Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation

Last Updated: November 26, 2012

The Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation feature helps ensure voice quality by adjusting the rate of traffic and activating fragmentation on the basis of the presence of voice on the permanent virtual circuit (PVC). Frame Relay voice-adaptive traffic shaping enables a PVC to adjust the rate of traffic if packets are detected in the priority queue or if H.323 call setup signaling packets are detected. Frame Relay voice-adaptive fragmentation allows fragmentation to be activated when priority-queue or H.323 signaling packets are detected. When priority-queue traffic and signaling packets are not present, Frame Relay voice-adaptive fragmentation allows fragmentation to be deactivated.

Feature Specifications for Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation

Feature History

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation

Prerequisites for Frame Relay Voice-Adaptive Traffic Shaping

- Traffic shaping and low latency queueing must be configured using the Modular QoS CLI (MQC).

Prerequisites for Frame Relay Voice-Adaptive Fragmentation

- End-to-end fragmentation must be configured in a map class or on the interface.
- Frame Relay traffic shaping or traffic shaping using the MQC must be configured. If end-to-end fragmentation is configured on the interface, traffic shaping must be configured using the MQC.
- Low latency queueing must be configured.
- End-to-end fragmentation must be configured on the peer router. Although the peer router may not see the expected fragmented packets from the router doing voice-adaptive fragmentation, the peer will be able to handle large unfragmented packets in addition to fragmented packets.

Restrictions for Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation

The feature supports FRF.12 fragmentation only. Neither FRF.11 Annex C nor Cisco proprietary fragmentation is supported.

Information About Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation

- Frame Relay Voice-Adaptive Traffic Shaping, page 3
- Frame Relay Voice-Adaptive Fragmentation, page 3
Benefits of Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation

Before the introduction of this new feature, Frame Relay adaptive shaping could be used to reduce the sending rate when a network was congested. Because the adaptive shaping mechanism was triggered by network congestion, voice traffic might already have been delayed by the time the sending rate was reduced. The Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation feature helps to ensure voice quality by adjusting the rate of traffic based on the presence of voice on the PVC.

Frame Relay voice-adaptive traffic shaping and fragmentation

- Prevents delay of voice packets when network congestion occurs by reducing the traffic rate to the minimum committed information rate (minCIR) and turning on fragmentation when voice packets are present on a PVC.
- Maximizes utilization of the PVC by increasing the traffic rate to committed information rate (CIR) when voice packets are not present.
- Reduces CPU utilization by turning off fragmentation when there are no voice packets present.

Frame Relay Voice-Adaptive Traffic Shaping

Frame Relay voice-adaptive traffic shaping enables a router to reduce the PVC sending rate to the minCIR whenever packets (usually voice) are detected in the low latency queueing priority queue or H.323 call setup signaling packets are present. When there are no packets in the priority queue and signaling packets are not present for a configured period of time, the router increases the PVC sending rate from minCIR to CIR to maximize throughput.

**Note**

Although the priority queue is generally used for voice traffic, Frame Relay voice-adaptive traffic shaping will respond to any packets (voice or data) in the priority queue.

Frame Relay voice-adaptive traffic shaping can be used at the same time as other types of adaptive traffic shaping. For example, if both Frame Relay voice-adaptive traffic shaping and adaptive shaping based on interface congestion are configured, the router will reduce the sending rate to minCIR if there are packets in the priority queue or the interface queue size exceeds the configured threshold.

Frame Relay voice-adaptive traffic shaping can be used in conjunction with or independently of voice-adaptive fragmentation.

Frame Relay Voice-Adaptive Fragmentation

Frame Relay voice-adaptive fragmentation enables a router to fragment large data packets whenever packets (usually voice) are detected in the low latency queueing priority queue or H.323 call setup signaling packets are present. When there are no packets in the priority queue for a configured period of time and signaling packets are not present, fragmentation is stopped.

**Note**

Although the priority queue is generally used for voice traffic, Frame Relay voice-adaptive fragmentation will respond to any packets (voice or data) in the priority queue.

Frame Relay voice-adaptive fragmentation can be used in conjunction with or independent of voice-adaptive traffic shaping.
To use voice-adaptive fragmentation, you must also have end-to-end fragmentation configured in a map class or on the interface.

How to Configure Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation

The following tasks enable both Frame Relay voice-adaptive traffic shaping and fragmentation. The features can also be used separately. If you choose to use voice-adaptive fragmentation by itself, you can configure either MQC traffic shaping (as in the tasks that follow) or Frame Relay traffic shaping. If you use Frame Relay traffic shaping, end-to-end fragmentation must be configured in a map class.

• Configuring Class Policy for the Priority Queue and Bandwidth Queues, page 4
• Configuring Frame Relay Voice-Adaptive Traffic Shaping Using the Class-Default Class, page 6
• Configuring a Map Class for Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation, page 8
• Enabling Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation on the Interface, page 9
• Verifying Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation, page 11

Configuring Class Policy for the Priority Queue and Bandwidth Queues

Perform this task to configure a policy map for the priority class and other classes.

SUMMARY STEPS

1. enable
2. configure terminal
3. policy-map policy-map
4. class class-name
5. priority bandwidth-kbps
6. exit
7. class class-name
8. bandwidth bandwidth-kbps
9. end

DETAILED STEPS

</table>
| **Step 3** policy-map policy-map | Specifies the name of the policy map to be created or modified.  
  - Use this command to define the shaping policy. |
| **Example:**  
  Router(config)# policy-map SHAPE | |
| **Step 4** class class-default | Specifies the default class so that you can configure or modify its policy. |
| **Example:**  
  Router(config-pmap)# class class-default | |
| **Step 5** shape [average | peak] mean-rate [[burst-size] [excess-burst-size]] | Shapes traffic to the indicated bit rate according to the algorithm specified. |
| **Example:**  
  Router(config-pmap-c)#  
  shape average 60000 | |
| **Step 6** shape adaptive mean-rate-lower-bound | (Optional) Configures a Frame Relay interface or a point-to-point subinterface to estimate the available bandwidth while traffic shaping is active. |
| **Example:**  
  Router(config-pmap-c)#  
  shape adaptive 30000 | |
| **Step 7** shape fr-voice-adapt [deactivation seconds] | Enables Frame Relay voice-adaptive traffic shaping. |
| **Example:**  
  Router(config-pmap-c)#  
  shape fr-voice-adapt deactivation 10 | |
| **Step 8** Service-policy policy-map-name | Specifies the name of a policy map to be used as a matching criterion (for nesting traffic policies [hierarchical traffic policies] within one another).  
  - Use this command to attach the policy map for the priority queue and bandwidth queues (the child policies) to the shaping policy (the parent policy). |
| **Example:**  
  Router(config-pmap-c)#service-policy FR-VATS | |
| **Step 9** end | (Optional) Exits to privileged EXEC mode. |
**Configuring a Map Class for Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation**

Perform the following task to configure a map class for Frame Relay voice-adaptive traffic shaping and fragmentation.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **map-class frame-relay map-class-name**
4. **frame-relay fragment fragment_size**
5. **service-policy output policy-map-name**
6. **end**

### Enabling Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation on the Interface

Perform the following task to enable Frame Relay voice-adaptive traffic shaping and fragmentation on the interface.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. encapsulation frame-relay
5. frame-relay fragmentation voice-adaptive [deactivation seconds]
6. frame-relay fragment fragment-size end-to-end
7. frame-relay interface-dlci dlci [ietf | cisco] [voice-cir cir]
8. class name
9. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

### Step 5: service-policy output policy-map-name

**Example:**

```
Router(config-map-class)# service-policy output SHAPE
```

**Purpose:**
Attaches a policy map to an output interface, to be used as the service policy for that interface.

- Use this command to attach the shaping policy to the map class.

### Step 6: end

**Example:**

```
Router(config-map-class)# end
```

**Purpose:**
Exits to privileged EXEC mode.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface type number</td>
<td>Specifies the interface to be configured and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# interface serial0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> encapsulation frame-relay</td>
<td>Enables Frame Relay encapsulation.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# encapsulation frame-relay</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> frame-relay fragmentation voice-adaptive [deactivation seconds]</td>
<td>Enables Frame Relay voice-adaptive fragmentation.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# frame-relay fragmentation voice-adaptive deactivation 50</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> frame-relay fragment fragment-size end-to-end</td>
<td>Enables Frame Relay fragmentation on an interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# frame-relay fragment 80 end-to-end</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>For voice-adaptive fragmentation to work, fragmentation must be enabled here on the interface, or it can be configured in a map class.</td>
</tr>
<tr>
<td>•</td>
<td>When fragmentation is enabled on an interface, all PVCs on the main interface and its subinterfaces will have fragmentation enabled with the same configured fragment size.</td>
</tr>
<tr>
<td>•</td>
<td>To maintain low latency and low jitter for priority queue traffic, configure the fragment size to be greater than the largest high-priority frame that would be expected.</td>
</tr>
<tr>
<td><strong>Step 7</strong> frame-relay interface-dlci dlci [ietf cisco] [voice-cir cir]</td>
<td>Specifies a PVC to be configured.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
---|---
**Step 8** class *name* | Associates a map class with a specified data-link connection identifier (DLCI).
   - Use this command to assign the map class that was configured with Frame Relay voice-adaptive traffic shaping to the PVC.

**Example:**
```
Router(config-fr-dlci)#
```

**Step 9** end | Exits to privileged EXEC mode.

**Example:**
```
Router(config-fr-dlci)# end
```

---

**Verifying Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation**

Perform this task to verify the configuration and operation of Frame Relay voice-adaptive traffic shaping and fragmentation.

**SUMMARY STEPS**

1. enable
2. `show policy-map [policy-map]`
3. `show policy-map interface interface-name [dlci dlci] [input | output]`
4. `show frame-relay pvc [interface interface] [dlci] [64-bit]`

**DETAILED STEPS**

| Command or Action | Purpose |
---|---|
**Step 1** enable | Enables privileged EXEC mode.
   - Enter your password if prompted.

**Example:**
```
Router> enable
```

**Step 2** `show policy-map [policy-map]` | Displays the configuration of all classes for a specified service policy map or all classes for all existing policy maps.

**Example:**
```
Router# show policy-map
```
### Command or Action

**Step 3**  
*show policy-map interface interface-name [dlci dlci] [input | output]*

**Purpose**  
Displays the packet statistics of all classes that are configured for all service policies either on the specified interface or subinterface or on a specific permanent virtual circuit (PVC) on the interface.

**Example:**

Router# show policy interface Serial3/1.1

**Step 4**  
*show frame-relay pvc [interface interface] [dlci] [64-bit]*

**Purpose**  
Displays statistics about permanent virtual circuits (PVCs) for Frame Relay interface.

**Example:**

Router# show frame-relay pvc 202

---

### Configuration Examples for Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation

- [Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation Examples, page 12](#)
- [Verifying Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation Example, page 13](#)

### Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation Examples

The following examples show the configuration of Frame Relay voice-adaptive traffic shaping and fragmentation. The first example shows end-to-end fragmentation configured in a map class that is associated with PVC 100. In the second example, end-to-end fragmentation is configured directly on the interface.

With both example configurations, priority-queue packets or H.323 call setup signaling packets destined for PVC 100 will result in the reduction of the sending rate from CIR to minCIR and the activation of FRF.12 end-to-end fragmentation. If signaling packets and priority-queue packets are not detected for 50 seconds, the sending rate will increase to CIR and fragmentation will be deactivated.

**Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation with End-to-End Fragmentation Configured in a Map Class**

```conf
interface serial0
  encapsulation frame-relay
  frame-relay fragmentation voice-adaptive deactivation 50

Verifying Frame Relay Voice-Adaptive Traffic Shaping and Fragmentation Example

Sample Output for the show policy-map Command

The following sample output for the show-policy-map command indicates that Frame Relay voice-adaptive traffic shaping is configured in the class-default class in the policy map "MQC-SHAPE-LLQ1" and that the deactivation timer is set at 30 seconds.

Router# show policy-map
Policy Map VSD1
  Class VOICE1
    Strict Priority
    Bandwidth 10 (kbps) Burst 250 (Bytes)
  Class SIGNALS1
    Bandwidth 8 (kbps) Max Threshold 64 (packets)
  Class DATA1
    Bandwidth 15 (kbps) Max Threshold 64 (packets)
Policy Map MQC-SHAPE-LLQ1
  Class class-default
    Traffic Shaping
      Average Rate Traffic Shaping
        CIR 63000 (bps) Max. Buffers Limit 1000 (Packets)
Adapt to 8000 (bps)
Voice Adapt Deactivation Timer 30 Sec
service-policy VSD1

Sample Output for the show policy interface Command

The following sample output shows that Frame Relay voice-adaptive traffic shaping is active and has 29 seconds left on the deactivation timer. This means that the current sending rate on DLCI 201 is minCIR, but if no voice packets are detected for 29 seconds, the sending rate will increase to CIR.

Router# show policy interface Serial3/1.1
Serial3/1.1:DLCI 201 -
Service-policy output:MQC-SHAPE-LLQ1

Class-map:class-default (match-any)
1434 packets, 148751 bytes
