Overview of MGCP and Related Protocols

This chapter provides overview information on Media Gateway Control Protocol (MGCP) and related protocols.

- Finding Feature Information, page 1
- Prerequisites for MGCP and Related Protocols, page 1
- Information About MGCP and Related Protocols, page 2
- Toll Fraud Prevention, page 6
- Additional References, page 7

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MGCP and Related Protocols

- Configure IP routing.
- Configure voice ports.
- Configure VoIP.
- Configure the call agent. (For information on setting up call agents, see the documentation that accompanies the call agents used in your network configuration.)
Information About MGCP and Related Protocols

MGCP is an extension of the earlier version of the protocol Simple Gateway Control Protocol (SGCP) and supports SGCP functionality in addition to several enhancements. Systems using SGCP can easily migrate to MGCP, and MGCP commands are available to enable SGCP capabilities.

An MGCP gateway handles translation between audio signals and the packet network. Gateways interact with a call agent (CA)–also called a media gateway controller (MGC)–that performs signal and call processing on gateway calls. In the MGCP configurations that Cisco IOS supports, a gateway can be a Cisco router, access server, or cable modem, and the CA is a server from a third-party vendor.

Configuration commands for MGCP define the path between the call agent and the gateway, the type of gateway, and the type of calls handled by the gateway.

MGCP uses endpoints and connections to construct a call. Endpoints are sources of or destinations for data, and can be physical or logical locations in a device. Connections can be point-to-point or multipoint.

Similar to SGCP, MGCP uses User Datagram Protocol (UDP) for establishing audio connections over IP networks. However, MGCP also uses hairpinning to return a call to the PSTN when the packet network is not available.

Package Types

A call connection involves a series of events and signals--such as off-hook status, a ringing signal, or a signal to play an announcement--that are specific to the type of endpoint involved in the call.

MGCP groups these events and signals into packages. A trunk package, for example, is a group of events and signals relevant to a trunking gateway; an announcement package is a group of events and signals relevant to an announcement server. MGCP supports the following seven package types:

- Trunk
- Line
- Dual-tone multifrequency (DTMF)
- Generic media
- Real-Time Transport Protocol (RTP)
- Announcement server
- Script

The trunk package and line package are supported by default on certain types of gateways. Although configuring a gateway with additional endpoint package information is optional, you may want to specify packages for your endpoints to add to or override the defaults.

Protocol Benefits

MGCP provides the following benefits:

- Alternative dial tone for VoIP environments--Deregulation in the telecommunications industry gives competitive local-exchange carriers (CLECs) opportunities to provide toll bypass from the incumbent local-exchange carriers (ILECs) by means of VoIP. MGCP enables a VoIP system to control call setup and teardown and Custom Local Area Subscriber Services (CLASS) features for less sophisticated gateways.
Simplified configuration for static VoIP network dial peers--When you use MGCP as the call agent in a VoIP environment, you need not configure static VoIP network dial peers. The MGCP call agent provides functions similar to VoIP-network dial peers.

Plain old telephone service (POTS) dial peer configuration is still required.

Note

- Migration paths--Systems using earlier versions of the protocol can migrate easily to MGCP.
- Varied network needs supported for the following:
  - Interexchange carriers (IXCs) who have no legacy time-division multiplexing (TDM) equipment in their networks and want to deploy a fully featured network that offers both long-distance services to corporate customers and connectivity to local exchange carriers or other IXCs with traditional TDM equipment.
  - IXCs who have TDM equipment in their networks and want to relieve network congestion using data technologies to carry voice traffic or to cap the growth of TDM ports. In these situations, the packet network provides basic switched trunking without services or features.
  - Competitive competitive local-exchange carriers (CLECs) who want to provide residential and enhanced services.
  - Dial-access customers who want enhanced Signaling System 7 (SS7) access capabilities and increased performance, reliability, scalability, and economy.

Supported Gateways

MGCP supports both residential and trunking gateways.
Residential Gateway

A residential gateway (RGW) provides an interface between analog (RJ-11) calls from a telephone and the VoIP network. Examples of RGWs include cable modems and Cisco 2600 series routers. The figure below shows an RGW configuration.

Figure 1: Residential and Trunking Gateways

RGW functionality supports analog POTS calls for both SGCP and MGCP on the Cisco 2600 series routers and Cisco uBR924 cable access router as shown in the table below.

RJGW function
Trunking Gateway

A trunking gateway (TGW) provides an interface between PSTN trunks and a VoIP network. A trunk can be a DS0, T1, or E1 line. Examples of TGWs include access servers and routers. The figure below shows a TGW configuration.

![Figure 2: Trunking Gateways](image)

TGW functionality supports SGCP and MGCP as shown in the table below.

1 Server must have SGCP 1.1+ protocol for Feature Group D Operator Services (FGD-OS)

**Toll Fraud Prevention**

When a Cisco router platform is installed with a voice-capable Cisco IOS software image, appropriate features must be enabled on the platform to prevent potential toll fraud exploitation by unauthorized users. Deploy these features on all Cisco router Unified Communications applications that process voice calls, such as Cisco Unified Communications Manager Express (CME), Cisco Survivable Remote Site Telephony (SRST), Cisco Unified Border Element (UBE), Cisco IOS-based router and standalone analog and digital PBX and public-switched telephone network (PSTN) gateways, and Cisco contact-center VoiceXML gateways. These features include, but are not limited to, the following:

- **Disable secondary dial tone on voice ports**—By default, secondary dial tone is presented on voice ports on Cisco router gateways. Use private line automatic ringdown (PLAR) for foreign exchange office (FXO) ports and direct-inward-dial (DID) for T1/E1 ports to prevent secondary dial tone from being presented to inbound callers.

- **Cisco router access control lists (ACLs)**—Define ACLs to allow only explicitly valid sources of calls to the router or gateway, and therefore to prevent unauthorized Session Initiation Protocol (SIP) or H.323 calls from unknown parties to be processed and connected by the router or gateway.

- **Close unused SIP and H.323 ports**—If either the SIP or H.323 protocol is not used in your deployment, close the associated protocol ports. If a Cisco voice gateway has dial peers configured to route calls outbound to the PSTN using either time division multiplex (TDM) trunks or IP, close the unused H.323 or SIP ports so that calls from unauthorized endpoints cannot connect calls. If the protocols are used and the ports must remain open, use ACLs to limit access to legitimate sources.

- **Change SIP port 5060**—If SIP is actively used, consider changing the port to something other than well-known port 5060.

- **SIP registration**—If SIP registration is available on SIP trunks, turn on this feature because it provides an extra level of authentication and validation that only legitimate sources can connect calls. If it is not available, ensure that the appropriate ACLs are in place.

- **SIP Digest Authentication**—If the SIP Digest Authentication feature is available for either registrations or invites, turn this feature on because it provides an extra level of authentication and validation that only legitimate sources can connect calls.

- **Explicit incoming and outgoing dial peers**—Use explicit dial peers to control the types and parameters of calls allowed by the router, especially in IP-to-IP connections used on CME, SRST, and Cisco UBE. Incoming dial peers offer additional control on the sources of calls, and outgoing dial peers on the destinations. Incoming dial peers are always used for calls. If a dial peer is not explicitly defined, the implicit dial peer 0 is used to allow all calls.
Explicit destination patterns—Use dial peers with more granularity than .T for destination patterns to block disallowed off-net call destinations. Use class of restriction (COR) on dial peers with specific destination patterns to allow even more granular control of calls to different destinations on the PSTN.

Translation rules—Use translation rules to manipulate dialed digits before calls connect to the PSTN to provide better control over who may dial PSTN destinations. Legitimate users dial an access code and an augmented number for PSTN for certain PSTN (for example, international) locations.

Tcl and VoiceXML scripts—Attach a Tcl/VoiceXML script to dial peers to do database lookups or additional off-router authorization checks to allow or deny call flows based on origination or destination numbers. Tcl/VoiceXML scripts can also be used to add a prefix to inbound DID calls. If the prefix plus DID matches internal extensions, then the call is completed. Otherwise, a prompt can be played to the caller that an invalid number has been dialed.

Hostname validation—Use the "permit hostname" feature to validate initial SIP Invites that contain a fully qualified domain name (FQDN) host name in the Request Uniform Resource Identifier (Request URI) against a configured list of legitimate source hostnames.

Dynamic Domain Name Service (DNS)—If you are using DNS as the "session target" on dial peers, the actual IP address destination of call connections can vary from one call to the next. Use voice source groups and ACLs to restrict the valid address ranges expected in DNS responses (which are used subsequently for call setup destinations).

For more configuration guidance, see the "Cisco IOS Unified Communications Toll Fraud Prevention" paper.

**Basic MGCP Configuration**

This chapter provides basic configuration information for Media Gateway Control Protocol (MGCP) and related protocols.

For more information about related Cisco IOS voice features, see the following:

- "Overview of MGCP and Related Protocols" on page 3
  - Finding Feature Information, page 9
  - How to Configure MGCP and Related Protocols, page 9
  - Configuration Examples for MGCP and Related Protocols, page 18
  - Additional References, page 23
  - Feature Information for Basic MGCP Configuration, page 24

**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**How to Configure MGCP and Related Protocols**

**Note**

RGWs are configured only with MGCP.
Configuring a TGW for MGCP

To configure a trunking gateway (TGW) for MGCP, perform this task:

**SUMMARY STEPS**

1. `mgcp`
2. `mgcp call-agent [ipaddr|hostname] [port] service-type mgcp`
3. `controller t1 number`
4. `ds0-group channel-number timeslots range type none service mgcp`
5. `exit`
6. `mgcp restart-delay value`
8. `mgcp default-package {as-package | dtmf-package | gm-package | rtp-package | trunk-package}`
9. `mgcp dtmf-relay {codec | low-bit-rate} mode {cisco | out-of-band}`
10. `mgcp modem passthru {cisco | ca}`
11. `mgcp sdp simple`
12. `exit`

**DETAILED STEPS**

### Configuring a TGW for SGCP

Perform this task to configure a trunking gateway (TGW) for Simple Gateway Control Protocol (SGCP):

#### SUMMARY STEPS

1. `mgcp`
2. `mgcp call-agent [ipaddr | hostname] [port] service-type sgcp`
3. `controller t1 number`
4. `ds0-group channel-number timeslots range type {none | fgdos} [tone_type] [addr_info] service {sgcp | voice}`
5. `exit`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>mgcp</td>
</tr>
<tr>
<td>Example:</td>
<td>Initiates the MGCP application.</td>
</tr>
<tr>
<td>Router(config)# mgcp</td>
<td></td>
</tr>
</tbody>
</table>
### Basic MGCP Configuration

**Step 2**
- **Command or Action**: `mgcp call-agent [ipaddr|hostname] [port] service-type sgcp`
- **Purpose**: Specifies the call agent’s IP address or domain name, the port, and gateway control service type.

**Example**:
```
Router(config)# mgcp call-agent [ipaddr | hostname] [port] service-type sgcp
```

**Step 3**
- **Command or Action**: `controller t1 number`
- **Purpose**: Specifies the channel number of the T1 trunk to be used for analog calls and enters controller configuration mode.

**Example**:
```
Router(config)# controller t1 number
```

**Step 4**
- **Command or Action**: `ds0-group channel-number timeslots range type {none | fgdos} [tone_type] [addr_info] service {sgcp | voice}`
- **Purpose**: Configures the channelized T1 time slots to accept the analog calls. For type `none`, use `service sgcp`. For type `fgdos`, use `service voice`.

**Example**:
```
Router(config-controller)# ds0-group channel-number timeslots range type {none | fgdos} [tone_type] [addr_info] service {sgcp | voice}
```

**Step 5**
- **Command or Action**: `exit`
- **Purpose**: Exits the current mode.

**Example**:
```
Router(config-controller)# exit
```

### Configuring an RGW

To configure a residential gateway (RGW), perform this task:

**SUMMARY STEPS**

1. `mgcp`
2. `mgcp call-agent [ipaddr | hostname] [port] service-type sgcp`
3. `dial-peer voice number pots`
4. `application MGCPAPP`
5. `exit`
6. `mgcp package-capability {line-package | dtmf-package | gm-package | rtp-package}`
7. `mgcp default-package {line-package | dtmf-package | gm-package}`
8. `exit`

</tr>
</tbody>
</table>
### Configuring a SDP Aware NSE Mode

The Cisco IOS MGCP gateway relies only on the local modem or fax configuration to determine whether Named Signaling Event (NSE) should be used or not for the current call. SDP-aware NSE mode enables the Cisco IOS MGCP gateway to negotiate NSE-based modem and fax features by considering both the local configuration and the remote support for NSE.

---

**Note**
Cisco Unified Call Manager (UCM) does not support modem or fax passthrough. This feature should not be enabled when Cisco UCM is the call agent.

---

### SUMMARY STEPS

1. `mgcp`
2. `mgcp behavior negotiate-nse enable`
3. `exit`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>mgcp</code></td>
<td>Initiates the MGCP application.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# mgcp</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>mgcp behavior negotiate-nse enable</code></td>
<td>Enables SDP-aware NSE mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Router(config)# mgcp behavior negotiate-nse enable</code></td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

Command or Action | Purpose
--- | ---
**Step 3** exit | Exits global configuration mode and returns to privileged EXEC mode.

---

## Verifying NSE Mode Configuration

### SUMMARY STEPS

1. show mgcp

### DETAILED STEPS

**show mgcp**

Use this command to display the state of the `mgcp behavior` command.

**Example:**

```
Router# show mgcp
MGCP Admin State ACTIVE, Oper State ACTIVE - Cause Code NONE
MGCP call-agent: 10.7.0.200 Initial protocol service is MGCP 0.1
```

The following lines show that the `mgcp behavior negotiate-nse enable` command is enabled:

**Example:**

```
mgcp modem passthrough voip mode nse
mgcp codec g723ar53 packetization-period 30
mgcp package-capability rtp-package
mgcp package-capability sst-package
mgcp package-capability pre-package
mgcp package-capability mdste-package
mgcp package-capability srtp-package
mgcp package-capability fm-package
no mgcp package-capability res-package
no mgcp timer receive-rtcp
mgcp sdp simple
mgcp sdp mdcx-ack
mgcp fax t38 ecm
mgcp fax t38 ls_redundancy 5
mgcp fax t38 hs_redundancy 2
mgcp behavior mdcx-sdp ack-with-sdp
mgcp behavior dynamically-change-codec-pt disable
mgcp behavior negotiate-nse enable
mgcp rtp payload-type nte 101
```
Verifying the TGW or RGW Configuration

SUMMARY STEPS

1. show running-configuration

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show running-configuration</td>
<td>Displays the current configuration settings.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# show running-configuration</td>
<td></td>
</tr>
</tbody>
</table>

Blocking New Calls

You can block all new MGCP calls to the router (Step 1) and terminate all existing active calls (Step 2), which means that an active call is not terminated until the caller hangs up.

To block all new calls, use the following commands in global configuration mode:

SUMMARY STEPS

1. mgcp block-newcalls
2. no mgcp block-newcalls

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>mgcp block-newcalls</td>
<td>Prevents the gateway from accepting new calls.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# mgcp block-newcalls</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>no mgcp block-newcalls</td>
<td>Restarts normal MGCP call operation.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# no mgcp block-newcalls</td>
<td></td>
</tr>
</tbody>
</table>
## Configuration Examples for MGCP and Related Protocols

### Configuring a Cisco AS5300 as a TGW with MGCP Example

The following example illustrates a configuration only for MGCP calls. FGD-OS calls are not supported.

```
version 12.2

Feature Information for Basic MGCP Configuration

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to . An account on Cisco.com is not required.

Configuring MGCP 1.0

This chapter provides configuration information on configuring the MGCP 1.0 Including Network-based Call Signaling (NCS) 1.0 and Trunking Gateway Control Protocol (TGCP) 1.0 Profiles feature. The feature implements MGCP 1.0, NCS 1.0, and TGCP 1.0 support in existing MGCP stacks.

Feature benefits include the following:

- MGCP 1.0 provides flexible interoperability with a wide variety of call agents, thus enabling a wide range of solutions.
- MGCP 1.0 contains many improvements over its previous release.
- NCS 1.0 and TGCP 1.0 allow participation in packet cable solutions.
- The ability to interoperate with H.323 and Session Initiation Protocol (SIP) control agents allows leverage of the feature sets available in the different protocols and provides the ability to migrate smoothly from one protocol to another.

For more information about this and related Cisco IOS voice features, see the following:

- "Overview of MGCP and Related Protocols" on page 3

Feature History for MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tr>
<td>12.2(2)XA1</td>
<td>This feature was implemented on the following platforms: Cisco CVA122, Cisco uBR925, and Cisco AS5300</td>
</tr>
<tr>
<td>12.2(2)XB</td>
<td>This feature was implemented on the following platforms: Cisco AS5350 and Cisco AS5400.</td>
</tr>
</tbody>
</table>
This feature was implemented on the following platforms: Cisco CVA122, Cisco CVA122E, Cisco uBR925, Cisco 2600 series, Cisco 2650, Cisco 3660, and Cisco MC3810. AAL2 PVC support was introduced for MGCP 1.0 on the Cisco MC3810. Certain gateway features were integrated into MGCP 1.0.

Note: The Cisco AS5300 is not supported in this release.

The voice-port (MGCP profile) command was changed to port (MGCP profile) for all platforms supported in this release.

Note: The Cisco AS5300 is not supported in this release.

The fax keyword was added to the mgcp playout command.

The maximum number of MGCP profiles that can be configured was increased from 13 (12 plus 1 default) to 29 (28 plus 1 default).

**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

**Prerequisites for MGCP 1.0**

Prerequisites are described in the "Prerequisites for Configuring MGCP and Related Protocols" section. In addition, the following apply:
- Ensure that the minimum software requirements are met. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at http://www.cisco.com/go/fn.

- Configure Voice over ATM AAL2 PVC (optional step that applies to Cisco MC3810 only). The router that is intending to use the VoAAL2 features must have hardware support for VoAAL2.

- Set up the cable modems, if any. See the documentation for the cable product as listed in the Preface.

Note: IP addresses and host names in these examples are fictitious.

### Information About MGCP 1.0

This feature implements the following MGCP protocols on supported Cisco media gateways:

- **MGCP 1.0 (RFC 2705)**
- **Network-based Call Signaling (NCS) 1.0**, the MGCP 1.0 profile for residential gateways (RGWs)
- **Trunking Gateway Control Protocol (TGCP) 1.0**, the MGCP 1.0 profile for trunking gateways (TGWs)
- **VoIP--Includes signaling methods under VoIP.**
- **AAL2 PVC--Includes signaling methods under ATM adaptation layer 2 (AAL2) permanent virtual circuit (PVC).**
- **Basic/Extended RGW--Includes a collection of residential gateway features supporting channel-associated signaling (CAS).** Digital CAS (recEive and transMit, or E&M) interfaces and analog (Foreign Exchange Office [FXO], Foreign Exchange Station [FXS], and E&M) interfaces are supported on platforms with the appropriate voice hardware.
- **ISUP--Supports ISDN user part signaling for SS7 trunks.**
- **FGD-OS--Supports Feature Group D Operator Services signaling over T1 or E1 trunks.**
- **Incoming CAS--Supports digital CAS interfaces for digital incoming multifrequency tones (MF) CAS wink-start trunks in which an operator at an Operator Services Console can initiate the Operator Interrupt and Busy Line Verify (OI and BLV) functions.**
- **CAS PBX--Includes CAS private branch exchange (PBX) trunks, digit maps, CAS events, and quarantine buffer software.** These features are supported on digital CAS interfaces.

MGCP 1.0 is a protocol for the control of VoIP calls by external call-control elements known as media gateway controllers (MGCs) or call agents (CAs). It is described in the informational RFC 2705, published by the Internet Society.

PacketCable is an industry-wide initiative for developing interoperability standards for multimedia services over cable facilities using packet technology. PacketCable developed the NCS and TGCP protocols, which contain extensions and modifications to MGCP while preserving basic MGCP architecture and constructs. NCS is designed for use with analog, single-line user equipment on residential gateways, while TGCP is intended for use in VoIP-to-PSTN trunking gateways in a cable environment. To meet European cable requirements and equipment characteristics, the EuroPacketCable working group has adapted PacketCable standards under the name **IP Cablecom**.
MGCP Model

MGCP bases its call control and intelligence in centralized call agents, also called media gateway controllers. The call agents issue commands to simple, low-cost endpoints, which are housed in media gateways (MGs), and the call agents also receive event reports from the gateways. MGCP messages between call agents and media gateways are sent with Internet Protocol over User Datagram Protocol (IP/UDP).

The MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles feature provides protocols for RGWs and TGWs, which sit at the border of the packet network to provide an interface between traditional, circuit-based voice services and the packet network. Residential gateways offer a small number of analog line interfaces, while trunking gateways generally manage a large number of digital trunk circuits.

Two basic MGCP constructs are endpoints and connections. An endpoint is a source or sink for call data (RTP/IP) that is flowing through the gateway. A common type of endpoint is found at the physical interface between the POTS (plain old telephone service) or Public Switched Telephone Network (PSTN) service and the gateway; this type of endpoint might be an analog voice port or a digital DS0 group. There are other types of endpoints as well, and some are logical rather than physical. An endpoint is identified by a two-part endpoint name that contains the name of the entity on which it exists (for example, an access server or router) and the local name by which it is known (for example, a port identifier).

A connection is a temporary allocation of resources that enables a call to be completed. One or more connections is necessary to complete a call. Connections have names that identify them with the call to which they belong. Connections can be one-to-one or multipoint. Calls and connections are initiated, modified, and deleted on instructions from call agents.

Call agents manage call flow through standard MGCP commands that are sent to the endpoints under their control. The commands are delivered in standard ASCII text, and may contain session descriptions transmitted in Session Description Protocol (SDP), a text-based protocol. These messages are sent over IP/UDP.

Call agents keep track of endpoint and connection status through the gateway’s reporting of standard events that are detected from endpoints and connections. Call agents also direct gateways to apply certain standard signals when a POTS or PSTN connection expects them. For example, when someone picks up a telephone handset, an off-hook event is detected on an endpoint on the residential gateway to which the telephone is connected. The gateway reports the event to a call agent, which orders the gateway to apply the dial-tone signal to the endpoint reporting the off-hook event. The person picking up the handset hears dial tone.

Related events and signals are grouped into standard packages that apply to particular types of endpoints. For instance, the off-hook event is found in the line package, which is associated with analog-line endpoints, which in turn are associated with residential gateways. Standard events, signals, and packages are defined in the NCS, TGCP, and MGCP standards and RFCs listed in the "Preface."

The figure below shows a hypothetical MGCP network with both residential and trunking gateways. The residential gateway has telephone sets connected to the gateway’s FXS voice ports. MGCP or NCS over IP/UDP is used for call control and reporting to the call agent, while Real-Time Transport Protocol (RTP) is used to transmit the actual voice data.

The figure below also shows two trunking gateways with T1 (or E1) connections to the PSTN. Incoming time-division multiplexing (TDM) data is sent through the gateway into the packet network using RTP. MGCP or TGCP over IP/UDP is used for call control and reporting to the call agent. Signaling System 7 (SS7) data travels a different route, however, bypassing the trunking gateway entirely in favor of a specialized signaling gateway, where the signaling data is transformed to ISUP/IP format and relayed to the call agent.

Communication between two signaling gateways in the same packet network can be done with Integrated
Services Digital Networks User Part over Internet Protocol (ISUP/IP), H.323, or Session Initiation Protocol (SIP).

Figure 3: MGCP Network Model

How to Configure MGCP 1.0

The three tasks listed below configure the MGCP 1.0 including NCS 1.0 and TGCP 1.0 Profiles feature on a media gateway. The first task names the voice ports or DS1 groups that are serving as MGCP endpoints. This task also associates the ports with an MGCP service type or application and starts the MGCP daemon.

The last two tasks allow you to configure MGCP parameters to meet your requirements. Each MGCP parameter is either a global parameter or a profile-related parameter. When you configure a global MGCP parameter value, it applies to all the MGCP endpoints on the gateway. When you configure a profile-related MGCP parameter value, it applies only to the endpoints associated with the MGCP profile that you are configuring at that moment (an MGCP profile is a user-defined subset of all the MGCP endpoints on the gateway). There is also a predefined MGCP profile named default that you can use to configure profile-related parameters for endpoints that do not belong to a user-defined MGCP profile.

See the following sections for configuration tasks for the MGCP 1.0 including NCS 1.0 and TGCP 1.0 Profiles feature. Each task in the list is identified as either required or optional:
Identifying Endpoints and Configuring the MGCP Application

This task is required. Voice ports or DS0 groups that are acting as MGCP endpoints must be identified and associated with the MGCP application. The commands to identify MGCP endpoints depend on the type of endpoint that you are configuring.

To identify endpoints and configure the MGCP application, use the commands in the appropriate table, beginning in global configuration mode:

### Analog CAS and POTS Lines

To identify endpoints and configure the MGCP application for use with analog CAS and POTS lines, use these commands, beginning in global configuration mode:

**SUMMARY STEPS**

1. `dial-peer voice tag pots`
2. `application mgcpapp`
3. `port port-number`
4. `exit`
5. `mgcp [gw-port]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>

</table>
### Digital CAS Trunks

To identify endpoints and configure the MGCP application for use with digital CAS trunks, use these commands, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>mgcp [gw-port]</td>
<td>Initiates the MGCP daemon. The optional argument is the UDP port over which the gateway receives messages from the call agent (the gateway MGCP port number). Default is 2427.</td>
</tr>
</tbody>
</table>
SUMMARY STEPS

1. controller \{t1 | e1\} cntlr-number
2. mode cas
3. Do one of the following:
   - framing \{sf | esf\}
     - for T1 lines
     - or for E1 lines
   - framing \{crc4 | no-crc4\} [australia]
4. Do one of the following:
   - linecode \{ami | b8zs\}
     - for T1 lines
     - or for E1 lines
   - linecode \{ami | hdb3\}
5. ds0-group channel-number timeslots range type type
6. exit
7. Do one of the following:
   - voice-port slot/port:ds0-group-no
     - for Cisco 2600 and Cisco 3600 series
     - or for Cisco MC3810
   - voice-port slot:ds0-group-no
8. dial-type \{dtmf | mf | pulse\}
9. exit
10. dial peer voice tag pots
11. application mgcpapp
12. port port-number
13. exit
14. mgcp [gw-port]

**ISUP Signaling Trunks**

To identify endpoints and configure the MGCP application for use with Integrated Services Digital Network Upper Part (ISUP) signaling trunks, use these commands, beginning in global configuration mode:
SUMMARY STEPS

1. controller {t1 | e1} cntlr-number
2. ds0-group channel-number timeslots range type none service mgcp
3. exit
4. mgcp [gw-port]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Configures a T1 or E1 controller and enters controller configuration mode for the ISUP trunk port.</td>
</tr>
<tr>
<td>controller {t1</td>
<td>e1} cntlr-number</td>
</tr>
<tr>
<td>Step 2</td>
<td>Specifies the DS0 time slots that make up a logical voice port on a T1 or E1 controller and specifies the signaling type by which the router connects to the PBX or PSTN. Specify the type none and service mgcp options to identify this voice port as an MGCP endpoint.</td>
</tr>
<tr>
<td>ds0-group channel-number timeslots range type none service mgcp</td>
<td>Example: Router(config-controller)# ds0-group channel-number timeslots range type none service mgcp</td>
</tr>
<tr>
<td>Step 3</td>
<td>Exits the current mode.</td>
</tr>
<tr>
<td>exit</td>
<td>Example: Router(config-controller)# exit</td>
</tr>
<tr>
<td>Step 4</td>
<td>Initiates the MGCP daemon. The optional port number argument allows you to specify the UDP port over which the gateway receives messages from the call agent (the gateway MGCP port number). Default UDP port number for gateways is 2427.</td>

### Digital VoATM with AAL2 PVC

To identify endpoints and configure the MGCP application for use with digital Voice over Asynchronous Transfer Mode (VoATM) with ATM Adaptation Layer 2 (AAL2) Permanent Virtual Circuit (PVC), use these commands, beginning in global configuration mode:
SUMMARY STEPS

1. controller \{t1 | e1\} cntlr-number
2. mode atm
3. Do one of the following:
   - framing \{sf | esf\}
     - for T1 lines
     - or for E1 lines
   - framing \{crc4 | no-crc4\} [australia]

4. Do one of the following:
   - linecode \{ami | b8zs\}
     - for T1 lines
     - or for E1 lines
   - linecode \{ami | hdb3\}

5. exit
6. dial peer voice tag pots
7. application mgepapp
8. port port-number
9. exit
10. mgcp [gw-port]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 controller {t1</td>
<td>e1} cntlr-number</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# controller {t1</td>
<td>e1} cntlr-number</td>
</tr>
<tr>
<td>Step 2 mode atm</td>
<td>Specifies that the controller supports ATM encapsulation and create ATM interface 0.</td>
</tr>
<tr>
<td>Example:</td>
<td>When the controller is set to ATM mode, the following takes place:</td>
</tr>
<tr>
<td>Router(config-controller)# mode atm</td>
<td>- Controller framing is automatically set to Extended Superframe (ESF).</td>
</tr>
<tr>
<td></td>
<td>- The line code is automatically set to B8ZS.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Do one of the following:</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>- or for E1 lines</td>
</tr>
<tr>
<td></td>
<td>- <strong>framing</strong> `{crc4</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-controller)# framing {sf</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-controller)# framing {crc4</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Do one of the following:</td>
</tr>
<tr>
<td></td>
<td>- <strong>linecode</strong> `{ami</td>
</tr>
<tr>
<td></td>
<td>- for T1 lines</td>
</tr>
<tr>
<td></td>
<td>- or for E1 lines</td>
</tr>
<tr>
<td></td>
<td>- <strong>linecode</strong> `{ami</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-controller)# linecode {ami</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-controller)# linecode {ami</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-controller)# exit</td>
</tr>
</tbody>
</table>

Selects frame type for T1 or E1 line. T1 default is **sf**. E1 default is **crc4**. Specifies the line encoding to use. T1 default is **ami**. E1 default is **hdb3**. Exits the current mode.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 6 dial peer voice tag pots</td>
<td>Enters dial-peer configuration mode and specifies the method of voice encapsulation.</td>
</tr>
<tr>

<td>Router(config-dial-peer)# exit</td>
</tr>
<tr>
<td>Step 10 mgcp [gw-port]</td>
<td>Initiates the MGCP daemon. The optional argument is the UDP port over which the gateway receives messages from the call agent (the gateway MGCP port number). Default is 2427.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# mgcp [gw-port]</td>
</tr>
</tbody>
</table>

**Configuring Global MGCP Parameters**

This optional task configures global MGCP parameters on the gateway so that you can set these values to conform to the requirements of the call agent, trunks, or lines that are being used with this gateway. The global parameter values that you configure are associated with every MGCP endpoint that you have identified on this gateway.

In addition to the global MGCP parameters, there are other MGCP parameters that apply only to MGCP profiles on the gateway. For configuration of profile-related parameters, see the Configuring an MGCP Profile and Profile-Related MGCP Parameters, on page 45.
The only parameter that is common to both profile and global configurations is the call-agent parameter, which is configured with the `call-agent` command for MGCP profile configuration and with the `mgcp call-agent` command for the global configuration. These commands are mutually exclusive; whichever command you configure first blocks configuration of the other. For example, if the MGCP profile `call-agent` command is configured on an endpoint, then you are not allowed to configure the global `mgcp call-agent` command.

To configure global MGCP parameters, complete these steps as needed, beginning in global configuration mode:

### SUMMARY STEPS

### DETAILED STEPS
### Configuring Global MGCP Parameters

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>You can define a call agent globally with the <code>mgcp call-agent</code> command, or locally for each MGCP profile with the <code>call-agent</code> command, but not both. Whichever command you configure first blocks configuration of the other.</td>
</tr>
<tr>
<td>`Router(config)# mgcp call-agent {dns-name</td>
<td>ip-address</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>**mgcp behavior {auep</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>- <strong>auep</strong> --Forces the gateway to reply to an Audit Endpoint (AUEP) command according to the MGCP Version 0.1 specification. If this keyword is used, an AUEP command on an out-of-service endpoint results in a return code of 501. Use this keyword with Cisco IOS Release 12.3(2)T1 or a later release.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>mgcp sdp simple</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Specifies that a subset of the SDP fields should be used.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>mgcp sdp xpc-codec</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Enables codec negotiation in the SDP.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>mgcp codec type [packetization-period value]</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Selects the default codec type and its optional packetization period value.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 6** no mgcp timer receive-rtcp | Disables the timer used by a gateway to disconnect a VoIP call when the IP connectivity is lost with the remote gateway. The timer is known as the RTP Control Protocol (RTCP) transmission interval timer.  
Example:  
Router(config)# no mgcp timer receive-rtcp |
| **Step 7** no mgcp piggyback message | Disables piggyback messages.  
Example:  
Router(config)# no mgcp piggyback message |
| **Step 8** mgcp endpoint offset | Increments the voice-port or DS0-group portion of the endpoint name for NCS 1.0.  
Example:  
Router(config)# mgcp endpoint offset |
| **Step 9** mgcp persistent {hookflash | offhook | onhook} | Enables call-agent notification of the specified type of event.  
Example:  
Router(config)# mgcp persistent (hookflash | offhook | onhook) |
| **Step 10** mgcp request timeout {timeout-value | max maxtimeout-value} | Specifies how long the gateway waits for a call-agent response to a request before retransmitting the request.  
Example:  
Router(config)# mgcp request timeout {timeout-value | max maxtimeout-value} |
| **Step 11** mgcp dtmf-relay voip codec {all | low-bit-rate} mode {cisco | nse | out-of-band} | Ensures accurate forwarding of digits with a compressed codec.  
Example:  
Router(config)# mgcp dtmf-relay voip codec {all | low-bit-rate} mode {cisco | nse | out-of-band} |
| **Step 12** mgcp max-waiting-delay value | Specifies the number of milliseconds to wait after a restart before connecting with the call agent. Range is from 0 to 600,000 (600 seconds). Default is 3000. If used, these values should be staggered among gateways to avoid having large numbers of gateways connecting with the call agent at the same time after a mass restart.  
Example:  
Router(config)# mgcp max-waiting-delay value |
### Configuring MGCP Parameters

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 13</strong> mgcp restart-delay value</td>
<td>Sets the delay value sent in the RestartInProgress (RSIP) graceful teardown, in seconds. Range is from 0 to 600. Default is 0.</td>
</tr>
</tbody>
</table>

**Example:**
```
Router(config)# mgcp restart-delay value
```

| **Step 14** mgcp vad | Enables voice activity detection (VAD) as a default for MGCP calls. Default is disabled. |

**Example:**
```
Router(config)# mgcp vad
```

| **Step 15** mgcp ip-tos {high-reliability | high-throughput | low-cost | low-delay | rtp precedence value | signaling precedence value} | Enables the IP type of service (ToS) for MGCP-controlled connections. |

**Example:**
```
Router(config)# mgcp ip-tos
{high-reliability | high-throughput | low-cost | low-delay | rtp precedence value
 | signaling precedence value
}
```

| **Step 16** mgcp quality-threshold {hwm-cell-loss value | hwm-jitter-buffer value | hwm-latency value | hwm-packet-loss value | lwm-cell-loss value | lwm-jitter-buffer value | lwm-latency value | lwm-packet-loss value} | Sets the jitter buffer size threshold, latency threshold, and packet-loss threshold parameters. |

**Example:**
```
Router(config)# mgcp quality-threshold
{hwm-cell-loss value
 | hwm-jitter-buffer value
 | hwm-latency value
 | hwm-packet-loss value
 | lwm-cell-loss value
 | lwm-jitter-buffer value
 | lwm-latency value
 | lwm-packet-loss value
}
```

| **Step 17** mgcp playout {adaptive init-value min-value max-value | fax value | fixed init-value} | Configures the jitter buffer packet size in milliseconds for MGCP calls. The default is adaptive 60 4 200 |

**Example:**
```
Router(config)# mgcp playout {adaptive init-value min-value max-value | fax value
 | fixed init-value
}
```

- **adaptive init-value min-value max-value** -- Defines the range for the jitter-buffer packet size. The range for each value is 4 to 250. Default is 60 4 200. Note that *init-value* must be between *min-value* and *max-value*.
- **fax value** -- Defines the fax playout buffer size. The range is 0 to 700. The default value is 300. The range and default
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>value might vary with different platforms. See the platform digital signal processor (DSP) specifications before setting this value.</td>
<td></td>
</tr>
<tr>
<td><strong>fixed</strong> init-value -- Defines the fixed size for the jitter-buffer packet size. The range is 4 to 250. There is no default value.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 18**

**mgcp package-capability [package-type]**

*Example:*

Router(config)#
mgcp package-capability [package-type]

Specifies an MGCP package to be supported on this gateway. Configure one package at a time and repeat this command to configure support for more than one package. Available package types vary with the type of gateway.

**Step 19**

**mgcp default package [package-type]**

*Example:*

Router(config)#
mgcp default package [package-type]

Defines the package to be used as the default when no package is named with an event. Available package types vary with the type of gateway.

---

**Configuring an MGCP Profile and Profile-Related MGCP Parameters**

This optional task creates a named, user-defined MGCP profile that consists of a subset of all the MGCP endpoints on this gateway. More than one MGCP profile can be configured on a gateway. Each MGCP profile is associated with a call agent and one or more endpoints. When multiple MGCP profiles are configured, endpoints on a single media gateway can be controlled by different call agents. When each endpoint comes on line, an RSIP (RestartInProgress) message notifies the appropriate call agent of the endpoint's presence.

**Note**

When partitioning a gateway for multiple call-agent control, the call agents must be coordinated so that there are no overlapping transaction identification numbers.

In addition, this task allows you to configure profile-related MGCP parameters to conform to the requirements of the call agent, trunks, or lines that are being used with the profile’s endpoints. These parameters are called profile-related MGCP parameters because they are associated with a particular MGCP profile, or subset of endpoints, and they are configured in MGCP profile configuration mode. Other parameters are considered global MGCP parameters; when they are configured, they apply to all the endpoints on a gateway. Global MGCP parameters are discussed in the Configuring Global MGCP Parameters, on page 40.
The parameters for an MGCP profile are configured in a special MGCP profile configuration mode that you enter with the `mgcp profile` command. One or more endpoints are associated with the profile by using the `voice-port` command in MGCP profile configuration mode.

**Note**

The only parameter that can be configured in both profile configuration mode and in global configuration mode is call agent, which is configured with the `call-agent` command for MGCP profiles, and with the `mgcp call-agent` command for global configurations. These commands are mutually exclusive; whichever command you configure first blocks configuration of the other. For example, if the MGCP profile `call-agent` command is configured on an endpoint, then you are not allowed to configure the global `mgcp call-agent` command.

You do not have to define MGCP profiles to configure profile-related parameters. For endpoints that are not associated with a user-defined MGCP profile, the values for profile-related parameters are provided by a predefined profile with the name `default`. The default profile is configured in the same way that a user-defined MGCP profile is configured, except that the keyword `default` is used in place of a profile name in the `mgcp profile` command. The default profile has no association with voice ports or a call agent (the call agent for these endpoints is defined by the global `mgcp call-agent` command).

In the excerpt below from a `show running-config` command output, two MGCP profiles are defined: MAX1 and MAX2. Each profile is associated with a different call agent and a different voice port. The MAX1 profile is configured with a value of 3 for the max1 retries parameter and 5 for max2 retries. The MAX2 profile uses the values in the default profile for those parameters. In the MAX2 profile, the MT package is configured as a persistent package. The `max1 retries` parameter for the default profile is configured with a value of 2. The `max2 retries` parameter is not configured, so the value used is the default value, which is 7. The MAX2 profile has a value of 2 for the `max1 retries` parameter and 7 for `max2 retries`.

```
! mgcp profile MAX1
  call agent ca1.example.com 4022 service-type mgcp version 1.0
  max1 retries 3
  max2 retries 5
  voice-port 2/1:1
!
mgcp profile MAX2
  call-agent ca2.example.com 50031 service-type mgcpp version 0.1
  package persistent mt-package
  voice-port 2/0:1
!
mgcp profile default
  max1 retries 2
!```

To configure parameters for a user-defined MGCP profile or for the default profile, use the following commands as appropriate, beginning in global configuration mode:
SUMMARY STEPS

1. mgcp profile \{profile-name | default\}
2. description text
3. call-agent \{dns-name | ip-address\} [port] [service-type type] [version protocol-version]
4. voice-port port-number
5. default command
6. package persistent package-name
7. timeout tmax tmax-value
8. timeout tdmax tdmax-value
9. timeout tdinit tdinit-value
10. timeout tcrit tcrit-value

29. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 mgcp profile {profile-name</td>
<td>default}</td>
</tr>
</tbody>
</table>

Example:

Router(config)# mgcp profile \{profile-name | default\}
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>Provides a description for the profile.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Defines the call agent’s DNS name or IP address, UDP port number, service type, and protocol version. (Not used when configuring the default profile.)</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Provides the voice port number or DS0 group number for the endpoint to be associated with this MGCP profile. Repeat this command to add more than one endpoint to the profile. (Not used when configuring the default profile.)</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Restores the parameter represented by command to its default value.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Configures the package type used when reporting persistent events for an MF CAS endpoint type. Valid types are ms-package and mt-package. Default is ms-package.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Configures the maximum timeout value after which MGCP messages are removed from the retransmission queue, in seconds. Range is from 1 to 1000. Default is 20.</td>
</tr>
</tbody>
</table>

**Example:**

- **Step 2**
  
  ```
  Router(config-mgcp-profile)# description text
  ```

- **Step 3**
  
  ```
  Router(config-mgcp-profile)# call-agent {dns-name | ip-address} [port] [service-type type] [version protocol-version]
  ```

- **Step 4**
  
  ```
  Router(config-mgcp-profile)# voice-port port-number
  ```

- **Step 5**
  
  ```
  Router(config-mgcp-profile)# default command
  ```

- **Step 6**
  
  ```
  Router(config-mgcp-profile)# package persistent package-name
  ```

- **Step 7**
  
  ```
  Router(config-mgcp-profile)# timeout tsmax tsmax-value
  ```

</tbody>
</table>
Verifying the Configuration

SUMMARY STEPS

1. `show running-configuration`
2. `show mgcp [connection | endpoint | profile [profile-name] | statistics`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| `show running-configuration`
| Example:
| `Router# show running-configuration`
| Displays the current configuration settings. |
| **Step 2**
| `show mgcp [connection | endpoint | profile [profile-name] | statistics`
| Example:
| `Router# show mgcp [connection | endpoint | profile [profile-name] | statistics`
| Displays the current MGCP settings. |

Troubleshooting Tips

The following suggestions help with troubleshooting:

- Use the `show running-config` command to verify that the following are properly configured:
  - For CAS and POTS endpoints, POTS dial peers are configured with the `mgcpapp` application.
  - The correct packages are enabled in the `mgcp package-capability` command.
  - The `mgcp call-agent` or `call-agent` command defines the call agent and service type correctly.

- Reset the MGCP statistical counters with the `clear mgcp statistics` command.

- If RTP traffic is not getting through, make sure that IP routing is enabled. Use the `show rtp statistics` command, then use the `debug ip udp` command and track down the MGCP RTP packets.

```plaintext
Router# show rtp statistics
RTP Statistics info:
No. CallId Xmit-pkts Xmit-bytes Rcvd-pkts Rcvd-bytes Lost pkts Jitter Latency
1 17492 0x8A 0x5640 0x8A 0x5640 0x0 0x0 0x0
```
If an RTP message is not received by the call agent, make sure that the `mgcp call-agent` command or the MGCP profile `call-agent` command is configured with the correct call agent name or IP address and UDP port. Use the `show mgcp` command or the `show mgcp profile` command to display this information:

```
Router# show mgcp
MGCP Admin State ACTIVE, Oper State ACTIVE - Cause Code NONE
MGCP call-agent: 172.29.248.51 Initial protocol service is MGCP, v. 1.0
...
MGCP gateway port: 2727, MGCP maximum waiting delay 3000
...
```

To verify connections and endpoints, use the `show mgcp` command:

```
Router# show mgcp connection
Endpoint Call_ID(C) Conn_ID(I) Port Mode State Codec Event[SIFL] Result[EA]
1. S0/DS1-1/5 C=F123AB,5,6 I=0x3 P=16506,16602 M=3 S=4 C=1 E=2,0,0,2 R=0,0
2. S0/DS1-1/6 C=F123AB,7,8 I=0x4 P=16602,16506 M=3 S=4 C=1 E=0,0,0,0 R=0,0
```

To check operation of interfaces, use the `show interface` command.

To view information about activity on the T1 or E1 line, use the `show controllers` command. Alarms, line conditions, and other errors are displayed. The data is updated every 10 seconds; and every 15 minutes, the cumulative data is stored and retained for 24 hours.

When necessary, you can enable debug traces for errors, events, media, packets, and parser. The command `debug mgcp packets` can be used to verify that your packets are arriving at the gateway and to monitor message flow in general. Note that there is always a performance penalty when using debug commands. The sample output below shows the use of the optional `input-hex` keyword to enable display of hexadecimal values.

```
Router# debug mgcp packets input-hex
Media Gateway Control Protocol input packets in hex value debugging is on
MGCP Packet received -
DLCX 49993 * MGCP 0.1
MGCP Packet received in hex -
44 4C 43 58 20 34 39 39 33 33 20 2A 20 4D 47 43 50 20 30 30 2E 31 A
send_mgcp_msg, MGCP Packet sent --->
250 49993
```
Cisco uBR925 Using Radio Frequency Interface Example

This example shows how to set up a Cisco uBR925 as an MGCP residential gateway. The call agent is specified to the cable router (Cisco uBR925, Cisco CVA122, or Cisco CVA122E) by a Dynamic Host Configuration Protocol (DHCP) offer on a cable radio frequency (RF) network. On completion of the DHCP offer, the call agent is set in the MGCP profile on the cable modem. This setting is displayed with the `show mgcp profile` command. The router does not show the call agent in the CLI.

Cisco MC3810 as a VoAAL2 Gateway using AAL2 PVCs Example
Configuring MGCP Basic CLASS and Operator Services

This chapter provides information on configuring and troubleshooting the MGCP Basic (CLASS) and Operation Services feature. The feature provides xGCP support for three-way calling on residential and trunking gateways.

Feature benefits include the following:

- The merged SGCP/MGCP software for RGWs, BGWs, and TGWs enables easier development and growth of Cisco and customer solutions.

- MGCP BCOS satisfies the requirements for providing basic CLASS services on Cisco IOS gateways that enable multiple xGCP solutions, particularly residential gateway and IP Centrex.

For more information about this and related Cisco IOS voice features, see the following:

- "Overview of MGCP and Related Protocols" on page 3

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MGCP Basic CLASS and Operator Services

Prerequisites are described in the "Prerequisites for Configuring MGCP and Related Protocols" section on page 3.

Restrictions for MGCP Basic CLASS and Operator Services

- For the Cisco MC3810 series platform, the MGCP BCOS software is supported on an HCM version of an DSP card; it is not supported on an VCM version.

To check the type of DSP card in your Cisco MC3810 series platform, enter a `show version` command at the EXEC prompt.

- If you have an HCM card, the following line appears as part of the `show version` information:

  1 6-DSP (slot 2) High Performance Compression Module(v01.A0)

- If you have an VCM card, the following line appears as part of the `show version` information:

  1 6-DSP (slot 2) Voice Compression Module(v255.V7)

If you have an HCM card, the MGCP BCOS features will function properly. If you have an VCM card, the feature is not supported.

- The G.728 and G.723 codecs do not support three-way calling.

Information About MGCP Basic CLASS and Operator Services

The MGCP BCOS are a set of calling features, sometimes called "custom calling" features, that use MGCP to transmit voice, video, and data over the IP network. These features are usually found in circuit-based networks. MGCP BCOS brings them to the Cisco IOS gateways on packet-based networks.

The MGCP BCOS software is built on the MGCP CAS PBX and AAL2 software package, and supports MGCP 0.1 and the earlier protocol version Simple Gateway Control Protocol (SGCP) 1.1 and 1.5.

The following MGCP BCOS features are available on residential gateways (RGWs) and business gateways (BGWs):
The following two features can be run as residential gateway (RGW) or trunking gateway (TGW) features:

**Distinctive Power Ring**

A telephone rings in a distinctive pattern when a call comes in from a predefined telephone number. The following patterns are available:

- R1: One long ring
- R2: Long ring - long ring
- R3: Short ring - short ring - long ring
- R4: Short ring - long ring - short ring
- R5: One short ring

**Visual Message Waiting Indicator**

A light goes on when a message is waiting for the line.

**Caller ID**

The calling party's telephone number, date, and time of the call appear on the receiving telephone's display between the first and second rings. A maximum of 18 digits are shown, and private and unlisted numbers are displayed. If the called party answers the phone on the first ring, the calling party's number does not appear.

If the called party has an appropriate name display unit, the calling party's name and telephone number appear on the display. The name and number appear between the first and second rings.

If the calling party has blocked Caller ID from displaying the telephone number, the called party sees "P" for private or "Anonymous" on the display unit.

**Caller ID with Call Waiting**

If the called party has Caller ID and has enabled the Call Waiting feature, then the calling party's name (if an appropriate display unit is available) and telephone number appear while the called party is on the line with another call.

If the calling party has blocked Caller ID from displaying the name and telephone number, the called party will see "P" for private or "Anonymous" on the display unit.

**Call Forwarding**

The following scenarios are available:

- The call agent transfers all incoming calls to a designated telephone number when the called number does not answer after a predetermined interval.
• The call agent transfers all incoming calls to a designated telephone number when the called number is busy.

• The call agent transfers all incoming calls to a specific destination when the user enters a code and a destination telephone number that receives the calls. The user is responsible for all charges between the original called number and the receiving telephone number.

• A user can activate Call Forwarding remotely using a touch-tone telephone and a user-defined personal identification number (PIN), which, by default, is the last four digits of the user’s telephone number. The original destination telephone emits a Ring Splash when a call is forwarded.

**Ring Splash**

Also known as Reminder Ring, Ring Splash is activated when the user enables Call Forwarding on the telephone. The user hears Distinctive Power Ring R5 when the line is idle and a call has been forwarded. This reminds the user that Call Forwarding is active.

**Distinctive Call-Waiting Tone**

The called party hears four audible tone patterns (waiting tones, or WTs) when a call is waiting on the called party’s line. The call agent provides the following tone patterns in sequence as the incoming call continues to wait:

- WT1: One short tone
- WT2: Short tone-short tone
- WT3: Short tone-short tone-short tone
- WT4: Short tone-long tone-short tone

**Message-Waiting Tone**

For users with an active voice mail system, a special dial tone is heard when the user goes off-hook and a message is waiting. The dial tone is a sequence of 10 short tones followed by a steady tone. If the user has a telephone with a visual message indicator, the indicator light goes on when a message is waiting.

**Stutter Dial Tone**

This tone is used in place of the dial tone to indicate that a message is waiting. When the user goes off-hook, a sequence of three short tones followed by a steady tone is heard.

**Off-Hook Warning Tone**

The user hears this tone when the telephone is off-hook. The tone is repeated bursts of sound of rising pitch.
911 Calls

The user can make a 911 call to an Emergency Service Bureau (ESB), and the call is maintained as long as the ESB does not hang up. If the user hangs up, the call is maintained. If the user hangs up and picks up the phone again, the call resumes. If the user hangs up and does not pick up the phone again, the ESB can ring the user and resume the call.

This feature is available in SGCP mode on the Cisco 3660 platforms and in MGCP mode on all supported platforms.

Three-Way Calling

The user can create a 3-way call by pressing the switchhook quickly to put the first call on hold, dial a third party, and press the switchhook again quickly to join all parties to the call. This feature is supported on all five platforms.

Considerations for Three-way Calling

- The user who sets up the 3-way call must be connected to a residential gateway, which handles the call setup. TWC is transparent to a trunking gateway.
- Only the G.711u and G.711a codecs support TWC. If any part of a 3-way call is made on a codec other than the G.711u, that codec must be switched to G.711u mode before the second switchhook flash in order for the 3-way call to be set up.
- TWC supports calls originating as Voice over IP or Voice over AAL2 calls, not Voice over ATM or Voice over Frame Relay calls. However, if the network has ATM or Frame Relay as a transport protocol, the VoIP call is completed.
- The user originating the 3-way call is the controller. Each of the two other users on the call can add another person onto the call, which is referred to as call chaining. Those new users can also add another person to the call. However, when five people in total are on the call, adding more users causes voice quality to degrade.
- If the controller of the call hangs up, all the users are disconnected from the call. If one of the non-controller users hangs up, the remaining users are still connected to the call.
- If the controller presses the switchhook quickly for a third time, the last user connected to the call is dropped from the call.
- If two users are on a call and a third user calls one of them, that third user cannot be joined (bridged) into the two-party call.

Examples of Service-Provider Solutions

The Basic CLASS and Operator Services features support MGCP solutions in the following areas:

- Residential cable access

A CLEC can use residential cable access to provide residential customers with basic telephony and data services. CLASS features and Three-way calling, Caller ID with Call Waiting, and Distinctive Call Waiting
Tone are features that support these customers. The figure below illustrates a possible residential cable access solution.

**Figure 4: Residential Cable Access Solution**

![Residential Cable Access Solution Diagram]

Note that, in the figure above, the residential gateway must support the CLASS features and 911 capability.

- IP Centrex and IP PBX

In these solutions, a call agent provides business voice services that are traditionally offered by a circuit-based PBX. CLASS features and Three-way calling, Caller ID with Call Waiting, Distinctive Call Waiting Tone, and Visual Message Waiting Indicator are features suitable for these customers. The figure below illustrates an IP Centrex solution:

**Figure 5: IP Centrex Solution**

![IP Centrex Solution Diagram]

In the figure above, the residential gateway (the Cisco 2600 series platforms) must support the CLASS features.
• Integrated access

A CLEC or IXC can provide small, medium, and large businesses with integrated voice and data access services. The integrated access device can be located at the central office or on the customer’s premises. Access to the subscriber can be analog or digital, and transport of voice and data can be over IP, Frame Relay, or ATM. CLASS features and Three-way calling, Caller ID with Call Waiting, Distinctive Call Waiting Tone, and Visual Message Waiting Indicator are features suitable for these customers. The figure below illustrates an integrated access solution.

**Figure 6: Integrated Access Solution**

In the figure above, the residential gateway (the Cisco 2600 series and Cisco MC3810 series platforms) must support the CLASS features.

• Telecommuter or small-office-home-office solution
The figure below illustrates a telecommuter or small-office-home-office solution:

*Figure 7: Telecommuter or Small Office-Home Office Solution*

In the figure above, the residential gateway must support the CLASS features. Other solutions are possible using the MGCP open protocol.

**Troubleshooting MGCP Basic CLASS and Operator Services**

No new or modified configuration tasks are required to initiate MGCP Basic CLASS and Operator Services. MGCP BCOS co resides with MGCP CAS PBX and AAL2 PVC software, for which configuration activities are required. These are discussed in "Appendix A: Configuring MGCP CAS PBX and AAL2 PVC".

The following MGCP BCOS features do not work on telephones from all manufacturers when the telephones are connected to a Cisco MC3810 series platform:

- CID - Caller ID
- VMWI - Visual Message Waiting Indicator
- CIDCW - Caller ID with Call Waiting

The table below summarizes the findings for the models tested.

*Table 4: Telephones and Feature Capabilities*

<table>

</tr>
</tbody>
</table>
To correct this operation, change the idle voltage in the voice port from low to high.

To change the voice port idle voltage, perform these additional steps:

- If the phone is already connected to the voice port, lift the phone's handset.
- If the phone is not connected to the voice port, do the following:
  1. Attach the phone to the voice port.
  2. Do a "shut" to the voice port.
  3. Do a "no shut" to the voice port.
  4. Lift the phone's handset.

### Configuration Examples for MGCP Basic CLASS and Operator Services

No new or modified configuration settings are needed to implement MGCP Basic CLASS and Operator Services. See the MGCP CAS PBX and AAL2 PVC setup in "Appendix A: Configuring MGCP CAS PBX and AAL2 PVC" for sample configurations.

**Tip**

See the "Additional References for MGCP and SGCP" section on page x for related documents, standards, and MIBs and the "Glossary" for definitions of terms in this guide.
Configuration Examples for MGCP Basic CLASS and Operator Services
CHAPTER 5

Configuring NAS Package for MGCP

This chapter provides information on configuring the Network Access Server (NAS) Package for MGCP feature. The feature adds support for the MGCP NAS package on universal gateways. Data calls can be terminated on a trunking media gateway that is serving as a NAS. Trunks on the NAS are controlled and managed by a call agent supporting MGCP for both voice and data calls. The call agent must support the MGCP NAS package.

Key feature benefits derive from the presence of universal ports that are able to terminate both voice and data calls under control of the MGCP call agent. These benefits include the following:

- Cost savings
  - Sharing of trunks (T1 or E1) for dial and voice services
  - Collapsed IP backbone infrastructure
  - Simplified operations and management

- Increased revenue
  - Optimized utilization of trunk (T1 or E1) resources

- Flexibility in deploying new services
- Flexibility in access network engineering

For more information about this and related Cisco IOS voice features, see the following:

- "Overview of MGCP and Related Protocols" on page 3

**Feature History for NAS Package for MGCP**

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for NAS Package for MGCP

Prerequisites are described in the "Prerequisites for Configuring MGCP and Related Protocols" section on page 3. In addition, the following apply:

- Configure a data network.
- Configure MGCP.

Information About NAS Package for MGCP

This feature adds support for the Network Access Server Package for Media Gateway Control Protocol package on the Cisco AS5350, Cisco AS5400, and Cisco AS5850 universal gateways. With this implementation, data calls can be terminated on a trunking media gateway that is serving as a network access server (NAS). Trunks on the NAS are controlled and managed by a call agent that supports Media Gateway Control Protocol (MGCP) for both voice and data calls. The call agent must support the MGCP NAS package.

These capabilities are enabled by the universal port functionality of the Cisco AS5350, Cisco AS5400, and Cisco AS5850, which allows these platforms to operate simultaneously as network access servers and voice gateways to deliver universal services on any port at any time. These universal services include dial access, real-time voice and fax, wireless data access, and unified communications.

The MGCP NAS package implements signals and events to create, modify, and tear down data calls. The events include signaling the arrival of an outbound call (IP to Public Switched Telephone Network [PSTN])
to the media gateway controller (call agent), reporting carrier loss and call authorization status, and receiving callback requests. The following types of calls can be terminated as data calls:

- Data within the voice band (analog modem)
- ISDN data (digital modem)
- Data over voice when using a call agent that recognizes this call type and delivers these calls as digital data to the NAS

The NAS package provides MGCP capabilities for data calls on the Cisco AS5350, Cisco AS5400, and Cisco AS5850 that support all the dial-in and dial-out services, including the following:

- Virtual Private Network (VPN) with Layer 2 Tunneling Protocol (L2TP)
- Scalable Multichassis Multilink PPP (MMP) across multiple channels
- MGCP 1.0 and MGCP 0.1
- Call preauthentication with MGCP dial calls

Resource pool management can be used to manage dial ports when dialed number identification service (DNIS) preauthentication is enabled. The NAS returns an error with a preauthentication failure code to the call agent, which releases the call gracefully with a busy cause. Refer to the Cisco IOS Release 12.3 Configuration Guides and Command References, for more information about dial-pool management, and for more information about authentication, authorization, and accounting (AAA) preauthentication services.

The figure below shows a typical network topology for universal port media gateways.

*Figure 8: Media Gateways Operating As Network Access Servers*
How to Configure NAS Package for MGCP

With the Network Access Server Package for Media Gateway Control Protocol feature, the NAS supports both data and voice calls, which can be managed from a single call agent that supports MGCP with the NAS package. The NAS package provides the interface to a call agent (media gateway controller) for handling modem calls that terminate on the NAS and that originate from the PSTN, including callback requests. Results of AAA authorization and preauthorization requests from the NAS are reported to the call agent as notifications.

See the following sections for configuration tasks for the Network Access Server Package for Media Gateway Control Protocol feature. Each task in the list is identified as either required or optional.

Configuring the NAS for MGCP

In this task, MGCP is configured on the trunking gateway (NAS), and the NAS package is set as the default package. The steps that are listed are the minimum needed to configure MGCP on the NAS. For more commands and optional settings for MGCP, see the documents listed in the "Related Documents" section on page xi.

To configure the NAS Package for MGCP feature, use the following commands in global configuration mode:

SUMMARY STEPS

1. mgcp [gw-port]
2. mgcp call-agent {dns-name | ip-address} [ca-port] [service-type type] [version protocol-version]
3. mgcp default-package nas-package

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Allocates resources for MGCP and starts the MGCP daemon. If no port is specified, the command defaults to port 2427.</td>
</tr>
<tr>
<td><strong>mgcp [gw-port]</strong></td>
<td></td>
</tr>
<tr>
<td>Example: Router(config)# mgcp [gw-port]</td>
<td></td>
</tr>
</tbody>
</table>

| Step 2 | Configures the gateway with the address and protocol of the call agent (media gateway controller). Make sure to specify a call agent that supports the NAS package. |
| mgcp call-agent {dns-name | ip-address} [ca-port] [service-type type] [version protocol-version] | |
| Example: Router(config)# mgcp call-agent {dns-name | ip-address [ca-port] [service-type type] [version protocol-version | |
### Configuring Controllers

In this task, in addition to the standard controller commands, you configure a T1 or E1 controller for external signaling control by MGCP. You can also set the AAA preauthentication timer to expire after a certain number of milliseconds have elapsed without a response from the AAA server and indicate whether the call should be accepted or rejected if no response occurs before the timer expires.

To configure a controller to use the Network Access Server Package for Media Gateway Control Protocol feature, use the following commands beginning in global configuration mode:

**SUMMARY STEPS**

1. `controller {t1 | e1} slot/port`
2. Do one of the following:
   - `framing {sf | esf}`
   - for T1 lines
   - or for E1 lines
   - `framing {crc4 | no-crc4} [australia]`
3. `extsig mgcp`
4. `guard-timer milliseconds [on-expiry {accept | reject}]`
5. Do one of the following:
   - `linecode {ami | b8zs}`
   - for T1 lines
   - or for E1 lines
   - `linecode {ami | hdb3}`
6. `ds0-group channel-number timeslots range type none service mgcp`
7. `exit`
# DETAILED STEPS

### Configuring Dialer Interfaces and Routing

This set of tasks configures dial-on-demand routing (DDR) on a dialer interface that is under external call control by MGCP.

DDR refers to a collection of Cisco features that allows two or more Cisco routers to establish a dynamic connection over simple dial-up facilities to route packets and exchange routing updates on an as-needed basis. DDR is used for low-volume, periodic network connections over the PSTN or an ISDN. A connection is automatically established whenever interesting traffic is detected; during configuration you define what constitutes interesting traffic.

#### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• linecode {ami</td>
<td>hdb3}</td>
</tr>
<tr>
<td>Example: Router(config-controller)# linecode {ami</td>
<td>b8zs}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Example: Router(config-controller)# linecode {ami</td>
<td>hdb3}</td>
</tr>
<tr>
<td>ds0-group channel-number timeslots range type none service mgcp</td>
<td></td>
</tr>
<tr>
<td>Example: Router(config-controller)# ds0-group channel-number</td>
<td></td>
</tr>
<tr>
<td>Example: timeslots range type none service mgcp</td>
<td></td>
</tr>
<tr>
<td>exit</td>
<td>Exits the current mode.</td>
</tr>
<tr>
<td>Example: Router(config-controller)# exit</td>
<td></td>
</tr>
</tbody>
</table>

#### Configuring NAS Package for MGCP

This section provides instructions on configuring the NAS Package for MGCP.
ISDN B channels, synchronous serial interfaces, and asynchronous interfaces can all be converted to dialer interfaces using dialer interface configuration commands.

DDR provides several functions. First, DDR spoofs, or pretends, that there are established configured routes to provide the image of full-time connectivity using the dialer interfaces. When the routing table forwards a packet to a dialer interface, DDR filters out the interesting packets for establishing, maintaining, and releasing switched connections. Internetworking is achieved over the DDR-maintained connection using PPP or other WAN encapsulation techniques.

The encapsulation methods available depend on the physical interface being used. Cisco supports PPP, High-Level Data Link Control (HDLC), Serial Line Internet Protocol (SLIP), and X.25 data-link encapsulations for DDR. PPP is the recommended encapsulation method because it supports multiple protocols and is used for synchronous, asynchronous, or ISDN connections. In addition, PPP performs address negotiation and authentication, and it is interoperable with different vendors.

There are two ways of setting up addressing on dialer interfaces:

- Applying a subnet to the dialer interfaces—Each site with a dialer interface is given a unique node address on a shared subnet for use on its dialer interface. This method is similar to numbering a LAN or multipoint WAN, and it simplifies the addressing scheme and creation of static routes.
- Using unnumbered interfaces—Similar to using unnumbered addressing on leased-line point-to-point interfaces, the address of another interface on the router is borrowed for use on the dialer interface. Unnumbered addressing takes advantage of the fact that there are only two devices on the point-to-point link.

DDR uses manually entered static network protocol routes. This eliminates the use of a routing protocol that broadcasts routing updates across the DDR connection, causing unnecessary connections.

Similar to the function provided by an Address Resolution Protocol (ARP) table, dialer map statements translate next-hop protocol addresses to telephone numbers. Without statically configured dialer maps, DDR call initiation cannot occur. When the routing table points at a dialer interface, and the next-hop address is not found in a dialer map, the packet is dropped.

Authentication in DDR network design provides two functions: security and dialer state. As most DDR networks connect to the PSTN, it is imperative that a strong security model be implemented to prevent unauthorized access to sensitive resources. Authentication also allows the DDR code to keep track of what sites are currently connected and provides for building of Multilink PPP bundles.

In summary, the following main tasks are involved in configuring the dialer interface and routing:

- Specification of interesting traffic—What traffic type should enable the link?
- Definition of static routes—What route do you take to get to the destination?
- Configuration of dialer information—What number do you call to get to the next-hop router, and what service parameters do you use for the call?

For MGCP NAS, configuration of dialer interfaces entails the use of the `dialer extsig` command in interface configuration mode, which enables the External Call Service Provider (XCSP) subsystem to provide an interface between the Cisco IOS software and the MGCP protocol. The XCSP subsystem enables services such as modem call setup and teardown for the dialer interface.

To configure the dialer interface and routing, use the following commands beginning in global configuration mode:
### SUMMARY STEPS

1. `interface dialer-name`
2. Do one of the following:
   - `ip unnumbered interface-number`
   - `ip address ip-address subnet-mask [secondary]`
3. `encapsulation ppp`
4. `dialer in-band [no-parity | odd-parity]`
5. `dialer idle-timeout seconds [inbound | either]`
6. `dialer map protocol next-hop-address [name host-name] [dial-string[: isdn-subaddress]]`
7. `dialer extsig`
8. `dialer-group number`
9. `no cdp enable`
10. `ppp authentication chap`
11. `exit`
12. `dialer list number protocol protocol-name [permit | deny [list access-list-number | access-group]]`
13. `ip route prefix mask {ip-address | interface-type interface-number} [distance] [tag tag] [permanent]`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters interface mode for the dialer interface.</td>
</tr>
<tr>
<td><code>interface dialer-name</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# interface dialer-name</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

Do one of the following:

- `ip unnumbered interface-number`
- `ip address ip-address subnet-mask [secondary]`

**Example:**

```
Router(config-if)# ip unnumbered interface-number
```

**Example:**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`ip route prefix mask {ip-address</td>
<td>interface-type interface-number} [distance] [tag tag] [permanent]`</td>
</tr>
</tbody>
</table>

**Example:**

```none
Router(config)# interface dialer-name
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip address ip-address subnet-mask [secondary]</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> encapsulation ppp</td>
<td>Sets encapsulation type for PPP.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# encapsulation ppp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> dialer in-band [no-parity</td>
<td>odd-parity]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# dialer in-band [no-parity</td>
<td>odd-parity]</td>
</tr>
<tr>
<td><strong>Step 5</strong> dialer idle-timeout seconds [inbound</td>
<td>either]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# dialer idle-timeout seconds [inbound</td>
<td>either]</td>
</tr>
<tr>
<td><strong>Step 6</strong> dialer map protocol next-hop-address [name host-name] [dial-string[: isdn-subaddress]]</td>
<td>Configures a serial interface to make digital calls or to accept incoming calls from a specified location and to authenticate if so configured.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# dialer map protocol next-hop-address [name host-name] [dial-string[: isdn-subaddress]]</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> dialer extsig</td>
<td>Specifies an interface for the initiation and termination of digital calls for external signaling protocols. Only one dialer with external signaling per NAS is permitted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# dialer extsig</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> dialer-group number</td>
<td>Controls access by configuring an interface to belong to a specific dialing group.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# dialer-group number</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 9</strong> no cdp enable</td>
<td>Disables Cisco Discovery Protocol (CDP) on the interface.</td>
</tr>
<tr>
<td>Example: Router(config-if)# no cdp enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> ppp authentication chap</td>
<td>Enables Challenge Handshake Authentication Protocol (CHAP) authentication on the interface.</td>
</tr>
<tr>
<td>Example: Router(config-if)# ppp authentication chap</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> exit</td>
<td>Exits the current mode.</td>
</tr>
<tr>
<td>Example: Router(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> dialer list number protocol protocol-name {permit</td>
<td>deny [list access-list-number</td>
</tr>
<tr>
<td>Example: Router(config)# dialer list number protocol protocol-name {permit</td>
<td>deny [list access-list-number</td>
</tr>
<tr>
<td><strong>Step 13</strong> ip route prefix mask {ip-address</td>
<td>interface-type interface-number} [distance] [tag tag] [permanent]</td>
</tr>
<tr>
<td>Example: Router(config)# ip route prefix mask {ip-address</td>
<td>interface-type interface-number} [distance] [tag tag] [permanent]</td>

**Verifying the NAS Package for MGCP**

To verify configuration, use the following commands.
SUMMARY STEPS

1. Use the following command to display the running configuration to verify configured parameters for MGCP, controllers, dialer interfaces, and routing:

2. Use the following command to display MGCP configurations for NAS:

DETAILED STEPS

Step 1

Use the following command to display the running configuration to verify configured parameters for MGCP, controllers, dialer interfaces, and routing:

Example:

Router# show running-configuration

The following example shows the configuration for serial interface 1:

Example:

Router# show running-configuration interface serial 1
Building configuration...
Current configuration:
!
interface Serial1
no ip address
no ip directed-broadcast
no ip route-cache
no ip mroute-cache
shutdown
!
end

Step 2

Use the following command to display MGCP configurations for NAS:

Example:

Router# show mgcp nas
(dump
(slot
port
channel |
info

The following is sample output from the show mgcp nas dump command:

Example:

Router# show mgcp nas dump 7 0 23
Slot 7 state= Up
Port 0 state= Up
State Idle PortCb=0x630DE864 ss_id=0x0 handle=0x0
bearer cap=Modem call_id= conn_id=
Events req- 4d21h:
callp-0x62D137D4 - state=MGCP_CALL_IDLE - data_call No
Endpt name=S7/DS1-0/23

The following is sample output from the show mgcp nas info command:
Example:

Router# show mgcp nas info
Slot 7 state= Up
Port 0 state= Up
ID ID ID ID ID ID ID ID ID ID ID ID ID ID ID ID XX XX XX
XX XX XX XX
Channel State Legend
NP=Not Present, OO=Out Of Service, ID=Idle, US=In Use
CI=Connection in progress, RI=Release in progress
RO=Out Release in progress, DR=Down,  SH=Shutdown
XX=Unconfigurable

Troubleshooting Tips

In addition, a number of show and debug commands are useful for troubleshooting the Network Access Server Package for Media Gateway Control Protocol feature. These commands are listed in the following sections:
**MGCP Troubleshooting**

To display detailed information on the MGCP application and operations, use the following commands in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show mgcp nas info</code></td>
<td>Displays status of the MGCP data channels.</td>
</tr>
<tr>
<td><code>Router# show mgcp nas info</code></td>
<td>See Example Output for <code>show mgcp nas info</code> Command, on page 88.</td>
</tr>
<tr>
<td><code>show mgcp nas dump slot port chan</code></td>
<td>Displays status and details about the specified MGCP data slot, port, and channel.</td>
</tr>
<tr>
<td><code>Router# show mgcp nas dump slot port chan</code></td>
<td>See Example Output for <code>show mgcp nas dump Command</code>, on page 89.</td>
</tr>
<tr>
<td><code>show mgcp connection</code></td>
<td>Displays active MGCP connections on the router.</td>
</tr>
<tr>
<td><code>Router# show mgcp connection</code></td>
<td>See Example Output for <code>show mgcp connection Command</code>, on page 89.</td>
</tr>
<tr>
<td><code>show xcsp slot slot-num</code></td>
<td>Displays the status of a router slot under the control of the External Call Service Provider (XCSP) subsystem.</td>
</tr>
<tr>
<td><code>Router# show xcsp slot slot-num</code></td>
<td>See Example Output for <code>show xcsp slot Command</code>, on page 89.</td>
</tr>
<tr>
<td><code>show xcsp port slot port</code></td>
<td>Displays the status of a port under the control of the External Call Service Provider (XCSP) subsystem.</td>
</tr>
<tr>
<td><code>Router# show xcsp port slot port</code></td>
<td>See Example Output for <code>show xcsp port Command</code>, on page 89.</td>
</tr>
<tr>
<td><code>show cdapi</code></td>
<td>Displays information about the call distributor application programming interface (CDAPI), which is the internal API that provides an interface between the MGCP signaling stacks and applications.</td>
</tr>
<tr>
<td><code>Router# show cdapi</code></td>
<td>See Example Output for <code>show cdapi Command</code>, on page 90.</td>
</tr>
</tbody>
</table>

**Example Output for show mgcp nas info Command**

The following is sample output from the `show mgcp nas info` command:

```
Router# show mgcp nas info
```
Example Output for show mgcp nas dump Command

The following is sample output from the `show mgcp nas dump` command:

```
Router# show mgcp nas dump 7 0 23
Slot 7 state= Up
Port 0 state= Up
State Idle PortCb=0x630DE864 ss_id=0x0 handle=0x0
bearer cap=Modem call_id= conn_id=
Events req-4d21h:
callp=0x62D137D4 - state=MGCP_CALL_IDLE - data_call No
Endpt name=S7/DS1-0/23
```

Example Output for show mgcp connection Command

The following is sample output from the `show mgcp connection` command for Voice over IP (VoIP) connections:

```
Router# show mgcp connection
Endpoint Call_ID(C) Conn_ID(I) (P)ort (M)ode (S)tate (C)odec (E)vent[SIFL] (R)esult[EA]
1. S0/DS1-0/1 C=103,23,24 I-0x8 P=16586,16634 M=3 S=4,4 C=5 E=2,0,0,2 R=0,0
2. S0/DS1-0/2 C=103,25,26 I-0x9 P=16634,16586 M=3 S=4,4 C=5 E=2,0,0,0 R=0,0
3. S0/DS1-0/3 C=101,15,16 I-0x4 P=16506,16544 M=3 S=4,4 C=5 E=2,0,0,2 R=0,0
4. S0/DS1-0/4 C=101,17,18 I-0x5 P=16544,16506 M=3 S=4,4 C=5 E=0,0,0,0 R=0,0
5. S0/DS1-0/5 C=102,19,20 I-0,6 P=16572,16600 M=3 S=4,4 C=5 E=2,0,0,2 R=0,0
6. S0/DS1-0/6 C=102,21,22 I-0x7 P=16600,16572 M=3 S=4,4 C=5 E=0,0,0,0 R=0,0
Total number of active calls 6
```

The following is sample output from the `show mgcp connection` command for VoAAL2 connections:

```
Router# show mgcp connection
Endpoint Call_ID(C) Conn_ID(I)(V)cci/cid (M)ode (S)tate (C)odec (E)vent[SIFL] (R)esult[EA]
1.aaln/S1/1 C=1,11,12 I-0x2 V=2/10 M=3 S=4,4 C=1 E=3,0,0,3 R=0,0
Total number of active calls 1
```

Example Output for show xcsp slot Command

The following is sample output from the `show xcsp slot` command:

```
Router# show xcsp slot 1
Slot 1 configured
Number of ports configured=1 slot state= Up
```

Example Output for show xcsp port Command

The following is sample output for the `show xcsp port` command:

```
Router# show xcsp port 1 0

MGCP Debugging

To debug MGCP calls, events, and operations, use the following commands in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug mgcp all</td>
<td>Enables all MGCP debugs.</td>
</tr>
<tr>
<td>Router# debug mgcp all</td>
<td>See Example Output for debug mgcp all Command, on page 92.</td>
</tr>
<tr>
<td>debug mgcp events</td>
<td>Enables MGCP events debugging, which shows information such as the following: whether the router is detected, the MGCP event that initiates a call, and the reset of an controller that is being serviced by MGCP.</td>
</tr>
<tr>
<td>Router# debug mgcp events</td>
<td>See Example Output for debug mgcp events Command, on page 92.</td>
</tr>
<tr>
<td>debug mgcp packets</td>
<td>Enables debugging of MGCP packets. Useful for displaying contents of NTFY, CRCX, DLCX, and other packets.</td>
</tr>
<tr>
<td>Router# debug mgcp packets</td>
<td>See Example Output for debug mgcp packets Command, on page 92.</td>
</tr>
<tr>
<td>debug mgcp parser</td>
<td>Enables debugging of MGCP parser and builder. Useful to determine whether NTFY, CRCX, and other packets have the format that the router expects.</td>
</tr>
<tr>
<td>Router# debug mgcp parser</td>
<td>See Example Output for debug mgcp parser Command, on page 92.</td>
</tr>
<tr>
<td>debug mgcp nas</td>
<td>Enables debugging for MGCP data channels and events.</td>
</tr>
<tr>
<td>Router# debug mgcp nas</td>
<td>See Example Output for debug mgcp nas Command, on page 93.</td>
</tr>
<tr>
<td>debug xcsp {all</td>
<td>cot</td>
</tr>
<tr>
<td>Router# debug xcsp {all</td>
<td>cot</td>
</tr>
<tr>
<td>debug cdapi {detail</td>
<td>events</td>
</tr>
<tr>
<td>Router# debug cdapi {detail</td>
<td>events</td>
</tr>
</tbody>
</table>
Example Output for debug mgcp all Command

The **debug mgcp all** command and keyword would show a compilation of all this output, including the **debug mgcp voipcap** command and keyword output. Note that using the **debug mgcp all** command and keyword may severely impact network performance.

Example Output for debug mgcp events Command

The following example illustrates the output from the **debug mgcp events** command and keyword:

```
Router# debug mgcp events
Media Gateway Control Protocol events debugging is on
Router#
1wl disproportionate: MGC str + 172.19.184.65, total=44, succ=7, failed=21
1wl disproportionate: MGCP msg 1
1wl disproportionate: remove_old_under_specifiedAck:
1wl disproportionate: MGC str + 172.19.184.65, total=44, succ=8, failed=21
1wl disproportionate: updating lport with 2427 setup_ipsocket: laddr=172.29.248.193, lport=2427,
   faddr=172.19.184.65, fport=2427
1wl disproportionate: enqueue_ack: ackqhead=0, ackqtail=0, ackp=1DC1D38, msg=21A037C
```

Example Output for debug mgcp packets Command

The following example illustrates the output from the **debug mgcp packets** command and keyword:

```
Router# debug mgcp packets
Media Gateway Control Protocol packets debugging is on
Router#
1wl disproportionate: MGCP Packet received -
   DLCX 408631346 * MGCP 0.1
1wl disproportionate: send_mgcp_msg, MGCP Packet sent --->
1wl disproportionate: 250 408631346
<---
```

Example Output for debug mgcp parser Command

The following example illustrates the output from the **debug mgcp parser** command and keyword:

```
Router# debug mgcp parser
Media Gateway Control Protocol parser debugging is on
Router#
1wl disproportionate: -- mgcp_parse_packet() - call mgcp_parse_header
   mgcp_parse_header() - Request Verb FOUND DLCX
   mgcp_parse_packet() - out mgcp_parse_header
   SUCCESS: mgcp_parse_packet() - MGCP Header parsing was OK
   mgcp_val_mandatory_parms()
   SUCCESS: mgcp_parse_packet() - END of Parsing
1wl disproportionate: -- mgcp_build_packet() -
   mgcp_estimate_msg_buf_length() - 87 bytes needed for header
   mgcp_estimate_msg_buf_length() - 87 bytes needed after checking parameter lines
   mgcp_estimate_msg_buf_length() - 87 bytes needed after checking SDP lines
   SUCCESS: MGCP message building OK
   SUCCESS: END of building
```
Example Output for **debug mgcp nas** Command

The following example displays output for the **debug mgcp nas** command and keyword, with the **debug mgcp packets** command and keyword enabled as well:

```
Router# debug mgcp nas

```
Controller Troubleshooting

The commands in this section can be helpful in finding sources of problems with call connections and switching. The call switching module (CSM) associated with a controller contains digit collection logic that processes incoming calls for automatic number information (ANI) and dialed number identification service (DNIS) digits.
To display information on controller and CSM configuration and operation, use the following commands in privileged EXEC mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show controllers t1</td>
<td>e1 [slot / port]`</td>
</tr>
<tr>
<td><code>show voice port [slot / port]</code></td>
<td>Displays the port state and the parameters configured on the voice ports of Cisco voice interface cards. Voice-port defaults, like all command-line interface default parameters, do not display in the output for the <code>show running-config</code> command, but they can be seen with the <code>show voice port</code> command. See Example Output for show voice port Command, on page 97.</td>

**Example Output for show controllers e1 or t1 Command**

The following is an output example from the `show controllers e1` command on the Cisco 7500 series:

```
Router# show controllers e1
e1 0/0 is up.
Applique type is Channelized E1 - unbalanced
Framing is CRC4, Line Code is HDB3
No alarms detected.
Data in current interval (725 seconds elapsed):
  0 Line Code Violations, 0 Path Code Violations
  0 Slip Secs, 0 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
  0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 0 Unavail Secs
Total Data (last 24 hours):
  0 Line Code Violations, 0 Path Code Violations,
```
The following is an example of the `show controllers e1` display including the board identifier type:

```
Router# show controllers e1
E1 4/1 is up.
No alarms detected.
Framing is CRC4, Line Code is hdb3
Data in current interval (0 seconds elapsed):
  0 Line Code Violations, 0 Path Code Violations 0 Slip Secs, 0 Fr Loss Secs,
  0 Line Err Secs, 0 Degraded Mins, 0 Errored Secs, 0 Bursty Err Secs,
  0 Severely Err Secs, 0 Unavail Secs
Total Data (last 79 15 minute intervals):
  0 Line Code Violations, 0 Path Code Violations, 0 Slip Secs, 0 Fr Loss Secs,
  0 Line Err Secs, 0 Degraded Mins, 0 Errored Secs, 0 Bursty Err Secs,
  0 Severely Err Secs, 0 Unavail Secs
```

The following is an example from the `show controllers t1` command on the Cisco 7500 series routers:

```
Router# show controllers t1
T1 4/1 is up.
No alarms detected.
Framing is ESF, Line Code is AMI, Clock Source is line
Data in current interval (0 seconds elapsed):
  0 Line Code Violations, 0 Path Code Violations 0 Slip Secs, 0 Fr Loss Secs,
  0 Line Err Secs, 0 Degraded Mins, 0 Errored Secs, 0 Bursty Err Secs,
  0 Severely Err Secs, 0 Unavail Secs
Total Data (last 79 15 minute intervals):
  0 Line Code Violations, 0 Path Code Violations, 0 Slip Secs, 0 Fr Loss Secs,
  0 Line Err Secs, 0 Degraded Mins, 0 Errored Secs, 0 Bursty Err Secs,
  0 Severely Err Secs, 0 Unavail Secs
```

The following example shows the status of the T1 controllers connected to the Cisco AS5800 access servers:

```
Router# show controller T1
T1 1/0/0:1 is up.
No alarms detected.
Framing is ESF, Line Code is AMI, Clock Source is Line.
Data in current interval (770 seconds elapsed):
  5 Line Code Violations, 8 Path Code Violations 0 Slip Secs, 7 Fr Loss Secs,
  7 Line Err Secs, 0 Degraded Mins, 0 Errored Secs, 0 Bursty Err Secs,
  7 Severely Err Secs, 2 Unavail Secs
Total Data (last 81 15 minute intervals):
  27 Line Code Violations, 22 Path Code Violations,
  0 Slip Secs, 13 Fr Loss Secs, 13 Line Err Secs, 0 Degraded Mins,
  0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 13 Unavail Secs
T1 1/0/1:5 is down.
Transmitter is sending remote alarm.
Receiver has loss of frame.
Framing is SF, Line Code is AMI, Clock Source is Line.
Data in current interval (770 seconds elapsed):
  50 Line Code Violations, 5 Path Code Violations
  0 Slip Secs, 7 Fr Loss Secs, 7 Line Err Secs, 0 Degraded Mins
  0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs
Total Data (last 81 15 minute intervals):
  27 Line Code Violations, 22 Path Code Violations,
  0 Slip Secs, 13 Fr Loss Secs, 13 Line Err Secs, 0 Degraded Mins,
  0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs
 Router# 
```

Example Output for show voice port Command

The following is sample output from the Cisco AS5800 for the `show voice port` command:

```
ISDN 1/0/0:0
Type of VoicePort is ISDN
Operation State is DORMANT
Administrative State is UP
No Interface Down Failure
```
Description is ""
Noise Regeneration is enabled
Non Linear Processing is enabled
Music On Hold Threshold is Set to -38 dBm
In Gain is Set to 0 dB
Out Attenuation is Set to 0 dB
Echo Cancellation is enabled
Echo Cancel Coverage is set to 16 ms
Connection Mode is normal
Connection Number is not set
Initial Time Out is set to 10 s
Interdigit Time Out is set to 10 s
Region Tone is set for US

The following example displays voice port configuration information for the digital voice port 0 located in slot 1, DS0 group 1:

receive and transmit Slot is 1, Sub-unit is 0, Port is 1
Type of VoicePort is E&M
Operation State is DORMANT
Administrative State is UP
No Interface Down Failure
Description is not set
Noise Regeneration is enabled
Non Linear Processing is enabled
Music On Hold Threshold is Set to -38 DBM
In Gain is Set to 0 dB
Out Attenuation is Set to 0 dB
Echo Cancellation is enabled
Echo Cancel Coverage is set to 8 ms
Connection Mode is normal
Connection Number is not set
Initial Time Out is set to 10 s
Interdigit Time Out is set to 10 s
Region Tone is set for US

The following is sample output from the show voice port command for an E&M digital voice port on a Cisco 3600 series:

receive and transmit Slot is 1, Sub-unit is 0, Port is 1
Type of VoicePort is E&M
Operation State is DORMANT
Administrative State is UP
No Interface Down Failure
Description is not set
Noise Regeneration is enabled
Non Linear Processing is enabled
Music On Hold Threshold is Set to -38 dBm
In Gain is Set to 0 dB
Out Attenuation is Set to 0 dB
Echo Cancellation is enabled
Echo Cancel Coverage is set to 8 ms
Connection Mode is normal
Connection Number is not set
Initial Time Out is set to 10 s
Interdigit Time Out is set to 10 s
Region Tone is set for US

The following is sample output from the show voice port command for an FXS analog voice port on a Cisco MC3810 multiservice concentrator:

Voice port 1/2 Slot is 1, Port is 2
Type of VoicePort is FXS
Operation State is UP
Administrative State is UP
No Interface Down Failure
Description is not set
Noise Regeneration is enabled
Non Linear Processing is enabled
In Gain is Set to 0 dB
Out Attenuation is Set to 0 dB
Echo Cancellation is enabled
Echo Cancel Coverage is set to 8 ms
Connection Mode is normal
Connection Number is not set
Initial Time Out is set to 10 s
Interdigit Time Out is set to 10 s
Coder Type is g729ar8
Compressing Type is u-law
Voice Activity Detection is disabled
Ringing Time Out is 180 s
Wait Release Time Out is 30 s
Nominal Playout Delay is 80 milliseconds
Maximum Playout Delay is 160 milliseconds
Analog Info Follows:
  Region Tone is set for northamerica
  Currently processing Voice
  Maintenance Mode Set to None (not in mtc mode)
  Number of signaling protocol errors are 0
  Impedance is set to 600r Ohm
  Analog interface A-D gain offset = -3 dB
  Analog interface D-A gain offset = -3 dB
  Voice card specific Info Follows:
    Signal Type is loopStart
    Ring Frequency is 20 Hz
    Hook Status is On Hook
    Ring Active Status is inactive
    Ring Ground Status is inactive
    Tip Ground Status is active
    Digit Duration Timing is set to 100 ms
    InterDigit Duration Timing is set to 100 ms
    Ring Cadence are [20 40] * 100 msec
    InterDigit Pulse Duration Timing is set to 500 ms

The following is sample output from the show voice port command for a Foreign Exchange Station (FXS) analog voice port on a Cisco 3600 series:

Foreign Exchange Station 1/0/0 Slot is 1, Sub-unit is 0, Port is 0
Type of VoicePort is FXS
Operation State is DORMANT
Administrative State is UP
The Interface Down Failure Cause is 0
Alias is NULL
Noise Regeneration is enabled
Non Linear Processing is enabled
Music On Hold Threshold is Set to 0 dBm
In Gain is Set to 0 dB
Out Attenuation is Set to 0 dB
Echo Cancellation is enabled
Echo Cancel Coverage is set to 16ms
Connection Mode is Normal
Connection Number is
Initial Time Out is set to 10 s
Interdigit Time Out is set to 10 s
Analog Info Follows:
  Region Tone is set for northamerica
  Currently processing none
  Maintenance Mode Set to None (not in mtc mode)
  Number of signaling protocol errors are 0
  Voice card specific Info Follows:
    Signal Type is loopStart
    Ring Frequency is 25 Hz
    Hook Status is On Hook
    Ring Active Status is inactive
    Ring Ground Status is inactive
    Tip Ground Status is inactive
    Digit Duration Timing is set to 100 ms
    InterDigit Duration Timing is set to 100 ms
    Hook Flash Duration Timing is set to 600 ms

The following is sample output from the show voice port command for an E&M analog voice port on a Cisco 3600 series:

E&M Slot is 1, Sub-unit is 0, Port is 0
Type of VoicePort is E&M
Operation State is unknown
Administrative State is unknown
The Interface Down Failure Cause is 0
Alias is NULL
Noise Regeneration is disabled
Non Linear Processing is disabled
Music On Hold Threshold is Set to 0 dBm
In Gain is Set to 0 dB
Out Attenuation is Set to 0 dB
Echo Cancellation is disabled
Echo Cancel Coverage is set to 16ms
Connection Mode is Normal
Connection Number is
Initial Time Out is set to 0 s
Interdigit Time Out is set to 0 s
Analog Info Follows:
Region Tone is set for northamerica
Currently processing none
Maintenance Mode Set to None (not in mtc mode)
Number of signaling protocol errors are 0
Voice card specific Info Follows:
Signal Type is wink-start
Operation Type is 2-wire
Impedance is set to 600r Ohm
E&M Type is unknown
Dial Type is dtmf
In Seizure is inactive
Out Seizure is inactive
Digit Duration Timing is set to 0 ms
InterDigit Duration Timing is set to 0 ms
Pulse Rate Timing is set to 0 pulses/second
InterDigit Pulse Duration Timing is set to 0 ms
Clear Wait Duration Timing is set to 0 ms
Wink Wait Duration Timing is set to 0 ms
Wink Duration Timing is set to 0 ms
Delay Start Timing is set to 0 ms
Delay Duration Timing is set to 0 ms
Dialer Interface and Routing Troubleshooting

To obtain information on dialer interfaces, routing configuration, and routing operations, use the following commands in privileged EXEC mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show dialer map</strong></td>
<td>Displays configured dynamic and static dialer maps. See Example Output for show dialer map Command, on page 101.</td>
</tr>
<tr>
<td>Router# show dialer map</td>
<td></td>
</tr>
<tr>
<td><strong>show dialer</strong></td>
<td>Displays general diagnostic information about an interface configured for DDR, such as the number of times the dialer string has been successfully reached, and the idle timer and the fast idle timer values for each B channel. Current call-specific information is also provided, such as the length of a call and the number and name of the device to which the interface is currently connected. When external signaling is configured, the output also displays the CDANI state. See Example Output for show dialer Command, on page 102.</td>
</tr>
<tr>
<td>Router# show dialer</td>
<td></td>
</tr>
<tr>
<td><strong>show interface Dialer-num</strong></td>
<td>Shows whether the interface and protocol are up (spoofing), a state in which the dialer interface pretends to be up/up so that associated routes remain in force and packets can be routed to the interface. See Example Output for show interface Command, on page 102.</td>
</tr>
<tr>
<td>Router# show interface Dialer-num</td>
<td></td>
</tr>
<tr>
<td><strong>show ip route</strong></td>
<td>Displays the routes known to the router, including static and dynamically learned routes. See Example Output for show ip route Command, on page 103.</td>
</tr>
<tr>
<td>Router# show ip route</td>
<td></td>
</tr>
</tbody>
</table>

Example Output for show dialer map Command

The following is sample output from the **show dialer map** command.

```
Router# show dialer map
Static dialer map ip 10.1.1.1 name peer_1 on Dialer1
Static dialer map ip 10.1.1.2 name peer_2 on Dialer1
BAP dialer map ip 10.1.1.2 name peer_2 on Dialer1
Dynamic dialer map ip 10.1.1.3 name peer_3 on Dialer1
BAP dialer map ip 10.1.1.3 name peer_3 on Dialer1
```
Example Output for show dialer Command

The following is sample output from the **show dialer** command for a BRI interface when dialer profiles are configured:

```
Router# show dialer interface bri 0
BRI0 - dialer type = ISDN
Dial String Successes Failures Last called Last status
0 incoming call(s) have been screened.
BRI0: B-Channel 1
Idle timer (120 secs), Fast idle timer (20 secs)
Wait for carrier (30 secs), Re-enable (15 secs)
Dialer state is data link layer up
Dial reason: ip (s=10.1.1.8, d=10.1.1.1)
Interface bound to profile Dialer0
Time until disconnect 102 secs
Current call connected 00:00:19
Connected to 5773872 (wolfman)
BRI0: B-Channel 2
Idle timer (120 secs), Fast idle timer (20 secs)
Wait for carrier (30 secs), Re-enable (15 secs)
Dialer state is idle
```

The following is sample output from the **show dialer** command for a dialer under external signaling control:

```
Router# show dialer
Se7/0:0 - dialer type = IN-BAND SYNC NO-PARITY
Rotary group 1, priority 0
Idle timer (222222 secs), Fast idle timer (20 secs)
Wait for carrier (30 secs), Re-enable (15 secs)
Dialer state is idle
Dialer cdapi state is idle
```

The following is sample output from the **show dialer** command for an asynchronous interface:

```
Router# show dialer interface async 1
Async1 - dialer type = IN-BAND NO-PARITY
Idle timer (900 secs), Fast idle timer (20 secs)
Wait for carrier (30 secs), Re-enable (15 secs)
Time until disconnect 838 secs
Current call connected 0:02:16
Connected to 8986
Dial String Successes Failures Last called Last status
8986 0 0 never Defaults
8986 8 3 0:02:16 Success Defaults
```

When the **show dialer EXEC** command is issued for a synchronous serial interface configured for DTR dialing, output similar to the following is displayed:

```
Serial 0 - dialer type = DTR SYNC
Idle timer (120 secs), Fast idle timer (20 secs)
Wait for carrier (30 secs), Re-enable (15 secs)
Dial String Successes Failures Last called Last status
---- 1 0 1:04:47 Success DTR dialer
8986 0 0 never Defaults
```

Example Output for show interface Command

The following is sample output from the **show interface Dialer0** command:

```
Router# show interface Dialer0
```
Dialer0 is up (spoofing), line protocol is up (spoofing)
Hardware is Unknown
Internet address is 60.0.0.2/24
MTU 1500 bytes, BW 56 Kbit, DLY 20000 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation PPP, loopback not set
DTR is pulsed for 1 seconds on reset
Last input never, output never, output hang never
Last clearing of "show interface" counters 1d17h
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: weighted fair
Output queue: 0/1000/64/0 (size/max total/threshold/drops)
Conversations 0/0/16 (active/max active/max total)
Available Bandwidth 42 kilobits/sec
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
0 packets input, 0 bytes
0 packets output, 0 bytes

Example Output for show ip route Command

The following examples display all downloaded static routes. A P designates which route was installed using AAA route download.

Router# show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
E2 - OSPF external type 2, E - EGP
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, * - candidate default
U - per-user static route, o - ODR, P - periodic downloaded static route
T - traffic engineered route
Gateway of last resort is 172.21.17.1 to network 0.0.0.0
172.31.0.0/32 is subnetted, 1 subnets
P 172.31.229.41 is directly connected, Dialer1 20.0.0.0/24 is subnetted, 3 subnets
P 10.1.1.0 [200/0] via 172.31.229.41, Dialer1
P 10.1.3.0 [200/0] via 172.31.229.41, Dialer1
P 10.1.2.0 [200/0] via 172.31.229.41, Dialer1
Router# show ip route static
172.27.4.0/8 is variably subnetted, 2 subnets, 2 masks
P 172.27.4.32 is directly connected, BR10
P 172.27.4.48 [1/0] via 103.1.1.1, BR10
S 172.27.4.16 [1/0] via 172.21.114.56, Ethernet0
S 10.0.0.0/8 is directly connected, BR10
P 10.0.0.0/8 is directly connected, BR10
S 172.21.0.0/16 is variably subnetted, 5 subnets, 2 masks
S 172.21.114.201/32 is directly connected, BR10
S 172.21.114.209/32 is directly connected, BR10
S 172.21.114.174/32 is directly connected, BR10
S 172.21.114.12/32 is directly connected, BR10
S 172.21.0.0/8 is directly connected, BR10
S 172.21.114.0/16 [1/0] via 172.21.114.65, Ethernet0
S 172.29.0.0/16 [1/0] via 172.21.114.65, Ethernet0

To debug dialer and authorization or to clear in-progress calls, use the following commands in privileged EXEC mode.
### Command and Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>debug dialer</code></td>
<td>Displays the activity that triggers a dial attempt. See Example Output for show dialer Command, on page 102.</td>
</tr>
<tr>
<td><code>clear interface</code></td>
<td>Clears a call that is in progress. In a troubleshooting situation, it is sometimes useful to clear historical statistics to track the current number of successful calls relative to failures. Use this command with care. It sometimes requires that you clear both the local and remote routers. See Example Output for clear interface Command, on page 104.</td>
</tr>
<tr>
<td><code>debug ppp negotiation</code></td>
<td>Displays negotiation of PPP options and Network Control Protocol (NCP) parameters. See Example Output for debug ppp negotiation Command, on page 105.</td>
</tr>
<tr>
<td><code>debug ppp authentication</code></td>
<td>Displays exchange of Challenge Handshake Authentication Protocol (CHAP) and Password Authentication Protocol (PAP) packets. See Example Output for debug ppp authentication Command, on page 105.</td>
</tr>
</tbody>
</table>

### Example Output for debug dialer Command

Displays the activity that triggers a dial attempt.

Dialing cause: Async1: ip (s=172.16.1.111 d=172.16.2.22)

### Example Output for clear interface Command

The following example demonstrates the use of the `clear interface` command with the RLM feature:

```
Router# clear interface
02:48:52: rlm 1: [State_Up, rx ACTIVE_LINK_BROKEN] over link [10.1.1.1(Loopback1), 10.1.4.1]
02:48:52: rlm 1: [State_Recover, rx USER_SOCKET_OPENED] over link [10.1.1.1(Loopback1), 10.1.4.1] for user RLM_MGR
02:48:52: rlm 1: [State_Recover, rx START_ACK] over link [10.1.1.2(Loopback2), 10.1.4.2]
```
Example Output for debug ppp negotiation Command

The following is sample output from the `debug ppp negotiation` command. This is a normal negotiation, where both sides agree on Network Control Program (NCP) parameters. In this case, protocol type IP is proposed and acknowledged.

```
Router# debug ppp negotiation
ppp: sending CONFREQ, type = 4 (CI_QUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 3D56CAC
ppp: received config for type = 4 (QUALITYTYPE) acked
ppp: received config for type = 5 (MAGICNUMBER) value = 3D567F8 acked (ok)
PPP Serial4: state = ACKSENT fsm_rconfack(C021): rcvd id 5
ppp: config ACK received, type = 4 (CI_QUALITYTYPE), value = C025
ppp: config ACK received, type = 5 (CI_MAGICNUMBER), value = 3D56CAC
ppp: ipcp_reqci: returning CONFACK.
(OK)
PPP Serial4: state = ACKSENT fsm_rconfack(8021): rcvd id 4
```

The following is sample output from the debug ppp negotiation command when the remote side of the connection is unable to respond to LQM requests:

```
Router# debug ppp negotiation
ppp: sending CONFREQ, type = 4 (CIQUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 44B7010
ppp: sending CONFREQ, type = 4 (CIQUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 44B7010
ppp: sending CONFREQ, type = 4 (CIQUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 44B7010
ppp: sending CONFREQ, type = 4 (CIQUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 44B7010
ppp: sending CONFREQ, type = 4 (CIQUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 44B7010
ppp: sending CONFREQ, type = 4 (CIQUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 44B7010
ppp: sending CONFREQ, type = 4 (CIQUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 44B7010
ppp: sending CONFREQ, type = 4 (CIQUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 44B7010
ppp: sending CONFREQ, type = 4 (CIQUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 44B7010
ppp: sending CONFREQ, type = 4 (CIQUALITYTYPE), value = C025/3E8
ppp: sending CONFREQ, type = 5 (CI_MAGICNUMBER), value = 44C1488
```

Example Output for debug ppp authentication Command

The following is sample output from the `debug ppp authentication` command. Use this debug command to determine why an authentication fails.

```
Router# debug ppp authentication
Serial0: Unable to authenticate. No name received from peer
Serial0: Unable to validate CHAP response. USERNAME pioneer not found.
Serial0: Unable to validate CHAP response. No password defined for USERNAME pioneer
Serial0: Failed CHAP authentication with remote.
Remote message is Unknown name
Serial0: remote passed CHAP authentication.
Serial0: Passed CHAP authentication with remote.
Serial0: CHAP input code = 4 id = 3 len = 48
```

# Configuring SGCP RSIP and AUEP Enhancements

This section provides information on configuring the Simple Gateway Control Protocol (SGCP) Restart In Progress (RSIP) and Audit Endpoint (AUEP) Enhancements feature. The feature provides enhancements to SGCP for disconnected RSIP and audit endpoints requested by call agents.

Feature benefits include the following:

- Provides SGCP 1.5 gateways with the ability to synchronize endpoints with call agents after the disconnected procedure has occurred.

For more information about this and related Cisco IOS voice features, see the following:

- "Overview of MGCP and Related Protocols" on page 3

## Feature History for SGCP RSIP and AUEP Enhancements

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for SGCP RSIP and AUEP Enhancements

• Configure SGCP 1.5 on the gateway.

Restrictions for SGCP RSIP and AUEP Enhancements

• This feature applies only to SGCP 1.5 gateways.

• This feature does not apply to MGCP gateways.

Information About SGCP RSIP and AUEP Enhancements

The SGCP RSIP and AUEP Enhancements feature provides additional messaging capabilities that allow an endpoint on a Simple Gateway Control Protocol (SGCP) 1.5 gateway to synchronize with a call agent after the endpoint returns to service from the disconnected procedure. The additional messaging capabilities provide the following:

• A special disconnected Restart In Progress (RSIP) message that the gateway sends to the call agent as a result of the disconnected procedure.

• Additional fields in the Audit Endpoint (AUEP) command that the call agent uses to query the endpoint's status when contact is reestablished.

Media Gateway Control Protocol (MGCP) provides this ability automatically, but it must be explicitly configured for SGCP networks, as described in the How to Configure SGCP RSIP and AUEP Enhancements, on page 113.

An endpoint may lose contact with its call agent because the call agent is temporarily off line or because of faults in the network. When a gateway recognizes that an endpoint has lost its communication with the call agent, it initiates the disconnected procedure. The disconnected procedure requires the endpoint to send RSIPs to the call agent and also to guarantee that the first message that the call agent sees from the endpoint is an RSIP command. The endpoint continues to attempt to send RSIPs at the intervals prescribed by the disconnected procedure until an attempt is successful. The RSIP identifies itself as an RSIP that was generated from a disconnected procedure rather than from a restart. The following output is seen on the gateway:

Disconnected RSIP sent from gateway
00:04:27:RSIP 7 ds1-3/2@RouterA SGCP 1.5
RM:disconnected
On receipt of a disconnected RSIP message, the call agent may decide to send an AUEP command to query the status of endpoints and synchronize endpoints. The SGCP RSIP and AUEP Enhancements feature provides the following additional fields of information in the AUEP:

- **I**—List of connection identifiers for current connections on the endpoint
- **ES**—Event state of the endpoint (off-hook or on-hook)
- **RM**—Restart method for the endpoint, which is one of the following:
  - Graceful—Endpoints are being taken out of service after a delay; the call agent should not make new connections.
  - Forced—Endpoints were abruptly taken out of service; connections were lost.
  - Restart—Endpoints with no connections will be returned to service after a delay.
  - Disconnected—Endpoints are being returned to service after the disconnected procedure.

## How to Configure SGCP RSIP and AUEP Enhancements

### Configuring SGCP RSIP and AUEP Enhancements

To configure enhanced restart and endpoint audit messaging capabilities on an SGCP gateway, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# mgcp sgcp disconnect notify</td>
<td>Enables enhanced endpoint synchronization with a call agent after a disconnected procedure. The command is disabled by default.</td>
</tr>
</tbody>
</table>

### Verifying SGCP RSIP Configuration

To verify your configuration, enter the `show mgcp` command. The following example shows that disconnected RSIP is enabled.

```
Router# show mgcp
MGCP Admin State ACTIVE, Oper State ACTIVE - Cause Code NONE
MGCP call-agent:172.16.193.148 Initial protocol service is SGCP 1.5
MGCP block-newcalls DISABLED
MGCP send SGCP RSIP:forced/restart/graceful DISABLED, disconnected ENABLED
MGCP quarantine mode discard/step
MGCP quarantine of persistent events is ENABLED
MGCP dtmf-relay for VoIP disabled for all codec types
MGCP dtmf-relay for VoAAL2 disabled for all codec types
MGCP voip modem passthrough mode:NSE, codec:g711ulaw, redundancy:DISABLED,
MGCP voaal2 modem passthrough mode:NSE, codec:g711ulaw
MGCP TSE payload:0
MGCP Named Signalling Event (NSE) response timer:200
MGCP Network (IP/AAL2) Continuity Test timer:200
```
Configuration Examples for SGCP RSIP and AUEP Enhancements

Disconnected RSIP Messaging Example
Configuring MGCP Gateway Support

This section provides information on configuring the MGCP Gateway Support for the `mgcp bind` command feature.

Feature benefits include the following:

- Media gateway controller-to-media gateway (MGC-to-MG) signaling and identification

The command allows you to use a loopback interface IP address for sourcing MGCP packets, which is transparent to any interface failure.

- Security of the media gateway

The command allows you to obtain a predefined interface for both MGCP and media control, which can be used for security configuration.

- Possible clash of voice and dial addressing

This feature allows you to assign a media bind interface other than loopback 0, which allows dial calls to conserve IP addresses.

- No interface diversity using routing and reduced MGCP voice diversity

You can use routing capability more efficiently if you configure the loopback interface for control. Using the command to configure the loopback interface helps in creating redundant MGCP control or media interface.

- MGCP backward compatibility

This feature is backward compatible with earlier MGCP features.

For more information about this and related Cisco IOS voice features, see the following:

- "Overview of MGCP and Related Protocols" on page 3

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring MGCP Gateway Support

The current Media Gateway Control Protocol (MGCP) implementation does not allow the assignment of particular IP addresses for sourcing MGCP commands and media packets, which can cause firewall and security problems. This feature allows you to configure interfaces on which control and media packets can be exchanged. This new functionality allows you to separate signaling from voice by binding control (MGCP signaling) and media (Real-Time Transport Protocol, or RTP voice, fax, and modem) to specific gateway interfaces.

This feature includes new commands that can be used to configure the required interface for MGCP control and control of the required media packets.

Information About MGCP Gateway Support

If the media gateway (MG) uses an IP address, which is the outgoing interface of the MG, the media gateway controller (MGC) identifies the MG entity with that address. If that interface fails, MG sources MGCP from another interface, which is not known to the MGC. Some form of name lookup (host or Domain Name System, or DNS) needs to occur on the MGC at this time. Using the mgcp bind command, a loopback interface IP address can be used for sourcing MGCP packets, which is transparent to any interface failure.

Present implementation of MGCP media uses the "loopback 0" or best available IP address in the order indicated for media. A fixed default loopback 0 address for media streams breaks the dial address pool convention used for most configurations, where dial IP addresses are assigned from the loopback 0 address
With this feature, it is possible to assign a media bind interface other than loopback 0, which helps dial calls conserve IP addresses.

If you configure the loopback interface for control, you can use routing capability more efficiently. Using the `mgcp bind` command to configure the loopback interface helps in creating redundant MGCP control or media interface.

In the current implementation of MGCP, the source address of MGCP and media control is given by the IP layer. Because of this inconsistency, it is not possible to include a reliable access list or firewall configuration. Using the `mgcp bind` command for both MGCP and media control, you can get a predefined interface or IP address that can be used for security configuration.
The figure below shows a typical configuration flow using the `mgcp bind` command.

*Figure 9: Bind Configuration Flowchart*

```
A

mgcp bind command

Is the system configured?

No

Yes

Are active calls present?

No

Is the IDB UP?

Yes

Is there an IP address for the interface?

No

Are MGCP control packets bound?

Yes

Is MGCP active?

Yes

Reject mgcp bind command.

Accept mgcp bind command, but take no action.

Store Bind IDB.

Post SYS event to MGCP application to open new UDP socket.

Return.

Save interface name.
```
The figure below shows how the `mgcp bind` command takes effect for MGCP control. When the `mgcp bind` command is configured for MGCP control, the MGCP_SYS_SOCKET_CHANG system event is posted to MGCPAPP. This event is processed by opening a new socket based on the configured interface.

**Figure 10: Bind Configuration for Control Flowchart**

The time frame for execution of the `mgcp bind` command for media is different from that for control. The figure below shows how the `mgcp bind` command is used for media. In this case, the IP address used for media Session Description Protocol (SDP) negotiation is taken from the configured interface. This flow is not active until an MGCP call is created.
The function call to get an IP address for the media returns a configured interface IP address, a loopback interface IP address, or a best available IP address in the order specified in the figure.

**Figure 11: Bind Configuration for Media Flowchart**

### How to Configure MGCP Gateway Support

### Configuring the MGCP Application

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `mgcp call-agent {dns-name | ip-address} [port] [service-type type] [version protocol-version]`
4. `mgcp`
5. `exit`
DETAILED STEPS

### Troubleshooting Tips

To troubleshoot the MGCP Gateway Support for the Bind Command feature, use the **debug mgcp** command to enable debug traces for MGCP errors, events, media, packets, parser, and call admission control (CAC).

The following example illustrates the output for the **debug mgcp** command with the all keyword:

```
Router# debug mgcp all
20:54:13: MGCP stat - 192.168.10.10, total=37, succ=28, failed=8

Configuring MGCP CAS MD Package

This chapter provides information on configuring the MGCP channel-associated signaling (CAS) MD Package feature. This feature introduces support for Feature Group D (FGD) Exchange Access North American (EANA) protocol signaling. The CAS MD package adds support for the reporting of automatic number identification (ANI) and dialed number identification service (DNIS) digits to enable the MGCP call agent to better handle customer billing.

For more information about this and related Cisco IOS voice features, see the following:

- "Overview of MGCP and Related Protocols" on page 3

Feature History for MGCP CAS MD Package

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MGCP CAS MD Package

Prerequisites are described in "Prerequisites for Configuring MGCP and Related Protocols" on page 3.

Restrictions for MGCP CAS MD Package

FGD Exchange Access International (EAIN) signaling is not supported.

Information About MGCP CAS MD Package

MD Package

The MD package supports the FGD EANA protocol for T1 CAS interfaces as defined in RFC 3064. It includes support for ANI and DNIS reporting that enables the MGCP call agent to improve its handling of customer billing. The MD package is enabled automatically when a T1 interface is configured using the ds0-group command with the fgd-eana keyword. The order in which the voice gateway sends the ANI and DNIS digits can be controlled by using the notify command in the MGCP profile.

How to Configure the MGCP CAS MD Package

You do not have to enable the CAS MD package with the mgcp package-capability command. The CAS MD package is enabled automatically when a T1 controller is configured for FGD EANA signaling using the ds0-group command.

Configuring the Incoming Called Number in the MGCP Dial Peer

Perform this procedure to specify the dial string to use for matching incoming calls to the MGCP dial peer.
### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dial-peer voice tag pots**
4. **service mgcpapp**
5. **incoming called number string**
6. **port port**
7. **end**

CHAPTER 9

Media and Signaling Authentication and Encryption

The Media and Signaling Authentication and Encryption Feature for Cisco IOS MGCP Gateways feature provides support for Cisco Secure Survivable Remote Site Telephony (SRST) and voice security features that include authentication, integrity, and encryption of voice media and related call control signaling.

- Finding Feature Information, page 137
- Prerequisites for Media and Signaling Authentication and Encryption, page 138
- Restrictions for Media and Signaling Authentication and Encryption, page 139
- Information About Media and Signaling Authentication and Encryption, page 140
- How to Configure Media and Signaling Authentication and Encryption Feature, page 144
- Configuration Examples for Media and Signaling Authentication and Encryption, page 160
- Additional References, page 162
- Feature Information for Media and Signaling Authentication and Encryption, page 165

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for Media and Signaling Authentication and Encryption

Make sure that the following tasks have been completed before configuring the Media and Signaling Authentication and Encryption Feature for Cisco IOS MGCP Gateways feature:

- Cisco IOS Media Gateway Control Protocol (MGCP) is configured.
- Cisco Unified Communications Manager 4.1(2) or a later release is running.
- Cisco Secure SRST is configured on the router. For more information on configuring secure SRST on the router, refer to the document Setting up Secure SRST.
- Cisco IOS gateways have the prerequisite Cisco IOS images installed. Voice security features are delivered on Advanced IP Services or Advanced Enterprise Services images.

It is recommended that IP security (IPsec) be configured on the Cisco IOS gateway. Both software and hardware-based IPsec connections are supported.

For more information on configuring Cisco IOS-based (software) IPsec, refer to the following:

- Cisco IOS Security Command Reference, Release 12.3

For more information on configuring hardware-based IPsec on the gateway, refer to the following books:

- Cisco 2621 Modular Access Router with AIM-VPN/BP Security Policy
- Cisco 2651 Modular Access Router with AIM-VPN/BP Security Policy
- Cisco 3640 Modular Access Router with AIM-VPN/BP Security Policy
- Cisco 3660 Modular Access Router with AIM-VPN/BP Security Policy

It is recommended that IPsec be configured on the Cisco CallManager. For more information, refer to the Microsoft Knowledge Base article "Configuring IPsec Between a Microsoft Windows 2000 Server and a Cisco Device."

If you want to interoperate with Cisco IP phones, make sure that the following tasks have been completed before configuring the Media and Signaling Authentication and Encryption Feature for Cisco IOS MGCP Gateways feature:

- Cisco CallManager is set up for secure mode operation, and a certificate trust list (CTL) client is installed. For more information on CTL client setup, refer to Cisco IP Phone Authentication and Encryption for Cisco CallManager 4.0(1), "Authentication, Integrity and Encryption" chapter.
- The phones are configured to support secure calls if the gateways will interoperate with Cisco IP phones. For more information on Cisco IP phone configuration, refer to the following:
  - Cisco IP Phone 7970 Administration Guide for Cisco CallManager, Release 4.x and later, "Understanding Security Features for Cisco IP Phones" section.
Restrictions for Media and Signaling Authentication and Encryption

The Media and Signaling Authentication and Encryption Feature for Cisco IOS MGCP Gateways feature is supported on Cisco IOS MGCP 0.1 and Cisco IOS MGCP 1.0.

Cisco IOS MGCP SRTP support on the Cisco AS5400XM gateway is limited to the c5510 digital signal processors (DSP) series.

Cisco IOS MGCP gateways support voice security features on the following endpoints only: T1, E1, FXS, and FXO.

When a Cisco IOS MGCP voice gateway is used in conjunction with the Cisco CallManager, the automatic download feature that allows you to complete the gateway configuration on the Cisco CallManager server by downloading the configuration to that gateway through a TFTP server is not supported with voice security features.

Voice security during conferencing, transcoding, and music-on-hold is not supported.

Note

If one component in the voice gateway path is not secure, the entire call falls back to nonsecure mode.

The table below provides a list of supported IP phones, gateways and network modules for voice security features.

Table 5: Supported Products for Voice Security Features

<table>
<thead>
<tr>
<th>Supported Cisco IP Phones</th>
<th>Supported Gateways</th>
<th>Supported Network Modules</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Cisco IP Phone 7940</td>
<td>• Cisco 2600XM</td>
<td>• EVM-HD</td>
</tr>
<tr>
<td>• Cisco IP Phone 7960</td>
<td>• Cisco 2691</td>
<td>• NM-HDV2</td>
</tr>
<tr>
<td>• Cisco IP Phone 7970</td>
<td>• Cisco 2811</td>
<td>• NM-HDV2-1T1/E1</td>

<tr>
<td></td>
<td>• Cisco 2821</td>
<td>• NM-HDV2-2T1/E1</td>
</tr>
<tr>
<td></td>
<td>• Cisco 2851</td>
<td>• NM-HD-1V</td>
</tr>
<tr>
<td></td>
<td>• Cisco 3640A</td>
<td>• NM-HD-2V</td>
</tr>
<tr>
<td></td>
<td>• Cisco 3660</td>
<td>• NM-HD-2VE</td>
</tr>
<tr>
<td></td>
<td>• Cisco 3700</td>
<td>• PVDM2</td>
</tr>
<tr>
<td></td>
<td>• Cisco 3825</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Cisco 3845</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Cisco VG224</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Cisco AS5400XM</td>
<td></td>
</tr>
</tbody>
</table>
Voice security features impact quality of service (QoS) as follows:

- The Secure Real-Time Transport Protocol Control Protocol (SRTCP) packet size increases by an 80-bit authentication tag, a 31-bit index field, and a 1-bit encryption flag.
- The bandwidth of Real-Time Transport Protocol (RTP) streams increases slightly with the introduction of the 32-bit authentication tag on every SRTP packet sent. Additional bandwidth is required for supported SRTP codecs as shown in the table below.

<table>
<thead>
<tr>
<th>Codec</th>
<th>Packetization Period (milliseconds)</th>
<th>RTP Bandwidth (kbps)</th>
<th>SRTP Bandwidth (kbps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>G.711 mu-law, G.711 A-law</td>
<td>10-20</td>
<td>96-80</td>
<td>99.2-81.6</td>
</tr>
<tr>
<td>G.729, G.729A</td>
<td>10-220</td>
<td>40-9.454</td>
<td>43.2-9.6</td>
</tr>
</tbody>
</table>

Only Clear Channel, G.711, and G.729 codecs support voice security features.

Voice security features support channel density on the TI-5510 DSP as shown in the table below.

<table>
<thead>
<tr>
<th>Codec</th>
<th>Number of Nonsecure Calls</th>
<th>Number of Secure Calls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear Channel, G.711</td>
<td>16</td>
<td>10</td>
</tr>
<tr>
<td>G.729</td>
<td>6</td>
<td>6</td>
</tr>
<tr>
<td>G.729A</td>
<td>8</td>
<td>8</td>
</tr>
</tbody>
</table>

Use the `codec complexity` command in voice-card configuration mode to specify secure codec complexity and call density per DSP.

**Information About Media and Signaling Authentication and Encryption**

**Benefits of Media and Signaling Authentication and Encryption**

- Provides privacy and confidentiality for voice calls
- Protects against voice security violations
Feature Design

The Media and Signaling Authentication and Encryption Feature for Cisco IOS MGCP Gateways feature implements voice security features that include signaling authentication along with media and signaling encryption on MGCP gateways.

The feature provides secure VoIP calls by addressing security requirements for privacy, integrity, and confidentiality of voice conversations. The Cisco IP telephony network establishes and maintains authenticated communications using authentication and encryption technology. Signaling authentication validates that no tampering has occurred to signaling packets during transmission.

Encryption, the process of converting clear-text data into enciphered data, provides data integrity and authentication. IPsec, a standards-based set of security protocols and algorithms, ensures that signaling information (that is, Dual Tone Multi-Frequency (DTMF) digits, passwords, personal identification numbers (PINs), and encryption keys) that is sent between the gateway and Cisco CallManager is encrypted. Media encryption using standards-based SRTP ensures that media streams between supported devices are secure.

Voice security features support the following capabilities between gateways and from gateways to IP phones that support the encryption feature:

- Gateway to Cisco CallManager call control authentication and encryption using IPsec
- Media encryption and authentication of voice RTP streams using SRTP
- Exchange of RTP Control Protocol (RTCP) information using SRTCP
- SRTP to RTP fallback for calls between secure and nonsecure endpoints
- Secure to clear-text fallback for new calls during SRST operation
The figure below shows a typical topology where voice security features are deployed.

Figure 12: Voice Security Features in the Telephony Network

MGCP Gateway Behavior and Voice Security Features

To implement voice security features in Cisco CallManager networks, the MGCP gateway communicates with Cisco CallManager over a secure IPsec connection that provides encryption of IP packets. To ensure that your signaling information is secure, establish an IPsec connection between the CallManager and the gateways, as described in the Prerequisites for Media and Signaling Authentication and Encryption, on page 138 section. You can verify that the IPsec tunnel is secure using the commands listed in the Verifying Voice Security Features, on page 151 section.

Note

Although you may enable media authentication and encryption without signaling encryption, this practice is discouraged. If the gateway to Cisco CallManager connection is not secure, media keys will be sent in clear-text and your voice call will not be considered secure.

After the IPsec tunnel is established, all call control and signaling of MGCP packets between the gateway and Cisco CallManager go through the secured IPsec tunnel, with the Cisco CallManager directing the MGCP gateway to set up and tear down SRTP streams. SRTP media keys are distributed by Cisco CallManager through the secured IPsec tunnel.

Cisco implements voice security features on MGCP gateways by supporting the SRTP package and SRTP Session Description Protocol (SDP) extensions, as defined in the Internet Engineering Task Force (IETF)
SRTP package capability is disabled by default. Use the Cisco IOS command-line interface (CLI) to enable the feature. For more information, see the Configuring Voice Security Features, on page 148 section.

Cisco uses the Internet Key Exchange (IKE) standard to implement IPsec. IKE provides authentication of the IPsec peers and negotiates IPsec keys and IPsec security associations (SAs). An IPsec SA describes how two or more entities will use security services to communicate securely. For example, an IPsec SA defines the encryption algorithm, the authentication algorithm, and the shared session key to be used during the IPsec connection. Both IPsec and IKE require and use SAs to identify the parameters of their connections. IKE can negotiate and establish its own SA. The IPsec SA is established either by IKE or by manual user configuration. IKE has two phases of key negotiation: phase 1 and phase 2. Phase 1 negotiates a security association (a key) between two IKE peers. The key negotiated in phase 1 enables IKE peers to communicate securely in phase 2. During phase 2 negotiation, IKE establishes keys (security associations) for other applications, such as IPsec.

The Media and Signaling Authentication and Encryption Feature for Cisco IOS MGCP Gateways feature also implements an extended codec selection algorithm that combines selection of a codec with selection of a cryptographic suite to be used to encrypt the RTP stream. Cisco IOS Release 12.3(11)T supports the AES_CM_128_HMAC_SHA1_32 cryptographic suite, which includes the AES-128-countermode encryption algorithm and the Hashed Message Authentication Codes (HMAC) Secure Hash Algorithm1 (SHA1) authentication algorithm.

**Note**

MGCP for SRTP on Cisco IOS gateways can be configured to use either MGCP 1.0 signaling support with the Cisco public switched telephone network (PSTN) Gateway (PGW) 2200 carrier-class call agent, or MGCP 0.1 signaling support with Cisco Unified Communications Manager.

**Voice Security Features Interoperability with Endpoints**

Cisco IOS MGCP gateways support voice security features on T1, E1, FXS, and FXO endpoints supported by network modules listed in Voice Security Features Interoperability with Endpoints, on page 143, thereby enabling secure calls from analog phone to analog phone, or fax machine to fax machine. Similarly, secure calls are enabled from time-division multiplexing (TDM) endpoints or analog phones to Cisco IP phones. For a Cisco IP Phone to make and receive secure calls, all endpoints, that is, phones of all call participants, must support voice security features. If a call is nonsecure, no special icon displays on the phone. If a call is secure, the phone displays either the authenticated or encrypted call icons. For more information on secure call icons, refer to Cisco IP Phone 7970 Administration Guide for Cisco CallManager, Release 4.x or later, "Identifying Encrypted and Authenticated Phone Calls" section.
How to Configure Media and Signaling Authentication and Encryption Feature

Installing Cisco CallManager

This task installs Cisco CallManager and configures it to work with IPsec and the Media and Signaling Authentication and Encryption Feature for Cisco IOS MGCP Gateways feature.

SUMMARY STEPS

1. Install Cisco CallManager on the server.
2. Determine the Windows OS version by going to C:\utils and double-clicking MCSVer.exe program. If you have Windows 2000.2.6sr3, no additional Windows upgrade is required. Go to Installing Cisco CallManager, on page 144. If you have Windows 2000.2.5 or a prior version, you must upgrade to Windows 2000.2.6. Go to Installing Cisco CallManager, on page 144. If you have Windows 2000.2.6, you must upgrade to Windows 2000.2.6sr3. Go to Installing Cisco CallManager, on page 144.
3. Upgrade from Windows 2000.2.5 or a prior version.
4. Upgrade from Windows 2000.2.6 to Windows 2000.2.6sr3.
5. Upgrade Cisco CallManager to version 4.1.
6. Use the ping command on both the gateway and Cisco CallManager to test the connection between the gateway and Cisco CallManager. Go to the Configuring IPsec on Cisco CallManager, on page 145.

DETAILED STEPS

Step 1
Install Cisco CallManager on the server.

• Insert Cisco CallManager HW Detection CD version 2000.2.6, Disk1.
• When prompted, insert Cisco CallManager Base OS CD, Disk3 or 4.

Step 2
Determine the Windows OS version by going to C:\utils and double-clicking MCSVer.exe program. If you have Windows 2000.2.6sr3, no additional Windows upgrade is required. Go to Installing Cisco CallManager, on page 144. If you have Windows 2000.2.5 or a prior version, you must upgrade to Windows 2000.2.6. Go to Installing Cisco CallManager, on page 144. If you have Windows 2000.2.6, you must upgrade to Windows 2000.2.6sr3. Go to Installing Cisco CallManager, on page 144.

Step 3
Upgrade from Windows 2000.2.5 or a prior version.

• Go to http://www.cisco.com/cgi-bin/tablebuild.pl/cmva-3des, to download the following files:
  • win-OS-Upgrade-K9.2000-2-6-Readme.htm

Follow the steps listed in the ReadMe file.

Step 4
Upgrade from Windows 2000.2.6 to Windows 2000.2.6sr3.
• Go to [http://www.cisco.com/cgi-bin/tablebuild.pl/cmva-3des](http://www.cisco.com/cgi-bin/tablebuild.pl/cmva-3des), to download the following files:

  Follow the steps listed in the ReadMe file.

Step 5  Upgrade Cisco CallManager to version 4.1.
  • Go to [http://www.cisco.com/cgi-bin/tablebuild.pl/cmva-3des](http://www.cisco.com/cgi-bin/tablebuild.pl/cmva-3des).
  • Copy CiscoCallManagerUpgrade.exe to the local system.
  • Run the upgrade.

Step 6  Use the `ping` command on both the gateway and Cisco CallManager to test the connection between the gateway and Cisco CallManager. Go to the [Configuring IPsec on Cisco CallManager](#), on page 145.

---

## Configuring IPsec on Cisco CallManager

This task configures the IPsec connection between the MGCP gateway and the Cisco CallManager.

### SUMMARY STEPS

2. Build a filter from the Cisco CallManager to the gateway.
3. Build a filter from the gateway to the Cisco CallManager.
4. Configure a rule to negotiate tunnel security.
5. Set key exchange security methods.
6. Assign the new IPsec policy to the Windows 2000 gateway.
7. Use the `ping` command on both the gateway and Cisco CallManager to test the connection between the gateway and Cisco CallManager.
8. Run `ipsecmon.exe` on the Cisco CallManager to verify the configuration.
9. Use the `show crypto isakmp sa` command on the gateway to verify the IPsec configuration.

### DETAILED STEPS

Step 1  Create an IPsec policy on the Windows 2000 server.

  • Use the Microsoft Management Console (MMC) to work on the IP Security Policy Management snap-in. Click **Start**, click **Run**, and then enter `secpol.msc`.

  • Right-click **IP Security Policies on Local Machine**, and then click **Create IP Security Policy**.

  • Click **Next**, and then type a name for your policy.
• Clear the Activate the default response rule check box, and then click Next.
• Click Finish, while keeping the Edit check box chosen.

**Step 2**

Build a filter from the Cisco CallManager to the gateway.

• In the properties for the new policy created in Configuring IPsec on Cisco CallManager, on page 145, clear the Use Add Wizard check box, and then click Add to create a new rule.
• On the IP Filter List tab, click Add.
• Enter an appropriate name for the filter list, clear the Use Add Wizard check box, and then click Add.
• In the Source address area, choose the option My IP Address from the drop-down arrow. Enter the Cisco CallManager IP address.
• In the Destination address area, click A specific IP Subnet from the drop-down arrow. Enter the IP address of the router interface in the same subnet as the Cisco CallManager.
• Clear the Mirrored check box.
• On the Protocol tab, make sure the protocol type is set to Any. (IPsec tunnels do not support protocol-specific or port-specific filters.)
• (Optional) If you want to enter a description for your filter, click the Description tab. It is recommended that you give the filter the same name you used for the filter list. The filter name is displayed in the IPsec monitor when the tunnel is active.
• Click OK, and then click Close.

**Step 3**

Build a filter from the gateway to the Cisco CallManager.

• On the IP Filter List tab, click Add.
• Type an appropriate name for the filter list, clear the Use Add Wizard check box, and then click Add.
• In the Source address area, click A specific IP Subnet from the dropdown arrow. Enter the IP address of the router interface in the same subnet as the Cisco CallManager.
• In the Destination address area, choose the option My IP Address from the dropdown arrow.
• Clear the Mirrored check box.
• (Optional) If you want to enter a description for your filter, click the Description tab.
• Click OK, and then click Close.

**Step 4**

Configure a rule to negotiate tunnel security.

• On the IP Filter List tab, click the filter list you created in Configuring IPsec on Cisco CallManager, on page 145.
• On the Tunnel Setting tab, choose the option Tunnel Setting - encryption peers. For Cisco-Microsoft and for Microsoft-Cisco, configure the setting according to:
• On the Connection Type tab, click All network connections.
• On the Filter Action tab, clear the Use Add Wizard check box, and then click Add to create a new filter action.
You must create a new filter; otherwise the default filter action allows incoming traffic in the clear.

- Keep the Negotiate security option enabled, and click the **Accept unsecured communication**, but clear the **always respond using IPsec** check box.

You must perform this step to ensure secure operation.

- Choose the **Custom** option to add a security method. Click the **Data integrity and encryption** box for Encapsulating Security Payload (ESP). Click **MD5** for the Integrity algorithm. Click **DES** for the Encryption algorithm. Check the **Generate a new Key every 3600 seconds** box.
- Click **OK**. On the General tab, enter a name for the new filter action and then click **OK**.
- Choose the filter action you created in **Configuring IPsec on Cisco CallManager**, on page 145.
- On the Authentication Methods tab, perform the steps to configure a preshared key.

The preshared key must match the key configured on the router.
- Click **Close**.

### Step 5
Set key exchange security methods.

- Right-click the IP Security Policy created in **Configuring IPsec on Cisco CallManager**, on page 145 and choose **Properties**.
  - Click the **General** tab.
  - Click the **Advanced** button.
  - Click the **Methods** button.
  - Ensure that the security Method with the following settings is at the top of the preference order: Type--IKE, Encryption--DES, Integrity--SHA1, Diffie-Hellman--Low(1)
  - Save the configuration.

### Step 6
Assign the new IPsec policy to the Windows 2000 gateway.

- In the IP Security Policies on Local Machine MMC snap-in, right-click the new policy, and then click **Assign**. A green arrow appears in the folder icon next to the new policy.

### Step 7
Use the **ping** command on both the gateway and Cisco CallManager to test the connection between the gateway and Cisco CallManager.

### Step 8
Run **ipsecmon.exe** on the Cisco CallManager to verify the configuration.

### Step 9
Use the **show crypto isakmp sa** command on the gateway to verify the IPsec configuration.
Configuring the Cisco PGW

MGCP for SRTP on Cisco IOS gateways can be configured for use with the Cisco PSTN gateway (PGW) 2200 carrier-class call agent.

To configure this feature, you must first tell the Cisco PGW 2200 Softswitch that the media gateways support SRTP. Then you specify that SIP and TDM trunk groups support SRTP.

For a detailed description of the configuration tasks, see the "Secure Real-time Transport Protocol Support" feature guide.

Configuring Voice Security Features

This task configures voice security features on the Cisco IOS MGCP gateway.

Before You Begin

We strongly recommend that you first establish an IPsec connection between the Cisco CallManager and the MGCP gateway before you use the MGCP SRTP package. Otherwise, media keys will be sent in clear text and your voice call will not be considered secure. For more information, see the "Installing Cisco CallManager, on page 144" and "Configuring IPsec on Cisco CallManager, on page 145" sections.

SUMMARY STEPS

1. enable
2. configure terminal
3. mgcp package-capability srtp-package
4. mgcp validate call-agent source-ipaddr
5. mgcp crypto rfc-preferred
6. voice-card slot
7. codec complexity secure
8. exit

### Configuring Secure IP Telephony Calls

This task enables secure IP telephony calls from gateway to IP phone.

Voice security features use digital certificates contained in eTokens for device authentication. This process validates the identity of a device and ensures that the entity is who it claims to be. Device authentication occurs between the Cisco CallManager server and supported IP phones when each entity accepts the certificate of the other entity. Cisco implements device authentication using the CTL feature on the Cisco CallManager. The CTL Client creates a certificate on each server in the cluster and generates a CTL file in the TFTP Path of the server for the phones to download. This file provides the IP phone with a list of certified hosts that it
can trust. For more information, refer to Cisco IP Phone Authentication and Encryption for Cisco CallManager 4.0(1), "Signaling Authentication" chapter.

**Before You Begin**

- CTL Provider service must be running on the Cisco CallManager server.
- Smart Card service must be running on the Cisco CallManager server.
- Two USB eTokens are required.

### SUMMARY STEPS

1. Install CiscoCTLClient.exe from c:\CiscoPlugins\Client\.
2. Launch Cisco CTL Client from the desktop shortcut.
3. Enter the Cisco CallManager IP address and password, then click Next.
4. Choose Set CallManager Cluster to Secure Mode, then click Next.
5. Click Add for Security Token Information.
6. Click Add Tokens for CTL Entries.
7. When prompted, insert the first USB eToken, then click OK.
8. Repeat Configuring Secure IP Telephony Calls, on page 149 and Configuring Secure IP Telephony Calls, on page 149 for the second eToken.
9. Click Finish for CTL Entries, then enter your eToken Password when prompted and click OK.
10. Verify that voice security features are enabled.

### DETAILED STEPS

**Step 1**
Install CiscoCTLClient.exe from c:\CiscoPlugins\Client\.

**Step 2**
Launch Cisco CTL Client from the desktop shortcut.

**Step 3**
Enter the Cisco CallManager IP address and password, then click Next.

**Step 4**
Choose Set CallManager Cluster to Secure Mode, then click Next.

**Step 5**
Click Add for Security Token Information.

**Step 6**
Click Add Tokens for CTL Entries.

**Step 7**
When prompted, insert the first USB eToken, then click OK.

**Step 8**
Repeat Configuring Secure IP Telephony Calls, on page 149 and Configuring Secure IP Telephony Calls, on page 149 for the second eToken.

**Step 9**
Click Finish for CTL Entries, then enter your eToken Password when prompted and click OK.

**Step 10**
Verify that voice security features are enabled.

- Open Cisco CallManager Administration, choose Access System, then Enterprise Parameters. Scroll down to Security Parameters, and verify that Cluster Security is set to 1.

- Set the Cisco CallManager Enterprise Parameter to Encrypted to force all devices in the cluster to run encrypted mode. You can also set each IP phone individually to encrypted mode by choosing Device, then Phone, then Find, then Security Mode = Encrypted. Reboot the IP phones and verify that the Security Mode displays Encrypted under Security Settings.
Verifying Voice Security Features

This task verifies voice security feature configuration and MGCP gateway to Cisco CallManager IPsec connections.

SUMMARY STEPS

1. show mgcp
2. show mgcp connection
3. show mgcp srtp {summary| detail [endpoint]}
4. show mgcp statistics
5. show call active voice
6. show voice call port
7. show voice call status
8. show voice call status call-id
9. show voice dsp
10. show rtpspi call
11. show rtpspi statistics
12. show ccm-manager
13. show crypto engine accelerator statistic
14. show crypto ipsec sa
15. show crypto isakmp sa
16. show crypto session
17. show crypto session detail

DETAILED STEPS

Step 1

show mgcp

Use this command to display the state of the mgcp package-capability srtp-package and mgcp validate call-agent source-ipaddr commands.

Example:

Router# show mgcp
MGCP Admin State ACTIVE, Oper State ACTIVE - Cause Code NONE
MGCP call-agent: 10.7.0.200 Initial protocol service is MGCP 0.1

The following line shows that call-agent validation is enabled:

Example:

MGCP validate call-agent source-ipaddr ENABLED
MGCP block-newcalls DISABLED
MGCP send SGCP RSIP: forced/restart/graceful/disconnected DISABLED
MGCP quarantine mode discard/step
MGCP quarantine of persistent events is ENABLED
MGCP dtmf-relay for VoIP disabled for all codec types
MGCP dtmf-relay for VoAAL2 disabled for all codec types
MGCP voip modem passthrough disabled
MGCP voa12 modem passthrough disabled
MGCP voip modem relay: Disabled.
MGCP TSE payload: 100
MGCP T.38 Named Signalling Event (NSE) response timer: 200
MGCP Network (IP/AAL2) Continuity Test timer: 200
MGCP 'RTP stream loss' timer disabled
MGCP request timeout 500
MGCP maximum exponential request timeout 4000
MGCP gateway port: 2427, MGCP maximum waiting delay 3000
MGCP restart delay 0, MGCP vad DISABLED
MGCP rtrcac DISABLED
MGCP system resource check DISABLED
MGCP xpc-codec: DISABLED, MGCP persistent hookflash: DISABLED
MGCP persistent offhook: ENABLED, MGCP persistent onhook: ENABLED
MGCP piggyback msg DISABLED, MGCP endpoint offset DISABLED
MGCP simple-sdp ENABLED
MGCP undotted-notation DISABLED
MGCP codec type g711ulaw, MGCP packetization period 20
MGCP JB threshold lwm 30, MGCP JB threshold hwm 150
MGCP LAT threshold lwm 150, MGCP LAT threshold hwm 300
MGCP PL threshold lwm 1000, MGCP PL threshold hwm 10000
MGCP CL threshold lwm 1000, MGCP CL threshold hwm 10000
MGCP playout mode is adaptive 60, 4, 200 in msec
MGCP Fax Playout Buffer is 300 in msec
MGCP media (RTP) dscp: ef, MGCP signaling dscp: af31
MGCP default package: line-package

The following lines show that the srtp-package command is enabled:

**Example:**

MGCP supported packages: gm-package dtmf-package mf-package trunk-package
   line-package ms-package dt-package mo-package mt-package
   sst-package fxr-package srtp-package
MGCP Digit Map matching order: shortest match
SGCP Digit Map matching order: always left-to-right
MGCP VoAAL2 ignore-lco-codec DISABLED
MGCP T.38 Fax is ENABLED
MGCP T.38 Fax ECM is ENABLED
MGCP T.38 Fax NSF Override is DISABLED
MGCP T.38 Fax Low Speed Redundancy: 0
MGCP control bound to interface FastEthernet0/0
MGCP media bind :DISABLED
MGCP Upapeed payload type for G711ulaw: 0, G711alaw: 8
MGCP Dynamic payload type for G.726-16K codec
MGCP Dynamic payload type for G.726-24K codec
MGCP Dynamic payload type for G.Clear codec

**Step 2**

**show mgcp connection**

Use this command to display information on active connections, including the encryption suite.

**Example:**

Router# show mgcp connection
Endpoint Call_ID(C) Conn_ID(I) (P)ort (M)ode (C)ode (E)vent[SIFL] (R)esult[EA] Encryption(K)

The following line shows that encryption status is enabled, K=1.
Example:

1. S1/DS1-0/1  C=2,1,2  I=0x2  P=18204,0  M=2  S=4,4  CO=1  E=0,0,0,0  R=0,0  K=1

Step 3  show mgcp srtp {summary|detail [endpoint]}

Use this command to display SRTP connections and validate master keys and salts for endpoints.

Example:

Router# show mgcp srtp summary
MGCP SRTP Connection Summary
Endpoint  Conn Id  Crypto Suite
aaln/S3/SU0/0  8  AES_CM_128_HMAC_SHA1_32
aaln/S3/SU0/1  9  AES_CM_128_HMAC_SHA1_32
S3/DS1-0/1  6  AES_CM_128_HMAC_SHA1_32
S3/DS1-0/2  7  AES_CM_128_HMAC_SHA1_32
4 SRTP connections active

Router# show mgcp srtp detail
MGCP SRTP Connection Detail for Endpoint *
Definitions: CS=Crypto Suite, KS=HASHED Master Key/Salt, SSRC=Syncronization Source, ROC=Rollover Counter, KDR=Key Derivation Rate, SEQ=Sequence Number, FEC=FEC Order, MLT=Master Key Lifetime, MKI=Master Key Index:MKI Size

The following lines allow you to compare and validate a hashed version of the master key and salt, as indicated by the KS field, without the display revealing the actual master key and salt.

Example:

Router# show mgcp srtp detail S3/DS1-0/*
MGCP SRTP Connection Detail for Endpoint S3/DS1-0/*
Definitions: CS=Crypto Suite, KS=HASHED Master Key/Salt, SSRC=Syncronization Source, ROC=Rollover Counter, KDR=Key Derivation Rate, SEQ=Sequence Number, FEC=FEC Order, MLT=Master Key Lifetime, MKI=Master Key Index:MKI Size

Step 4  show mgcp statistics
Use this command to display statistics, including dropped packets from unconfigured call agents.

Example:

```
Router# show mgcp statistics
UDP pkts rx 0, tx 0
Unrecognized rx pkts 0, MGCP message parsing errors 0
Duplicate MGCP ack tx 0, Invalid versions count 0
```

The following line shows the number of dropped packets from unconfigured call agents.

Example:

```
rx pkts from unknown Call Agent 0
CreateConn rx 0, successful 0, failed 0
DeleteConn rx 0, successful 0, failed 0
ModifyConn rx 0, successful 0, failed 0
DeleteConn tx 0, successful 0, failed 0
NotifyRequest rx 0, successful 0, failed 0
AuditConnection rx 0, successful 0, failed 0
AuditEndpoint rx 0, successful 0, failed 0
RestartInProgress tx 0, successful 0, failed 0
Notify tx 0, successful 0, failed 0
ACK tx 0, NACK tx 0
ACK rx 0, NACK rx 0
IP address based Call Agents statistics:
No Call Agent message.
System resource check is DISABLED. No available statistic
```

**Step 5**

**show call active voice**

Use this command to display encryption statistics.

Example:

```
Router# show call active voice
GENERIC: SetupTime=21072 Index=0 PeerAddress= PeerSubAddress= PeerId=0
PeerIfIndex=0 LogicalIfIndex=0 ConnectTime=0 CallState=3 CallOrigin=2 ChargedUnits=0
InfoType=0 TransmitPackets=375413 TransmitBytes=7508260 ReceivePackets=377734
ReceiveBytes=7554680
VOIP: ConnectionId=[0x19BDF910 0xAF500007 0x0 0x58ED0] RemoteIPAddress=17635075
RemoteUDPPort=16394 RoundTripDelay=0 SelectedQoS=0 SessionProtocol=1
SessionTarget= OnTimeRvPlayout=0 GapFillWithSilence=0 GapFillWithPrediction=600
GapFillWithInterpolation=0 GapFillWithRedundancy=0 HiWaterPlayoutDelay-110
LoWaterPlayoutDelay-64 ReceiveDelay-94 VADEnable=0 CoderTypeRate=0
GENERIC: SetupTime=21072 Index=1 PeerAddress=+14085271001 PeerSubAddress=
PeerId=0 PeerIfIndex=0 LogicalIfIndex=5 ConnectTime=21115 CallState=4 CallOrigin=1
ChargedUnits=0 InfoType=1 TransmitPackets=379915 TransmitBytes=7558300
ReceivePackets=375594 ReceiveBytes=7511880 TotalPacketsEncrypted=375594
```

The following lines show statistics for encrypted and decrypted packets.

Example:

```
TotalPacketsDecrypted=375594 DecryptionFailurePacketCount=0 TotalPacketsAuthenticated=375594
AuthenticationFailurePacketCount=0 DuplicateReplayPacketCount=0 OutsideWindowReplayPacketCount=0
TELE: ConnectionId=[0x19BDF910 0xAF500007 0x0 0x58ED0] TxDuration=16640
VoiceTxDuration=16640 FaxTxDuration=0 CoderTypeRate=0 NoiseLevel=0 ACOMLevel=4
OutSignalLevel=-440 InSignalLevel=-440 InfoActivity=2 ERLLevel=227
SessionTarget=
```

**Step 6**

**show voice call port**
Use this command to display SRTP statistics.

Example:

```
Router# show voice call 1/0/0
1/0/0
  vtsp level 0 state = S_CONNECT
  vpm level 1 state = FXSLS_CONNECT
  calling number, calling name unavailable, calling time 01/08 03:44
  c3745_13#
  ***DSP VOICE TX STATISTICS***
  Tx Vox/Fax Pkts: 108616, Tx Sig Pkts: 0, Tx Comfort Pkts: 0
  Tx Dur(ms): 2172320, Tx Vox Dur(ms): 2172320, Tx Fax Dur(ms): 0
  ***DSP VOICE RX STATISTICS***
  Rx Vox/Fax Pkts: 108602, Rx Signal Pkts: 0, Rx Comfort Pkts: 0
  Rx Dur(ms): 2172320, Rx Vox Dur(ms): 2171990, Rx Fax Dur(ms): 0
  Rx Non-seq Pkts: 3, Rx Bad Hdr Pkts: 0
  Rx Early Pkts: 0, Rx Late Pkts: 0
  ***DSP VOICE VP_DELAY STATISTICS***
  Clk Offset(ms): -2819596, Rx Delay Est(ms): 65
  Rx Delay Lo Water Mark(ms): 65, Rx Delay Hi Water Mark(ms): 65
  ***DSP VOICE VP_ERROR STATISTICS***
  Predict Conceal(ms): 250, Interpolate Conceal(ms): 0
  Silence Conceal(ms): 0, Retroact Mem Update(ms): 0
  Buf Overflow Discard(ms): 0, Talkspurt Endpoint Detect Err: 0
  ***DSP LEVELS***
  TDM Bus Levels(dBm0): Rx -37.7 from PBX/Phone, Tx -35.5 to PBX/Phone
  TDM ACOM Levels(dBm0): +5.0, TDM ERL Level(dBm0): +5.0
  TDM Bgd Levels(dBm0): -35.9, with activity being silence
  ***DSP VOICE SRTP STATISTICS***
  The following lines show voice SRTP statistics.
  *Jan 8 2004 04:21:01.743 PAT: TotalPacketsEncrypted: 108616 TotalPacketsDecrypted: 108602
  DecryptionFailurePacketCount: 0 TotalPacketsAuthenticated: 108602
  AuthenticationFailurePacketCount: 0 DuplicateReplayPacketCount: 0
  OutsideWindowReplayPacketCount: 0 packetsBadReceivedSSRC: 0
```

Note When a T.38 fax call (nonsecure) is attempted and the fax call goes through, then switches back to secure voice (SRTP) mode, output for the `show voice call port` command displays an authentication failure packet count of 20. This is a normal occurrence and should not affect voice quality. The authentication failure packet count occurs because the gateways do not switch back to secure voice at the same time; that is, one side of the call is in SRTP voice mode for a short period of time while the other side is in T.38 fax mode.

Example:

```
*Jan 8 2004 04:21:01.743 PAT: TotalPacketsEncrypted: 108616 TotalPacketsDecrypted: 108602
DecryptionFailurePacketCount: 0 TotalPacketsAuthenticated: 108602
AuthenticationFailurePacketCount: 0 DuplicateReplayPacketCount: 0
OutsideWindowReplayPacketCount: 0 packetsBadReceivedSSRC: 0
```

Step 7 `show voice call status`

Use this command to display status of all voice ports.

Example:

```
Router# show voice call status
CallID CID ccVdb Port DSP/Ch Called # Codec Dial-peers
 0x5 11DE 0x660B24D0 1/0/0 1/1  g711ulaw 999100/0
 0x7 11E1 0x665031A8 1/0:23.-1 1/2  g711ulaw 999100/0
g729ar8 0/999
```
Step 8  
**show voice call status call-id**

Use this command to display status of a specific call.

**Example:**

```
Router# show voice call status 5
Gathering information (10 seconds)...
CallID Port DSP/Ch Codec Rx/Tx En/De ERL/Reflctr Jitter
0x5 1/0/0 1/1 g711ulaw 500/500 500/500 5.0/3 65/0
```

```
Router# show voice call status 7
Gathering information (10 seconds)...
CallID Port DSP/Ch Codec Rx/Tx En/De ERL/Reflctr Jitter
0x7 1/0:23.-1 1/2 g729ar8 500/500 500/500 6.0/4 70/0
```

```
Router# show voice call status 11
Gathering information (10 seconds)...
CallID Port DSP/Ch Codec Rx/Tx En/De ERL/Reflctr Jitter
0x11 1/1:1.1 1/3 g729ar8 500/500 500/500 7.0/4 70/0
```

Step 9  
**show voice dsp**

Use this command to display the status of DSP voice channels.

**Example:**

```
Router# show voice dsp
DSP DSP DSPWARE CURR BOOT PAK TX/RX
TYPE NUM CH CODEC VERSION STATE STATE RST AI VOICEPORT TS ABORT PACK COUNT
==== === == ======== ======= ===== ======= === == ======== === ==== ===========
C549 1 01 {medium} 4.4.3 IDLE idle 0 0 1/0:0 1 0 9357/9775
C549 1 02 {medium} 4.4.3 IDLE idle 0 1/0:0 2 0 0/0
C549 2 01 {medium} 4.4.3 IDLE idle 0 0 1/0:0 3 0 0/0
C549 2 02 {medium} 4.4.3 IDLE idle 0 1/0:0 4 0 0/0
C549 3 01 {medium} 4.4.3 IDLE idle 0 0 1/0:0 5 0 0/13
C549 3 02 {medium} 4.4.3 IDLE idle 0 1/0:0 6 0 0/13
```

Step 10  
**show rtpspi call**

Use this command to display active SRTP call details.

**Example:**

```
Router# show rtpspi call
RTP Service Provider info:
No. CallId dstCallId Mode LocalRTP RmtRTP LocalIP RemoteIP SRTP
1 6 5 Snd-Rcv 18662 19392 0xA0A0A0D 0xA0A0A0B 1
2 8 7 Snd-Rcv 18940 16994 0xA0A0A0D 0xA0A0A0B 1
3 16 17 Snd-Rcv 19038 17198 0xA0A0A0D 0xA0A0A0B 1
```

Step 11  
**show rtpspi statistics**

Use this command to display RTP statistics.

**Example:**

```
Router# show rtpspi statistics
RTP Statistics info:
No. CallId Xmit-pkts Xmit-bytes Rcvd-pkts Rcvd-bytes Lost pkts Jitter Late
No. 1 6 0x842C 0x54AC30 0x842A 0x54AAE8 0x0 0x41 0x2
```
Step 12  
show ccm-manager

Use this command to display the status and availability of Cisco CallManager.

Example:

Router# show ccm-manager
MGCP Domain Name: router
Priority Status Host
============================================================
Primary Registered 10.10.10.130
First Backup Duplicate of Primary 10.10.10.130

Step 13  
show crypto engine accelerator statistic

Use this command to display statistics and error counters for the onboard hardware accelerator of the router for IPsec encryption.

Example:

Router# show crypto engine accelerator statistic
Virtual Private Network (VPN) Module in slot : 0
Statistics for Hardware VPN Module since the last clear
of counters 1814 seconds ago
  638 packets in 638 packets out
  88640 bytes in 87601 bytes out
  0 paks/sec in 0 paks/sec out
  0 Kbits/sec in 0 Kbits/sec out

  21104 bytes decrypted 67536 bytes after encrypt
  0 packets decompressed 0 packets compressed
  0 bytes before decom 0 bytes before comp
  0 bytes after decom 0 bytes after comp
  0 packets bypass compr 0 packets bypass compress
  0 bytes bypass decompr 0 bytes bypass compressi
  0 packets not decompress 0 packets not compressed

MGCP Configuration Guide, Cisco IOS Release 15M&T
Step 14: show crypto ipsec sa

Use this command to display the settings used by current SAs.

Example:

Router# show crypto ipsec sa

interface: FastEthernet0/0
Crypto map tag: Gateway, local addr. 10.10.10.13
protected vrf:
local ident (addr-mask/port/port): (10.10.10.13/255.255.255.255/0/0)

IV size: 8 bytes
replay detection support: Y

Step 15  show crypto isakmp sa
Use this command to display current IKE SAs at a peer.

Example:

Router# show crypto isakmp sa
dst   src   state     conn-id slot
10.10.10.130  10.10.10.13  QM_IDLE     1  0

Step 16  show crypto session
Use this command to display the status of the current crypto session.

Example:

Router# show crypto session
Crypto session current status
Interface: FastEthernet0/0
Session status: UP-ACTIVE
Peer: 10.10.10.130/500
IKE SA: local 10.10.10.13/500 remote 10.10.10.130/500 Active
IPSEC FLOW: permit ip host 10.10.10.13 host 10.10.10.130
    Active SAs: 4, origin: crypto map

Step 17  show crypto session detail
Use this command to display IPsec details and statistics of the current crypto session.

Example:

Router# show crypto session detail
Crypto session current status
Code: C - IKE Configuration mode, D - Dead Peer Detection
    K - Keepalives, N - NAT-traversal, X - IKE Extended Authentication
    Interface: FastEthernet0/0
Session status: UP-ACTIVE
Peer: 10.10.10.130/500 fvrf: (none) ivrf: (none)
    Phase1_id: 10.10.10.130
    Desc: (none)
IKE SA: local 10.10.10.13/500 remote 10.10.10.130/500 Active
   Capabilities:(none) connid:1 lifetime:07:30:00
IPSEC FLOW: permit ip host 10.10.10.13 host 10.10.10.130
    Active SAs: 4, origin: crypto map
    Inbound: #pkts dec'ed 335 drop 0 life (KB/Sec) 4402106/1800
    Outbound: #pkts enc'ed 327 drop 71 life (KB/Sec) 4402076/180

Configuration Examples for Media and Signaling Authentication and Encryption

Voice Security Features Example

The following example shows voice security features enabled:

Router# show running-config
Building configuration...
Current configuration : 2304 bytes

! version 12.3
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname router
!
boot-start-marker
boot-end-marker
!
voice-card 1
    no dspfarm
!
voice-card 2
    no dspfarm
The following lines show secure codec complexity enabled:

```plaintext
voice-card 4
codec complexity secure
dspfarm
!
no aaa new-model
ip subnet-zero
!
ip cef
no ip domain lookup
!
ip domain name cisco.com
```

The IP domain name should match the domain name configured on Cisco CallManager.

```plaintext
Cisco CallManager-manager mgcp
!
crypto isakmp policy 1
  authentication pre-share
  lifetime 28800
crypto isakmp key cisco123 address 10.1.1.12
```

The crypto key should match the key configured on Cisco CallManager. This method and encapsulation mode should also match the method and encapsulation mode configured on Cisco CallManager. Other methods of key exchange are also supported. For more information refer to *Cisco IOS Security Configuration Guide*, Release 12.3.

```plaintext
crypto ipsec transform-set rtpset esp-des esp-md5-hmac
mode transport
```

The crypto IPsec configuration should match the Cisco CallManager configuration.

```plaintext
crypto map rtp 1 ipsec-isakmp
  set peer 10.1.1.12
  set transform-set rtpset
  match address 115
!
interface FastEthernet0/1
  ip address 10.1.1.212 255.255.255.0
  load-interval 30
duplex auto
  speed auto
crypto map rtp
!
```

The following line shows the IPsec access list.

```plaintext
access-list 115 permit ip host 10.1.1.212 host 10.1.1.12
!
voice-port 1/0/0
!
voice-port 2/0/0
!
mgcp
mgcp call-agent 10.1.1.12 service-type mgcp version 0.1
```

The `mgcp package-capability` command enables the MGCP application ability to manage SRTP calls and advertise SRTP capability in SDP sent to remote gateways.

```plaintext
mgcp package-capability srtp-package
!
mgcp profile default
!
dial-peer voice 100 pots
  application mgcpapp
```
port 1/0/0
!
dial-peer voice 200 pots

VoIP -- Voice over IP.
CHAPTER 10

Configuring MGCP CAS PBX and AAL2 PVC

This section provides information on configuring the MGCP Channel-Associated Signaling (CAS) Private-Branch-Exchange (PBX) and ATM Adaptation Layer 2 (AAL2) Permanent Virtual Circuit (PVC) feature.

Feature benefits include the following:

• The merged Simple Gateway Control Protocol/Media Gateway Control Protocol (SGCP/MGCP) software for residential gateways (RGWs), business gateways (BGWs), and trunking gateways (TGWs) enables easier development and growth of Cisco and customer solutions.

• MGCP CAS PBX and AAL2 PVC software meets customer requirements for CAS connectivity to traditional PBXs and regulatory requirements for support of 911, Barge In, and Busy Line Verify features.

For more information about this and related Cisco IOS voice features, see the following:

• "Overview of MGCP and Related Protocols" on page 3

Feature History for MGCP CAS PBX and AAL2 PVC

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(5)XM</td>
<td>This feature was introduced on the following platforms: Cisco 1750, Cisco 2600 series, Cisco 3600 series, Cisco AS5300, Cisco MC3810, and Cisco uBR924.</td>
</tr>
<tr>
<td>12.2(2)T</td>
<td>This feature was integrated into this release on all previously supported platforms except the Cisco AS5300. A new command was added (mgcp rtp unreachable timeout) and an existing command was modified (mgcp sdp).</td>
</tr>
</tbody>
</table>
This feature was implemented on the Cisco AS5300 and Cisco AS5850.

Note: AAL2 PVC is not supported on the Cisco AS5850.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MGCP CAS PBX and AAL2 PVC

Prerequisites are described in the "Prerequisites for Configuring MGCP and Related Protocols" section on page 3.

Restrictions for MGCP CAS PBX and AAL2 PVC

MGCP CAS PBX and AAL2 PVC Software Caveats

- Only the Cisco MC3810 series platform supports MGCP 0.1 control of AAL2 voice transport in this Cisco IOS release.

- For the Cisco MC3810 series platform, the AAL2 PVC functionality is supported on an high-performance compression module (HCM) version of an digital signal processor (DSP) card; it is not supported on an voice compression module (VCM) version.

To check the type of DSP card, enter a show version command at the EXEC prompt.
If you have an HCM card, the following line appears as part of the `show version` information:

1 6-DSP (slot 2) High Performance Compression Module(v01.A0)

If you have an VCM card, the following line appears as part of the `show version` information:

1 6-DSP (slot 2) Voice Compression Module(v255.V7)

If you have an HCM card, the MGCP Basic CLASS and Operator Services (BCOS) features will function correctly. If you have an VCM card, the AAL2 PVC feature is not supported.

- The Cisco AS5300 multiservice platform supports only the Feature Group-D Operator Services (FGD-OS) Barge-In/Busy Line Verify and 911 features of the MGCP CAS PBX and AAL2 PVC software.

**Features Not Supported**

- Basic CLASS and Operator features are covered in the MGCP Basic CLASS and Operator Services software. For more information on these capabilities, see Configuring MGCP Basic CLASS and Operator Services.

- The MGCP CAS PBX and AAL2 PVC software has not implemented DSP clock slotting changes, Comfort Noise Indication, ATM SVCs, TGCP, AAL1, FXO support in SGCP, ATM on the Cisco 3660 platform, and VoIP Call Admission Control (CAC). These capabilities are part of other Cisco development efforts.

## Information About MGCP CAS PBX and AAL2 PVC

The MGCP CAS PBX and AAL2 PVC features extend the earlier Simple Gateway Control Protocol (SGCP) Channel Associated Signaling (CAS) and AAL2 support onto the merged SGCP/MGCP software base to enable various service provider solutions.

### MGCP CAS PBX and AAL2 PVC Features

- CAS termination and translation to MGCP on Business Gateways (BGWs) and Trunking Gateways (TGWs).

Digital CAS (E&M) interfaces are supported in addition to the analog (FXO, FXS, and E&M) interfaces. For this feature release, the BGWs are the Cisco 3810 series and Cisco 2600 series routers. The TGWs are the Cisco 3600 series multiservice platforms.

- Support for CAS PBX and Feature Group D CAS Functions.

MGCP 0.1 has been expanded to support CAS packages that handle CAS PBX and Feature Group D CAS functions, including Barge-In/Busy Line Verify, and 911 capabilities on the TGW.

- Expanding MGCP 0.1 to control AAL2 voice transport.

The earlier version of the merged SGCP/MGCP stack supported only Voice over IP. The merged stack will now support both VoIP and VoAAL2.

Only the Cisco MC3810 series platforms supports this feature in this release.
• Addition of SGCP CAS PBX support to the existing merged SGCP/MGCP software stack.

The CAS PBX gateway features include CAS PBX trunks, digit maps, CAS events, and quarantine buffer software. These features were available in the existing standalone SGCP software; now they are supported in the merged stack.

• Consolidation of various SGCP and MGCP feature sets onto one software image for Residential Gateways (RGWs), BGWs, and TGWs.

For this feature release, the RGWs are the Cisco uBR924 cable router and Cisco 1750 access router.

The essential difference for current SGCP users is that support for the SGCP application has been replaced with the MGCP application. The MGCP application supports both SGCP commands and MGCP commands, permitting access to a larger feature set than with the SGCP application alone. The MGCP CAS PBX and AAL2 PVC software assumes the MGCP mode as the default environment. This allows the gateway to recognize both MGCP and SGCP messages sent by the call agent. However, the user can specify SGCP mode for certain messages that will be sent by the gateway (by using the `sgcp` option as the service type in the `mgcp call-agent` command).

Examples of Service Provider Solutions

MGCP CAS PBX and AAL2 PVC features support several types of service provider solutions:

• Residential cable access

A CLEC can use residential cable access to provide residential customers with basic telephony and data services. The figure below illustrates a possible residential cable access solution:

Figure 13: Residential Cable Access Solution

Note that in the figure above, the trunking gateway (the Cisco 3660 platform) requires support of incoming and outgoing MF signaling for the Barge-In and Busy-Line Verify features. The residential gateway (the Cisco uBR924 cable access router) must support the CLASS features and 911 capability.

• IP Centrex and IP PBX
In these solutions, a call agent provides business voice services traditionally offered by a circuit-based PBX. The figure below illustrates an IP Centrex solution:

**Figure 14: IP Centrex Solution**

In the figure above, the BGW (the Cisco 2600 platform) requires PBX connectivity to interface with the legacy PBX.

- Integrated Access

A CLEC or IXC can provide small, medium, and large businesses with integrated voice and data access services. The integrated access device can be located at the central office or on the customer’s premises. Access to the subscriber can be analog or digital T1 interfaces in addition to DSL. Transport of voice and data can be over IP, Frame Relay, or ATM. The figure below illustrates an integrated access solution:

**Figure 15: Integrated Access Solution**

In the figure above, MGCP control of calls over the AAL2 PVCs is required on the BGWs (the Cisco 2600 series, Cisco 3600, and Cisco 3810 series platforms) to connect into the ATM network for VToA.
• Telecommuter or Small Office-Home Office

The figure below illustrates a telecommuter/small office-home office solution:

Figure 16: Telecommuter or Small Office-Home Office Solution

In the figure above, MGCP must control the calls over AAL2 PVCs, and an analog FXS interface is required.

How to Configure MGCP CAS PBX and AAL2 PVC

Some tasks indicate one or more configuration examples affected by the command. See the specific configuration example listing for the parameter values.
Configuring the Gateway

SUMMARY STEPS

1. mgcp
2. mgcp call-agent {ipaddr | hostname} [port] [service-type type] version version-number
3. mgcp dtmf-relay voip codec {all | low-bit-rate} mode {cisco | nse | out-of-band}
5. mgcp sgcp restart notify
6. mgcp modem passthrough [voip | voaal2] mode [cisco | nse]
7. mgcp tse payload type
8. mgcp rtp unreachable timeout timer-value

### Configuring Subcell Multiplexing for AAL2 Voice

This section describes the configuration tasks necessary to enable AAL2 common part sublayer (CPS) subcell multiplexing when the Cisco MC3810 series platform interoperates with a voice interface service module (VISM) in an MGX switch.

**SUMMARY STEPS**

1. voice service voatm  
2. session protocol aal2  
3. subcell-mux  
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
voice service voatm | (Required) Enters voice-service configuration mode.  
**Example:**  
Router(config)# voice service voatm |
| **Step 2**  
session protocol aal2 | (Required) Enters voice-service-session configuration mode and specifies AAL2 trunking.  
**Example:**  
Router(config-voice-service)# session protocol aal2 |
| **Step 3**  
subcell-mux | (Required) Enables subcell multiplexing. |
Configuring the Cable Access Router for SGCP and MGCP

The Cisco uBR924 cable access router requires standard per-port provisioning to work with MGCP CAS PBX and AAL2 PVC:

To access SGCP functionality, use the command:

S|0|ca1@call-agent.abc.com:2427|S|1|ca2@call-agent.abc.com:2427

To access MGCP functionality, use the command:

M|0|ca1@call-agent.abc.com:2427|M|1|ca2@call-agent.abc.com:2427

For either functionality type, port 0 points to call agent 1 and port 1 points to call agent 2. If needed, both ports can point to the same call agent.

Verifying the MGCP CAS PBX and AAL2 PVC Configurations

To verify configuration, use the following commands.

**SUMMARY STEPS**

1. show dial-peer voice sum
2. show running-configuration

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 show dial-peer voice sum</td>
<td>Displays the status of the dial peer. The dial peer should be active. If it is not, use the no shut command to make it so.</td>
</tr>
</tbody>
</table>

Example:

Router# show dial-peer voice sum
### Configuration Examples for MGCP CAS PBX and AAL2 PVC

Example 4 SGCP 1.5 CAS PBX using Voice over ATM AAL2

The following figure and configuration illustrate the network connections for a Cisco MC3810 series platform with CAS running the MGCP application in SGCP 1.5 mode. ATM AAL2 carries voice traffic.

- T1/0 is configured to run ATM with three permanent virtual circuits (PVCs):
  - 1 PVC with encapsulation AAL5 carries SGCP messages (signaling VC)
  - 1 PVC with encapsulation AAL5 carries data traffic (data VC)
  - 1 PVC with encapsulation AAL2 carries voice traffic (bearer VC)

This bearer VC has a vc.ci of 2 assigned to it. The service manager uses this vc.ci value and a selected channel identifier (CID) value for a voice call on this router.

For AAL2, allocate 200 ATM cells/sec (84.8K bits/sec) for each G711u no vad call, 100 ATM cells/sec (42.4K bits/sec) for each G726-32 no vad or G729a no vad call.

- In this configuration, T1/1 is configured as three DS-0 groups:
  - 1 FXS ground start group
  - 1 E&M immediate start group
  - 1 E&M wink start group

For these voice ports, the dial type is set to mf to support mf dialing.

- mgcp sdp is configured to enable SGCP RSIP messages notification.
- mgcp modem passthrough mode is configured to allow nse processing of fax or modem calls.

Example 5 SGCP 1.5 CAS PBX using Voice over IP over ATM AAL5

The following figure and configuration illustrate the network connections for a Cisco MC3810 series platform with CAS running the MGCP application in SGCP 1.5 mode. Voice over IP over ATM AAL5 carries voice traffic.

This configuration is very similar to the AAL2 example in the previous section except that an AAL5 PVC is the bearer PVC for voice traffic.

This configuration has a loopback interface with an IP address assigned to it. During voice calls, the gateway gives this IP address to the service manager as the address for the other gateway of the voice connection to use as the destination IP address.

In the example below, Router A’s loopback address is 192.168.1.0 and Router B’s address is 192.168.5.0. If Router A originated a call to Router B, A would give 192.168.1.0 to the Service Manager and B would give 192.168.5.0. The IP route configuration commands of both routers direct the IP traffic into the voice bearer PVC since the loopback addresses are on different IP subnets.

For Voice over IP, allocate 300 ATM cells/sec (127.2K bits/sec) for each G711u no vad call, and 200 ATM cells/sec (84.8K bits/sec) for each G726-32 no vad or G729a no vad call.

```bash
dial-peer voice 2 pots
  application MGCPAPP
  port 1:2

dial-peer voice 3 pots
  application MGCPAPP
  port 1:3

line con 0
  exec-timeout 0 0
  privilege level 15
  transport input none
line aux 0
line 2 3
line vty 0 4
  login
end
```
For G.711u no vad calls, a T1 running ATM does not have enough bandwidth to carry 24 voice calls.

Example 6 SGCP 1.5 Analog EM PBX using Voice over ATM AAL2

The following figure and configuration illustrate the network connections for a Cisco MC3810 series platform with Analog E&M running the MGCP application in SGCP 1.5 mode. ATM AAL2 carries voice traffic.

This configuration is similar to the SGCP 1.5 CAS PBX using Voice over ATM AAL2 configuration, with these exceptions:

- No DS-0 groups are configured for T1/1 because the slot is used by analog voice.
- The E&M port must be configured to match the type of analog PBX to which the port is connected.
- E&M protocol is set to either E&M immediate or wink start. For wink start, set the dial-type to `mf`.
- Operation must be set to 2-w (for 2-wire) or 4-w (for 4-wire).
- Type is set to I, II, IV, or V.

In this example, the bearer PVC has enough bandwidth for two G711u no vad calls because the router has only two voice ports.

Example 7 SGCP 1.5 Analog EM PBX using Voice over IP over ATM AAL5

The following figure and configuration illustrate the network connections for a Cisco MC3810 series platform RGW with analog FXS loopstart ports running the MGCP application in SGCP 1.5 mode. Voice over IP over ATM AAL5 carries voice traffic.

This configuration is similar to the SGCP 1.5 CAS PBX using Voice over IP over ATM AAL5 configuration, with these exceptions:
• No DS-0 groups are configured for T1/1 because the slot is used by analog voice.
• The E&M port must be configured to match the type of analog PBX to which the port is connected.
• E&M protocol is set to either E&M immediate or wink start. For wink start, set the dial-type to mf.
• Operation must be set to 2-w (for 2-wire) or 4-w (for 4-wire).
• Type is set to I, II, IV, or V.

In this example, the bearer PVC has enough bandwidth for two G711u no vad calls because the router has only two voice ports.

Tip

See the "Additional References for MGCP and SGCP" section for related documents, standards, and MIBs, and the "Glossary" for definitions of terms in this guide.
Secure Tone on MGCP TDM Gateways

The Secure Tone feature provides support for Cisco Unified Communications Manager (UCM) to play a secure or non secure tone when the secure status of the call changes.

- Finding Feature Information, page 209
- Prerequisites for Secure Tone on MGCP TDM Gateways, page 209
- Restrictions for Secure Tone on MGCP TDM Gateways, page 210
- Secure Tone on MGCP TDM Gateways, page 210
- How to Configure Secure Tone on MGCP TDM Gateways, page 210
- Configuration Examples for Secure Tone on MGCP TDM Gateways, page 212
- Additional References, page 212
- Feature Information for Secure Tone on MGCP TDM Gateways, page 214

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Secure Tone on MGCP TDM Gateways

- Cisco Unified Communications Manager (UCM) 8.0(3) or a later release is running.
- Cisco IOS Media Gateway Control Protocol (MGCP) version 0.1 is configured.
Restrictions for Secure Tone on MGCP TDM Gateways

- Cisco UCM 8.0 will play the secure or non-secure indication tone to the protected device only when a two-way media connection is established.
- This feature is available only on Cisco IOS secure images.

Secure Tone on MGCP TDM Gateways

Cisco UCM not provides support for including supplementary service calls such as transfer and conferencing also changes the way in which secure and non secure indication tones are played. This new feature of playing the secure indication tone is based on the overall secure status unlike the earlier versions when it was based on end-to-end device's protected status. If the overall status is secure, the Secure Indication Tone (SIT) will be played to the protected phone. If the overall secure status is non-secure, the Non-Secure Indication Tone (NSIT) will be played to the protected phone. SIT or NSIT will be played when a two-way audio media connection is first established on the protected phone.

Cisco UCM sends a Notification Request (RQNT) with the newly defined tone ID for secure or non secure status. Following is a sample message sent from Cisco UCM to the MGCP gateway to play the secure tone when the status of the call changes:

RQNT 199 S2/DS1-0/10nw053b-3745.cisco.com MGCP 0.1
X: 1
R: D/[0-9ABCD*#]
S: X+TONE/st
Q: process,loop

How to Configure Secure Tone on MGCP TDM Gateways

Configuring Secure Tone on MGCP TDM Gateways

SUMMARY STEPS

1. enable
2. configure terminal
3. mgcp package-capability tone-package
4. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

</tbody>
</table>

**Step 2**

configure terminal

Example:

Router# configure terminal

**Step 3**

mgcp package-capability tone-package

Example:

Router(config)# mgcp package-capability tone-package

**Step 4**

exit

Example:

Router# exit

---

**Verifying and Troubleshooting Secure Tone on MGCP TDM Gateways**

**SUMMARY STEPS**

1. show mgcp
2. debug mgcp all
3. debug mgcp packets

**DETAILED STEPS**

**Step 1**

show mgcp

This command is used for displaying the values for MGCP parameters. The parameters are displayed only when the tone package has been enabled using the `mgcp package-capability tone-package` command.

**Step 2**

depug mgcp all

This command is used to enable all debug traces for the MGCP gateway.

**Step 3**

debug mgcp packets

This command is used for enabling debug traces for the MGCP packets.
Configuration Examples for Secure Tone on MGCP TDM Gateways

Example Configuring Secure Tone for MGCP TDM Gateways

The following example shows how to enable the trunk package, DTMF package, script package, and tone package on the gateway, and then names the trunk package as the default package for the gateway:

```
Router(config)# mgcp package-capability trunk-package
Router(config)# mgcp package-capability dtmf-package
Router(config)# mgcp package-capability script-package
Router(config)# mgcp package-capability tone-package
Router(config)# mgcp default-package trunk-package
```

Example Verifying Secure Tone for MGCP TDM Gateways

The following is a partial sample output from the `show mgcp` command when the package capability has been enabled for tone package:

```
Router# show mgcp
MGCP Admin State ACTIVE, Oper State ACTIVE - Cause Code NONE
MGCP call-agent: 10.7.0.200 3460 Initial protocol service is MGCP 0.1
MGCP validate call-agent source-ipaddr DISABLED
MGCP block-newcalls DISABLED
MGCP send SGCP RSIP: forced/restart/graceful/disconnected DISABLED
MGCP quarantine mode discard/step
GCP quarantine of persistent events is ENABLED
MGCP dtmf-relay for VoIP disabled for all codec types
MGCP dtmf-relay for VoAAL2 disabled for all codec types
MGCP voip modem passthrough mode: NSE, codec: g711ulaw, redundancy: DISABLED,
MGCP voaa12 modem passthrough disabled
MGCP voip nse modem relay: Disabled
MGCP voip mdste modem relay: Enabled
SPRT rx v14 hold time: 50 (ms), SPRT tx v14 hold count: 16,
   SPRT tx v14 hold time: 20 (ms), SPRT Retries: 12
SSE redundancy interval: 20 (ms), SSE redundancy packet: 3,
   SSE t1 timer: 1000 (ms), SSE retries: 3
The following lines show that the `tone-package` keyword is enabled:

```
MGCP supported packages: gm-package dtmf-package mf-package trunk-package
   line-package hs-package rtp-package script-package ms-package
dt-package mo-package mt-package sst-package mdr-package
   fxxr-package pre-package mdste-package srtp-package tone-package
```

DSP Voice Quality Statistics in DLCX Messages

The DSP Voice Quality Statistics in DLCX Messages feature provides a way to trace a Media Gateway Control Protocol (MGCP) call between a Cisco PGW 2200 Softswitch and the Cisco IOS gateway by including the MGCP call ID and the DS0 and digital signal processor (DSP) channel ID in call-active and call-history records.

The voice quality statistics are sent as part of the MGCP Delete Connection (DLCX) message. By correlating an MGCP call on the Cisco PGW 2200 Softswitch with a call record on the gateway, you can understand and debug additional statistics from the DSP for problems related to voice quality.

- Finding Feature Information, page 215

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for DSP Voice Quality Statistics in DLCX Messages

You must be using Cisco PGW 2200 version 9.4.1 or a later version with a patch level higher than CSCOgs008/CSCOnn008.

Restrictions for DSP Voice Quality Statistics in DLCX Messages

When the Secure Real-Time Transfer Protocol (SRTP) is enabled, the DLCX message will not report voice quality statistics. The following lines will be omitted for SRTP calls:

- DSP/Endpoint Configuration (EC)
- DSP/MOS K-Factor Statistics (KF)
- DSP/Concealment Statistics (CS)
- DSP/R-Factor Statistics (RF)
- DSP/User Concealment (UC)

Information About DSP Voice Quality Statistics in DLCX Messages

Cisco PGW 2200

A call agent (or media gateway controller) and softswitch are industry standard terms used to describe the network element that provides call control functionality to telephony and packet networks. The Cisco PGW 2200 Softswitch functions as a call agent or softswitch in “call control mode.”

Note

All voice quality parameters for Cisco IOS Release 12.4(4)T and later releases are supported only on the Cisco PGW 2200 call agent.

A public switched telephone network (PSTN) gateway provides an interface between traditional Signaling System No. 7 (SS7) or non-SS7 networks and networks based on MGCP, H.323, and Session Initiation Protocol (SIP), which include signaling, call control, and time-division multiplexing/IP (TDM/IP) gateway functions. The Cisco PGW 2200 Softswitch, coupled with Cisco media gateways, functions as a PSTN gateway.

Caution

There is a significant performance degradation on the Cisco PGW 2200 if all connected gateways have the DSP Voice Quality Statistics in DLCX Messages feature enabled. Enabling voice quality statistics on the gateway should only be performed by Cisco personnel.

The Cisco PGW 2200 Softswitch, in either signaling or call control mode, provides a robust, carrier-class interface between PSTN and IP-based networks. Interworking with Cisco media gateways, the Cisco PGW 2200 Softswitch supports a multitude of applications and networks, including the following:
• Application service provider (ASP) termination
• Centralized routing and billing for clearinghouse of IP-based networks
• Dial access
• International and national transit networks
• Managed business voice applications
• Managed voice VPNs
• Network clearinghouse applications
• PSTN access for hosted and managed IP telephony
• PSTN access for voice over broadband networks
• Residential voice applications

**MGCP**

MGCP defines the call control relationship between call agents (CAs) and VoIP gateways that translate audio signals to and from the packet network. CAs are responsible for processing the calls.

An MGCP gateway handles the translation between audio signals and the packet network. The gateways interact with a CA, also called a media gateway controller (MGC), which performs signal and call processing on gateway calls. MGCP uses endpoints and connections to construct a call.

Endpoints are sources of or destinations for data and can be physical or logical locations in a device. Connections can be either point-to-point or multipoint. The gateway can be a Cisco router, an access server, or a cable modem, and the CA is a server from a third-party vendor.

**Voice Quality Statistics**

The Cisco PGW 2200 Softswitch can capture voice quality statistics sent from MGCP-controlled media gateways and can propagate the statistics into call detail records (CDRs) at the end of each call. The Cisco AS5x00 media gateways send voice quality statistics to the Cisco PGW 2200 Softswitch.

Most voice quality statistics are available from the DSP and are controlled using RTP Control Protocol (RTCP) report interval statistics polling. The mean and maximum values are calculated by Cisco IOS software-based polling, which results in additional CPU load for each call. The additional CPU load can be controlled by configuring polling interval by using the `ip rtcp report interval` command.

The playout delay, playout error, and DSP receive and transmit statistics are automatically polled periodically. Polling for the voice quality statistics, level, and error parameters can be added. For logging the voice quality statistics using syslog, the existing VoIP gateway accounting has been extended. For more information about statistics polling, see the `ip rtcp report interval` command in the http://www.cisco.com/en/US/partner/docs/ios-xml/ios/voice/vcr2/vcr2-cr-book.html.

Quality of Service for Voice

The DSP Voice Quality Statistics in DLCX Messages feature is part of the Cisco quality of service (QoS) technology. QoS is the ability of a network to provide better service to selected network traffic over various technologies, including ATM, Ethernet and 802.1 networks, Frame Relay, SONET, and IP-routed networks that may use any or all of these underlying technologies.

QoS provides the following benefits:

- Control over bandwidth, equipment, and wide-area facilities—As an example, you can limit the bandwidth consumed over a backbone link by FTP or limit the queueing of an important database access.
- More efficient use of network resources—Network analysis management and accounting tools enable you to know what your network is being used for and ensure that you are servicing the most important traffic to your business.
- Ability to customize services—QoS enables ISPs to offer carefully customized grades of service differentiation to their customers.
- Coexistence of mission-critical applications—Cisco QoS technologies ensure that bandwidth and minimum delays required by time-sensitive multimedia and voice applications are available and that other applications using the link get their fair service without interfering with mission-critical traffic.
- Foundation for a fully integrated network—Cisco QoS technologies fully integrate a multimedia network, for example, by implementing weighted fair queueing (WFQ) to increase service predictability and by implementing IP precedence signaling to differentiate traffic. In addition, the availability of Resource Reservation Protocol (RSVP) allows you to take advantage of dynamically signaled QoS.

To deliver QoS across a network that comprises heterogeneous technologies (for example, IP, ATM, LAN switches), basic QoS architecture consists of the following three components:
• QoS within a single network element (for example, queueing, scheduling, and traffic shaping tools).
• QoS signaling techniques for coordinating end-to-end QoS between network elements.
• QoS policy, management, and accounting functions to control and administer end-to-end traffic across a network.

Voice Quality Parameters for Cisco IOS Release 12.4(4)T and Later Releases

The following voice quality parameters were introduced in Cisco IOS Release 12.4(4)T:

DSP/EC

The following parameters describe the configuration of a VoIP endpoint. You can define these parameters and they are useful for debugging and logging purposes because they capture the state of the endpoint.

• CI—Codec ID. A string or a number that identifies the voice codec which is currently used in the call.

• FM—Frame size. Native frame size, in milliseconds (ms), of the selected codec. An example of a frame size and codec combination is G.729a/30ms. For the G.711 codec, the frame size is a value that you can define in the voice dial peer. For example, G.711 at 80 bytes gives 10 ms per frame. G.711 at 240 bytes gives 30 ms per frame.

• FP—Frames per packet. Number of codec speech frames encapsulated into a single Real-time Transport Protocol (RTP) packet. Typical values are 1, 2, and 3. Packing lower number of frames per packet results in lower efficiency of IP bandwidth usage. The tradeoff is lower delays and higher robustness of the network.

• VS—Voice Activity Detection (VAD)-enabled flag. VAD is enabled when VS has a value of one. It results in compression of silent periods leading to reduced or zero packets per second. VAD is disabled when VS has a value of zero. It results in the transmission of continuous packets per second irrespective of active or silent periods on the transmission path.

• GT—Transmission gain factor (linear). Digital gain multiplier applied to the transmission on the signal path from the PSTN toward the network. GT is applied at the echo canceller Sout port. A gain factor of less than one indicates a loss pad.

• GR—Reception gain factor (linear). Digital gain multiplier applied to reception on the signal path from the network toward the PSTN. GR is applied at the echo canceller Rin port. A gain factor of less than one indicates a loss pad.

• JD—Jitter buffer mode. It consists of the following modes:
  • Adaptive mode = 1
  • Fixed mode (no timestamps) = 2
  • Fixed mode (with timestamps) = 3
  • Fixed mode (with passthrough) = 4

• JN—Jitter buffer nominal playout delay. Size of the jitter buffer in milliseconds. An adaptive jitter buffer tries to make the playout delay equal to the nominal (desired) delay when the observed jitter is small.
enough to allow this adjustment. For a fixed-mode jitter buffer, the nominal setting is the constant playback delay itself.

• JM—Minimum playback delay. Minimum playback delay setting for an adaptive-mode jitter buffer. The playback delay never goes below the minimum playback setting even if the observed jitter is zero. This setting is not used for a fixed-mode jitter buffer because the playback delay is fixed and constant at the nominal setting.

• JX—Maximum playback delay. Sets the limit for increasing the playback delay of an adaptive-mode jitter buffer. An adaptive buffer increases when the jitter is higher than the instantaneous playback delay value.

**DSP/KF**

K-factor is an endpoint mean opinion score (MOS) estimation algorithm defined in the ITU standard P.862. It is a general estimator of the mean value of a perceptual evaluation of speech quality (PESQ) population for a specific impairment pattern.

The ITU standard P.862 defines and describes the PESQ as an objective method for end-to-end speech quality assessment of narrowband telephone networks and speech codecs.

Mean opinion score (MOS) is associated with the output of a well-designed listening experiment. All MOS experiments use a five-point PESQ scale as defined in the ITU standard P.862. The MOS estimate is inversely proportional to frame loss density. Clarity decreases as more frames are lost or discarded at the receiving end.

K-factor represents a weighted estimate of average user annoyance due to distortions caused by effective packet loss such as dropouts and warbles. It does not estimate the impact of delay-related impairments such as echo. It is an estimate of listening quality (MOS-LQO) rather than conversational quality (MOS-CQO), and measurements of average user annoyance range from 1 (poor voice quality) to 5 (very good voice quality).

K-factor is trained or conditioned by speech samples from numerous speech databases, where each training sentence or network condition associated with a P.862 value has a duration of eight seconds. For more accurate scores, K-factor estimates are generated for every 8 seconds of active speech.

K-factor and other MOS estimators are considered to be secondary or derived statistics because they warn a network operator of frame loss only after the problem becomes significant. Packet counts, concealment ratios, and concealment second counters are primary statistics because they alert the network operator before network impairment has an audible impact or is visible through MOS.

• KF—K-factor MOS-LQO estimate (instantaneous). Estimate of the MOS score of the last 8 seconds of speech on the reception signal path. If VAD is active, the MOS calculation is suspended during periods of received silence to avoid inflation of MOS scores for calls with higher silence fractions.

• AV—Average K-factor score. Running average of scores observed since the beginning of a call.

• MI—Minimum K-factor score. Minimum score observed since the beginning of a call, and represents the worst sounding 8-second interval.

• BS—Baseline (maximum) K-factor score. K-factor score that can be obtained for the defined codec.

• NB—Number of bursts. Number of burst loss events after a call is started. A burst loss is a contiguous run of concealment events of length greater than one.
• FL—Average frame loss count. Total number of frame losses and concealment events observed after starting a call. The ratio of FL/NB provides the mean burst length in frames. The total concealment duration of the call is provided by the parameter DSP/CS: CT.

• NW—Number of windows. Total number of K-factor windows observed after starting a call. The number of windows is directly proportional to the duration of a call.

• VR—Version ID. Version number that identifies a specific K-factor MOS score.

DSP/CS

DSP/CS measures packet (frame) loss and its effect on voice quality in an impaired network. The parameters for concealment statistics are as follows:

• CR—Concealment ratio (instantaneous). An interval-based average concealment rate, and is the ratio of concealment time over speech time for the last 3 seconds of active speech. When VAD is enabled, calculation of the concealment ratio is suspended during periods of speech silence. During this suspension, it may take more than 3 seconds for a new value to be generated.

• AV—Average CR. Average of all CR reports after starting a call.

• MX—Maximum CR. The maximum concealment ratio observed after starting a call.

• CS—Concealed time. The duration of time in seconds during which some concealment is observed.

• CT—Total concealment time. The total duration of time in milliseconds during which concealment is observed after starting a call.

• TT—Total speech time. The duration of time in milliseconds during which active speech is observed after starting a call.

• OK—Ok time. The duration of time in seconds during which no concealment is observed.

• SC—Severely concealed time. The duration of time in seconds during which a significant amount of concealment is observed. If the concealment observed is usually greater than 50 milliseconds or approximately five percent, it is possible that the speech is not very audible.

• TS—Concealment threshold. The threshold in milliseconds used to determine a second as severely concealed. The threshold for concealed seconds is 0 milliseconds, and for severely concealed seconds is 50 milliseconds.

DSP/RF

The R-factor helps in planning voice transmission. In ITU standards G.107 and G.113, the R-factor is defined as follows:

\[ R = R_o - I_s - I_d - I_e - \text{eff} + A \]

The parameters for the R-Factor are as follows:

• Ro is based on the signal-to-noise ratio.
• Is is the simultaneous impairment factor and includes the overall loudness rating.
• Id is the delay impairment factor and includes talker (Idte) and listener (Idle) echos, and delays (Idd).
• Ie-eff is the equipment impairment factor and includes packet losses and the types of codecs.
• A is the advantage factor.
• ML—R-factor MOS listening quality objective. It reflects only packet loss and codec-related impairments and does not include delay effects.
• MC—R-factor MOS-CQE.
• R1—R-factor LQ profile 1.
• R2—R-factor LQ profile 2.
• IF—Effective codec impairment (Ie_eff).
• ID—Idd.
• IE—Codec baseline score (Ie). The tabulated baseline codec impairment factor.
• BL—Codec baseline (Bpl). The packet loss robustness factor for the codec being used.
• R0—R0 (default). The nominal value at which the signal-to-noise ratio is considered nominal.

**DSP/UC**

The parameters for user concealment are as follows:
• U1—User concealment seconds 1 count (UCS1)
• U2—User concealment seconds 2 count (UCS2)
• T1—UCS1 threshold in milliseconds
• T2—UCS2 threshold in milliseconds

**DSP/DL**

The parameters for delay statistics are as follows:
• RT—Round trip delay
• ED—End system delay
How to Configure DSP Voice Quality Statistics in DLCX Messages

Configuring DSP Voice Quality Statistics in DLCX Messages

To configure voice quality statistics reporting for MGCP, use the following commands beginning in user EXEC mode.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **mgcp voice-quality stats [priority value] [all]**
4. **end**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| Example | Router> enable | |
| Step 2 | configure terminal | Enters global configuration mode. |
| Example | Router# configure terminal | |
| Step 3 | mgcp voice-quality stats [priority value] [all] | Enables voice quality statistics reporting for MGCP.  
The following parameters are sent by default if the priority or all keywords are not used: DSP/TX, DSP/RX, DSP/PD, DSP/PE, DSP/LE, DSP/ER, DSP/IC.  
**Priority 1** parameters are: DSP/TX, DSP/RX, DSP/PD, DSP/LE, DSP/EC, DSP/CS, DSP/DL.  
**Priority 2** parameters are: DSP/PE, DSP/ER, DSP/IC, DSP/KF, DSP/RF, DSP/UC.  
Using **Priority 2** is similar to using the all keyword when the output contains the following parameters: DSP/TX, DSP/RX, DSP/PD, DSP/PE, DSP/LE, DSP/ER, DSP/IC, DSP/EC, DSP/KF, DSP/CS, DSP/RF, DSP/UC, and DSP/DL. |
| Example | Router(config)# mgcp voice-quality-stats priority 1 | |
## What to Do Next

Use the following Troubleshooting Tips if you did not get the expected results after configuring voice quality statistics reporting for MGCP. See the Troubleshooting Tips section for additional guidelines.

### Troubleshooting Tips

Use the `debug mgcp packets` command to display statistics reported in the DLCX message generated at the end of a call. The following is sample debug output:

```
Router# debug mgcp packets
DLCX 311216 s6/ds1-4/1@as5400a MGCP 0.1

DSP/IC: IC=0
```

### Verifying DSP Voice Quality Statistics in DLCX Messages

Use the following `show` commands to check your configuration:

#### SUMMARY STEPS

1. Obtain the call ID by using the `show call active voice compact` command in privileged EXEC mode.
2. Check the status of active calls using the call ID obtained from the `show call active voice brief` command.
3. Verify your configuration using the `show call history voice brief` command.
DETAILED STEPS

Step 1 Obtain the call ID by using the `show call active voice compact` command in privileged EXEC mode.

Example:
```
Router# show call active voice compact
G<id> A/O FAX T<sec> Codec type Peer Address IP R<ip>:<udp>
Total call-legs: 2
G11D6 ORG T187 g729r8 TELE P
G11D6 ORG T0 g729r8 VOIP P 192.0.2.1:19324
```

Step 2 Check the status of active calls using the call ID obtained from the `show call active voice brief` command.

Example:
```
Router# show call active voice brief id 11D6
<ID>: <CallID> <start>.<index> +<connect> pid:<peer_id> <dir> <addr> <state>
dur hh:mm:ss tx:<packets>/bytes rx:<packets>/bytes
IP <ip>:<udp> rtt:<time>ms pl:<play>/<gap>ms lost:<lost>/total:<early>/<late>
delay:<last>/<min>/<max>ms <codec>
media inactive detected:<y/n> media cntrl rcvd:<y/n> timestamp:<time>
```

Telephony call-legs: 0
SIP call-legs: 0
H323 call-legs: 0
Call agent controlled call-legs: 0
SCCP call-legs: 0
Multicast call-legs: 0
Total call-legs: 0

Step 3 Verify your configuration using the `show call history voice brief` command.

Example:
```
Router# show call history voice brief

MGCP Configuration Guide, Cisco IOS Release 15M&T

Verifying DSP Voice Quality Statistics in DLCX Messages

DSP Voice Quality Statistics in DLCX Messages
Configuration Examples for DSP Voice Quality Statistics in DLCX Messages

Example: Configuring DSP Voice Quality Statistics in DLCX Messages

The following example shows how to enable voice quality statistics reporting for MGCP:

```
Router> enable
Router# configure terminal
Router(config)# mgcp voice-quality-stats
Router(config)# end
```

The following example shows the voice quality parameters selected for `priority` 1:

```
Router(config)# mgcp voice-quality-stats priority 1
```

```
16:38:20.461771 192.0.2.1:2427 192.0.2.4:2427 MGCP...... -> 250 1133 OK
P: PS=0, OS=0, PR=0, OR=0, PL=0, JI=65, LA=0
DSP/TX: PK=118, SG=0, NS=1, DU=28860, VO=2350
DSP/RX: PK=0, SG=0, CF=0, RX=28860, VO=0, BS=0, LP=0, BP=0
DSP/PD: CU=65, NI=65, MA=65, CO=0, IJ=0
DSP/LE: TP=0, RP=0, TM=0, RM=0, BN=0, ER=0, AC=0
DSP/IN: CI=0, FM=0, FP =0, VS=0, GT=0, GR=0, JD=0, JN=0, JM=0,
DSP/CR: CR=0, MN=0, CT=0, TT=0,
DSP/DC: DC=0,
DSP/CS: CS=0, SC=0, TS=0,
DSP/UIC: U1=0, U2=0, T1=0, T2=0
```

The following example shows the voice quality parameters selected for the `all` keyword:

```
Router(config)# mgcp voice-quality-stats all
```

```
16:38:20.461771 192.0.2.1:2427 192.0.2.4:2427 MGCP...... -> 250 1133 OK
P: PS=0, OS=0, PR=0, OR=0, PL=0, JI=65, LA=0
DSP/TX: PK=118, SG=0, NS=1, DU=28860, VO=2350
DSP/RX: PK=0, SG=0, CF=0, RX=28860, VO=0, BS=0, LP=0, BP=0
DSP/PD: CU=65, NI=65, MA=65, CO=0, IJ=0
DSP/PE: PC=0, IC=0, SC=0, RM=0, BO=0, EE=0
DSP/LE: TP=0, RP=0, TM=0, RM=0, BN=0, ER=0, AC=0
DSP/ER: RD=0, TD=0, RC=0, TC=0
DSP/IC: IC=0
```
DSP/EC: CI=0, FM=0, FP=0, VS=0, GT=10, GR=0, JD=0, JN=0, JM=0, JX=0,
DSP/KF: KF=0, AV=0, MI=0, BS=0, NB=0, FL=0,
DSP/CS: CR=0, AV=0, MN=0, MX=0, CS=0, SC=0, TS=0, DC=0,
DSP/RF: ML=0, MC=0, R1=0, R2=0, IF=0, ID=0, IE=0, BL=0, R0=0,
DSP/UC: U1=0, U2=0, T1=0, T2=0,
DSP/DL: RT=0, ED=0

Feature Information for DLCP Voice Quality Statistics in DLCX Messages

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to . An account on Cisco.com is not required.
