<td>Voice and quality of service features for ADSL were introduced for Cisco 2600 and 3600 series routers.</td>
</tr>
</tbody>
</table>

This document describes the voice and quality of service (QoS) features for asymmetric digital subscriber lines (ADSL) on Cisco 2600 and 3600 series routers in Cisco IOS Release 12.2(2)XK.

For information about QoS features on Cisco 1700 series routers, refer to the following document:

Cisco IOS Software Release 12.2(2)XQ1

This document includes the following sections:

- Feature Overview, page 1
- Supported Platforms, page 8
- Supported Standards, MIBs, and RFCs, page 9
- Configuration Tasks, page 9
- Configuration Examples, page 13
- Command Reference, page 19

Feature Overview

Cisco 2600 and 3600 series routers with an ADSL WAN interface card support the integration of voice and data over the same ADSL circuit using Voice over IP (VoIP) and Voice over ATM (VoATM). QoS features make it possible to effectively combine voice and data traffic in the same WAN connection without sacrificing quality and reliability. Service providers can increase revenue by building differentiated service options based on premium, standard, or best-effort service classes.
Voice and Quality of Service Features for ADSL on Cisco 2600 and 3600 Series Routers

Feature Overview

The following voice and QoS features are supported in the 12.2(2)XK release:

To configure these voice and QoS features, you must first install and configure the ADSL WAN interface card on your Cisco 2600 or 3600 router. Refer to the installation and configuration instructions in the following document:

1-Port ADSL WAN Interface Card for Cisco 2600 Series and 3600 Series Routers, Release 12.2(4)T

- Classification and Marking
  - Class-Based Packet Marking with DSCP
  - Committed Access Rate
  - Dial-Peer DSCP and IP Precedence Marking

- Queuing and Scheduling
  - Class-Based Weighted Fair Queuing
  - Low Latency Queuing
  - Driver Per-VC Queuing

- Congestion Avoidance
  - Class-Based WRED with DSCP (egress)

- Policing and Traffic Shaping
  - Class-Based Policing
  - Per-ATM VC Shaping for VBR-NRT

- Link Latency
  - Selectable Transmission Ring

- Other (IP QoS)
  - Local Policy Routing
  - Policy-Based Routing
  - IP QoS Mapping to ATM CoS
  - Access Lists

- Additional Features Supported in Release 12.2(2)XK
  - Multiple PVC Support
  - RFC1483 Routing
  - H.323 VoIP

Classification and Marking

The following existing Cisco IOS classification and marking features are now supported on ADSL:

- Class-Based Packet Marking with DSCP
- Committed Access Rate
- Dial-Peer DSCP and IP Precedence Marking
Class-Based Packet Marking with DSCP

For information about class-based packet marking with differentiated services code point (DSCP), refer to the following document:
The chapter “Quality of Service Overview” in the Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.2

Committed Access Rate

For information about committed access rate (CAR), refer to the following document:
The chapter “Quality of Service Overview” in the Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.2

Dial-Peer DSCP and IP Precedence Marking

For information about dial-peer DSCPs and IP precedence marking, refer to the following document:
The chapter “Quality of Service Overview” in Cisco IOS Quality of Service Solutions

Queuing and Scheduling

The following existing Cisco IOS queuing and scheduling features are now supported on ADSL:
- Class-Based Weighted Fair Queuing
- Low Latency Queuing
- Driver Per-VC Queuing

Class-Based Weighted Fair Queuing

For information about class-based weighted fair queuing (CBWFQ), refer to the following document:
The chapter “Quality of Service Overview” in the Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.2

Low Latency Queuing

For information about low latency queuing (LLQ), refer to the following documents:
- The chapter “Congestion Management Overview” in the Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.2
- The chapter “Quality of Service for Voice over IP” in Cisco IOS Quality of Service Solutions

Note

Setting the tx ring works in conjunction with low latency queuing. (For more information, see the section “Selectable Transmission Ring.”)
Driver Per-VC Queuing

In Cisco IOS Release 12.2(2)XK, per-virtual circuit (per-VC) queuing is supported on ADSL interfaces at the driver level, similar to VC-queuing features on other ATM interfaces. This feature underlies many of the IOS QoS queuing features, such as LLQ.

For more information about per-VC queuing, refer to the following documents:

- Understanding Weighted Fair Queuing on ATM
- Per-VC Class-Based, Weighted Fair Queuing (Per-VC CBWFQ) on the Cisco 7200, 3600, and 2600 Routers

Congestion Avoidance

The following existing Cisco IOS congestion avoidance feature is now supported on ADSL:

- Class-Based WRED with DSCP (egress)

Class-Based WRED with DSCP (egress)

Weighted random early detection (WRED) is supported in Release 12.2(2)XK.

For more information about WRED, refer to the following documents:

- The chapter “Quality of Service Overview” in the Cisco IOS Quality of Service Solutions Configuration Guide
- Cisco IOS Quality of Service Solutions Command Reference, Release 12.2
- DiffServ Compliant Weighted Random Error Detection

Policing and Traffic Shaping

The following existing Cisco IOS policing and shaping features are now supported on ADSL:

- Class-Based Policing
- Per-ATM VC Shaping for VBR-NRT

Class-Based Policing

For information about traffic classes and traffic policies, refer to the following document:

The chapter “Configuring Traffic Policing” in the Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.2

Per-ATM VC Shaping for VBR-NRT

For information about per-ATM VC shaping for variable bit rate-nonreal time (VBR-NRT), refer to the following document:

- Understanding the VBR-nrt Service Category and Traffic Shaping for ATM VCs
Link Latency

The following existing Cisco IOS link latency feature is now supported on ADSL:

- Selectable Transmission Ring

Selectable Transmission Ring

The transmission ring (tx ring) is the first-in, first-out (FIFO) buffer used to hold frames before transmission at the digital subscriber line (DSL) driver level. The tx ring defines the maximum number of packets that can wait for transmission at Layer 2.

The tx ring complements the ability of LLQ to minimize jitter and latency of voice packets. For maximum voice quality, a low tx ring setting should be used. For maximum data throughput, a high tx ring setting should be used.

You can configure the size of the tx ring for each permanent virtual circuit (PVC). The default value is 24. The value can be changed to 3. (The only permitted values are 24 and 3.) A tx ring setting of 3 is required for latency-critical traffic. For example, when the tx ring limit is configured as 3 and LLQ is configured on the PVC, the worst case delay for a voice packet is the time required to transmit three data packets. When the buffering is reduced by configuring the tx ring limit, the delay experienced by voice packets is reduced by a combination of the tx ring and LLQ mechanism.

**Note**
The size of the tx ring buffer is measured in packets, not bits.

Other (IP QoS)

The following IP QoS features are now supported on ADSL:

- Local Policy Routing
- Policy-Based Routing
- IP QoS Mapping to ATM CoS
- Access Lists

Local Policy Routing

For information about local policy routing (LPR), refer to the following documents:

- The chapter “Configuring IP Routing Protocols” in the Router Products Configuration Guide

Policy-Based Routing

For information about policy-based routing (PBR), refer to the following document:

- The chapter “Quality of Service Overview” in the Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.2
IP QoS Mapping to ATM CoS

For more information about IP QoS mapping to ATM class of service (CoS), refer to the following document:

The chapter “Configuring IP to ATM Class of Service” in the *Cisco IOS Quality of Service Solutions Configuration Guide*, Release 12.2

Access Lists

For information about configuring access lists, refer to the following document:

The chapter “Configuring IP Services” in the *Cisco IOS IP Configuration Guide*, Release 12.2

Additional Features Supported in Release 12.2(2)XK

The following existing Cisco IOS features are now supported on ADSL:

- Multiple PVC Support
- RFC1483 Routing
- H.323 VoIP

Multiple PVC Support

For information about PVCs, refer to the following documents:

- The chapter “Wide-Area Networking Overview” in the *Cisco IOS Wide-Area Networking Configuration Guide*, Release 12.2
- The chapter “Configuring ATM” in the *Cisco IOS Wide-Area Networking Configuration Guide*, Release 12.2

For caveat information for the Cisco 2600 and 3600 series routers, refer to the following documents:

- *Release Notes for Cisco 2600 Series for Cisco IOS Release 12.2 XK*
- *Release Notes for Cisco 3600 Series for Cisco IOS Release 12.2 XK*

RFC1483 Routing

For information about ATM and ATM adaptation layers (AALs), refer to the following document:

- The chapter “Wide-Area Networking Overview” in the *Cisco IOS Wide-Area Networking Configuration Guide*, Release 12.2

For information regarding AAL5 Subnetwork Access Protocol (AAL5SNAP) encapsulations, refer to the following document:

- The chapter “Configuring ATM” in the *Cisco IOS Wide-Area Networking Configuration Guide*, Release 12.2
H.323 VoIP

For information about Cisco H.323 VoIP features, refer to the following documents:

- The chapter “Configuring Voice over IP” in the *Cisco IOS Voice, Video, and Fax Configuration Guide*, Release 12.2
- The chapter “H.323 Applications” in the *Cisco IOS Voice, Video, and Fax Configuration Guide*, Release 12.2

Benefits

QoS provides improved and more predictable network service for ADSL by

- Supporting dedicated bandwidth.
- Improving loss characteristics.
- Avoiding and managing network congestion.
- Shaping network traffic.
- Setting traffic priorities across the network.

Restrictions

- Analog and BRI voice on the NM-1V/2V card are not supported over VoATM in AAL2.
- Refer to the following documents for caveat information for multiple PVCs on Cisco 2600 and 3600 series routers:
  - *Release Notes for Cisco 2600 Series for Cisco IOS Release 12.2 XK*  
  - *Release Notes for Cisco 3600 Series for Cisco IOS Release 12.2 XK*  
- Multilink Point-to-Point Protocol link fragmentation with interleaving (MLP with LFI) is not supported in this release.

Related Documents

  - *Release Notes for Cisco 3600 Series for Cisco IOS Release 12.2 XL*

**Note**

As of Cisco IOS Release 12.2(2)XK, Feature Navigator does not support features included in this limited-lifetime release.
Supported Standards, MIBs, and RFCs

Standards
No new or modified standards are supported by this feature.

MIBs
No new or modified MIBs are supported by this feature.
To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at the following URL:

RFCs
No new or modified RFCs are supported by this feature.

Prerequisites
To configure these voice and QoS features, you must first install and configure the ADSL WAN interface card on your Cisco 2600 or 3600 router. Refer to the installation and configuration instructions in the following document:

- 1-Port ADSL WAN Interface Card for Cisco 2600 Series and 3600 Series Routers, Release 12.2(4)T

Configuration Tasks
See the following section to configure the tx ring limit.

- Configuring the Tx Ring Limit (required)

Note
For information about configuring the ADSL WAN interface card, refer to the following document:

1-Port ADSL WAN Interface Card for Cisco 2600 Series and 3600 Series Routers, Release 12.2(4)T
# Configuring the Tx Ring Limit

To configure the tx ring limit, use the following commands beginning in global configuration mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
Router (config)# interface atm slot/port | Configures an ATM interface type and enters interface configuration mode.  
The arguments are as follows:  
- *slot*—Specifies the backplane slot number on your router. The value ranges from 0 to 4, depending on what router you are configuring. Refer to your router hardware documentation.  
- *port*—ATM port number on a Cisco 2600 or 3600 series router, indicating the T1 link that you are configuring. Enter a value from 0 to 3 or from 0 to 7, depending on whether the network module has four ports or eight ports. |
| **Step 2**  
Router (config-if)# pvc [name] vpi/vci [ces | ilmi | qsaal | smds] | Creates or assigns a name to an ATM permanent virtual circuit (PVC), specifies the encapsulation type on an ATM PVC, and enters interface-ATM-VC configuration mode.  
The keywords and arguments are as follows:  
- *name*—(Optional) Specifies the name of the PVC or map. The name can be a maximum of 16 characters.  
- *vpi*—Specifies the ATM network virtual path identifier (VPI) for this PVC. The absence of the “/” and a VPI value defaults the VPI value to 0.  
  On Cisco 2600 and 3600 series routers using inverse multiplexing over ATM (IMA), the ranges are 0 to 15, 64 to 79, 128 to 143, and 192 to 207.  
- *vci*—Specifies the ATM network virtual channel identifier (VCI) for this PVC. This value ranges from 0 to 1 less than the maximum value set for this interface by the `atm vc-per-vp` command.  
  Typically, lower values 0 to 31 are reserved for specific traffic (for example, F4 Operation, Administration, and Maintenance [OAM], switched virtual circuit [SVC] signaling, and Integrated Local Management Interface [ILMI]) and should not be used.  
  The VCI is a 16-bit field in the header of the ATM cell. The VCI value is unique only on a single link, not throughout the ATM network, because it has local significance only.  
  The *vpi* and *vci* arguments cannot both be set to 0; if one is 0, the other cannot be 0.  
- *ces*—(Optional) circuit emulation service encapsulation. This keyword is available on the OC-3/STM-1 ATM Circuit Emulation Service network module only. |
Voice and Quality of Service Features for ADSL on Cisco 2600 and 3600 Series Routers

Configuration Tasks

Cisco IOS Release 12.2(2)XK

Verifying

The tx ring limit has been set in the following VoIP and data configuration examples:

The following `show policy-map interface` command output from a Cisco 2600 router displays a service-policy setup:

```
Router# show policy-map interface atm0/0

ATM0/0:VC 0/201 -

Service-policy output:VOICE-160-DATA-480

Class-map:class-default (match-any)
27234 packets, 41109865 bytes
30 second offered rate 7000 bps, drop rate 3000 bps
Match:any
Weighted Fair Queueing
Queue:Conversation 73
Bandwidth 320 (kbps) Max Threshold 64 (packets)
(pkts matched/bytes matched) 27231/41105329
(depth/total drops/no-buffer drops) 0/14711/0

For
Class-map:class-default (match-any)
113187 packets, 140760375 bytes
30 second offered rate 1205000 bps, drop rate 787000 bps
Match:any
```

Step 3

```
Router (config-if-atm-vc)#

```

```
tx-ring-limit ring-limit
```

Limits the number of packets that can be used on a transmission ring on the WIC-180SL. The `ring-limit` argument specifies the maximum number of allowable packets that can be placed on the transmission ring.

**Note** The default value is 24. The value can be changed to 3. (The only permitted values are 24 and 3.)
The following *show queue* command output from a Cisco 2600 router displays the flow of traffic currently being transported over an ATM interface:

Router# show queue atm 0/0

Interface ATM0/0 VC 0/201
Queueing strategy:weighted fair
Output queue:70/512/64/70462 (size/max total/threshold/drops)
   Conversations 3/6/64 (active/max active/max total)
   Reserved Conversations 0/0 (allocated/max allocated)
Available Bandwidth 320 kilobits/sec

   (depth/weight/total drops/no-buffer drops/interleaves) 3/0/0/0/0
Conversation 72, linktype:ip, length:72
   source:192.168.1.2, destination:192.168.1.1, id:0x0C77E, ttl:254,
   TOS:16 prot:17, source port 19406, destination port 16406

   (depth/weight/total drops/no-buffer drops/interleaves) 1/32384/0/0/0
Conversation 23, linktype:ip, length:196
   source:192.168.1.2, destination:192.168.1.1, id:0x00000, ttl:255,
   TOS:0 prot:17, source port 18653, destination port 18691

   (depth/weight/total drops/no-buffer drops/interleaves) 64/32384/65793/0/0
Conversation 59, linktype:ip, length:1502
   source:10.1.1.205, destination:10.10.11.200, id:0x0000, ttl:59,
   TOS:0 prot:17, source port 500, destination port 500

The following *show queueing interface* command output from a Cisco 2600 router displays the queuing configuration of an ATM interface:

Router# show queueing interface atm0/0

Interface ATM0/0 VC 0/201
Queueing strategy:weighted fair
Output queue:66/512/64/61642 (size/max total/threshold/drops)
   Conversations 2/6/64 (active/max active/max total)
   Reserved Conversations 0/0 (allocated/max allocated)
Available Bandwidth 320 kilobits/sec

The following *show interfaces atm* command output from a Cisco 2600 router displays statistics for an ATM interface:

Router# show interfaces atm 0/0

ATM0/0 is up, line protocol is up
Hardware is DSLSE (with Alcatel ADSL Module)
Internet address is 192.168.1.2/24
MTU 4470 bytes, sub MTU 4470, BW 800 Kbit, DLY 2560 usec,
   reliability 255/255, txload 166/255, rxload 21/255
Encapsulation ATM, loopback not set
Encapsulation(s):AAL5 AAL2, PVC mode
23 maximum active VCs, 256 VCs per VP, 2 current VCCs
VC idle disconnect time:300 seconds
Last input 00:00:02, output 00:00:00, output hang never
Last clearing of "show interface" counters never
Input queue:0/75/0/0 (size/max/drops/flushes); Total output drops:62360
Queueing strategy:None
30 second input rate 66000 bits/sec, 113 packets/sec
30 second output rate 523000 bits/sec, 229 packets/sec
1603630 packets input, 403845485 bytes, 0 no buffer
Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
2680554 packets output, 518308502 bytes, 0 underruns
The following `show atm vc` command output from a Cisco 2600 router displays information about an ATM virtual circuit:

Router# show atm vc

<table>

The following `show interfaces` command output is from a Cisco 2600 router:

Router# show interfaces e0/1 rate-limit

Ethernet0/1
Input matches: access-group 1
params: 160000 bps, 4470 limit, 4470 extended limit
conformed 15673 packets, 23728922 bytes; action: set-dscp-transmit 32
exceeded 102965 packets, 155889010 bytes; action: continue
last packet: 0ms ago, current burst: 4146 bytes
last cleared 00:19:46 ago, conformed 160000 bps, exceeded 1051000 bps
matches: access-group 1
params: 80000 bps, 4470 limit, 4470 extended limit
conformed 7836 packets, 11863704 bytes; action: set-dscp-transmit 16
exceeded 95130 packets, 144026820 bytes; action: drop
last packet: 4ms ago, current burst: 3708 bytes
last cleared 00:19:46 ago, conformed 79000 bps, exceeded 971000 bps
The following `show interfaces atm` command output is from a Cisco 2600 router:

```
Router# show interfaces atm0/0
ATM0/0 is up, line protocol is up
Hardware is DSLSAR (with Alcatel ADSL Module)
MTU 4470 bytes, sub MTU 4470, BW 800 Kbit, DLY 2560 usec,
reliability 255/255, txload 181/255, rxload 1/255
Encapsulation ATM, loopback not set
Encapsulation(s):AAL5  AAL2, PVC mode
23 maximum active VCs, 256 VCs per VP, 2 current VCCs
VC idle disconnect time:300 seconds
Last input 00:33:22, output 00:00:00, output hang never
Last clearing of 'show interface' counters 00:20:09
Input queue:0/75/0/0 (size/max/drops/flushes); Total output drops:208908
Queueing strategy:None
30 second input rate 0 bits/sec, 0 packets/sec
30 second output rate 569000 bits/sec, 48 packets/sec
0 packets input, 0 bytes, 0 no buffer
Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
57315 packets output, 86075268 bytes, 0 underruns
0 output errors, 0 collisions, 0 interface resets
0 output buffer failures, 0 output buffers swapped out
```

The following `show queue` command output is from a Cisco 2600 router:

```
Router# show queue atm0/0
Interface ATM0/0 VC 0/201
Queueing strategy:weighted fair
Output queue:130/512/64/214301 (size/max total/threshold/drops)
Conversations 3/3/64 (active/max active/max total)
Reserved Conversations 2/2 (allocated/max allocated)
Available Bandwidth 0 kilobits/sec

```

**VoIP and Data Example**

The following is sample output from a Cisco 2611 router. In this example, the customer premises equipment (CPE) is restricted to only a single PVC. Voice and data are sent over a single VC. The `tx-ring-limit` command and LLQ are used to give preferential treatment for voice traffic.
