sip
Device(config-voice-uri-clas)# pattern 25054..

!Associates a Provision Policy with an Outbound Dial Peer.
The FROM SIP headers of the inbound leg is matched to select the below outbound dial peer.
Device(config-dial-peer)# destination uri-from 200
Device(config-dial-peer)# end
CHAPTER 11

Server Groups in Outbound Dial Peers

This feature configures a server group (group of server addresses) that can be referenced from an outbound dial peer.

- Feature Information for Configuring Server Groups in Outbound Dial Peers, page 135
- Information About Server Groups in Outbound Dial Peers, page 136
- How to Configure Server Groups in Outbound Dial Peers, page 137
- Configuration Examples for Server Groups in Outbound Dial Peers, page 140

Feature Information for Configuring Server Groups in Outbound Dial Peers

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
### Table 10: Feature Information for Configuring Server Groups in Outbound Dial Peers

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuring Server Groups in Outbound Dial Peers</td>
<td>Cisco IOS XE Release 3.11S 15.4(1)T</td>
<td>This feature configures server groups (groups of IPv4 and IPv6 addresses) which can be referenced from an outbound SIP dial peer. The following commands were introduced or modified: <code>voice class server-group</code>, <code>description</code>, <code>ipv4 port preference</code>, <code>ipv6 port preference</code>, <code>hunt-scheme</code>, <code>show voice class server-group</code>, <code>shutdown (Server Group)</code>.</td>
</tr>
</tbody>
</table>

### Information About Server Groups in Outbound Dial Peers

You can now group IPv4 and IPv6 addresses of servers and configure it as in an outbound SIP dial-peer destination. A server group is first created and associated with a SIP outbound dial peer. When a call matches an outbound dial peer, a connection is made to one of the servers of the group, which can then route the call to the destination.

You can associate a preference with each of the servers in the group, which decides the order of selection for outgoing call setup.

You can also configure the round-robin selection of servers in the group.

You can configure up to five dial peers to a server group.

If neither round robin nor preference order is configured, the selection of servers is random.

If the specified server-group is in shutdown mode, the referenced dial peers are not selected to route outgoing calls.
How to Configure Server Groups in Outbound Dial Peers

Configuring Server Groups in Outbound Dial Peers

SUMMARY STEPS

1. enable
2. configure terminal
3. voice class server-group server-group-id
4. {ipv4 | ipv6} address [port port] [preference preference-order]
5. (Optional) hunt-scheme round-robin
6. (Optional) description string
7. exit
8. dial-peer voice dial-peer-id voip
9. session protocol sipv2
10. destination-pattern [+] string [T]
11. session server-group server-group-id
12. end
13. show voice class server-group server-group-id

DETAILED STEPS

### Configuring Server Groups in Outbound Dial Peers

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-class)# ipv4 10.1.1.1</code></td>
<td>• Repeat this step to add up to five servers to the server group.</td>
</tr>
<tr>
<td><code>preference 3</code></td>
<td>• The servers are not selected by the preference value if round robin is configured in the next step.</td>
</tr>
<tr>
<td></td>
<td>• Default and highest value of preference is zero.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>hunt-scheme round-robin</code></td>
<td>(Optional)</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-class)# hunt-scheme round-robin</code></td>
<td>Defines a hunt method for the order of selection of target server IP addresses (from the IP addresses configured for this server group) for the setting up of outgoing calls.</td>
</tr>
<tr>
<td></td>
<td>• If a hunt scheme is not defined, an available IP address of highest preference value is selected. If neither a round-robin hunt scheme nor a preference values is configured, the selection of servers is random.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td><code>description string</code></td>
<td>(Optional)</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-class)# description It has 3 entries</code></td>
<td>Provides a description for the server group.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td></td>
</tr>
<tr>
<td><code>exit</code></td>
<td></td>

### Verifying Server Groups in Outbound Dial Peers

#### SUMMARY STEPS

1. `show voice class server-group [server-group-id]`
2. `show voice class server-group dialpeer dial-peer-id`

#### DETAILED STEPS

**Step 1**

`show voice class server-group [server-group-id]`
Displays the configurations for all configured server groups or a specified server group.

**Example:**
```
Device# show voice class server-group 171
```

<table>
<thead>
<tr>
<th>Voice class server-group: 171</th>
</tr>
</thead>
<tbody>
<tr>
<td>AdminStatus: Up</td>
</tr>
<tr>
<td>Hunt-Scheme: preference</td>
</tr>
<tr>
<td>Description:</td>
</tr>
<tr>
<td>Total server entries: 3</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Pref</th>
<th>Type</th>
<th>IP Address</th>
<th>IP Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ipv4</td>
<td>10.1.1.1</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>ipv4</td>
<td>10.1.1.2</td>
<td>34515</td>
</tr>
<tr>
<td>3</td>
<td>ipv4</td>
<td>2001:DB8:12:1:1:26</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

`show voice class server-group dialpeer dial-peer-id`
Displays the configurations for dial peers associated with server groups.
Configuration Examples for Server Groups in Outbound Dial Peers

Server Groups in Outbound Dial Peers (Preference-Based Selection)

! Configuring the Server Group
Device(config)# voice class server-group 171
Device(config-class)# ipv4 10.1.1.1 preference 1
Device(config-class)# ipv4 10.1.1.2 preference 2
Device(config-class)# ipv4 10.1.1.3 preference 3
Device(config-class)# description It has 3 entries
Device(config-class)# exit

! Configuring an outbound SIP dial peer.
Device(config)# dial-peer voice 181 voip
! Associate a destination pattern
Device(config-dial-peer)# destination-pattern 3001
Device(config-dial-peer)# session protocol sipv2
! Associate a server group with the dial peer
Device(config-dial-peer)# session server-group 171
Device(config-dial-peer)# end

! Displays the configurations made for the outbound dial peer 181 associated with a server group
Device# show voice class server-group dialpeer 181
Voice class server-group: 171 AdminStatus: Up
Hunt-Scheme: preference Total Remote Targets: 3
Pref Type IP Address IP Port
---- ---- --------- -------
1 ipv4 10.1.1.1
2 ipv4 10.1.1.2
3 ipv4 10.1.1.3

! Displays the configurations made for the server group.
Device# show voice class server-group 171
Voice class server-group: 171 AdminStatus: Up OperStatus: Up
Hunt-Scheme: preference Last returned server: 10.1.1.1
Description: It has 3 entries
