INDEX
About Cisco IOS Software Documentation

This chapter discusses the objectives, audience, organization, and conventions of Cisco IOS software documentation. It also provides sources for obtaining documentation from Cisco Systems.

Documentation Objectives

Cisco IOS software documentation describes the tasks and commands necessary to configure and maintain Cisco networking devices.

Audience

The Cisco IOS software documentation set is intended primarily for users who configure and maintain Cisco networking devices (such as routers and switches) but who may not be familiar with the tasks, the relationship between tasks, or the Cisco IOS software commands necessary to perform particular tasks. The Cisco IOS software documentation set is also intended for those users experienced with Cisco IOS software who need to know about new features, new configuration options, and new software characteristics in the current Cisco IOS software release.

Documentation Organization

The Cisco IOS software documentation set consists of documentation modules and master indexes. In addition to the main documentation set, there are supporting documents and resources.

Documentation Modules

The Cisco IOS documentation modules consist of configuration guides and corresponding command reference publications. Chapters in a configuration guide describe protocols, configuration tasks, and Cisco IOS software functionality and contain comprehensive configuration examples. Chapters in a command reference publication provide complete Cisco IOS command syntax information. Use each configuration guide in conjunction with its corresponding command reference publication.
Figure 1 shows the Cisco IOS software documentation modules.

The abbreviations (for example, FC and FR) next to the book icons are page designators, which are defined in a key in the index of each document to help you with navigation. The bullets under each module list the major technology areas discussed in the corresponding books.
Module DC/DR:
- Preparing for Dial Access
- Modem and Dial Shelf Configuration and Management
- ISDN Configuration
- Signalling Configuration
- Dial-on-Demand Routing Configuration
- Dial-Backup Configuration
- Dial-Related Addressing Services
- Virtual Templates, Profiles, and Networks
- PPP Configuration
- Callback and Bandwidth Allocation Configuration
- Dial Access Specialized Features
- Dial Access Scenarios

Module TC/TR:
- ARA
- LAT
- NASI
- Telnet
- TN3270
- X.25 PAD
- Protocol Translation

Module BC/B1R:
- Transparent Bridging
- SRB
- Token Ring Inter-Switch Link
- Token Ring Route Switch Module
- RSRB
- DLSw+
- Serial Tunnel and Block Serial Tunnel
- LLC2 and SDLC
- IBM Network Media Translation
- SNA Frame Relay Access
- NCIA Client/Server
- Airline Product Set

Module BC/B2R:
- DSPU and SNA Service Point
- SNA Switching Services
- Cisco Transaction Connection
- Cisco Mainframe Channel Connection
- CLAW and TCP/IP Offload
- CSNA, CMPC, and CMPC+
- TN3270 Server

Module VC/VR:
- Voice over IP
- Call Control Signalling
- Voice over Frame Relay
- Voice over ATM
- Telephony Applications
- Trunk Management
- Fax, Video, and Modem Support

Module QC/QR:
- Packet Classification
- Congestion Management
- Congestion Avoidance
- Policing and Shaping
- Signalling
- Link Efficiency Mechanisms

Module XC/XR:
- Cisco IOS Switching Paths
- NetFlow Switching
- Multiprotocol Label Switching
- Multilayer Switching
- Multicast Distributed Switching
- Virtual LANs
- LAN Emulation
Master Indexes

Two master indexes provide indexing information for the Cisco IOS software documentation set: an index for the configuration guides and an index for the command references. Individual books also contain a book-specific index.

The master indexes provide a quick way for you to find a command when you know the command name but not which module contains the command. When you use the online master indexes, you can click the page number for an index entry and go to that page in the online document.

Supporting Documents and Resources

The following documents and resources support the Cisco IOS software documentation set:

- **Cisco IOS Command Summary** (two volumes)—This publication explains the function and syntax of the Cisco IOS software commands. For more information about defaults and usage guidelines, refer to the Cisco IOS command reference publications.

- **Cisco IOS System Error Messages**—This publication lists and describes Cisco IOS system error messages. Not all system error messages indicate problems with your system. Some are purely informational, and others may help diagnose problems with communications lines, internal hardware, or the system software.

- **Cisco IOS Debug Command Reference**—This publication contains an alphabetical listing of the debug commands and their descriptions. Documentation for each command includes a brief description of its use, command syntax, usage guidelines, and sample output.

- **Dictionary of Internetworking Terms and Acronyms**—This Cisco publication compiles and defines the terms and acronyms used in the internetworking industry.

- New feature documentation—The Cisco IOS software documentation set documents the mainline release of Cisco IOS software (for example, Cisco IOS Release 12.2). New software features are introduced in early deployment releases (for example, the Cisco IOS “T” release train for 12.2, 12.2(x)T). Documentation for these new features can be found in standalone documents called “feature modules.” Feature module documentation describes new Cisco IOS software and hardware networking functionality and is available on Cisco.com and the Documentation CD-ROM.

- Release notes—This documentation describes system requirements, provides information about new and changed features, and includes other useful information about specific software releases. See the section “Using Software Release Notes” in the chapter “Using Cisco IOS Software” for more information.

- Caveats documentation—This documentation provides information about Cisco IOS software defects in specific software releases.

- RFCs—RFCs are standards documents maintained by the Internet Engineering Task Force (IETF). Cisco IOS software documentation references supported RFCs when applicable. The full text of referenced RFCs may be obtained on the World Wide Web at http://www.rfc-editor.org/.

- MIBs—MIBs are used for network monitoring. For lists of supported MIBs by platform and release, and to download MIB files, see the Cisco MIB website on Cisco.com at http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml.
New and Changed Information

The following is new or changed information since the last release of the Cisco IOS IP and IP routing publications:

- The title of the *Cisco IOS IP and IP Routing Configuration Guide* has been changed to *Cisco IOS IP Configuration Guide*.
- The *Cisco IOS IP and IP Routing Command Reference* has been divided into three separate publications with the following titles:
  - *Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services*
  - *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols*
  - *Cisco IOS IP Command Reference, Volume 3 of 3: Multicast*
- The following new chapters were added to the *Cisco IOS IP Configuration Guide*:
  - “Configuring Server Load Balancing”
  - “Configuring Source Specific Multicast”
  - “Configuring Bidirectional PIM”
  - “Configuring Router-Port Group Management Protocol”
- The following new chapter was added to the *Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services*:
  - “Server Load Balancing Commands”

Document Conventions

Within Cisco IOS software documentation, the term *router* is generally used to refer to a variety of Cisco products (for example, routers, access servers, and switches). Routers, access servers, and other networking devices that support Cisco IOS software are shown interchangeably within examples. These products are used only for illustrative purposes; that is, an example that shows one product does not necessarily indicate that other products are not supported.

The Cisco IOS documentation set uses the following conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^ or Ctrl</td>
<td>The ^ and Ctrl symbols represent the Control key. For example, the key combination ^D or Ctrl-D means hold down the Control key while you press the D key. Keys are indicated in capital letters but are not case sensitive.</td>
</tr>
<tr>
<td>string</td>
<td>A string is a nonquoted set of characters shown in italics. For example, when setting an SNMP community string to public, do not use quotation marks around the string or the string will include the quotation marks.</td>
</tr>
</tbody>
</table>
Command syntax descriptions use the following conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface text indicates commands and keywords that you enter literally as shown.</td>
</tr>
<tr>
<td><em>italics</em></td>
<td>Italic text indicates arguments for which you supply values.</td>
</tr>
<tr>
<td><code>[x]</code></td>
<td>Square brackets enclose an optional element (keyword or argument).</td>
</tr>
<tr>
<td>`</td>
<td>`</td>
</tr>
<tr>
<td>`[x</td>
<td>y]`</td>
</tr>
<tr>
<td>`{x</td>
<td>y}`</td>
</tr>
</tbody>
</table>

Nested sets of square brackets or braces indicate optional or required choices within optional or required elements. For example:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`[x {y</td>
<td>z}]`</td>
</tr>
</tbody>
</table>

Examples use the following conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>screen</code></td>
<td>Examples of information displayed on the screen are set in Courier font.</td>
</tr>
<tr>
<td><code>boldface screen</code></td>
<td>Examples of text that you must enter are set in Courier bold font.</td>
</tr>
<tr>
<td><code>&lt; &gt;</code></td>
<td>Angle brackets enclose text that is not printed to the screen, such as passwords.</td>
</tr>
<tr>
<td><code>!</code></td>
<td>An exclamation point at the beginning of a line indicates a comment line. (Exclamation points are also displayed by the Cisco IOS software for certain processes.)</td>
</tr>
<tr>
<td><code>[ ]</code></td>
<td>Square brackets enclose default responses to system prompts.</td>
</tr>
</tbody>
</table>

The following conventions are used to attract the attention of the reader:

- **Caution**
  - Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

- **Note**
  - Means *reader take note*. Notes contain helpful suggestions or references to materials not contained in this manual.

- **Timesaver**
  - Means the *described action saves time*. You can save time by performing the action described in the paragraph.
Obtaining Documentation

The following sections provide sources for obtaining documentation from Cisco Systems.

World Wide Web

The most current Cisco documentation is available on the World Wide Web at the following website:
http://www.cisco.com
Translated documentation is available at the following website:

Documentation CD-ROM

Cisco documentation and additional literature are available in a CD-ROM package, which ships with your product. The Documentation CD-ROM is updated monthly and may be more current than printed documentation. The CD-ROM package is available as a single unit or through an annual subscription.

Ordering Documentation

Cisco documentation can be ordered in the following ways:

- Registered Cisco Direct Customers can order Cisco product documentation from the Networking Products MarketPlace:
  http://www.cisco.com/cgi-bin/order/order_root.pl
- Registered Cisco.com users can order the Documentation CD-ROM through the online Subscription Store:
  http://www.cisco.com/go/subscription
- Nonregistered Cisco.com users can order documentation through a local account representative by calling Cisco corporate headquarters (California, USA) at 408 526-7208 or, in North America, by calling 800 553-NETS(6387).

Documentation Feedback

If you are reading Cisco product documentation on the World Wide Web, you can submit technical comments electronically. Click Feedback in the toolbar and select Documentation. After you complete the form, click Submit to send it to Cisco.

You can e-mail your comments to bug-doc@cisco.com.
To submit your comments by mail, use the response card behind the front cover of your document, or write to the following address:
Cisco Systems, Inc.
Document Resource Connection
170 West Tasman Drive
San Jose, CA 95134-9883
We appreciate your comments.

Obtaining Technical Assistance

Cisco provides Cisco.com as a starting point for all technical assistance. Customers and partners can obtain documentation, troubleshooting tips, and sample configurations from online tools. For Cisco.com registered users, additional troubleshooting tools are available from the TAC website.

Cisco.com

Cisco.com is the foundation of a suite of interactive, networked services that provides immediate, open access to Cisco information and resources at anytime, from anywhere in the world. This highly integrated Internet application is a powerful, easy-to-use tool for doing business with Cisco.

Cisco.com provides a broad range of features and services to help customers and partners streamline business processes and improve productivity. Through Cisco.com, you can find information about Cisco and our networking solutions, services, and programs. In addition, you can resolve technical issues with online technical support, download and test software packages, and order Cisco learning materials and merchandise. Valuable online skill assessment, training, and certification programs are also available.

Customers and partners can self-register on Cisco.com to obtain additional personalized information and services. Registered users can order products, check on the status of an order, access technical support, and view benefits specific to their relationships with Cisco.

To access Cisco.com, go to the following website:

http://www.cisco.com

Technical Assistance Center

The Cisco TAC website is available to all customers who need technical assistance with a Cisco product or technology that is under warranty or covered by a maintenance contract.

Contacting TAC by Using the Cisco TAC Website

If you have a priority level 3 (P3) or priority level 4 (P4) problem, contact TAC by going to the TAC website:

http://www.cisco.com/tac
P3 and P4 level problems are defined as follows:

- **P3**—Your network performance is degraded. Network functionality is noticeably impaired, but most business operations continue.
- **P4**—You need information or assistance on Cisco product capabilities, product installation, or basic product configuration.

In each of the above cases, use the Cisco TAC website to quickly find answers to your questions.

To register for Cisco.com, go to the following website:

http://www.cisco.com/register/

If you cannot resolve your technical issue by using the TAC online resources, Cisco.com registered users can open a case online by using the TAC Case Open tool at the following website:

http://www.cisco.com/tac/caseopen

**Contacting TAC by Telephone**

If you have a priority level 1 (P1) or priority level 2 (P2) problem, contact TAC by telephone and immediately open a case. To obtain a directory of toll-free numbers for your country, go to the following website:

P1 and P2 level problems are defined as follows:

- **P1**—Your production network is down, causing a critical impact to business operations if service is not restored quickly. No workaround is available.
- **P2**—Your production network is severely degraded, affecting significant aspects of your business operations. No workaround is available.
Using Cisco IOS Software

This chapter provides helpful tips for understanding and configuring Cisco IOS software using the command-line interface (CLI). It contains the following sections:

- Understanding Command Modes
- Getting Help
- Using the no and default Forms of Commands
- Saving Configuration Changes
- Filtering Output from the show and more Commands
- Identifying Supported Platforms

For an overview of Cisco IOS software configuration, refer to the *Cisco IOS Configuration Fundamentals Configuration Guide*.

For information on the conventions used in the Cisco IOS software documentation set, see the chapter “About Cisco IOS Software Documentation” located at the beginning of this book.

Understanding Command Modes

You use the CLI to access Cisco IOS software. Because the CLI is divided into many different modes, the commands available to you at any given time depend on the mode you are currently in. Entering a question mark (?) at the CLI prompt allows you to obtain a list of commands available for each command mode.

When you log in to the CLI, you are in user EXEC mode. User EXEC mode contains only a limited subset of commands. To have access to all commands, you must enter privileged EXEC mode, normally by using a password. From privileged EXEC mode you can issue any EXEC command—user or privileged mode—or you can enter global configuration mode. Most EXEC commands are one-time commands. For example, *show* commands show important status information, and *clear* commands clear counters or interfaces. The EXEC commands are not saved when the software reboots.

Configuration modes allow you to make changes to the running configuration. If you later save the running configuration to the startup configuration, these changed commands are stored when the software is rebooted. To enter specific configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and a variety of other modes, such as protocol-specific modes.

ROM monitor mode is a separate mode used when the Cisco IOS software cannot load properly. If a valid software image is not found when the software boots or if the configuration file is corrupted at startup, the software might enter ROM monitor mode.
Table 1 describes how to access and exit various common command modes of the Cisco IOS software. It also shows examples of the prompts displayed for each mode.

**Table 1  Accessing and Exiting Command Modes**

<table>
<thead>
<tr>
<th>Command Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>User EXEC</td>
<td>Log in.</td>
<td>Router&gt;</td>
<td>Use the <code>logout</code> command.</td>
</tr>
<tr>
<td>Privileged EXEC</td>
<td>From user EXEC mode, use the <code>enable</code> EXEC command.</td>
<td>Router#</td>
<td>To return to user EXEC mode, use the <code>disable</code> command.</td>
</tr>
<tr>
<td>Global configuration</td>
<td>From privileged EXEC mode, use the <code>configure terminal</code> privileged EXEC command.</td>
<td>Router(config)#</td>
<td>To return to privileged EXEC mode from global configuration mode, use the <code>exit</code> or <code>end</code> command, or press Ctrl-Z.</td>
</tr>
<tr>
<td>Interface configuration</td>
<td>From global configuration mode, specify an interface using an <code>interface</code> command.</td>
<td>Router(config-if)#</td>
<td>To return to global configuration mode, use the <code>exit</code> command. To return to privileged EXEC mode, use the <code>end</code> command, or press Ctrl-Z.</td>
</tr>
<tr>
<td>ROM monitor</td>
<td>From privileged EXEC mode, use the <code>reload</code> EXEC command. Press the Break key during the first 60 seconds while the system is booting.</td>
<td>&gt;</td>
<td>To exit ROM monitor mode, use the <code>continue</code> command.</td>
</tr>
</tbody>
</table>

For more information on command modes, refer to the “Using the Command-Line Interface” chapter in the *Cisco IOS Configuration Fundamentals Configuration Guide*.

**Getting Help**

Entering a question mark (?) at the CLI prompt displays a list of commands available for each command mode. You can also get a list of keywords and arguments associated with any command by using the context-sensitive help feature.

To get help specific to a command mode, a command, a keyword, or an argument, use one of the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>help</td>
<td>Provides a brief description of the help system in any command mode.</td>
</tr>
<tr>
<td><code>abbreviated-command-entry?</code></td>
<td>Provides a list of commands that begin with a particular character string. (No space between command and question mark.)</td>
</tr>
<tr>
<td><code>abbreviated-command-entry&lt;Tab&gt;</code></td>
<td>Completes a partial command name.</td>
</tr>
<tr>
<td>?</td>
<td>Lists all commands available for a particular command mode.</td>
</tr>
<tr>
<td><code>command ?</code></td>
<td>Lists the keywords or arguments that you must enter next on the command line. (Space between command and question mark.)</td>
</tr>
</tbody>
</table>
Example: How to Find Command Options

This section provides an example of how to display syntax for a command. The syntax can consist of optional or required keywords and arguments. To display keywords and arguments for a command, enter a question mark (?) at the configuration prompt or after entering part of a command followed by a space. The Cisco IOS software displays a list and brief description of available keywords and arguments. For example, if you were in global configuration mode and wanted to see all the keywords or arguments for the arap command, you would type arap ?.

The <cr> symbol in command help output stands for “carriage return.” On older keyboards, the carriage return key is the Return key. On most modern keyboards, the carriage return key is the Enter key. The <cr> symbol at the end of command help output indicates that you have the option to press Enter to complete the command and that the arguments and keywords in the list preceding the <cr> symbol are optional. The <cr> symbol by itself indicates that no more arguments or keywords are available and that you must press Enter to complete the command.

Table 2 shows examples of how you can use the question mark (?) to assist you in entering commands. The table steps you through configuring an IP address on a serial interface on a Cisco 7206 router that is running Cisco IOS Release 12.0(3).

<table>
<thead>
<tr>
<th>Command</th>
<th>Comment</th>
</tr>
</thead>
</table>
| Router> enable <password> | Enter the enable command and password to access privileged EXEC commands. You are in privileged EXEC mode when the prompt changes to Router#.
| Router# configure terminal | Enter the configure terminal privileged EXEC command to enter global configuration mode. You are in global configuration mode when the prompt changes to Router(config)#.
| Router(config)# interface serial ? | Enter interface configuration mode by specifying the serial interface that you want to configure using the interface serial global configuration command. Enter ? to display what you must enter next on the command line. In this example, you must enter the serial interface slot number and port number, separated by a forward slash.
| Router(config)# interface serial 4/0 | You are in interface configuration mode when the prompt changes to Router(config-if)#.
| Router(config)# interface serial 4/0 | |
Table 2  How to Find Command Options (continued)

<table>

</tr>
<tr>
<td></td>
<td>example shows only some of the available interface IP configuration</td>
</tr>
<tr>
<td></td>
<td>commands.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Almost every configuration command has a **no** form. In general, use the **no** form to disable a function. Use the command without the **no** keyword to reenable a disabled function or to enable a function that is disabled by default. For example, IP routing is enabled by default. To disable IP routing, use the **no ip routing** command; to reenable IP routing, use the **ip routing** command. The Cisco IOS software command reference publications provide the complete syntax for the configuration commands and describe what the **no** form of a command does.

Configuration commands also can have a **default** form, which returns the command settings to the default values. Most commands are disabled by default, so in such cases using the **default** form has the same result as using the **no** form of the command. However, some commands are enabled by default and...
have variables set to certain default values. In these cases, the **default** form of the command enables the command and sets the variables to their default values. The Cisco IOS software command reference publications describe the effect of the **default** form of a command if the command functions differently than the **no** form.

**Saving Configuration Changes**

Use the `copy system:running-config nvram:startup-config` command to save your configuration changes to the startup configuration so that the changes will not be lost if the software reloads or a power outage occurs. For example:

```
Router# copy system:running-config nvram:startup-config
Building configuration...
```

It might take a minute or two to save the configuration. After the configuration has been saved, the following output appears:

```
[OK]
Router#
```

On most platforms, this task saves the configuration to NVRAM. On the Class A Flash file system platforms, this task saves the configuration to the location specified by the `CONFIG_FILE` environment variable. The `CONFIG_FILE` variable defaults to NVRAM.

**Filtering Output from the show and more Commands**

In Cisco IOS Release 12.0(1)T and later releases, you can search and filter the output of `show` and `more` commands. This functionality is useful if you need to sort through large amounts of output or if you want to exclude output that you need not see.

To use this functionality, enter a `show` or `more` command followed by the “pipe” character (|); one of the keywords `begin`, `include`, or `exclude`; and a regular expression on which you want to search or filter (the expression is case-sensitive):

```
command | { begin | include | exclude } regular-expression
```

The output matches certain lines of information in the configuration file. The following example illustrates how to use output modifiers with the `show interface` command when you want the output to include only lines in which the expression “protocol” appears:

```
Router# show interface | include protocol
FastEthernet0/0 is up, line protocol is up
Serial4/0 is up, line protocol is up
Serial4/1 is up, line protocol is up
Serial4/2 is administratively down, line protocol is down
Serial4/3 is administratively down, line protocol is down
```

For more information on the search and filter functionality, refer to the “Using the Command-Line Interface” chapter in the *Cisco IOS Configuration Fundamentals Configuration Guide.*
Identifying Supported Platforms

Cisco IOS software is packaged in feature sets consisting of software images that support specific platforms. The feature sets available for a specific platform depend on which Cisco IOS software images are included in a release. To identify the set of software images available in a specific release or to find out if a feature is available in a given Cisco IOS software image, see the following sections:

- Using Feature Navigator
- Using Software Release Notes

Using Feature Navigator

Feature Navigator is a web-based tool that enables you to quickly determine which Cisco IOS software images support a particular set of features and which features are supported in a particular Cisco IOS image.

Feature Navigator is available 24 hours a day, 7 days a week. To access Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, e-mail the Contact Database Administration group at cdbadmin@cisco.com. If you do not have an account on Cisco.com, go to http://www.cisco.com/register and follow the directions to establish an account.

To use Feature Navigator, you must have a JavaScript-enabled web browser such as Netscape 3.0 or later, or Internet Explorer 4.0 or later. Internet Explorer 4.0 always has JavaScript enabled. To enable JavaScript for Netscape 3.x or Netscape 4.x, follow the instructions provided with the web browser. For JavaScript support and enabling instructions for other browsers, check with the browser vendor.

Feature Navigator is updated when major Cisco IOS software releases and technology releases occur. You can access Feature Navigator at the following URL:

http://www.cisco.com/go/fn

Using Software Release Notes

Cisco IOS software releases include release notes that provide the following information:

- Platform support information
- Memory recommendations
- Microcode support information
- Feature set tables
- Feature descriptions
- Open and resolved severity 1 and 2 caveats for all platforms

Release notes are intended to be release-specific for the most current release, and the information provided in these documents may not be cumulative in providing information about features that first appeared in previous releases.
IP Multicast Routing Commands

This chapter describes the commands used to configure and monitor IP multicast routing. For IP multicast routing configuration information and examples, refer to the “Configuring IP Multicast Routing” chapter of the Cisco IOS IP Configuration Guide.
clear ip cgmp

To clear all group entries from the caches of Catalyst switches, use the clear ip cgmp command in EXEC mode.

```
clear ip cgmp [type number]
```

**Syntax Description**
- `type number` (Optional) Interface type and number.

**Command Modes**
- EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command sends a Cisco Group Management Protocol (CGMP) leave message with a group address of 0000.0000.0000 and a unicast address of 0000.0000.0000. This message instructs the switches to clear all group entries they have cached.

If an interface type and number are specified, the leave message is sent only on that interface. Otherwise, it is sent on all CGMP-enabled interfaces.

**Examples**

The following example clears the CGMP cache:

```
Router# clear ip cgmp
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip cgmp</td>
<td>Enables CGMP on an interface of a router connected to a Catalyst 5000 switch.</td>
</tr>
</tbody>
</table>
clear ip dvmrp route

To delete routes from the Distance Vector Multicast Routing Protocol (DVMRP) routing table, use the `clear ip dvmrp route` command in EXEC mode.

```
clear ip dvmrp route { * | route }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Clears all routes from the DVMRP table.</td>
</tr>
<tr>
<td>route</td>
<td>Clears the longest matched route. Can be an IP address, a network number, or an IP Domain Name System (DNS) name.</td>
</tr>
</tbody>
</table>

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

The following example deletes route 10.1.1.1 from the DVMRP routing table:

```
Router# clear ip dvmrp route 10.1.1.1
```
clear ip igmp group

To delete entries from the Internet Group Management Protocol (IGMP) cache, use the `clear ip igmp group` command in EXEC mode.

```
clear ip igmp group [group-name | group-address | type number]
```

**Syntax Description**

- `group-name` (Optional) Name of the multicast group, as defined in the Domain Name System (DNS) hosts table or with the `ip host` command.
- `group-address` (Optional) Address of the multicast group. This is a multicast IP address in four-part, dotted notation.
- `type number` (Optional) Interface type and number.

**Defaults**

When this command is used with no arguments, all entries are deleted from the IGMP cache.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The IGMP cache contains a list of the multicast groups of which hosts on the directly connected LAN are members. If the router has joined a group, it is also listed in the cache.

To delete all entries from the IGMP cache, specify the `clear ip igmp group` command with no arguments.

**Examples**

The following example clears entries for the multicast group 224.0.255.1 from the IGMP cache:

```
Router# clear ip igmp group 224.0.255.1
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip host</code></td>
<td>Defines a static host name-to-address mapping in the host cache.</td>
</tr>
<tr>
<td><code>show ip igmp groups</code></td>
<td>Displays the multicast groups that are directly connected to the router and that were learned through IGMP.</td>
</tr>
<tr>
<td><code>show ip igmp interface</code></td>
<td>Displays multicast-related information about an interface.</td>
</tr>
</tbody>
</table>
clear ip mroute

To delete entries from the IP multicast routing table, use the `clear ip mroute` command in EXEC mode.

```
clear ip mroute { * | group-name [source-name | source-address] | group-address [source-name | source-address] }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>*</code></td>
<td>Deletes all entries from the IP multicast routing table.</td>
</tr>
<tr>
<td><code>group-name</code></td>
<td>Name of the multicast group, as defined in the Domain Name System (DNS) hosts table or with the <code>ip host</code> command.</td>
</tr>
<tr>
<td><code>group-address</code></td>
<td>IP address of the multicast group. This is a multicast IP address in four-part, dotted notation.</td>
</tr>
<tr>
<td><code>source-name</code></td>
<td>(Optional) If you specify a group name or address, you can also specify a name or address of a multicast source that is sending to the group. A source need not be a member of the group.</td>
</tr>
<tr>
<td><code>source-address</code></td>
<td>(Optional) If you specify a group name or address, you can also specify a name or address of a multicast source that is sending to the group. A source need not be a member of the group.</td>
</tr>
</tbody>
</table>

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

The following example deletes all entries from the IP multicast routing table:

```
Router# clear ip mroute *
```

The following example deletes from the IP multicast routing table all sources on the 10.3.0.0 subnet that are sending to the multicast group 224.2.205.42. Note that this example deletes all sources on network 10.3, not individual sources.

```
Router# clear ip mroute 224.2.205.42 10.3.0.0
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip host</td>
<td>Defines a static host name-to-address mapping in the host cache.</td>
</tr>
<tr>
<td>show ip mroute</td>
<td>Displays the contents of the IP multicast routing table.</td>
</tr>
</tbody>
</table>
clear ip pim auto-rp

The `clear ip pim auto-rp` command is replaced by the `clear ip pim rp-mapping` command. See the `clear ip pim rp-mapping` command for more information.
clear ip pim rp-mapping

To delete group-to-rendezvous point (RP) mapping entries from the RP mapping cache, use the `clear ip pim rp-mapping` command in privileged EXEC mode.

```
clear ip pim [vrf vrf-name] rp-mapping [rp-address]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf</td>
<td>(Optional) Supports the multicast VPN routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td>vrf-name</td>
<td>(Optional) Name assigned to the VRF.</td>
</tr>
<tr>
<td>rp-address</td>
<td>(Optional) IP address of the RP about which to clear associated group-to-RP mappings. If this argument is omitted, all group-to-RP mapping entries are cleared.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1</td>
<td>The <code>clear ip pim auto-rp</code> command was deprecated and replaced by the <code>clear ip pim rp-mapping</code> command.</td>
</tr>
<tr>
<td>12.0(23)S</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `clear ip pim rp-mapping` command replaces the `clear ip pim auto-rp` command.

The `clear ip pim rp-mapping` command deletes group-to-RP mapping entries learned by Auto-RP or by a bootstrap router (BSR) from the RP mapping cache.

Use the `show ip pim rp` command to display active RPs that are cached with associated multicast routing entries.

**Examples**

The following example shows how to clear all group-to-RP entries from the RP mapping cache:

```
Router# clear ip pim rp-mapping
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip pim rp</code></td>
<td>Displays active RPs that are cached with associated multicast routing entries.</td>
</tr>
</tbody>
</table>
clear ip rtp header-compression

To clear Real-Time Transport Protocol (RTP) header compression structures and statistics, use the `clear ip rtp header-compression` command in EXEC mode.

```
clear ip rtp header-compression [type number]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>type number</th>
<th>(Optional) Interface type and number.</th>
</tr>
</thead>
</table>

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If this command is used without an interface type and number, it clears all RTP header compression structures and statistics.

**Examples**

The following example clears RTP header compression structures and statistics for serial interface 0:

```
Router# clear ip rtp header-compression serial 0
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip rtp header-compression</td>
<td>Enables RTP header compression.</td>
</tr>
</tbody>
</table>
clear ip sap

To delete a Session Announcement Protocol (SAP) cache entry or the entire SAP cache, use the clear ip sap command in EXEC mode.

clear ip sap [group-address | "session-name"]

Syntax Description

- **group-address** (Optional) Deletes all sessions associated with the IP group address.
- **"session-name"** (Optional) Deletes only the SAP cache entry with the specified session name. The session name is enclosed in quotation marks (" ") that the user must enter.

Command Modes

EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>The clear ip sdr command was introduced.</td>
</tr>
<tr>
<td>12.2</td>
<td>The clear ip sdr command was replaced by the clear ip sap command.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If no arguments or keywords are used with this command, the system deletes the entire SAP cache.

Examples

The following example clears the SAP cache:

Router# clear ip sap "Sample Session"

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip sap cache-timeout</td>
<td>Limits how long a SAP cache entry stays active in the cache.</td>
</tr>
<tr>
<td>ip sap listen</td>
<td>Enables the Cisco IOS software to listen to session directory announcements.</td>
</tr>
<tr>
<td>show ip sap</td>
<td>Displays the SAP cache.</td>
</tr>
</tbody>
</table>
clear ip sdr

The clear ip sdr command is replaced by the clear ip sap command. See the description of the clear ip sap command in this chapter for more information.
frame-relay ip rtp compression-connections

To specify the maximum number of Real-Time Transport Protocol (RTP) header compression connections that can exist on a Frame Relay interface, use the `frame-relay ip rtp compression-connections` command in interface configuration mode. To restore the default, use the `no` form of this command.

```
frame-relay ip rtp compression-connections number
no frame-relay ip rtp compression-connections
```

**Syntax Description**

- `number` Maximum number of RTP header compression connections. The range is from 3 to 256.

**Defaults**

No default behavior or values.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(2)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you can configure the maximum number of connections, RTP header compression must be configured on the interface using the `frame-relay ip rtp header-compression` command.

The number of RTP header compression connections must be set to the same value at each end of the connection.

**Examples**

The following example shows the configuration of a maximum of 150 RTP header compression connections on serial interface 0:

```
interface serial 0
  encapsulation frame-relay
  frame-relay ip rtp header-compression
  frame-relay ip rtp compression-connections 150
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>frame-relay ip rtp header-compression</code></td>
<td>Enables RTP header compression for all Frame Relay maps on a physical interface.</td>
</tr>
<tr>
<td><code>frame-relay map ip compress</code></td>
<td>Enables both RTP and TCP header compression on a link.</td>
</tr>
<tr>
<td><code>frame-relay map ip rtp header-compression</code></td>
<td>Enables RTP header compression per DLCI.</td>
</tr>
<tr>
<td><code>show frame-relay ip rtp header-compression</code></td>

</tbody>
</table>
frame-relay ip rtp header-compression

To enable Real-Time Transport Protocol (RTP) header compression for all Frame Relay maps on a physical interface, use the `frame-relay ip rtp header-compression` command in interface configuration mode. To disable the compression, use the `no` form of this command.

```
frame-relay ip rtp header-compression [active | passive]
no frame-relay ip rtp header-compression [active | passive]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active</td>
<td>(Optional) Compresses all outgoing RTP packets. This is the default.</td>
</tr>
<tr>
<td>passive</td>
<td>(Optional) Compresses the outgoing RTP/User Datagram Protocol (UDP)/IP header only if an incoming packet had a compressed header.</td>
</tr>
</tbody>
</table>

### Defaults

Disabled.

If the command is configured, `active` is the default keyword.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When this command is used on the physical interface, all the interface maps inherit the command; that is, all maps will perform IP/UDP/RTP header compression.

### Examples

The following example enables RTP header compression for all Frame Relay maps on a physical interface:

```
frame-relay ip rtp header-compression
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<td>Disables both RTP and TCP header compression on a link.</td>
</tr>
<tr>
<td><code>show frame-relay ip rtp header-compression</code></td>
<td>Displays RTP header compression statistics for Frame Relay.</td>
</tr>
</tbody>
</table>
frame-relay map ip compress

To enable both Real-Time Transport Protocol (RTP) and TCP header compression on a link, use the `frame-relay map ip compress` command in interface configuration mode.

```
frame-relay map ip ip-address dlci [broadcast] compress [active | passive] [connections number]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-address</td>
<td>IP address of the destination or next hop.</td>
</tr>
<tr>
<td>dlci</td>
<td>Data-link connection identifier (DLCI) number.</td>
</tr>
<tr>
<td>broadcast</td>
<td>(Optional) Forwards broadcasts to the specified IP address.</td>
</tr>
<tr>
<td>active</td>
<td>(Optional) Compresses all outgoing RTP and TCP packets. This is the default.</td>
</tr>
<tr>
<td>passive</td>
<td>(Optional) Compresses the outgoing RTP and TCP header only if an incoming packet had a compressed header.</td>
</tr>
<tr>
<td>connections number</td>
<td>(Optional) Specifies the maximum number of RTP and TCP header compression connections. The range is from 3 to 256.</td>
</tr>
</tbody>
</table>

**Defaults**

Disabled.

The default maximum number of header compression connections is 256.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(2)T</td>
<td>This command was modified to enable the configuration of the maximum number of header compression connections.</td>
</tr>
</tbody>
</table>

**Examples**

The following example enables both RTP and TCP header compression on serial interface 1 and sets the maximum number of RTP and TCP header connections at 16:

```
interface serial 1
encapsulation frame-relay
ip address 10.108.175.110 255.255.255.0
frame-relay map ip 10.108.175.220 180 compress connections 16
```
### Related Commands

<td><code>show frame-relay ip tcp header-compression</code></td>
<td>Displays statistics and TCP/IP header compression information for the interface.</td>
</tr>
</tbody>
</table>
**frame-relay map ip nocompress**

To disable both Real-Time Transport Protocol (RTP) and TCP header compression on a link, use the `frame-relay map ip nocompress` command in interface configuration mode.

```
frame-relay map ip ip-address dlci [broadcast] nocompress
```

**Syntax Description**

- `ip-address`  
  IP address of the destination or next hop.

- `dlci`  
  Data-link connection identifier (DLCI) number.

- `broadcast`  
  (Optional) Forwards broadcasts to the specified IP address.

**Defaults**

No default behaviors or values.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

The following example disables RTP and TCP header compression on DLCI 180:

```
interface serial 1
encapsulation frame-relay
frame-relay map ip 10.108.175.220 180 nocompress
```

**Related Commands**

<table>
<thead>

<td>Displays statistics and TCP/IP header compression information for the interface.</td>
</tr>
</tbody>
</table>
frame-relay map ip rtp header-compression

To enable Real-Time Transport Protocol (RTP) header compression per data-link connection identifier (DLCI), use the `frame-relay map ip rtp header-compression` command in interface configuration mode.

```
frame-relay map ip ip-address dlci [broadcast] rtp header-compression [active | passive] [connections number]
```

**Syntax Description**

- **ip-address**: IP address of the destination or next hop.
- **dlci**: DLCI number.
- **broadcast**: (Optional) Forwards broadcasts to the specified IP address.
- **active**: (Optional) Compresses outgoing RTP packets. This is the default.
- **passive**: (Optional) Compresses the outgoing RTP/UDP/IP header only if an incoming packet had a compressed header.
- **connections number**: (Optional) Specifies the maximum number of RTP header compression connections. The range is from 3 to 256.

**Defaults**

Disabled.

If the command is configured, **active** is the default keyword.

The default maximum number of header compression connections is 256.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(2)T</td>
<td>This command was modified to enable the configuration of the maximum number of header compression connections.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When this command is configured, the specified maps inherit RTP header compression. You can have multiple Frame Relay maps, with and without RTP header compression. If you do not specify the number of RTP header compression connections, the map will inherit the current value from the interface.

**Examples**

The following example enables RTP header compression on serial interface 1 and sets the maximum number of RTP header compression connections at 64:

```
interface serial 1
encapsulation frame-relay
ip address 10.108.175.110 255.255.255.0
frame-relay map ip 10.108.175.220 180 rtp header-compression connections 64
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>frame-relay ip rtp compression-connections</code></td>
<td>Specifies the maximum number of RTP header compression connections on a Frame Relay interface.</td>
</tr>
<tr>
<td><code>frame-relay ip rtp header-compression</code></td>
<td>Enables RTP header compression for all Frame Relay maps on a physical interface.</td>
</tr>
<tr>
<td><code>frame-relay map ip compress</code></td>
<td>Enables both RTP and TCP header compression on a link.</td>
</tr>
<tr>
<td><code>show frame-relay ip rtp header-compression</code></td>
<td>Displays RTP header compression statistics for Frame Relay.</td>
</tr>
</tbody>
</table>
ip cgmp

To enable Cisco Group Management Protocol (CGMP) on an interface of a router connected to a Cisco Catalyst 5000 family switch, use the `ip cgmp` command in interface configuration mode. To disable CGMP routing, use the `no` form of this command.

```
ip cgmp [proxy | router-only]
no ip cgmp
```

### Syntax Description

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>(Optional) Enables CGMP and the CGMP proxy function.</td>
</tr>
<tr>
<td>router-only</td>
<td>(Optional) Enables the router to send only CGMP self-join and CGMP self-leave messages.</td>
</tr>
</tbody>
</table>

### Defaults

CGMP is disabled.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2</td>
<td>The <code>router-only</code> keyword was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When enabled on an interface, this command triggers a CGMP join message. This command should be used only on 802 media (that is, Ethernet, FDDI, or Token Ring) or ATM. When a `no ip cgmp` command is issued, a triggered CGMP leave message is sent for the MAC address on the interface for group 0000.0000.0000 (all groups). CGMP can run on an interface only if Protocol Independent Multicast (PIM) is configured on the same interface.

A Cisco router will send CGMP join messages in response to receiving Internet Group Management Protocol (IGMP) reports from IGMP-capable members. Only the CGMP querier Cisco router sends these CGMP join messages on behalf of hosts.

The `ip cgmp router-only` command enables the routers in a VLAN to send only CGMP self-join and CGMP self-leave messages—no other types of CGMP messages will be sent. This feature allows other CGMP-capable routers to learn about multicast router ports. If the `ip cgmp router-only` command is not available on any of the external routers in the network, the `ip cgmp` command can be used instead. Issuing the `ip cgmp` command on a router enables that router to send CGMP self-join and CGMP self-leave messages as well as other types of CGMP messages.

When the `proxy` keyword is specified, the CGMP proxy function is also enabled. That is, any router that is not CGMP-capable will be advertised by the proxy router. The proxy router advertises the existence of other non-CGMP-capable routers by sending a CGMP join message with the MAC address of the non-CGMP-capable router and a group address of 0000.0000.0000.
Initially supported is Distance Vector Multicast Routing Protocol (DVMRP) proxying. If a DVMRP report is received from a router that is not a PIM router, a Cisco IGMP querier will advertise the MAC address of the DVMRP router in a CGMP join message with the group address 0000.0000.0000.

To perform CGMP proxy, a Cisco router must be the IGMP querier. If you configure the `ip cgmp proxy` command, you must manipulate the IP addresses so that a Cisco router will be the IGMP querier, which might be the highest or lowest IP address, depending on which version of IGMP is being run on the network. An IGMP Version 2 querier is selected based on the lowest IP addressed router on the interface. An IGMP Version 1 querier is selected based on the multicast routing protocol used on the interface.

When multiple Cisco routers are connected to a switched network and the `ip cgmp proxy` command is needed, we recommend that all routers be configured in the following manner:

- With the same CGMP option.
- To have precedence of becoming IGMP querier over non-Cisco routers.

### Examples

The following example enables CGMP:

```plaintext
ip cgmp
```

The following example enables CGMP and CGMP proxy:

```plaintext
ip cgmp proxy
```
**ip dvmrp accept-filter**

To configure an acceptance filter for incoming Distance Vector Multicast Routing Protocol (DVMRP) reports, use the `ip dvmrp accept-filter` command in interface configuration mode. To disable this filter, use the `no` form of this command.

```
ip dvmrp accept-filter access-list [distance | neighbor-list access-list]
no ip dvmrp accept-filter access-list [distance | neighbor-list access-list]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>access-list</code></td>
<td>Access list number or name. A value of 0 means that all sources are accepted with the configured distance.</td>
</tr>
<tr>
<td><code>distance</code></td>
<td>(Optional) Administrative distance to the destination.</td>
</tr>
<tr>
<td><code>neighbor-list</code></td>
<td>(Optional) Number of a neighbor list. DVMRP reports are accepted only by those neighbors on the list.</td>
</tr>
</tbody>
</table>

**Defaults**

All destination reports are accepted with a distance of 0. Default settings accept reports from all neighbors.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>11.2</td>
<td>The <code>neighbor-list</code> keyword and <code>access-list-number</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Any sources that match the access list are stored in the DVMRP routing table with the `distance` argument. The `distance` value is used to compare with the same source in the unicast routing table. The route with the lower distance (either the route in the unicast routing table or that in the DVMRP routing table) takes precedence when computing the Reverse Path Forwarding (RPF) interface for a source of a multicast packet.

By default, the administrative distance for DVMRP routes is 0, which means that they always take precedence over unicast routing table routes. If you have two paths to a source, one through unicast routing (using Protocol Independent Multicast [PIM] as the multicast routing protocol) and another path using DVMRP (unicast and multicast routing), and if you want to use the PIM path, use the `ip dvmrp accept-filter` command to increase the administrative distance for DVMRP routes.
**Examples**

The following example shows how to apply an access list such that the RPF interface used to accept multicast packets will be through an Enhanced Interior Gateway Routing Protocol (IGRP)/PIM path. The Enhanced IGRP unicast routing protocol has a default administrative distance of 90.

```
ip dvmrp accept-filter 1 100
access-list 1 permit 0.0.0.0 255.255.255.255
```

The following example applies access list 57 to the interface and sets a distance of 4:

```
access-list 57 permit 131.108.0.0 0.0.255.255
access-list 57 permit 198.92.37.0 0.0.0.255
access-list 57 deny 0.0.0.0 255.255.255.255
ip dvmrp accept-filter 57 4
```

ip dvmrp auto-summary

To enable Distance Vector Multicast Routing Protocol (DVMRP) automatic summarization if it was disabled, use the ip dvmrp auto-summary command in interface configuration mode. To disable the feature, use the no form of this command.

```
ip dvmrp auto-summary
no ip dvmrp auto-summary
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Enabled

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
DVMRP automatic summarization occurs when a unicast subnet route is collapsed into a classful network number route. This situation occurs when the subnet is a different network number than the IP address of the interface (or tunnel) over which the advertisement is sent. If the interface is unnumbered, the network number of the numbered interface the unnumbered interface points to is compared to the subnet.

Disable this feature if the information you want to send using the `ip dvmrp summary-address` command is the same as the information that would be sent using DVMRP automatic-summarization.

**Examples**
The following example disables DVMRP automatic summarization:

```
no ip dvmrp auto-summary
```

**Related Commands**

<table>

<tbody>
<tr>
<td>ip dvmrp summary-address</td>
<td>Configures a DVMRP summary address to be advertised out the interface.</td>
</tr>
</tbody>
</table>
ip dvmrp default-information

To advertise network 0.0.0.0 to Distance Vector Multicast Routing Protocol (DVMRP) neighbors on an interface, use the `ip dvmrp default-information` command in interface configuration mode. To prevent the advertisement, use the `no` form of this command.

```
ip dvmrp default-information { originate | only }
no ip dvmrp default-information { originate | only }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>originate</th>
<th>Other routes more specific than 0.0.0.0 may be advertised.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>only</td>
<td>No DVMRP routes other than 0.0.0.0 are advertised.</td>
</tr>
</tbody>
</table>

**Defaults**

Disabled

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command should only be used when the router is a neighbor to mrouted version 3.6 devices. The mrouted protocol is a public domain implementation of DVMRP.

You can use the `ip dvmrp metric` command with the `ip dvmrp default-information` command to tailor the metric used when advertising the default route 0.0.0.0. By default, metric 1 is used.

**Examples**

The following example configures the Cisco IOS software to advertise network 0.0.0.0, in addition to other networks, to DVMRP neighbors:

```
ip dvmrp default-information originate
```

**Related Commands**

<table>
<thead>

ip dvmrp metric

To configure the metric associated with a set of destinations for Distance Vector Multicast Routing Protocol (DVMRP) reports, use the appropriate form of the `ip dvmrp metric` command in interface configuration mode. To disable this function, use the appropriate `no` form of this command.

```
ip dvmrp metric metric [list access-list] [route-map map-name] [mbgp] [protocol process-id]
no ip dvmrp metric metric [list access-list] [route-map map-name] [mbgp] [protocol process-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>metric</code></td>
<td>Metric associated with a set of destinations for DVMRP reports. It can be a value from 0 to 32. A value of 0 means that the route is not advertised. A value of 32 is equivalent to infinity (unreachable).</td>
</tr>
<tr>
<td><code>list access-list</code></td>
<td>(Optional) Number name of an access list. If you specify this argument, only the multicast destinations that match the access list are reported with the configured metric. Any destinations not advertised because of split horizon do not use the configured metric.</td>
</tr>
<tr>
<td><code>route-map map-name</code></td>
<td>(Optional) Name of the route map. Only the destinations that match the route map are reported with the configured metric. Unicast routes are subject to route map conditions before being injected into DVMRP. Route maps cannot be used for DVMRP routes.</td>
</tr>
<tr>
<td><code>mbgp</code></td>
<td>(Optional) Configures redistribution of only IP version 4 (IPv4) multicast routes into DVMRP.</td>
</tr>
<tr>
<td><code>protocol</code></td>
<td>(Optional) Name of unicast routing protocol, such as <code>bgp</code>, <code>eigrp</code>, <code>igrp</code>, <code>isis</code>, <code>ospf</code>, <code>rip</code>, <code>static</code>, or <code>dvmrp</code>. If you specify these arguments, only routes learned by the specified routing protocol are advertised in DVMRP report messages.</td>
</tr>
<tr>
<td><code>process-id</code></td>
<td>(Optional) Process ID number of the unicast routing protocol.</td>
</tr>
</tbody>
</table>

**Defaults**

No metric is preconfigured. Only directly connected subnets and networks are advertised to neighboring DVMRP routers.

<tr>
<td>12.1</td>
<td>The <code>mbgp</code> keyword was added.</td>
</tr>
</tbody>
</table>
When Protocol Independent Multicast (PIM) is configured on an interface and DVMRP neighbors are discovered, the Cisco IOS software sends DVMRP report messages for directly connected networks. The `ip dvmrp metric` command enables DVMRP report messages for multicast destinations that match the access list. Usually, the metric for these routes is 1. Under certain circumstances, you might want to tailor the metric used for various unicast routes. This command lets you configure the metric associated with a set of destinations for report messages sent out this interface.

You can use the `access-list-number` argument in conjunction with the `protocol process-id` arguments to selectively list the destinations learned from a given routing protocol.

To display DVMRP activity, use the `debug ip dvmrp` command.

The following example connects a PIM cloud to a DVMRP cloud. Access list 1 permits the sending of DVMRP reports to the DVMRP routers advertising all sources in the 198.92.35.0 network with a metric of 1. Access list 2 permits all other destinations, but the metric of 0 means that no DVMRP reports are sent for these destinations.

```
access-list 1 permit 198.92.35.0 0.0.0.255
access-list 1 deny 0.0.0.0 255.255.255.255
access-list 2 permit 0.0.0.0 255.255.255.255
interface tunnel 0
  ip dvmrp metric 1 list 1
  ip dvmrp metric 0 list 2
```

The following example redistributes IPv4 multicast routes into DVMRP neighbors with a metric of 1:

```
interface tunnel 0
  ip dvmrp metric 1 mbgp
```

### Related Commands

<td><code>ip dvmrp accept-filter</code></td>
<td>Configures an acceptance filter for incoming DVMRP reports.</td>
</tr>
</tbody>
</table>
ip dvmrp metric-offset

To change the metrics of advertised Distance Vector Multicast Routing Protocol (DVMRP) routes and thus favor or not favor a certain route, use the `ip dvmrp metric-offset` command in interface configuration mode. To restore the default values, use the `no` form of this command.

```
  ip dvmrp metric-offset [in | out] increment
  no ip dvmrp metric-offset
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>(Optional) The <code>increment</code> value is added to incoming DVMRP reports and is reported in mrinfo replies. The default for <code>in</code> is 1.</td>
</tr>
<tr>
<td>out</td>
<td>(Optional) The <code>increment</code> value is added to outgoing DVMRP reports for routes from the DVMRP routing table. The default for <code>out</code> is 0.</td>
</tr>
<tr>
<td>increment</td>
<td>Value added to the metric of a DVMRP route advertised in a report message.</td>
</tr>
</tbody>
</table>

**Defaults**

If neither `in` nor `out` is specified, `in` is the default.

The default for `in` is 1.

The default for `out` is 0.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to influence which routes are used, as you prefer. The DVMRP metric is in hop count.

**Examples**

The following example adds 10 to the incoming DVMRP reports:

```
ip dvmrp metric-offset 10
```
ip dvmrp output-report-delay

To configure an interpacket delay of a Distance Vector Multicast Routing Protocol (DVMRP) report, use the `ip dvmrp output-report-delay` command in interface configuration mode. To restore the default values, use the `no` form of this command.

```
ip dvmrp output-report-delay milliseconds [burst]
no ip dvmrp output-report-delay milliseconds [burst]
```

**Syntax Description**

| `milliseconds` | Number of milliseconds that elapse between transmissions of a set of DVMRP report packets. The number of packets in the set is determined by the `burst` argument. The default number of milliseconds is 100 milliseconds. |
| `burst` | (Optional) The number of packets in the set being sent. The default is 2 packets. |

**Defaults**

- `milliseconds`: 100 milliseconds
- `burst`: 2 packets

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The delay is the number of milliseconds that elapse between transmissions of sets of packets that constitute a report. The number of packets in the set is determined by the `burst` value.

You might want to change the default values, depending on the CPU and buffering of the mrouted machine.

**Examples**

The following example sets the interpacket delay to 200 milliseconds and the burst size to 3 packets. Therefore, at the periodic DVMRP report interval, if six packets are built, three packets will be sent, then a delay of 200 milliseconds will occur, and then the next three packets will be sent.

```
ip dvmrp output-report-delay 200 3
```
ip dvmrp reject-non-pruners

To configure the router so that it will not peer with a Distance Vector Multicast Routing Protocol (DVMRP) neighbor if that neighbor does not support DVMRP pruning or grafting, use the ip dvmrp reject-non-pruners command in interface configuration mode. To disable the function, use the no form of this command.

```
ip dvmrp reject-non-pruners
no ip dvmrp reject-non-pruners
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
By default, the router accepts all DVMRP neighbors as peers, regardless of their DVMRP capability or lack thereof.

Use this command to prevent a router from peering with a DVMRP neighbor if that neighbor does not support DVMRP pruning or grafting. If the router receives a DVMRP probe or report message without the Prune-Capable flag set, the router logs a syslog message and discards the message.

Note that this command prevents peering with neighbors only. If there are any nonpruning routers multiple hops away (downstream toward potential receivers) that are not rejected, then a nonpruning DVMRP network might still exist.

**Examples**
The following example configures the router not to peer with DVMRP neighbors that do not support pruning or grafting:

```
ip dvmrp reject-non-pruners
```
ip dvmrp routehog-notification

To change the number of Distance Vector Multicast Routing Protocol (DVMRP) routes allowed before a syslog warning message is issued, use the `ip dvmrp routehog-notification` command in global configuration mode. To restore the default value, use the `no` form of this command.

```
ip dvmrp routehog-notification route-count

no ip dvmrp routehog-notification
```

**Syntax Description**

```
route-count
```

Number of routes allowed before a syslog message is triggered. The default is 10,000 routes.

**Defaults**

10,000 routes

**Command Modes**

Global configuration

**Command History**

```
Release       Modification
10.2           This command was introduced.
```

**Usage Guidelines**

This command configures how many DVMRP routes are accepted on each interface within an approximate one-minute period before a syslog message is issued, warning that there might be a route surge occurring. The warning is typically used to detect quickly when routers have been misconfigured to inject a large number of routes into the multicast backbone (MBONE).

The `show ip igmp interface` command displays a running count of routes. When the count is exceeded, an “*** ALERT ***” is appended to the line.

**Examples**

The following example lowers the threshold to 8000 routes:

```
ip dvmrp routehog-notification 8000
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip igmp interface</code></td>
<td>Displays multicast-related information about an interface.</td>
</tr>
</tbody>
</table>
ip dvmrp route-limit

To change the limit on the number of Distance Vector Multicast Routing Protocol (DVMRP) routes that can be advertised over an interface enabled to run DVMRP, use the `ip dvmrp route-limit` command in global configuration mode. To configure no limit, use the `no` form of this command.

```
ip dvmrp route-limit count

no ip dvmrp route-limit
```

**Syntax Description**

- `count`: Number of DVMRP routes that can be advertised. The default is 7000 routes.

**Defaults**

7000 routes

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Interfaces enabled to run DVMRP include a DVMRP tunnel, an interface where a DVMRP neighbor has been discovered, and an interface configured to run the `ip dvmrp unicast-routing` command.

The `ip dvmrp route-limit` command is automatically generated to the configuration file when at least one interface is enabled for multicast routing. This command is necessary to prevent misconfigured `ip dvmrp metric` commands from causing massive route injection into the multicast backbone (MBONE).

**Examples**

The following example changes the limit to 5000 DVMRP routes allowed to be advertised:

```
ip dvmrp route-limit 5000
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip dvmrp unicast-routing</code></td>
<td>Enables DVMRP unicast routing on an interface.</td>
</tr>
</tbody>
</table>
ip dvmrp summary-address

To configure a Distance Vector Multicast Routing Protocol (DVMRP) summary address to be advertised out the interface, use the `ip dvmrp summary-address` command in interface configuration mode. To remove the summary address, use the `no` form of this command.

```
ip dvmrp summary-address summary-address mask [metric value]
no ip dvmrp summary-address summary-address mask [metric value]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>summary-address</code></td>
<td>Summary IP address that is advertised instead of the more specific route.</td>
</tr>
<tr>
<td><code>mask</code></td>
<td>Mask on the summary IP address.</td>
</tr>
<tr>
<td><code>metric value</code></td>
<td>(Optional) Metric that is advertised with the summary address. The default is 1.</td>
</tr>
</tbody>
</table>

**Defaults**

`metric value`: 1

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If there is at least a single, more specific route in the unicast routing table that matches the specified `address` and `mask` arguments, the summary is advertised. Routes in the DVMRP routing table are not candidates for summarization.

When the `metric` keyword is specified, the summary is advertised with that metric value.

Multiple summary address can be configured on an interface. When multiple overlapping summary addresses are configured on an interface, the one with the longest mask takes preference.

**Examples**

The following example configures the DVMRP summary address 171.69.0.0 to be advertised out the interface:

```
ip dvmrp summary-address 171.69.0.0 255.255.0.0 metric 1
```

**Related Commands**

**ip dvmrp unicast-routing**

To enable Distance Vector Multicast Routing Protocol (DVMRP) unicast routing on an interface, use the `ip dvmrp unicast-routing` command in interface configuration mode. To disable the feature, use the `no` form of this command.

```
    ip dvmrp unicast-routing
    no ip dvmrp unicast-routing
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Enabling DVMRP unicast routing means that routes in DVMRP report messages are cached by the router in a DVMRP routing table. When Protocol Independent Multicast (PIM) is running, these routes may get preference over routes in the unicast routing table. This capability allows PIM to run on the multicast backbone (MBONE) topology when it is different from the unicast topology.

DVMRP unicast routing can run on all interfaces, including generic routing encapsulation (GRE) tunnels. On DVMRP tunnels, it runs by virtue of DVMRP multicast routing. This command does not enable DVMRP multicast routing among Cisco routers. However, if there is a DVMRP-capable multicast router, the Cisco router will do PIM/DVMRP multicast routing interaction.

**Examples**
The following example enables DVMRP unicast routing:

```
    ip dvmrp unicast-routing
```

**Related Commands**

<table>
<thead>
<tr>

ip igmp access-group

To control the multicast groups that hosts on the subnet serviced by an interface can join, use the `ip igmp access-group` command in interface configuration mode. To disable groups on an interface, use the `no` form of this command.

```
ip igmp access-group access-list version

no ip igmp access-group access-list version
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>access-list</code></td>
<td>Number or name of a standard IP access list. The access list can be a number from 1 to 99.</td>
</tr>
<tr>
<td><code>version</code></td>
<td>Changes Internet Group Management Protocol (IGMP) version. Default is version 2.</td>
</tr>
</tbody>
</table>

### Defaults

All groups are allowed on an interface.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Examples

In the following example, hosts serviced by Ethernet interface 0 can join the group 225.2.2.2 only:

```
access-list 1 225.2.2.2 0.0.0.0
interface ethernet 0
ip igmp access-group 1
```

### Related Commands

ip igmp helper-address

To cause the system to forward all Internet Group Management Protocol (IGMP) host reports and leave messages received on the interface to the specified IP address, use the **ip igmp helper-address** command in interface configuration mode. To disable such forwarding, use the **no** form of this command.

```
  ip igmp helper-address ip-address

  no ip igmp helper-address
```

**Syntax Description**

- `ip-address`: IP address to which IGMP host reports and leave messages are forwarded. Specify the IP address of an interface on the central router.

**Defaults**

Disabled

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.2 F</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command and the **ip pim neighbor-filter** command together enable stub multicast routing. The IGMP host reports and leave messages are forwarded to the IP address specified. The reports are re-sent out the next hop interface toward the IP address, with the source address of that interface. This command enables a type of “dense-mode” join, allowing stub sites not participating in Protocol Independent Multicast (PIM) to indicate membership in IP multicast groups.

**Examples**

The following example enables stub multicast routing on Router A, which has an outgoing interface with IP address 10.0.0.1. Router B is a central router with an incoming interface with address 10.0.0.2. Access list 1 filters PIM messages from the source (stub Router A).

**Router A Configuration**

```
  ip multicast-routing
  ip pim dense-mode
  ip igmp helper-address 10.0.0.2
```

**Router B Configuration**

```
  ip multicast-routing
  ip pim dense-mode : or ip pim sparse-mode
  ip pim neighbor-filter 1
  access-list 1 deny 10.0.0.1
```
### Related Commands

<table>
<thead>
<tr>

</table>
ip igmp immediate-leave

To minimize the leave latency of Internet Group Management Protocol (IGMP) memberships when IGMP Version 2 is used and only one receiver host is connected to each interface, use the **ip igmp immediate-leave** command in global or interface configuration mode. To disable this feature, use the **no** form of this command.

```
ip igmp immediate-leave group-list access-list

no ip igmp immediate-leave
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group-list <strong>access-list</strong></td>
<td>Standard access list number or name that defines multicast groups in which the immediate leave feature is enabled.</td>
</tr>
</tbody>
</table>

**Defaults**

Disabled

**Command Modes**

Global configuration
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot configure this command in both interface and global configuration mode.

When this command is not configured, the router will send an IGMP group-specific query message upon receipt of an IGMP Version 2 (IGMPv2) group leave message. The router will stop forwarding traffic for that group only if no host replies to the query within the timeout period. The timeout period is determined by the **ip igmp last-member-query-interval** command and the IGMP robustness variable, which is defined by the IGMP specification. By default, the timeout period in Cisco IOS is approximately 2.5 seconds.

If this command is configured, the router assumes that only one host has joined the group and stops forwarding the group’s traffic immediately upon receipt of an IGMPv2 group leave message.

**Global Configuration Mode**

When this command is configured in global configuration mode, it applies to all IGMP-enabled interfaces. Any existing configuration of this command in interface configuration mode will be removed from the configuration. Also, any new configuration of this command in interface configuration mode will be ignored.

**Interface Configuration Mode**

When this command is configured in interface configuration mode, it applies to an individual interface. Configure this command on an interface if only one IGMP-enabled neighbor is connected to the interface. The neighbor can be either a host or switch running IGMP Snooping. When the **ip igmp immediate-leave** command is enabled on an interface, the router will not send IGMP group-specific host
queries when an IGMP Version 2 leave group message is received from that interface. Instead, the router will immediately remove the interface from the IGMP cache for that group and send Protocol Independent Multicast (PIM) prune messages toward sources if this interface was the last one to join that group.

### Examples

The following example shows how to enable the immediate leave feature on all interfaces for all multicast groups:

```plaintext
ip multicast-routing
igmp immediate-leave group-list all-groups

interface ethernet 0
  ip address 10.0.10.1 255.255.255.0
  ip pim sparse-dense mode

ip access-list standard all-groups
  permit 224.0.0.0 15.255.255.255
```

The following example shows how to enable the immediate leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the `tv-groups` access list consists of groups that have only one host membership at a time per interface:

```plaintext
ip multicast-routing

interface ethernet 0
  ip address 10.0.10.1 255.255.255.0
  ip pim sparse-dense-mode
  igmp immediate-leave group-list tv-groups

ip access-list standard tv-groups
  permit 239.192.20.0 0.0.0.255
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</tbody>
</table>

**Usage Guidelines**

IP packets that are addressed to the group address are passed to the IP client process in the Cisco IOS software.

If all the multicast-capable routers and access servers that you administer are members of a multicast group, pinging that group causes all routers to respond, which can be a useful administrative and debugging tool.

Another reason to have a router join a multicast group is when other hosts on the network have a bug in Interior Gateway Routing Protocol (IGRP) that prevents them from correctly answering IGMP queries. Having the router join the multicast group causes upstream routers to maintain multicast routing table information for that group and keep the paths for that group active.

**Examples**

In the following example, the router joins multicast group 225.2.2.2:

```
ip igmp join-group 225.2.2.2
```

ip igmp last-member-query-count

To configure the number of times that the router sends Internet Group Management Protocol (IGMP) group-specific or group-source-specific (with IGMP version 3) query messages in response to receiving a group-specific or group-source-specific leave message, use the `ip igmp last-member-query-count` command in interface configuration mode. To set this interval to the default value, use the `no` form of this command.

```
no ip igmp last-member-query-count lmqc
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>

</tr>
</thead>
<tbody>
<tr>
<td>12.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a router receives an IGMP version 2 (IGMPv2) or IGMP version 3 (IGMPv3) message indicating that a host wants to leave a group, source, or channel, it sends last-member-query-count group- or group-source-specific IGMP query messages at intervals of `igmp-last-member-interval` milliseconds. If no response is received after this period, the router stops forwarding for the group, source, or channel.

**Caution**

Do not set the LMQC to 1, because in this situation the loss of a single packet—the query packet from the router to the host or the report packet from the host to the router—may result in traffic forwarding being stopped, even though there is still a receiver. Traffic will continue to be forwarded after the next general query sent by the router, but the interval during which a receiver may not receive the query could be as long as 1 minute (with the default query interval).

The leave latency in Cisco IOS software may increase by up to one last member query interval (LMQI) value when the router is processing more than one leave within a LMQI. In this case, the average leave latency is determined by the \((LMQC + 0.5) \times LMQI\). The result is that the default leave latency can range from 2.0 to 3.0 seconds with an average of 2.5 seconds under a higher load of IGMP leave processing. The leave latency under load for the minimum LMQI value of 100 msec and a LMQC of 1 is from 100 to 200 milliseconds, with an average of 150 milliseconds. This is done to limit the impact of higher rates of IGMP leave messages.
If no response is received after this period, the router will stop forwarding traffic for that group, source, or channel only if no host replies to the query within the timeout period. The timeout period is determined by the `ip igmp last-member-query-interval` and the `ip igmp last-member-query-count` commands.

**Examples**

The following example changes the number of times that the router sends group-specific or group-source-specific query messages to 5:

```
interface tunnel 0
  ip igmp last-member-query-count 5:
```

**Related Commands**

<table>

<td><code>ip igmp last-member-query-interval</code></td>
<td>Configures the interval at which the router sends IGMP group-specific or group-source-specific (with IGMPv3) query messages</td>
</tr>
</tbody>
</table>
**ip igmp last-member-query-interval**

To configure the interval at which the router sends Internet Group Management Protocol (IGMP) group-specific or group-source-specific (with IGMP Version 3) query messages, use the `ip igmp last-member-query-interval` command in interface configuration mode. To set this interval to the default value, use the `no` form of this command.

```
ip igmp last-member-query-interval interval
no ip igmp last-member-query-interval interval
```

**Syntax Description**

| **interval** | Interval, in milliseconds, at which IGMP group-specific host query messages are sent. The interval value is an integer from 100 to 25,500. The `interval` argument in 12.0 S, 12.1 E, 12.2, and 12.2 S releases is an integer from 100 through 65,535. |

**Defaults**

`interval`: 1000 milliseconds (1 second)

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(4)T</td>
<td>The highest <code>interval</code> integer value accepted was changed from 65,535 to 25,500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a router receives an IGMP Version 2 (IGMPv2) or IGMP Version 3 (IGMPv3) message indicating that a host wants to leave a group, source, or channel, it sends last-member-query-count group, group-specific, or source-specific IGMP query messages at intervals set by the `ip igmp last-member-query-interval` command. If no response is received after this period, the router stops forwarding for the group, source, or channel.

The leave latency in Cisco IOS software may increase by up to one last member query interval (LMQI) value when the router is processing more than one leave within a LMQI. In this case, the average leave latency is determined by the (last member query count + 0.5) * LMQI. The result is that the default leave latency can range from 2.0 to 3.0 seconds with an average of 2.5 seconds under a higher load of IGMP leave processing. The leave latency under load for the minimum LMQI value of 100 msec and a last member query count of 1 is from 100 to 200 milliseconds, with an average of 150 milliseconds. This is done to limit the impact of higher rates of IGMP leave messages.

If no response is received after this period, the router will stop forwarding traffic for that group, source, or channel only if no host replies to the query within the timeout period. The timeout period is determined by the `ip igmp last-member-query-interval` and the `ip igmp last-member-query-count` commands.
The following example changes the IGMP group-specific host query message interval to 2000 milliseconds (2 seconds):

```plaintext
interface tunnel 0
ip igmp last-member-query-interval 2000
```

ip igmp query-interval

To configure the frequency at which Cisco IOS software sends Internet Group Management Protocol (IGMP) host query messages, use the `ip igmp query-interval` command in interface configuration mode. To return to the default frequency, use the no form of this command.

```
ip igmp query-interval seconds
no ip igmp query-interval
```

**Syntax Description**

- `seconds`  
  Frequency, in seconds, at which to send IGMP host query messages. It can be a number from 0 to 65535. The default is 60 seconds.

**Defaults**

- 60 seconds

**Command Modes**

- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Multicast routers send host membership query messages (host query messages) to discover which multicast groups have members on the attached networks of the router. Hosts respond with IGMP report messages indicating that they wish to receive multicast packets for specific groups (that is, indicating that the host wants to become a member of the group). Host query messages are addressed to the all-hosts multicast group, which has the address 224.0.0.1, and has an IP time-to-live (TTL) value of 1.

The designated router for a LAN is the only router that sends IGMP host query messages:

- For IGMP Version 1, the designated router is elected according to the multicast routing protocol that runs on the LAN.
- For IGMP Version 2, the designated querier is the lowest IP-addressed multicast router on the subnet.

If the router hears no queries for the timeout period (controlled by the `ip igmp query-timeout` command), it becomes the querier.

**Caution**

Changing this value may severely impact multicast forwarding.

**Examples**

The following example changes the frequency at which the designated router sends IGMP host-query messages to 2 minutes:

```
interface tunnel 0
  ip igmp query-interval 120
```
### Related Commands

</tr>
</tbody>
</table>
ip igmp query-max-response-time

To configure the maximum response time advertised in Internet Group Management Protocol (IGMP) queries, use the `ip igmp query-max-response-time` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
ip igmp query-max-response-time seconds

no ip igmp query-max-response-time
```

**Syntax Description**

| seconds     | Maximum response time, in seconds, advertised in IGMP queries. The default value is 10 seconds. |

**Defaults**

10 seconds

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is valid only when IGMP Version 2 is running.

This command controls the period during which the responder can respond to an IGMP query message before the router deletes the group.

**Examples**

The following example configures a maximum response time of 8 seconds:

```
ip igmp query-max-response-time 8
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip pim query-interval</td>
<td>Configures the frequency of PIM router-query messages.</td>
</tr>
<tr>
<td>show ip igmp groups</td>
<td>Displays the multicast groups that are directly connected to the router and that were learned through IGMP.</td>
</tr>
</tbody>
</table>
ip igmp query-timeout

To configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying, use the `ip igmp query-timeout` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
ip igmp query-timeout seconds

no ip igmp query-timeout
```

**Syntax Description**

| seconds | Number of seconds that the router waits after the previous querier has stopped querying and before it takes over as the querier. |

**Defaults**

Two times the query interval

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command requires IGMP Version 2.

By default, the router waits twice the query interval specified by the `ip igmp query-interval` command, after which, if it has heard no queries, it becomes the querier. By default, the `ip igmp query-interval` defaults to 60 seconds, which means the `ip igmp query-timeout` defaults to 120 seconds.

**Examples**

The following example configures the router to wait 30 seconds from the time it received the last query before it takes over as the querier for the interface:

```
ip igmp query-timeout 30
```

**Related Commands**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
ip igmp static-group

To configure the router to be a statically connected member of the specified group on the interface, or to statically forward for a multicast group onto the interface, use the `ip igmp static-group` command in interface configuration mode. To remove the router as a member of the group, use the `no` form of this command.

```
  ip igmp static-group {[* | group-address [source {source-address | ssm-map}]]}
  no ip igmp static-group {[* | group-address [source {source-address | ssm-map}]]}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Places the interface into all newly created multicast route (mroute) entries.</td>
</tr>
<tr>
<td>group-address</td>
<td>IP multicast group address of a group to which the router belongs.</td>
</tr>
<tr>
<td>source</td>
<td>(Optional) Statically forwards a (S, G) channel out of the interface.</td>
</tr>
<tr>
<td>source-address</td>
<td>(Optional) IP address of a system where multicast data packets originate.</td>
</tr>
<tr>
<td>ssm-map</td>
<td>(Optional) Configures Source Specific Multicast (SSM) mapping to be used to determine the source associated with this group. The resulting (S, G) channels are statically forwarded.</td>
</tr>
</tbody>
</table>

**Defaults**

A router is not a statically connected member of an IP multicast group.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.3(2)T</td>
<td>The <code>source</code> and the <code>ssm-map</code> keywords were added.</td>
</tr>
<tr>
<td>12.2(27)SBC</td>
<td>This command was integrated into Cisco IOS Release 12.2(27)SBC.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you configure the `ip igmp static-group` command, packets to the group are fast-switched out the interface, provided that packets were received on the correct reverse path forwarding (RPF) interface.

Configuring the `ip igmp static-group` command is unlike configuring the `ip igmp join-group` command, which allows the router to join the multicast group. This configuration of the `ip igmp static-group` command would cause the upstream routers to maintain the multicast routing table information for that group, which would ensure that all the paths to that multicast group are active.

If you configure the `ip igmp join-group` command for the same group address as the `ip igmp static-group` command, the `ip igmp join-group` command takes precedence, and the group behaves like a locally joined group.

The use of SSM mapping determines the source or sources associated with a specific source (S) and group (G) combination and puts the particular interface in the outgoing interface list (OIL) for that (S, G) entry. Traffic coming from source S destined toward group G will be forwarded out that interface regardless of a receiver joining the group on that interface.
### Examples

The following example configures group address 192.168.2.2 on Ethernet interface 0:

```plaintext
interface ethernet 0
ip igmp static-group 192.168.2.2
```

The following example shows how to configure group address 192.168.2.3 to use SSM mapping for statically forwarded groups on Ethernet interface 0:

```plaintext
interface ethernet 0
ip igmp static-group 192.168.2.3 source ssm-map
```

ip igmp v3lite

To enable acceptance and processing of Internet Group Management Protocol Version 3 lite (IGMP v3lite) membership reports on an interface, use the `ip igmp v3lite` command in interface configuration mode. To disable IGMP v3lite, use the `no` form of this command.

```
ip igmp v3lite
no ip igmp v3lite
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(3)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must define a Source Specific Multicast (SSM) range of IP addresses using the `ip pim ssm` global configuration command. When IGMP v3lite is enabled, it is supported in the SSM range of addresses only.

**Examples**
The following example shows how to configure IGMP v3lite on Ethernet interface 3/1:

```
interface ethernet 3/1
ip igmp v3lite
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip pim ssm</td>
<td>Defines the SSM range of IP multicast addresses.</td>

</tbody>
</table>
ip igmp version

To configure which version of Internet Group Management Protocol (IGMP) the router uses, use the **ip igmp version** command in interface configuration mode. To restore the default value, use the **no** form of this command.

```
ip igmp version {1 | 2 | 3}
no ip igmp version
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>IGMP Version 1.</td>
</tr>
<tr>
<td>2</td>
<td>IGMP Version 2.</td>
</tr>
<tr>
<td>3</td>
<td>IGMP Version 3.</td>
</tr>
</tbody>
</table>

**Defaults**

Version 2

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(5)T</td>
<td>The 3 keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

All routers on the subnet must support the same version. The router does not automatically detect Version 1 routers and switch to Version 1 as did earlier releases of the Cisco IOS software. Hosts can have any IGMP version (1, 2, or 3) and the router will correctly detect their presence and query them appropriately.

Some commands require IGMP Version 2 or 3, such as the **ip igmp query-max-response-time** and **ip igmp query-timeout** commands.

**Examples**

The following example configures the router to use IGMP Version 3:

```
ip igmp version 3
```

</tr>
<tr>
<td></td>
<td>mroute will take precedence. The default is 0.</td>
</tr>
</tbody>
</table>

**Defaults**

```
distance: 0
```

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command allows you to statically configure where multicast sources are located (even though the unicast routing table shows something different).

When a source range is specified, the **rpf-address** argument applies only to those sources.

**Examples**

The following example configures all sources via a single interface (in this case, a tunnel):

```
ip mroute 0.0.0.0 0.0.0.0 tunnel0
```
The following example configures all specific sources within a network number to be reachable through 172.30.10.13:

```
ip mroute 172.16.0.0 255.255.0.0 172.30.10.13
```

The following example causes this multicast static route to take effect if the unicast routes for any given destination go away:

```
ip mroute 0.0.0.0 0.0.0.0 serial0 200
```
ip mroute-cache

To configure IP multicast fast switching or multicast distributed switching (MDS), use the ip mroute-cache command in interface configuration mode. To disable either of these features, use the no form of this command.

    ip mroute-cache [distributed]

    no ip mroute-cache [distributed]

Syntax Description  distributed  (Optional) Enables MDS on the interface. In the case of RSP, this keyword is optional; if it is omitted, fast switching occurs. On the GSR, this keyword is required because the GSR does only distributed switching.

Defaults  On the RSP, IP multicast fast switching is enabled; MDS is disabled.

            On the GSR, MDS is disabled.

Command Modes  Interface configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>11.2(11)GS</td>
<td>The distributed keyword was added.</td>
</tr>
</tbody>
</table>

Usage Guidelines  On the RSP

If multicast fast switching is disabled on an incoming interface for a multicast routing table entry, the packet will be sent at process level for all interfaces in the outgoing interface list.

If multicast fast switching is disabled on an outgoing interface for a multicast routing table entry, the packet is process-level switched for that interface, but may be fast switched for other interfaces in the outgoing interface list.

When multicast fast switching is enabled (like unicast routing), debug messages are not logged. If you want to log debug messages, disable fast switching.

If MDS is not enabled on an incoming interface that is capable of MDS, incoming multicast packets will not be distributed switched; they will be fast switched at the Route Processor (RP) as before. Also, if the incoming interface is not capable of MDS, packets will get fast switched or process-switched at the RP as before.

If MDS is enabled on the incoming interface, but at least one of the outgoing interfaces cannot fast switch, packets will be process-switched. We recommend that you disable fast switching on any interface when MDS is enabled.

On the GSR

On the GSR, all interfaces should be configured for MDS because that is the only switching mode.
**Examples**

The following example enables IP multicast fast switching on the interface:
```
ip mroute-cache
```

The following example disables IP multicast fast switching on the interface:
```
oip mroute-cache
```

The following example enables MDS on the interface:
```
ip mroute-cache distributed
```

The following example disables MDS and IP multicast fast switching on the interface:
```
oip mroute-cache distributed
```
ip msdp cache-rejected-sa

To track rejected Source-Active (SA) request messages from a Multicast Source Discovery Protocol (MSDP) peer, use the `ip msdp cache-rejected-sa` command in global configuration mode. To stop tracking SA request messages, use the `no` form of this command.

```
ip msdp cache-rejected-sa number-of-entries
no ip msdp cache-rejected-sa number-of-entries
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>number-of-entries</code></th>
<th>Number of entries that need to be cached. The range is from 1 to 32766.</th>
</tr>
</thead>
</table>

**Defaults**

Rejected SA request messages are not tracked.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(22)S</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1E</td>
<td>This command was integrated into Cisco IOS Release 12.1E.</td>
</tr>
<tr>
<td>12.2</td>
<td>This command was integrated into Cisco IOS Release 12.2.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `ip msdp cache-rejected-sa` command displays the history of SA messages that have been recently received from an MSDP peer but were rejected by the local router. If the cache overflows, entries are overwritten, starting from the first entry.

**Examples**

The following example enables the MSDP peer to track rejected MSDP SA request messages:

```
Router(config)# ip msdp cache-rejected-sa 200
```

ip multicast boundary

To configure an administratively scoped boundary, use the **ip multicast boundary** command in interface configuration mode. To remove the boundary, use the **no** form of this command.

```
ip multicast boundary access-list [filter-autorp]
no ip multicast boundary [filter-autorp]
```

### Syntax Description

</tr>
</tbody>
</table>

### Usage Guidelines

Use this command to configure an administratively scoped boundary on an interface to filter multicast group addresses in the range defined by the **access-list** argument. A standard access list defines the range of addresses affected. When this command is configured, no multicast data packets are allowed to flow across the boundary from either direction. Restricting multicast data packet flow enables reuse of the same multicast group address in different administrative domains.

If you configure the **filter-autorp** keyword, the administratively scoped boundary also examines Auto-RP discovery and announcement messages and removes any Auto-RP group range announcements from the Auto-RP packets that are denied by the boundary ACL. An Auto-RP group range announcement is permitted and passed by the boundary only if all addresses in the Auto-RP group range are permitted by the boundary ACL. If any address is not permitted, the entire group range is filtered and removed from the Auto-RP message before the Auto-RP message is forwarded.

### Examples

The following example sets up a boundary for all administratively scoped addresses:

```
access-list 1 deny 239.0.0.0 0.255.255.255
access-list 1 permit 224.0.0.0 15.255.255.255
interface ethernet 0
```
**Related Commands**

```bash
ip multicast boundary 1
```
ip multicast cache-headers

To allocate a circular buffer to store IP multicast packet headers that the router receives, use the `ip multicast cache-headers` command in global configuration mode. To remove the buffer, use the `no` form of this command.

```
ip multicast [vrf vrf-name] cache-headers [rtp]
no ip multicast [vrf vrf-name] cache-headers [rtp]
```

**Syntax Description**
- **vrf** (Optional) Supports the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance.
- **vrf-name** (Optional) Name assigned to the VRF.
- **rtp** (Optional) Caches Real-Time Transport Protocol (RTP) headers.

**Defaults**
The command is disabled.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>

</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You can store IP multicast packet headers in a cache and then display them to determine the following information:
- Who is sending IP multicast packets to which groups
- Interpacket delay
- Duplicate IP multicast packets (if any)
- Multicast forwarding loops in your network (if any)
- Scope of the group
- User Datagram Protocol (UDP) port numbers
- Packet length

**Note**
This command allocates a circular buffer of approximately 32 KB. Do not configure this command if you are low on memory.

Use the `show ip mpacket` command to display the buffer.
Examples

The following example allocates a buffer to store IP multicast packet headers:

```
ip multicast cache-headers
```

<td>Number of seconds interval to receive packet. Value must be a multiple of 10.</td>
</tr>
</tbody>
</table>

**Defaults**

Disabled

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(3)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The subject group is joined at the subject interface so that multicast data for the subject group will be attracted toward the subject router.

The router monitors multicast packets destined to the group address at the `interval` value. This is a binary decision. That is, the number of packets seen in this period is not as important as whether any packet for the group is seen.

If multicast packets were observed in less than the `minimum-number` value out of the last `window-size` value intervals, a Simple Network Management Protocol (SNMP) trap would be sent from this router to a network management station to indicate a loss of heartbeat exception. This trap will be defined in CISCO-IPMROUTE-MIB.my.

The `interval` value must be a multiple of 10. In multicast distributed switching (MDS), statistics from the Versatile Interface Processor (in the Route Switch Processor) or the Label Controller (in the Gigabit Switch Router) are passed to the routing processor once every 10 seconds. Monitoring packets not in intervals of multiple of 10 seconds may lead to incorrect decisions.
This command does not create any multicast routing entries that are necessary for the monitoring of the heartbeat packets. These entries can be created by either the downstream members of the group, or with the `ip pim join-group` or `ip pim static-group` command. If a multicast routing entry corresponding to a group address expires due to lack of interest from the downstream members, the monitoring for the subject group would not work; that is, no more SNMP traps would be sent.

**Examples**

The following is an example configuration of the `ip multicast heartbeat` command:

```
snmp-server enable traps ipmulticast-heartbeat
ip multicast heartbeat 224.0.1.53 1 1 10
```

In this example, multicast packets forwarded through this router to group address 224.0.1.53 will be monitored. If no packet for this group is received in a 10-second interval, an SNMP trap will be sent to a designated SNMP management station.

**Note**

It may take about 20 seconds of losing the multicast feed before the SNMP trap is sent.

<table>

</tbody>
</table>
ip multicast helper-map

To allow IP multicast routing in a multicast-capable internetwork between two broadcast-only internetworks, use the `ip multicast helper-map` command in interface configuration mode. To disable this function, use the `no` form of this command.

```
   ip multicast helper-map { group-address broadcast-address | broadcast multicast-address }
   access-list
```

```
   no ip multicast helper-map { group-address broadcast-address | broadcast multicast-address }
   access-list
```

### Syntax Description

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>group-address</td>
<td>Multicast group address of traffic to be converted to broadcast traffic. Use this with the <code>broadcast-address</code> value.</td>
</tr>
<tr>
<td>broadcast-address</td>
<td>Address to which broadcast traffic is sent. Use this with the <code>group-address</code> value.</td>
</tr>
<tr>
<td>broadcast</td>
<td>Specifies the traffic is being converted from broadcast to multicast. Use this with the <code>multicast-address</code> value.</td>
</tr>
<tr>
<td>multicast-address</td>
<td>IP multicast address to which the converted traffic is directed. Use this with the <code>broadcast</code> keyword.</td>
</tr>
<tr>
<td>access-list</td>
<td>IP extended access list number or name that controls which broadcast packets are translated, based on the User Datagram Protocol (UDP) port number.</td>
</tr>
</tbody>
</table>

### Defaults

No conversion between broadcast and multicast occurs.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When a multicast-capable internetwork is between two broadcast-only internetworks, you can convert broadcast traffic to multicast at the first hop router, and convert it back to broadcast at the last hop router before delivering the packets to the broadcast clients. However, broadcast packets with the IP source address of 0.0.0.0 (such as a Dynamic Host Configuration Protocol [DHCP] request) will not be translated to any multicast group.

Thus, you can take advantage of the multicast capability of the intermediate multicast internetwork. This feature prevents unnecessary replication at the intermediate routers and allows multicast fast switching in the multicast internetwork.

If you need to send a directed broadcast to the subnet, the outgoing interface of the last hop router can be configured with an IP broadcast address of x.x.x.255, where x.x.x.0 is the subnet that you are trying to reach; otherwise the packet will be converted to 255.255.255.255.
The following example illustrates how a helper address on two routers converts from broadcast to multicast and back to broadcast.

The configuration on the first hop router converts a broadcast stream arriving at incoming interface Ethernet interface 0 destined to UDP port 4000 to a multicast stream. The access list denies other traffic from being forwarded into the multicast cloud. The traffic is sent to group address 224.5.5.5. Because fast switching does not perform such a conversion, the `ip forward-protocol` command causes the proper process level to perform the conversion.

The configuration on the last hop router converts the multicast stream at incoming interface Ethernet interface 1 back to broadcast. All multicast traffic emerging from the multicast cloud should not be converted to broadcast, only the traffic destined for UDP port 4000.

**First Hop Router Configuration**

```plaintext
interface ethernet 0
  ip directed-broadcast
  ip multicast helper-map broadcast 224.5.5.5 120
  ip pim dense-mode
  !
  access-list 120 permit any any udp 4000
  access-list 120 deny any any udp
  ip forward-protocol udp 4000
```

**Last Hop Router Configuration**

```plaintext
interface ethernet 1
  ip directed-broadcast
  ip broadcast-address 172.16.0.0
  ip multicast helper-map 224.5.5.5 172.16.0.0
  ip pim dense-mode
  !
  access-list 135 permit any any udp 4000
  access-list 135 deny any any udp
  ip forward-protocol udp 4000
```

**Related Commands**

<tr>
<td>ip directed-broadcast</td>
<td>Enables the translation of directed broadcast to physical broadcasts.</td>
</tr>
<tr>
<td>ip forward-protocol</td>
<td>Specifies which protocols and ports the router forwards when forwarding broadcast packets.</td>
</tr>
</tbody>
</table>
To enable load splitting of IP multicast traffic across multiple equal-cost paths, use the `ip multicast multipath` command in global configuration mode. To disable this configuration, use the `no` form of this command.

```
ip multicast [vrf vrf-name] multipath
no ip multicast [vrf vrf-name] multipath
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vrf</code></td>
<td>(Optional) Supports the multicast VPN routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td><code>vrf-name</code></td>
<td>(Optional) Name assigned to the VRF.</td>
</tr>
</tbody>
</table>

### Defaults

By default, if multiple equal-cost paths exist, multicast traffic will not be load split across these paths.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(8)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.0(5)S</td>
<td>This command was integrated into Cisco IOS Release 12.0(5)S.</td>
</tr>
<tr>
<td>12.0(23)S</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If the `ip multicast multipath` command is configured and multiple equal-cost paths exist, load splitting will occur across the equal-cost paths for multicast traffic from different sources to the same multicast group, but not for traffic from the same source to different multicast groups. Because this command changes the way a Reverse Path Forwarding (RPF) neighbor is selected, it must be configured consistently on all routers in a redundant topology to avoid looping.

### Examples

The following example shows how to configure the `ip multicast multipath` command:

```
ip multicast multipath
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip rpf</code></td>
<td>Displays how IP multicast routing does RPF.</td>
</tr>
</tbody>
</table>
ip multicast rate-limit

To control the rate a sender from the source list can send to a multicast group in the group list, use the `ip multicast rate-limit` command in interface configuration mode. To remove the control, use the `no` form of this command.

```
ip multicast rate-limit {in | out} [video | whiteboard] [group-list access-list] [source-list access-list] kbps

no ip multicast rate-limit {in | out} [video | whiteboard] [group-list access-list] [source-list access-list] kbps
```

**Syntax Description**

- **in**
  Accepts only packets at the rate of the `kbps` value or slower on the interface.
- **out**
  Sends only a maximum of the `kbps` value on the interface.
- **video**
  (Optional) Performs rate limiting based on the User Datagram Protocol (UDP) port number used by video traffic. Video traffic is identified by consulting the Session Announcement Protocol (SAP) cache.
- **whiteboard**
  (Optional) Performs rate limiting based on the UDP port number used by whiteboard traffic. Whiteboard traffic is identified by consulting the SAP cache.
- **group-list access-list**
  (Optional) Specifies the access list number or name that controls which multicast groups are subject to the rate limit.
- **source-list access-list**
  (Optional) Specifies the access list number or name that controls which senders are subject to the rate limit.
- **kbps**
  Transmission rate (in kbps). Any packets sent at greater than this value are silently discarded. The default value is 0, meaning that no traffic is permitted. Therefore, set this to a positive value.

**Defaults**

If this command is not configured, there is no rate limit.
If this command is configured, the `kbps` value defaults to 0, meaning that no traffic is permitted.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If a router receives a packet the user has sent over the limit, the packet is dropped; otherwise, it is forwarded.

For the `video` or `whiteboard` keyword to work, the `ip sap listen` command must be enabled so that the port number can be obtained from the SAP cache. If the `ip sap listen` command is not enabled, or the group address is not in the SAP cache, no rate-limiting is done for the group.
Examples

In the following example, packets to any group from sources in network 172.16.0.0 will have their packets rate-limited to 64 kbps:

```
interface serial 0
  ip multicast rate-limit out group-list 1 source-list 2 64
access-list 1 permit 0.0.0.0 255.255.255.255
access-list 2 permit 172.16.0.0 0.0.255.255
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip sap listen</td>
<td>Enables the Cisco IOS software to listen to session directory advertisements.</td>
</tr>
</tbody>
</table>
To configure the time-to-live (TTL) threshold of packets being forwarded out an interface, use the `ip multicast ttl-threshold` command in interface configuration mode. To return to the default TTL threshold, use the `no` form of this command.

```
ip multicast ttl-threshold ttl-value
no ip multicast ttl-threshold ttl-value
```

**Syntax Description**
- `ttl-value`: Time-to-live value, in hops. It can be a value from 0 to 255. The default value is 0, which means that all multicast packets are forwarded out the interface.

**Defaults**
The default TTL value is 0, which means that all multicast packets are forwarded out the interface.

**Command Modes**
Interface configuration

**Command History**
- **Release**
  - **Modification**
  - 11.0: This command was introduced.

**Usage Guidelines**
Only multicast packets with a TTL value greater than the threshold are forwarded out the interface.

You should configure the TTL threshold only on border routers. Conversely, routers on which you configure a TTL threshold value automatically become border routers.

This command replaces the `ip multicast-threshold` command.

**Examples**
The following example sets the TTL threshold on a border router to 200, which is a very high value. In this example multicast packets must have a TTL greater than 200 in order to be forwarded out this interface. Multicast applications generally set this value well below 200. Therefore, setting a value of 200 means that no packets will be forwarded out the interface.

```
interface tunnel 0
ip multicast ttl-threshold 200
```
ip multicast use-functional

To enable the mapping of IP multicast addresses to the Token Ring functional address 0xc000.0004.0000, use the `ip multicast use-functional` command in interface configuration mode. To disable the function, use the `no` form of this command.

```
   ip multicast use-functional
   no ip multicast use-functional
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
IP multicast address are mapped to the MAC-layer address 0xFFFF.FFFF.FFFF.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command is accepted only on a Token Ring interface.

Neighboring devices on the Token Ring on which this feature is used should also use the same functional address for IP multicast traffic.

Because there are a limited number of Token Ring functional addresses, other protocols may be assigned to the Token Ring functional address 0xc000.0004.0000. Therefore, not every frame sent to the functional address is necessarily an IP multicast frame.

**Examples**
The following example configures any IP multicast packets going out Token Ring interface 0 to be mapped to MAC address 0xc000.0004.0000:

```
interface token 0
ip address 1.1.1.1 255.255.255.0
ip pim dense-mode
ip multicast use-functional
```
ip pim

To enable Protocol Independent Multicast (PIM) on an interface, use the `ip pim` command in interface configuration mode. To disable PIM on the interface, use the `no` form of this command.

```
ip pim {sparse-mode | sparse-dense-mode | dense-mode [proxy-register {list access-list | route-map map-name}]}
no ip pim {sparse-mode | sparse-dense-mode | dense-mode [proxy-register {list access-list | route-map map-name}]}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sparse-mode</code></td>
<td>Enables sparse mode of operation.</td>
</tr>
<tr>
<td><code>sparse-dense-mode</code></td>
<td>Treats the interface in either sparse mode or dense mode of operation, depending on which mode the multicast group operates in.</td>
</tr>
<tr>
<td><code>dense-mode</code></td>
<td>Enables dense mode of operation.</td>
</tr>
<tr>
<td><code>proxy-register</code></td>
<td>(Optional) Enables proxy registering on the interface of a designated router (DR) (leading toward the bordering dense mode region) for multicast traffic from sources not connected to the DR.</td>
</tr>

</tr>
<tr>
<td></td>
<td>• <code>list access-list</code></td>
</tr>
<tr>
<td></td>
<td>• <code>route-map map-name</code></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enabling PIM on an interface also enables Internet Group Management Protocol (IGMP) operation on that interface. An interface can be configured to be in dense mode, sparse mode, or sparse-dense mode. The mode describes how the Cisco IOS software populates its multicast routing table and how the software forwards multicast packets it receives from its directly connected LANs. Dense mode interfaces are always added to the table when the multicast routing table is populated. Sparse mode interfaces are added to the table only when periodic join messages are received from downstream routers, or there is a directly connected member on the interface.
Dense Mode
Initially, a dense mode interface forwards multicast packets until the router determines that there are group members or downstream routers, or until a prune message is received from a downstream router. Then, the dense mode interface periodically forwards multicast packets out the interface until the same conditions occur. Dense mode assumes that multicast group members are present. Dense mode routers never send a join message. They do send prune messages as soon as they determine they have no members or downstream PIM routers. A dense mode interface is subject to multicast flooding by default.

Dense Mode with Proxy Registering
For a router in a PIM sparse mode (PIM-SM) domain configured to operate in sparse mode or sparse-dense mode, the `ip pim dense-mode proxy-register` command must be configured on the interface leading toward the bordering dense mode region. This configuration will enable the router to register traffic from the dense mode region with the rendezvous point (RP) in the sparse mode domain.

Prior to Cisco IOS Release 12.0 S, an RP needed to be running on the border router leading toward a dense mode region so that the RP could learn about traffic from sources in the dense mode region. This command requires an extended access list or route map argument specifying which traffic the router needs to register with the RP. This command applies only to sources reachable through a PIM router. Cisco IOS software will always register traffic from remote sources if it arrives on a dense mode interface and if the Reverse Path Forwarding (RPF) neighbor leading toward the source is a Distance Vector Multicast Routing Protocol (DVMRP) but not a PIM router. This functionality has existed since Cisco IOS Release 10.0 and cannot be modified (restricted) with an access list or route map.

Sparse Mode
A sparse mode interface is used for multicast forwarding only if a join message is received from a downstream router or if group members are directly connected to the interface. Sparse mode assumes that no other multicast group members are present. When sparse mode routers want to join the shared path, they periodically send join messages toward the RP. When sparse mode routers want to join the source path, they periodically send join messages toward the source; they also send periodic prune messages toward the RP to prune the shared path.

Sparse-Dense Mode
An alternative to choosing just dense mode or just sparse mode is to run PIM in a single region in sparse mode for some groups and dense mode for other groups.

In sparse-dense mode, if the group is in dense mode, the interface will be treated as dense mode. If the group is in sparse mode, the interface will be treated in sparse mode. The group is “sparse” if the router knows about an RP for that group.

When an interface is treated in dense mode, it is populated in the outgoing interface list of the multicast routing table when either of the following conditions is true:
- Members or DVMRP neighbors are on the interface.
- Any of the PIM neighbors on the interface have not pruned for the group.

When an interface is treated in sparse mode, it is populated in the outgoing interface list of the multicast routing table when either of the following conditions is true:
- Members or DVMRP neighbors are on the interface.
- A PIM neighbor on the interface has received an explicit join message.
IP Multicast Routing Commands

Examples

The following example shows how to enable PIM-SM on tunnel interface 0 and set the address of the RP router to 226.0.0.8:

```plaintext
ip pim rp-address 226.0.0.8
interface tunnel 0
  ip pim sparse-mode
```

The following example shows how to enable PIM dense mode (PIM-DM) on Ethernet interface 1:

```plaintext
interface ethernet 1
  ip pim dense-mode
```

The following example shows how to enable PIM sparse-dense mode on Ethernet interface 1:

```plaintext
interface ethernet 1
  ip pim sparse-dense-mode
```

The following example shows how to register the multicast traffic for any source and any multicast group:

```plaintext
interface ethernet 0
  ip address 172.16.0.0 255.255.255.0
description Ethernet interface towards the PIM sparse-mode domain
  ip pim sparse-dense-mode
! interface ethernet 1
  ip address 192.44.81.5 255.255.255.0
description Ethernet interface towards the PIM dense-mode region
  ip pim dense-mode proxy-register list 100
! access-list 100 permit ip any any
```

</tr>
<tr>
<td>12.2(13)T</td>
<td>The <em>vrf</em> keyword and <em>vrf-name</em> argument were added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use this command to prevent unauthorized sources from registering with the RP. If an unauthorized source sends a register message to the RP, the RP will immediately send back a register-stop message.

### Examples

The following example shows how to restrict the RP from allowing sources in the Source Specific Multicast (SSM) range of addresses to register with the RP. These statements need to be configured only on the RP.

```
ip pim accept-register list no-ssm-range

ip access-list extended no-ssm-range
deny ip any 232.0.0.0 0.255.255.255
permit ip any any
```
ip pim accept-rp

To configure a router to accept join or prune messages destined for a specified rendezvous point (RP) and for a specific list of groups, use the `ip pim accept-rp` command in global configuration mode. To remove that check, use the `no` form of this command.

```
ip pim [vrf vrf-name] accept-rp {rp-address | auto-rp} [access-list]
no ip pim [vrf vrf-name] accept-rp {rp-address | auto-rp} [access-list]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf</td>
<td>(Optional) Supports the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td>vrf-name</td>
<td>(Optional) Name assigned to the VRF.</td>
</tr>
<tr>
<td>rp-address</td>
<td>RP address of the RP allowed to send join messages to groups in the range specified by the group access list.</td>
</tr>
<tr>
<td>auto-rp</td>
<td>Accepts join and register messages only for RPs that are in the Auto-RP cache.</td>
</tr>
<tr>
<td>access-list</td>
<td>(Optional) Access list number or name that defines which groups are subject to the check.</td>
</tr>
</tbody>
</table>

**Defaults**

The command is disabled, so all join messages and prune messages are processed.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.2</td>
<td>This command was introduced.</td>

<tr>
<td>12.0(23)S</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command causes the router to accept only (*, G) join messages destined for the specified RP address. Additionally, the group address must be in the range specified by the access list.

When the `rp-address` argument is one of the addresses of the system, the system will be the RP only for the specified group range specified by the access list. When the group address is not in the group range, the RP will not accept join or register messages and will respond immediately to register messages with register-stop messages.

**Examples**

The following example states that the router will accept join or prune messages destined for the RP at address 172.17.1.1 for the multicast group 224.2.2.2:

```
ip pim accept-rp 172.17.1.1 3
access-list 3 permit 224.2.2.2
```
<table>

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(7)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Use the `ip pim autorp listener` command with interfaces configured for PIM sparse mode operation in order to establish a network configuration where Auto-RP operates in PIM dense mode and multicast traffic can operate in sparse mode, bidirectional mode, or source specific multicast (SSM) mode.

Examples
The following example enables IP multicast routing and the Auto-RP listener feature on a router. It also configures the router as a Candidate RP for the multicast groups 239.254.2.0 through 239.254.2.255.

```
ip multicast-routing
ip pim autorp listener

ip pim send-rp-announce Loopback0 scope 16 group-list 1
ip pim send-rp-discovery Loopback1 scope 16
access-list 1 permit 239.254.2.0 0.0.0.255
```
**ip pim bidir-enable**

To enable bidirectional Protocol Independent Multicast (bidir-PIM), use the `ip pim bidir-enable` command in global configuration mode. To disable bidir-PIM, use the `no` form of this command.

```
ip pim [vrf vrf-name] bidir-enable
no ip pim [vrf vrf-name] bidir-enable
```

<table>

</tr>
<tr>
<td>12.2(13)T</td>
<td>This command was integrated into Cisco IOS Release 12.2(13)T.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Bidir-PIM is disabled by default to ensure complete backward compatibility when upgrading a router to Cisco IOS Release 12.0(18)ST or a later release.

When bidir-PIM is disabled, the router will behave similarly to a router without bidir-PIM support. The following conditions will apply:

- PIM hello messages sent by the router will not contain the bidirectional mode option.
- The router will not send designated forwarder (DF) election messages and will ignore DF election messages it receives.
- The `ip pim rp-address`, `ip pim send-rp-announce`, and `ip pim rp-candidate` global configuration commands will be treated as follows:
  - If these commands are configured when bidir-PIM is disabled, bidirectional mode will not be a configuration option.
  - If these commands are configured with the bidirectional mode option when bidir-PIM is enabled and then bidir-PIM is disabled, these commands will be removed from the command-line interface (CLI). In this situation, these commands must be configured again with the bidirectional mode option when bidir-PIM is reenabled.
- The `df` keyword for the `show ip pim interface` user EXEC or privileged EXEC command and `debug ip pim` privileged EXEC command is not supported.
The following example shows how to configure a rendezvous point (RP) for both sparse mode and bidirectional mode groups: 224/8 and 227/8 are bidirectional groups, 226/8 is sparse mode, and 225/8 is dense mode. The RP must be configured to use different IP addresses for the sparse mode and bidirectional mode operations. Two loopback interfaces are used to allow this configuration. The addresses of these loopback interfaces must be routed throughout the PIM domain such that the other routers in the PIM domain can receive Auto-RP announcements and communicate with the RP.

```plaintext
ip multicast-routing !Enable IP multicast routing
ip pim bidir-enable !Enable bidir-PIM
!
interface loopback 0
description One Loopback address for this routers Bidir Mode RP function
ip address 10.0.1.1 255.255.255.0
  ip pim sparse-dense-mode
!
interface loopback 1
description One Loopback address for this routers Sparse Mode RP function
ip address 10.0.2.1 255.255.255.0
  ip pim sparse-dense-mode

ip pim send-rp-announce Loopback0 scope 10 group-list 45 bidir
ip pim send-rp-announce Loopback1 scope 10 group-list 46
ip pim send-rp-discovery scope 10

access-list 45 permit 224.0.0.0 0.255.255.255
access-list 45 permit 227.0.0.0 0.255.255.255
access-list 45 deny 225.0.0.0 0.255.255.255
access-list 46 permit 226.0.0.0 0.255.255.255
```

</tr>
<tr>
<td>12.0(8)</td>
<td>The <code>ip pim border</code> command was replaced by the <code>ip pim bsr-border</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
When this command is configured on an interface, no PIM Version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two domains. BSR messages should not be exchanged between different domains, because routers in one domain may elect rendezvous points (RPs) in the other domain, resulting in protocol malfunction or loss of isolation between the domains.

**Note**
This command does not set up multicast boundaries. It only sets up a PIM domain BSR message border.

**Examples**
The following example configures the interface to be the PIM domain border:

```
interface ethernet 1
ip pim bsr-border
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip multicast boundary</code></td>
<td>Configures an administratively scoped boundary.</td>
</tr>
<tr>
<td><code>ip pim bsr-candidate</code></td>
<td>Configures the router to announce its candidacy as a BSR.</td>
</tr>
</tbody>
</table>
To configure the router to announce its candidacy as a bootstrap router (BSR), use the `ip pim bsr-candidate` command in global configuration mode. To remove this router as a candidate for being a bootstrap router, use the `no` form of this command.

```
ip pim [vrf vrf-name] bsr-candidate interface-type interface-number [hash-mask-length] [priority]
```

```
no ip pim [vrf vrf-name] bsr-candidate interface-type interface-number [hash-mask-length] [priority]
```

**Syntax Description**

- `vrf` (Optional) Supports the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance.
- `vrf-name` (Optional) Name assigned to the VRF.
- `interface-type interface-number` Interface type and number on this router from which the BSR address is derived, to make it a candidate. This interface must be enabled with Protocol Independent Multicast (PIM).
- `hash-mask-length` (Optional) Length of a mask (32 bits maximum) that is to be ANDed with the group address before the hash function is called. All groups with the same seed hash (correspond) to the same RP. For example, if this value is 24, only the first 24 bits of the group addresses matter. This fact allows you to get one RP for multiple groups.
- `priority` (Optional) Priority of the candidate BSR. Integer from 0 to 255. The BSR with the larger priority is preferred. If the priority values are the same, the router with the larger IP address is the BSR. The default value is 0.

**Defaults**

The command is disabled.

```
priority: 0
```

**Note**

The Cisco IOS implementation of PIM BSR uses the value 0 as the default priority for candidate RPs and BSRs. This implementation predates the draft-ietf-pim-sm-bsr IETF draft, the first IETF draft to specify 192 as the default priority value. The Cisco IOS implementation, thus, deviates from the IETF draft. To comply with the default priority value specified in the draft, you must explicitly set the priority value to 192.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>

</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

This command causes the router to send bootstrap messages to all its PIM neighbors, with the address of the designated interface as the BSR address. Each neighbor compares the BSR address with the address it had from previous bootstrap messages (not necessarily received on the same interface). If the current address is the same or higher address, it caches the current address and forwards the bootstrap message. Otherwise, it drops the bootstrap message.

This router continues to be the BSR until it receives a bootstrap message from another candidate BSR saying that it has a higher priority (or if the same priority, a higher IP address).

Use this command only in backbone routers that have good connectivity to all parts of the PIM domain. That is, a stub router that relies on an on-demand dialup link to connect to the rest of the PIM domain is not a good candidate BSR.

**Examples**

The following example shows how to configure the IP address of the router on Ethernet interface 0/0 to be a candidate BSR with priority of 192:

```
ip pim bsr-candidate ethernet 0/0 192
```
**ip pim dr-priority**

To set the priority for which a router is elected as the designated router (DR), use the `ip pim dr-priority` command in interface configuration mode. To disable this function, use the `no` form of this command.

```
ip pim dr-priority priority-value
no ip pim dr-priority priority-value
```

**Syntax Description**

| priority-value | Value in the range from 0 to 4294967294 used to determine the priority of the router to be selected as the DR. |

**Defaults**

Disabled

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(2)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a DR is elected, the following conditions apply:

- The router with the highest priority value configured on an interface will be elected as the DR. If this priority value is the same on multiple routers, then the router with the highest IP address configured on an interface will be elected as the DR.
- If a router does not advertise a priority value in its hello messages, the router is regarded as having the highest priority and will be elected as the DR. If there are multiple routers with this priority status, then the router with the highest IP address configured on an interface will be elected as the DR.

**Examples**

The following example sets the DR priority value of the Ethernet0 interface to 200:

```
interface Ethernet0
 ip address 10.0.1.2 255.255.255.0
 ip pim dr-priority 200
```
**ip pim minimum-vc-rate**

To configure the minimum traffic rate to keep virtual circuits (VCs) from being idled, use the `ip pim minimum-vc-rate` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
ip pim minimum-vc-rate pps
no ip pim minimum-vc-rate [pps]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pps</strong></td>
<td>Rate, in packets per second, below which a VC is eligible for idling. The default value is 0, which means all VCs are eligible for idling. The range is from 0 to 4294967295.</td>
</tr>
</tbody>
</table>

**Defaults**

0 pps, which indicates all VCs are eligible for idling.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command applies to an ATM interface only and also requires IP Protocol Independent Multicast sparse mode (PIM-SM).

An idling policy uses the `ip pim vc-count number` command to limit the number of VCs created by PIM. When the router stays at or below this number, no idling policy is in effect. When the next VC to be opened will exceed the number, an idling policy is exercised. Any virtual circuits with a traffic rate lower than the `ip pim minimum-vc-rate` command are subject to the idling policy, which is described in the section “Limit the Number of Virtual Circuits” in the “Configuring IP Multicast Routing” chapter of the Cisco IOS IP Configuration Guide.

**Examples**

The following example configures a minimum rate of 2500 pps over a VC, below which the VC is eligible for idling:

```
ip pim minimum-vc-rate 2500
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip pim vc-count</code></td>
<td>Changes the maximum number of VCs that PIM can open.</td>
</tr>
</tbody>
</table>
ip pim multipoint-signalling

To enable Protocol Independent Multicast (PIM) to open ATM multipoint switched virtual circuits (VCs) for each multicast group that a receiver joins, use the ip pim multipoint-signalling command in interface configuration mode. To disable the feature, use the no form of this command.

```
ip pim multipoint-signalling

no ip pim multipoint-signalling
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Disabled.

All multicast traffic goes to the static map multipoint VC as long as the atm multipoint-signalling command is configured.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is accepted only on an ATM interface. It allows optimal multicast trees to be built down to ATM switch granularity. This command can enhance router performance and link utilization because packets are not replicated and sent multiple times over the ATM interface.

**Examples**

The following example enables PIM to open ATM multipoint switched VCs for each multicast group that is joined:

```
ip pim multipoint-signalling
```

**Related Commands**

<table>
<thead>
<tr>

</tbody>
</table>
**ip pim nbma-mode**

To configure a multiaccess WAN interface to be in nonbroadcast multiaccess (NBMA) mode, use the ip pim nbma-mode command in interface configuration mode. To disable this function, use the no form of this command.

```
ip pim nbma-mode
no ip pim nbma-mode
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Disabled

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command on Frame Relay, Switched Multimegabit Data Service (SMDS), or ATM only, especially when these media do not have native multicast available. Do not use this command on multicast-capable LANs such as Ethernet or FDDI.

When this command is configured, each Protocol Independent Multicast (PIM) join message is tracked in the outgoing interface list of a multicast routing table entry. Therefore, only PIM WAN neighbors that have joined for the group will get packets sent as data-link unicasts. This command should only be used when the ip pim sparse-mode command is configured on the interface. This command is not recommended for LANs that have natural multicast capabilities.

**Examples**

The following example configures an interface to be in NBMA mode:

```
ip pim nbma-mode
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

The following example enables stub multicast routing on Router A, which has an outgoing interface with IP address 10.0.0.1. Router B is a central router with an incoming interface with address 10.0.0.2. Access list 1 filters PIM messages from the source (stub Router A).

**Router A Configuration**

```
ip multicast-routing
ip pim dense-mode
ip igmp helper-address 10.0.0.2
```

**Router B Configuration**

```
ip multicast-routing
   ip pim dense-mode ; or ip pim sparse-mode
   ip pim neighbor-filter 1
   access-list 1 deny 10.0.0.1
```

**Related Commands**

</tbody>
</table>
ip pim query-interval

To configure the frequency of Protocol Independent Multicast (PIM) router query messages, use the `ip pim query-interval` command in interface configuration mode. To return to the default interval, use the `no` form of this command.

```
ip pim query-interval seconds

no ip pim query-interval [seconds]
```

**Syntax Description**

- `seconds`: Interval, in seconds, at which periodic PIM router query messages are sent. It can be a number from 1 to 65535. The default is 30 seconds.

**Defaults**

- 30 seconds

**Command Modes**

- Interface configuration

**Command History**

- **Release**
- **Modification**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Routers configured for IP multicast send PIM router query messages to determine which router will be the designated router for each LAN segment (subnet). The designated router is responsible for sending Internet Group Management Protocol (IGMP) host query messages to all hosts on the directly connected LAN. When operating in sparse mode, the designated router is responsible for sending source registration messages to the RP. The designated router is the router with the largest IP address.

**Examples**

The following example changes the PIM router query message interval to 45 seconds:

```
interface tunnel 0
ip pim query-interval 45
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip igmp query-interval</code></td>
<td>Configures the frequency at which the Cisco IOS software sends IGMP host query messages.</td>
</tr>
</tbody>
</table>
ip pim register-rate-limit

To set a limit on the maximum number of Protocol Independent Multicast sparse mode (PIM-SM) register messages sent per second for each (S, G) routing entry, use the `ip pim register-rate-limit` command in global configuration mode. To disable this limit, use the `no` form of this command.

```
ip pim [vrf vrf-name] register-rate-limit rate
no ip pim [vrf vrf-name] register-rate-limit rate
```

**Syntax Description**

- **vrf** (Optional) Supports the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance.
- **vrf-name** (Optional) Name assigned to the VRF.
- **rate** Maximum number of register messages sent per second by the router. If no limit is defined, the router will not limit the rate of register messages sent.

**Defaults**
No limit is defined.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3 T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.0(23)S</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to limit the number of register messages that the designated router (DR) will allow for each (S, G) entry. Enabling this command will limit the load on the DR and RP at the expense of dropping those register messages that exceed the set limit. Receivers may experience data packet loss within the first second in which register messages are sent from bursty sources.

If the `ip pim dense-mode proxy-register` command is configured, then the `ip pim register-rate-limit` command must be configured because of the potentially large number of sources from the dense mode area that may send data into the sparse mode region (and thus need registering in the border router).

This command applies only to sparse mode (S, G) multicast routing entries.

**Examples**
The following example shows how to configure the `ip pim register-rate-limit` command with a maximum rate of two register messages per second:

```
ip pim register-rate-limit 2
```
<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ip pim</td>
<td>Enables PIM on an interface.</td>
</tr>
</tbody>
</table>
ip pim register-source

To configure the IP source address of a register message to an interface address other than the outgoing interface address of the designated router (DR) leading toward the rendezvous point (RP), use the `ip pim register-source` command in global configuration mode. To disable this configuration, use the `no` form of this command.

```
ip pim [vrf vrf-name] register-source interface-type interface-number
no ip pim [vrf vrf-name] register-source interface-type interface-number
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf</td>
<td>(Optional) Supports the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance.</td>

</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is required only when the IP source address of a register message is not a uniquely routed address to which the RP can send packets. This situation may occur if the source address is filtered such that packets sent to it will not be forwarded or if the source address is not unique to the network. In these cases, the replies sent from the RP to the source address will fail to reach the DR, resulting in Protocol Independent Multicast sparse mode (PIM-SM) protocol failures.

If no IP source address is configured or if the configured source address is not in service, the IP address of the outgoing interface of the DR leading toward the RP is used as the IP source address of the register message. Therefore, we recommend using a loopback interface with an IP address that is uniquely routed throughout the PIM-SM domain.

**Examples**

The following example shows how to configure the IP source address of the register message to the loopback 3 interface of a DR:

```
ip pim register-source loopback 3
```
ip pim rp-address

To configure the address of a Protocol Independent Multicast (PIM) rendezvous point (RP) for a particular group, use the `ip pim rp-address` command in global configuration mode. To remove an RP address, use the `no` form of this command.

```
ip pim rp-address rp-address [access-list] [override] [bidir]
no ip pim rp-address rp-address [access-list] [override] [bidir]
```

**Syntax Description**

- `rp-address` - IP address of a router to be a PIM RP. This is a unicast IP address in four-part dotted-decimal notation.
- `access-list` - (Optional) Number or name of an access list that defines for which multicast groups the RP should be used.
- `override` - (Optional) Indicates that if there is a conflict, the RP configured with this command prevails over the RP learned by Auto-RP.
- `bidir` - (Optional) Indicates that the multicast groups specified by the `access-list` argument are to operate in bidirectional mode. If the command is configured without this option, the groups specified will operate in PIM sparse mode.

**Defaults**

No PIM RPs are preconfigured.

**Command Modes**

Global configuration

**Command History**

- **Release** | **Modification**
  - 10.2 | This command was introduced.
  - 11.1 | The `override` keyword was added.
  - 12.1(2)T | The `bidir` keyword was added.

**Usage Guidelines**

In the Cisco IOS implementation of PIM, each multicast group individually operates in one of the following modes: dense mode, sparse mode, or bidirectional mode. Groups in sparse mode or bidirectional mode need to have the IP address of one router to operate as the RP for the group. All routers in a PIM domain need to have a consistent configuration for the mode and RP addresses of the multicast groups.

The Cisco IOS software learns the mode and RP addresses of multicast groups via the following three mechanisms: static configuration, Auto-RP, and bootstrap router (BSR). Use the `ip pim rp-address` command to statically define the mode of operations and RP address for multicast groups that are to operate in sparse mode or bidirectional mode. By default, groups will operate in dense mode. No commands explicitly define groups to operate in dense mode.
You can configure the Cisco IOS software to use a single RP for more than one group. The conditions specified by the access list determine for which groups the RP can be used. If no access list is configured, the RP is used for all groups. A PIM router can use multiple RPs, but only one per group.

If multiple `ip pim rp-address` commands are configured, the following rules apply to a multicast group:

- **Highest RP IP address selection:** If a group is matched by the access list of more than one `ip pim rp-address` command whose prefix masks are all the same lengths, then the mode and RP for the group are determined by the `ip pim rp-address` command with the highest RP address parameter.

- **Static evaluation:** The mode and RP selection for a group are static and do not depend on the reachability of the individual RPs. The router will not start using an RP with a lower IP address or a shorter prefix length match if the better RP is not reachable. Use Auto-RP, BSR, or Anycast-RP to configure redundancy.

- **One IP address per command:** An IP address can be used as a parameter for only one `ip pim rp-address` command. If an `ip pim rp-address` command is configured with an IP address parameter that was previously used to configure an older `ip pim rp-address` command, then this old command will be replaced with the newly configured command. This restriction also means that only one IP address can be used to provide RP functions for either sparse mode or bidirectional mode groups. Use different IP addresses of the same router to provide RP functions for both sparse mode and bidirectional mode from the same router.

- **One access list per command:** A specific access list can be used as a parameter for only one `ip pim rp-address` command. If an `ip pim rp-address` command is configured with an access list parameter that was previously used to configure an older `ip pim rp-address` command, then this old command will be replaced with the newly configured command.

Static definitions for the group mode and RP address of the `ip pim rp-address` command may be used together with dynamically learned group mode and RP address mapping through Auto-RP or BSR. The following rules apply to a multicast group:

- **Group mode and RP address mappings learned through Auto-RP and BSR take precedence over mappings statistically defined by the `ip pim rp-address` command without the `override` keyword.** Commands with the `override` keyword take precedence over dynamically learned mappings.

- **If you are using Auto-RP to distribute group-to-RP mappings, use the `bidir` keyword with the `ip pim send-rp-announce` command.**

- **If you are using the PIM Version 2 bootstrap mechanism to distribute group-to-RP mappings, use the `bidir` keyword with the `ip pim rp-candidate` command.**

### Examples

The following example sets the PIM RP address to 192.168.0.0 for all multicast groups and defines all groups to operate in sparse mode:

```plaintext
ip pim rp-address 192.168.0.0
```

**Note**

The same RP cannot be used for both bidirectional and sparse mode groups.

The following example sets the PIM RP address to 172.16.0.0 for the multicast group 225.2.2.2 only:

```plaintext
access list 1 225.2.2.2 0.0.0.0
ip pim rp-address 172.16.0.0
```

<td>Uses Auto-RP to configure for which groups the router is willing to act as RP.</td>
</tr>
</tbody>
</table>
**ip pim rp-announce-filter**

To filter incoming Auto-RP announcement messages coming from the rendezvous point (RP), use the `ip pim rp-announce-filter` command in global configuration mode. To remove the filter, use the `no` form of this command.

```
  ip pim [vrf vrf-name] rp-announce-filter rp-list access-list group-list access-list
  no ip pim [vrf vrf-name] rp-announce-filter rp-list access-list group-list access-list
```

**Syntax Description**

- `vrf` (Optional) Supports the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance.
- `vrf-name` (Optional) Name assigned to the VRF.
- `rp-list access-list` Specifies the number or name of a standard access list of RP addresses that are allowable for the group ranges supplied in the `group-list access-list` combination.
- `group-list access-list` Specifies the number or name of a standard access list that describes the multicast groups the RPs serve.

**Defaults**

All RP announcements are accepted.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.0(23)S</td>

</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Configure this command on the Protocol Independent Multicast (PIM) RP mapping agent. We recommend that if you use more than one RP mapping agent, make the filters among them consistent so that there are no conflicts in mapping state when the announcing agent goes down.

**Examples**

The following example configures the router to accept RP announcements from RPs in access list 1 for group ranges described in access list 2:

```
ip pim rp-announce-filter rp-list 1 group-list 2
access-list 1 permit 10.0.0.1
access-list 1 permit 10.0.0.2
access-list 2 permit 224.0.0.0 192.168.255.255
```
### Related Commands

</tr>
</thead>
<tbody>
<tr>
<td>access-list (IP standard)</td>
<td>Defines a standard IP access list.</td>
</tr>
</tbody>
</table>
ip pim rp-candidate

To configure the router to advertise itself to the bootstrap router (BSR) as a Protocol Independent Multicast (PIM) Version 2 candidate rendezvous point (RP), use the `ip pim rp-candidate` command in global configuration mode. To remove this router as an RP candidate, use the `no` form of this command.

```
ip pim [vrf vrf-name] rp-candidate interface-type interface-number [bidir] [group-list access-list] [interval seconds] [priority value]
no ip pim [vrf vrf-name] rp-candidate
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf</td>
<td>(Optional) Supports the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td>vrf-name</td>
<td>(Optional) Name assigned to the VRF.</td>
</tr>
<tr>
<td>interface-type interface-number</td>
<td>The IP address associated with this interface type and number is advertised as a candidate RP address.</td>
</tr>
<tr>
<td>bidir</td>
<td>(Optional) Indicates that the multicast groups specified by the <code>access-list</code> argument are to operate in bidirectional mode. If the command is configured without this option, the groups specified will operate in PIM sparse mode.</td>
</tr>
<tr>
<td>group-list access-list</td>
<td>(Optional) Specifies the standard IP access list number or name that defines the group prefixes that are advertised in association with the RP address. The access list name cannot contain a space or quotation mark, and must begin with an alphabetic character to avoid confusion with numbered access lists.</td>
</tr>
<tr>
<td>interval seconds</td>
<td>(Optional) Indicates the RP candidate advertisement interval. The range is from 1 to 16383 seconds. The default value is 60 seconds.</td>
</tr>
<tr>
<td>priority value</td>
<td>(Optional) Indicates the RP priority value. The range is from 0 to 255. The default value is 0.</td>
</tr>
</tbody>
</table>

### Defaults

The command is disabled.

- `seconds`: 60
- `priority`: 0

### Note

The Cisco IOS implementation of PIM BSR uses the value 0 as the default priority for candidate RPs and BSRs. This implementation predates the draft-ietf-pim-sm-bsr IETF draft, the first IETF draft to specify 192 as the default priority value. The Cisco IOS implementation, thus, deviates from the IETF draft. To comply with the default priority value specified in the draft, you must explicitly set the priority value to 192.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3 T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(2)T</td>
<td>The <code>bidir</code> keyword was added.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

This command causes the router to send a PIM Version 2 message advertising itself as a candidate RP to the BSR. The addresses allowed by the access list, together with the router identified by the type and number, constitute the RP and its range of addresses for which it is responsible.

Use this command only in backbone routers that have good connectivity to all parts of the PIM domain. That is, a stub router that relies on an on-demand dialup link to connect to the rest of the PIM domain is not a good candidate RP.

Use this command with the `bidir` keyword when you want bidirectional forwarding and you are using the PIM Version 2 BSR mechanism to distribute group-to-RP mappings. Other options are as follows:

- If you are using Auto-RP to distribute group-to-RP mappings, use the `bidir` keyword with the `ip pim send-rp-announce` command.
- If you are not distributing group-to-RP mappings using either Auto-RP or the PIM Version 2 BSR mechanism, use the `bidir` keyword with the `ip pim rp-address` command.

When the `interval` keyword is specified, the candidate RP advertisement interval is set to a value specified by the `seconds` argument. The default interval is 60 seconds. Reducing this interval to a time of less than 60 seconds can reduce the time required to fail over to a secondary RP at the expense of generating more PIM Version 2 messages.

**Examples**

The following example shows how to configure the router to advertise itself as a candidate RP to the BSR in its PIM domain. Standard access list number 4 specifies the group prefix associated with the RP that has the address identified by Ethernet interface 2. That RP is responsible for the groups with the prefix 239.

```
ip pim rp-candidate ethernet 2 group-list 4
access-list 4 permit 239.0.0.0 0.255.255.255
```

<td>The vrf keyword and vrf-name argument were added.</td>
</tr>
<tr>
<td>12.2(13)T</td>
<td>The vrf keyword and vrf-name argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command in the router you want to be an RP. When you are using Auto-RP to distribute group-to-RP mappings, this command causes the router to send an Auto-RP announcement message to the well-known group CISCO-RP-ANNOUNCE (224.0.1.39). This message announces the router as a candidate RP for the groups in the range described by the access list.

Use this command with the `bidir` keyword when you want bidirectional forwarding and you are using Auto-RP to distribute group-to-RP mappings. Other options are as follows:

- If you are using the PIM Version 2 bootstrap router (PIMv2 BSR) mechanism to distribute group-to-RP mappings, use the `bidir` keyword with the `ip pim rp-candidate` command.
- If you are not distributing group-to-RP mappings using either Auto-RP or the PIMv2 BSR mechanism, use the `bidir` keyword with the `ip pim rp-address` command.

**Examples**

The following example sends RP announcements out all Protocol Independent Multicast (PIM)-enabled interfaces for a maximum of 31 hops. The IP address by which the router wants to be identified as RP is the IP address associated with Ethernet interface 0. Access list 5 describes the groups for which this router serves as RP.

```
ip pim send-rp-announce ethernet0 scope 31 group-list 5 access-list 5 permit 224.0.0.0 15.255.255.255
```

</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Configure this command on the router designated as an RP mapping agent. Specify a TTL large enough to cover your Protocol Independent Multicast (PIM) domain.

When Auto-RP is used, the following events occur:

1. The RP mapping agent listens on well-known group address CISCO-RP-ANNOUNCE (224.0.1.39), which candidate RPs send to.
2. The RP mapping agent sends RP-to-group mappings in an Auto-RP discovery message to the well-known group CISCO-RP-DISCOVERY (224.0.1.40). The TTL value limits how many hops the message can take.
3. PIM designated routers listen to this group and use the RPs they learn about from the discovery message.

**Examples**

The following example limits Auto-RP RP discovery messages to 20 hops:

```
ip pim send-rp-discovery scope 20
```
ip pim spt-threshold

To configure when a Protocol Independent Multicast (PIM) leaf router should join the shortest path source tree for the specified group, use the ip pim spt-threshold command in global configuration mode. To restore the default value, use the no form of this command.

```
ip pim [vrf vrf-name] spt-threshold {kbps | infinity} [group-list access-list]
no ip pim [vrf vrf-name] spt-threshold {kbps | infinity} [group-list access-list]
```

**Syntax Description**

- **vrf**: (Optional) Supports the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance.
- **vrf-name**: (Optional) Name assigned to the VRF.
- **kbps**: Traffic rate (in kbps).
- **infinity**: Causes all sources for the specified group to use the shared tree.
- **group-list access-list**: (Optional) Indicates which groups the threshold applies to. Must be an IP standard access list number or name. If the value is 0 or is omitted, the threshold applies to all groups.

**Defaults**

When this command is not used, the PIM leaf router joins the shortest path tree immediately after the first packet arrives from a new source.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.0(23)S</td>
<td>The vrf keyword and vrf-name argument were added.</td>
</tr>
<tr>
<td>12.2(13)T</td>
<td>The vrf keyword and vrf-name argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If a source sends at a rate greater than or equal to traffic rate (the kbps value), a PIM join message is triggered toward the source to construct a source tree.

If the infinity keyword is specified, all sources for the specified group will use the shared tree. Specifying a group list access list indicates the groups to which the threshold applies.

If the traffic rate from the source drops below the threshold traffic rate, the leaf router will switch back to the shared tree and send a prune message toward the source.

**Examples**

The following example sets a threshold of 4 kbps, above which traffic to a group from a source will cause the router to switch to the shortest path tree to that source:

```
ip pim spt-threshold 4
```
**ip pim ssm**

To define the Source Specific Multicast (SSM) range of IP multicast addresses, use the `ip pim ssm` command in global configuration mode. To disable the SSM range, use the `no` form of this command.

```
ip pim [vrf vrf-name] ssm {default | range access-list}
no ip pim [vrf vrf-name] ssm {default | range access-list}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>vrf</th>
<th>(Optional) Supports the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance.</th>
</tr>
</thead>

</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When an SSM range of IP multicast addresses is defined by the `ip pim ssm` command, no Multicast Source Discovery Protocol (MSDP) Source-Active (SA) messages will be accepted or originated in the SSM range.

**Examples**

The following example shows how to configure SSM service for the IP address range defined by access list 4:

```
access-list 4 permit 224.2.151.141
ip pim ssm range 4
```

ip pim state-refresh origination-interval

To configure the origination of and the interval for PIM dense mode state refresh control messages on a Protocol Independent Multicast (PIM) router, use the **ip pim state-refresh origination-interval** command in interface configuration mode. To stop the origination of the PIM dense mode state refresh control message, use the **no** form of this command.

**ip pim state-refresh origination-interval** [interval]

**no ip pim state-refresh origination-interval** [interval]

**Syntax Description**

`interval` *(Optional)* The number of seconds between PIM dense mode state refresh control messages. The default is 60 seconds. The available interval range is from 4 to 100 seconds.

**Defaults**

PIM dense mode state refresh control message origination is disabled. By default, all PIM routers that are running a Cisco IOS software release that supports PIM dense mode state refresh process and forward PIM dense mode state refresh control messages.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(5)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Configure this command on the interfaces of the first hop, PIM dense mode routers that are directly connected to sources for PIM-DM multicast groups.

By default, the processing and forwarding of PIM dense mode state refresh control messages is enabled on PIM routers that are running a Cisco IOS software release that supports PIM dense mode state refresh.

**Examples**

The following example configures the origination of the state refresh control message on Ethernet interface 0 of a PIM dense mode router with an interval of 80 seconds:

```
interface ethernet 0
ip pim state-refresh origination-interval 80
```

ip pim version

To configure the Protocol Independent Multicast (PIM) version of the interface, use the ip pim version command in interface configuration mode. To restore the default value, use the no form of this command.

ip pim version [1 | 2]

no ip pim version

Syntax Description

1 (Optional) Configures PIM Version 1.
2 (Optional) Configures PIM Version 2.

Defaults

Version 2

Command Modes

Interface configuration

Command History

Release  Modification
11.3 T  This command was introduced.

Usage Guidelines

An interface in Version 2 mode automatically downgrades to Version 1 mode if that interface has a PIM Version 1 neighbor. The interface returns to Version 2 mode after all Version 1 neighbors disappear (that is, they are shut down or upgraded).

Examples

The following example configures the interface to operate in PIM Version 1 mode:

interface ethernet 0
ip address 1.1.1.1 255.0.0.0
ip pim sparse-dense-mode
ip pim version 1
ip rgmp

To enable the Router-Port Group Management Protocol (RGMP) on Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces, use the `ip rgmp` command in interface configuration mode. To disable RGMP on the interfaces, use the `no` form of this command.

```
ip rgmp

no ip rgmp
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

RGMP is not enabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(10)S</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(1)E</td>
<td>This command was integrated into Cisco IOS Release 12.1(1)E.</td>
</tr>
<tr>
<td>12.1(5)T</td>
<td>This command was integrated into Cisco IOS Release 12.1(5)T.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

RGMP is supported only on Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces.

Before enabling RGMP, the following features must be enabled on your router:

- IP routing
- IP multicast
- PIM in sparse mode, sparse-dense mode, source specific mode, or bidirectional mode

If your router is in a bidirectional group, make sure to enable RGMP only on interfaces that do not function as a designated forwarder (DF). If you enable RGMP on an interface that functions as a DF, the interface will not forward multicast packets up the bidirectional shared tree to the rendezvous point (RP).

The following features must be enabled on your switch:

- IP multicast
- IGMP snooping

**Examples**

The following example enables RGMP on Ethernet interface 1/0:

```
interface ethernet 1/0
ip rgmp
```
## Related Commands

ip rtp compression-connections

To specify the total number of Real-Time Transport Protocol (RTP) header compression connections that can exist on an interface, use the `ip rtp compression-connections` command in interface configuration mode. To restore the default value, use the `no` form of this command.

```
ip rtp compression-connections number
no ip rtp compression-connections
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>number</code></th>
<th>Number of RTP header compression connections the cache supports, in the range from 3 to 1000. The default is 32 connections (16 calls).</th>
</tr>
</thead>
</table>

**Defaults**

32 connections

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>

</tr>
</tbody>
</table>
ip rtp header-compression

To enable Real-Time Transport Protocol (RTP) header compression, use the **ip rtp header-compression** command in interface configuration mode. To disable RTP header compression, use the **no** form of this command.

```
ip rtp header-compression [passive]

no ip rtp header-compression [passive]
```

**Syntax Description**

| passive (Optional) Compresses outgoing RTP packets only if incoming RTP packets on the same interface are compressed. |

**Defaults**

Disabled

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you use this command without the **passive** keyword, the software compresses all RTP traffic.

You can compress IP/User Datagram Protocol (UDP)/RTP headers to reduce the size of your packets. Compressing headers is especially useful for RTP, because RTP payload size can be as small as 20 bytes, and the uncompressed header is 40 bytes.

RTP header compression is supported on serial lines using Frame Relay, High-Level Data Link Control (HDLC), or PPP encapsulation. You must enable compression on both ends of a serial connection.

This command can compress unicast or multicast RTP packets, and hence multicast backbone (MBONE) traffic can also be compressed over slow links. The compression scheme is beneficial only when you have small payload sizes, as in audio traffic.

**Examples**

The following example enables RTP header compression on serial interface 0 and limits the number of RTP header compression connections to 10:

```
interface serial 0
encapsulation ppp
ip rtp header-compression
ip rtp compression-connections 10
```
### Related Commands

</table>
ip sap cache-timeout

To limit how long a Session Announcement Protocol (SAP) cache entry stays active in the cache, use the **ip sap cache-timeout** command in global configuration mode. To restore the default value, use the **no** form of this command.

```
ip sap cache-timeout minutes

no ip sap cache-timeout
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>minutes</td>
<td>Time (in minutes) that a SAP cache entry is active in the cache.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, session announcements remain for 1440 minutes (24 hours) in the cache.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.2</td>
<td>The <strong>ip sdr cache-timeout</strong> command was introduced.</td>
</tr>
<tr>
<td>12.2</td>
<td>The <strong>ip sdr cache-timeout</strong> command was replaced by the <strong>ip sap cache-timeout</strong> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command defines how long session announcements are cached by the router. Active session announcements are periodically re-sent by the originating site, refreshing the cached state in the router. The minimum interval between announcements for a single group is 5 minutes. Setting the cache timeout to a value less than 30 minutes is not recommended. Set the cache timeout to 0 to keep entries in the cache indefinitely.

**Examples**

The following example causes SAP cache entries to remain in the cache for 30 minutes:

```
ip sap cache-timeout 30
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip sap</td>
<td>Deletes a SAP cache entry or the entire SAP cache.</td>
</tr>
<tr>
<td>show ip sap</td>
<td>Displays the SAP cache.</td>
</tr>
</tbody>
</table>
**ip sap listen**

To enable the Cisco IOS software to listen to session directory announcements, use the `ip sap listen` command in interface configuration mode. To disable the function, use the `no` form of this command.

```
  ip sap listen
  no ip sap listen
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>The <code>ip sdr listen</code> command was introduced.</td>
</tr>
<tr>
<td>12.2</td>
<td>The <code>ip sdr listen</code> command was replaced by the <code>ip sap listen</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Cisco IOS software can receive and store Session Description Protocol (SDP) and Session Announcement Protocol (SAP) session announcements.

SAP is a protocol used to announce multicast multimedia conferences and other multicast sessions, and it is used to communicate session setup information to prospective participants. A SAP announcer periodically sends an announcement packet to a well-known multicast address and port. The announcement is sent via multicast with the same scope as the session it is announcing to ensure that the recipients of the announcement can also be recipients of the session the announcement describes. SAP should be used for sessions of public interest where participants are not known in advance.

When the `ip sap listen` command is configured on an interface, the well-known session directory groups on that interface can receive and store session announcements. Each announcer listens to other announcements in order to determine the total number of sessions being announced on a particular group, and the interfaces are put into the outgoing interface list for the IP SAP group. The announcements can be displayed with the `show ip sap` command. The `ip multicast rate-limit` command uses stored session announcements. To configure the period of time after which received announcements will expire, use the `ip sap cache-timeout` command.

When the `no ip multicast routing` command is configured, announcements are only stored if they are received on an interface configured with the `ip sap listen` command. When a system is configured as a multicast router, it is sufficient to configure the `ip sap listen` command on only a single multicast-enabled interface. The well-known session directory groups are handled as local joined groups after the `ip sap listen` command is first configured. (See the L flag of the `show ip mroute` command.) This configuration causes announcements received from all multicast-enabled interfaces to be routed and stored within the system.
Examples

The following example shows how to enable a router to listen to session directory announcements:

```
ip routing
interface loopback 0
ip address 10.0.0.51 255.255.255.0
ip pim sparse-dense mode
ip sap listen
```

Related Commands

</tbody>
</table>
ip sdr cache-timeout

The `ip sdr cache-timeout` command is replaced by the `ip sap cache-timeout` command. See the description of the `ip sap cache-timeout` command in this chapter for more information.
ip sdr listen

The `ip sdr listen` command is replaced by the `ip sap listen` command. See the description of the `ip sap listen` command in this chapter for more information.
**ip urd**

To enable interception of TCP packets sent to the reserved URL Rendezvous Directory (URD) port 465 on an interface and processing of URD channel subscription reports, use the `ip urd` command in interface configuration mode. To disable URD on an interface, use the `no` form of this command.

```
ip urd [proxy]
```

```
no ip urd [proxy]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>(Optional) Allows an interface to accept URL requests from any TCP connection sent to that interface. If the <code>proxy</code> keyword is not configured, the interface will accept URL requests from TCP connections only if the requests originated from directly connected hosts.</td>
</tr>
</tbody>
</table>

The `proxy` option must be enabled on an interface if it is unnumbered or if it has downstream routers configured with Internet Group Management Protocol (IGMP) proxy routing. To prevent users on the backbone from creating URD state on your router, do not enable the `proxy` option on a backbone interface of your router.

**Defaults**

Disabled

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(3)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must first define a Source Specific Multicast (SSM) range of IP addresses using the `ip pim ssm` global configuration command. When URD is enabled, it is supported in the SSM range of addresses only. We recommend that you not enable URD on backbone interfaces, but only on interfaces connecting to hosts.

URD functionality is available for multicast process switching, fast switching, and distributed fast-switching paths.

**Examples**

The following example shows how to configure URD on Ethernet interface 3/3:

```
interface ethernet 3/3
ip urd
```

show ip igmp groups

To display the multicast groups with receivers that are directly connected to the router and that were learned through Internet Group Management Protocol (IGMP), use the `show ip igmp groups` command in EXEC mode.

`show ip igmp groups [group-name | group-address | type number] [detail]`

**Syntax Description**

- **group-name** (Optional) Name of the multicast group, as defined in the Domain Name System (DNS) hosts table.
- **group-address** (Optional) Address of the multicast group. This is a multicast IP address in four-part, dotted notation.
- **type** (Optional) Interface type.
- **number** (Optional) Interface number.
- **detail** (Optional) Provides a detailed description of the sources known through IGMP Version 3 (IGMPv3), IGMP v3lite, or URL Rendezvous Directory (URD).

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>

**Usage Guidelines**

If you omit the optional arguments, the `show ip igmp interface` command displays information about all interfaces.

This command also displays information about dynamically learned Distance Vector Multicast Routing Protocol (DVMRP) routers on the interface.

**Examples**

The following is sample output from the `show ip igmp interface` command:

```
Router# show ip igmp interface

Ethernet0 is up, line protocol is up
  Internet address is 198.92.37.6, subnet mask is 255.255.255.0
  IGMP is enabled on interface
  IGMP query interval is 60 seconds
  Inbound IGMP access group is not set
  Multicast routing is enabled on interface
  Multicast TTL threshold is 0
  Multicast designated router (DR) is 198.92.37.33
  No multicast groups joined

Ethernet1 is up, line protocol is up
  Internet address is 198.92.36.129, subnet mask is 255.255.255.0
  IGMP is enabled on interface
  IGMP query interval is 60 seconds
  Inbound IGMP access group is not set
  Multicast routing is enabled on interface
  Multicast TTL threshold is 0
  Multicast designated router (DR) is 198.92.36.131
  Multicast groups joined: 225.2.2.2 226.2.2.2
```
**show ip igmp interface**

Tunnel0 is up, line protocol is up  
Internet address is 10.1.37.2, subnet mask is 255.255.0.0  
IGMP is enabled on interface  
IGMP query interval is 60 seconds  
Inbound IGMP access group is not set  
Multicast routing is enabled on interface  
Multicast TTL threshold is 0  
No multicast groups joined

**Examples**

The following is sample output from the **show ip mcache** command. This entry shows a specific source (wrn-source 204.62.246.73) sending to the World Radio Network group (224.2.143.24).

```
Router# show ip mcache wrn wrn-source
```

IP Multicast Fast-Switching Cache
(204.62.246.73/32, 224.2.143.24), Fddi0, Last used: 00:00:00
  Ethernet0  MAC Header: 01005E028F1800000C1883D30800
  Ethernet1  MAC Header: 01005E028F1800000C1883D60800
  Ethernet2  MAC Header: 01005E028F1800000C1883D40800
  Ethernet3  MAC Header: 01005E028F1800000C1883D70800

The following is sample output from the **show ip mcache** command when multicast distributed switching (MDS) is in effect.

```
Router# show ip mcache
```

IP Multicast Fast-Switching Cache
(*, 224.2.170.73), Fddi3/0/0, Last used: mds
  Tunnel13  MAC Header: 5000602F9C150000603E473F60AAAA030000000800 (Fddi3/0/0)
  Tunnel10  MAC Header: 5000602F9C150000603E473F60AAAA030000000800 (Fddi3/0/0)
  Tunnel11  MAC Header: 5000602F9C150000603E473F60AAAA030000000800 (Fddi3/0/0)

show ip mpacket

To display the contents of the circular cache-header buffer, use the show ip mpacket command in EXEC mode.

```
show ip mpacket [group-address | group-name] [source-address | source-name] [detail]
```

**Syntax Description**
- `group-address` | `group-name` (Optional) Displays cache headers matching the specified group address or group name.
- `source-address` | `source-name` (Optional) Displays cache headers matching the specified source address or source name.
- `detail` (Optional) In addition to the summary information, displays the rest of the IP header fields on an additional line, plus the first 8 bytes after the IP header (usually the User Datagram Protocol [UDP] port numbers).

**Command Modes**
- EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is only applicable when the `ip multicast cache-headers` command is in effect.

Each time this command is entered, a new buffer is allocated. The summary display (when the `detail` keyword is omitted) shows the IP packet identifier, time-to-live (TTL), source and destination IP addresses, and a local time stamp when the packet was received.

The two arguments and one keyword can be used in the same command in any combination.

**Examples**

The following is sample output of the `show ip mpacket` command with the `group-name` argument:

```
Router # show ip mpacket smallgroup

IP Multicast Header Cache - entry count:6, next index: 7
Key: id/ttl timestamp (name) source group

D782/117 206416.908 (ABC-xy.company.com) 198.15.228.10 224.5.6.7
7302/113 206417.908 (school.edu) 147.12.2.17 224.5.6.7
6CB2/114 206417.412 (MSSRS.company.com) 154.2.19.40 224.5.6.7
D782/117 206417.868 (ABC-xy.company.com) 198.15.228.10 224.5.6.7
E2E9/123 206418.488 (Newman.com) 211.1.8.10 224.5.6.7
1CA7/127 206418.544 (teller.company.com) 192.4.6.10 224.5.6.7
```

Table 8 describes the significant fields shown in the display.

show ip mroute

To display the contents of the IP multicast routing table, use the `show ip mroute` command in EXEC mode.

```
show ip mroute [group-address | group-name] [source-address | source-name] [type number] [summary] [count] [active kbps]
```

**Syntax Description**

- `group-address | group-name` (Optional) IP address or name multicast group as defined in the Domain Name System (DNS) hosts table.
- `source-address | source-name` (Optional) IP address or name of a multicast source.
- `type number` (Optional) Interface type and number.
- `summary` (Optional) Displays a one-line, abbreviated summary of each entry in the IP multicast routing table.
- `count` (Optional) Displays statistics about the group and source, including number of packets, packets per second, average packet size, and bytes per second.
- `active kbps` (Optional) Displays the rate that active sources are sending to multicast groups. Active sources are those sending at the kbps value or higher. The `kbps` argument defaults to 4 kbps.

**Defaults**

The `show ip mroute` command displays all groups and sources.

The `show ip mroute active` command displays all sources sending at a rate greater than or equal to 4 kbps.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.0(5)T</td>
<td>The H flag for Multicast Multilayer Switching (MMLS) was added in the output display.</td>
</tr>
<tr>
<td>12.1(3)T</td>
<td>The U, s, and I flags for Source Specific Multicast (SSM) were added in the output display.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you omit all optional arguments and keywords, the `show ip mroute` command displays all entries in the IP multicast routing table.

The Cisco IOS software populates the multicast routing table by creating (S, G) entries from (*, G) entries. The asterisk (*) refers to all source addresses, the “S” refers to a single source address, and the “G” is the destination multicast group address. In creating (S, G) entries, the software uses the best path to that destination group found in the unicast routing table (that is, through Reverse Path Forwarding [RPF]).
The output for the `show ip mroute` command with the `active` keyword will display either positive or negative numbers for the rate pps. The router displays negative numbers when RPF packets fail or when the router observes RPF packets with an empty OIF list. This type of activity may indicate a multicast routing problem.

**Examples**

The following is sample output from the `show ip mroute` command for a router operating in dense mode. This output displays the contents of the IP multicast routing table for the multicast group named cbone-audio.

Router# `show ip mroute cbone-audio`

```
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned
       R - RP-bit set, F - Register flag, T - SPT-bit set
Timers: Uptime/Expires
Interface state: Interface, Next-Hop, State/Mode

(*, 224.0.255.1), uptime 0:57:31, expires 0:02:59, RP is 0.0.0.0, flags: DC
Incoming interface: Null, RPF neighbor 0.0.0.0, Dvmrp
Outgoing interface list:
   Ethernet0, Forward/Dense, 0:57:31/0:02:52
   Tunnel0, Forward/Dense, 0:56:55/0:01:28

(198.92.37.100/32, 224.0.255.1), uptime 20:20:00, expires 0:02:55, flags: C
Incoming interface: Tunnel0, RPF neighbor 10.20.37.33, Dvmrp
Outgoing interface list:
   Ethernet0, Forward/Dense, 20:20:00/0:02:52
```

The following is sample output from the `show ip mroute` command for a router operating in sparse mode:

Router# `show ip mroute`

```
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned
       R - RP-bit set, F - Register flag, T - SPT-bit set
Timers: Uptime/Expires
Interface state: Interface, Next-Hop, State/Mode

(*, 224.0.255.3), uptime 5:29:15, expires 0:02:59, flags: SC
Incoming interface: Tunnel0, RPF neighbor 10.3.35.1, Dvmrp
Outgoing interface list:
   Ethernet0, Forward/Sparse, 5:29:15/0:02:57

(198.92.46.0/24, 224.0.255.3), uptime 5:29:15, expires 0:02:59, flags: C
Incoming interface: Tunnel0, RPF neighbor 10.3.35.1
Outgoing interface list:
   Ethernet0, Forward/Sparse, 5:29:15/0:02:57
```

The following is sample output from the `show ip mroute` command that shows the virtual circuit descriptor (VCD) value, because an ATM interface with PIM multipoint signalling is enabled:

Router# `show ip mroute 224.1.1.1`

```
IP Multicast Routing Table
Flags:D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected, L - Local, P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT, M - MSDP created entry, X - Proxy Join Timer Running, A - Advertised via MSDP, U - URD, I - Received Source Specific Host Report
Outgoing interface flags:H - Hardware switched
Timers:Uptime/Expires
```
The following is sample output from the **show ip mroute** command with the **summary** keyword:

```
Router# show ip mroute summary
```

```
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected, L - Local, P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT, M - MSDP created entry, X - Proxy Join Timer Running, A - Advertised via MSDP, U - URD, I - Received Source Specific Host Report
Outgoing interface flags: H - Hardware switched
Timers: Uptime/Expires
```

```
(*, 224.255.255.255), 2d16h/00:00:00, RP 171.69.10.13, flags: SJPC
(*, 224.1.127.255), 00:58:21/00:00:03, RP 171.69.10.13, flags: SJC
```

The following is sample output from the **show ip mroute** command with the **active** keyword:

```
Router# show ip mroute active
```

```
Active IP Multicast Sources - sending >= 4 kbps
```

```
Group: 224.2.127.254, (sdr.cisco.com)
  Source: 146.137.28.69 (mbone.ipd.anl.gov)
  Rate: 1 pps/4 kbps(1sec), 4 kbps(last 1 secs), 4 kbps(life avg)
```

```
Group: 224.2.201.241, ACM 97
  Source: 130.129.52.160 (webcast3-e1.acm97.interop.net)
  Rate: 9 pps/93 kbps(1sec), 145 kbps(last 20 secs), 85 kbps(life avg)
```

```
Group: 224.2.207.215, ACM 97
  Source: 130.129.52.160 (webcast3-e1.acm97.interop.net)
  Rate: 3 pps/31 kbps(1sec), 63 kbps(last 19 secs), 65 kbps(life avg)
```
The following is sample output from the `show ip mroute` command with the `active` keyword. However, this sample shows negative numbers for the rate pps. The router displays negative numbers when RPF packets fail or for RPF packets with an empty OIF list. The question marks that follow the group and source IP addresses indicate that the domain name could not be resolved.

```
Router# show ip mroute active
Active IP Multicast Sources - sending >= 4 kbps
Group: 239.254.1.0, (?)
  Source: 126.32.1.51 (?)
    Rate: -3373 pps/964 kbps(1sec), 964 kbps(last 0 secs), 163 kbps(life avg)

<tr>
<td>C - Connected</td>
<td>A member of the multicast group is present on the directly connected interface.</td>
</tr>
<tr>
<td>L - Local</td>
<td>The router itself is a member of the multicast group. Groups are joined locally by the <strong>ip igmp join-group</strong> command (for the configured group), the <strong>ip sap listen</strong> command (for the well-known session directory groups), and rendezvous point (RP) mapping (for the well-known groups 224.0.1.39 and 224.0.1.40). Locally joined groups are not fast switched.</td>
</tr>
<tr>
<td>P - Pruned</td>
<td>Route has been pruned. The Cisco IOS software keeps this information so that a downstream member can join the source.</td>
</tr>
<tr>
<td>R - RP-bit set</td>
<td>Indicates that the (S, G) entry is pointing toward the RP. This is typically prune state along the shared tree for a particular source.</td>
</tr>
<tr>
<td>F - Register flag</td>
<td>Indicates that the software is registering for a multicast source.</td>
</tr>
<tr>
<td>T - SPT-bit set</td>
<td>Indicates that packets have been received on the shortest path source tree.</td>
</tr>
</tbody>
</table>
J - Join SPT

For (*, G) entries, indicates that the rate of traffic flowing down the shared tree is exceeding the SPT-Threshold set for the group. (The default SPT-Threshold setting is 0 kbps.) When the J - Join shortest path tree (SPT) flag is set, the next (S, G) packet received down the shared tree triggers an (S, G) join in the direction of the source, thereby causing the router to join the source tree.

For (S, G) entries, indicates that the entry was created because the SPT-Threshold for the group was exceeded. When the J - Join SPT flag is set for (S, G) entries, the router monitors the traffic rate on the source tree and attempts to switch back to the shared tree for this source if the traffic rate on the source tree falls below the SPT-Threshold of the group for more than 1 minute.

Note

The router measures the traffic rate on the shared tree and compares the measured rate to the SPT-Threshold of the group once every second. If the traffic rate exceeds the SPT-Threshold, the J - Join SPT flag is set on the (*, G) entry until the next measurement of the traffic rate. The flag is cleared when the next packet arrives on the shared tree and a new measurement interval is started.

If the default SPT-Threshold value of 0 kbps is used for the group, the J - Join SPT flag is always set on (*, G) entries and is never cleared. When the default SPT-Threshold value is used, the router immediately switches to the shortest path source tree when traffic from a new source is received.

M - MSDP created entry

Indicates that a (*, G) entry was learned through a Multicast Source Discovery Protocol (MSDP) peer. This flag is only applicable for a rendezvous point (RP) running MSDP.

X - Proxy Join Timer Running

Indicates that the proxy join timer is running. This flag is only set for (S, G) entries of an RP or “turnaround” router. A “turnaround” router is located at the intersection of a shared path (*, G) tree and the shortest path from the source to the RP.

A - Advertised via MSDP

Indicates that an (S, G) entry was advertised through an MSDP peer. This flag is only applicable for an RP running MSDP.

U - URD

Indicates that a URL Rendezvous Directory (URD) channel subscription report was received for the (S, G) entry.

I - Received Source Specific Host Report

Indicates that an (S, G) entry was created by an (S, G) report. This (S, G) report could have been created by Internet Group Management Protocol Version 3 (IGMPv3), URD, or IGMP v3lite. This flag is only set on the designated router (DR).

Outgoing interface flags:

Provides information about the entry.

H - Hardware switched

Indicates that a Multicast Multilayer Switching (MMLS) forwarding path has been established for this entry.
### Table 9  show ip mroute Field Descriptions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timers:Uptime/Expires</td>
<td>“Uptime” indicates per interface how long (in hours, minutes, and seconds) the entry has been in the IP multicast routing table. “Expires” indicates per interface how long (in hours, minutes, and seconds) until the entry will be removed from the IP multicast routing table.</td>
</tr>
<tr>
<td>Interface state:</td>
<td>Indicates the state of the incoming or outgoing interface.</td>
</tr>
<tr>
<td>Interface</td>
<td>Indicates the type and number of the interface listed in the incoming or outgoing interface list.</td>
</tr>
<tr>
<td>Next-Hop or VCD</td>
<td>“Next-hop” specifies the IP address of the downstream neighbor. “VCD” specifies the virtual circuit descriptor number. “VCD0” means the group is using the static map virtual circuit.</td>
</tr>
<tr>
<td>State/Mode</td>
<td>“State” indicates that packets will either be forwarded, pruned, or null on the interface depending on whether there are restrictions due to access lists or a Time To Live (TTL) threshold. “Mode” indicates whether the interface is operating in dense, sparse, or sparse-dense mode.</td>
</tr>
<tr>
<td>(*, 224.0.255.1) and</td>
<td>Entry in the IP multicast routing table. The entry consists of the IP address of the source router followed by the IP address of the multicast group. An asterisk (*) in place of the source router indicates all sources.</td>
</tr>
<tr>
<td>(198.92.37.100/32,</td>
<td></td>

  RP-tree: Forwarding: 8803/8/774/49, Other: 8803/0/0

Note:
The RP-tree: field is displayed only for non-Source Specific Multicast (SSM) groups that have a (*, G) entry and a positive packet received count.

Table 10 describes the significant fields shown in the display.
### Table 10  *show ip mroute count* Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group:</td>
<td>Summary statistics for traffic on an IP multicast group G. This row is displayed only for non-SSM groups.</td>
</tr>
<tr>
<td>Forwarding Counts:</td>
<td>Statistics on the packets that are received and forwarded to at least one interface.</td>
</tr>
</tbody>
</table>

**Note** There is no specific command to clear only the forwarding counters; you can clear only the actual multicast forwarding state with the `clear ip mroute` command. Issuing this command will cause interruption of traffic forwarding.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pkt Count/</td>
<td>Total number of packets received and forwarded since the multicast forwarding state to which this counter applies was created.</td>
</tr>
<tr>
<td>Pkts per second/</td>
<td>Number of packets received and forwarded per second. On an IP multicast fast-switching platform, this number is the number of packets during the last second. Other platforms may use a different approach to calculate this number. Please refer to the platform documentation for more information.</td>
</tr>
<tr>
<td>Avg Pkt Size/</td>
<td>Total number of bytes divided by the total number of packets for this multicast forwarding state. There is no direct display for the total number of bytes. You can calculate the total number of bytes by multiplying the average packet size by the packet count.</td>
</tr>
<tr>
<td>Kilobits per second</td>
<td>Bytes per second divided by packets per second divided by 1000. On an IP multicast fast switching platform, the number of packets per second is the number of packets during the last second. Other platforms may use a different approach to calculate this number. Please refer to the platform documentation for more information.</td>
</tr>
<tr>
<td>Other counts:</td>
<td>Statistics on the received packets. These counters include statistics about the packets received and forwarded and packets received but not forwarded.</td>
</tr>
<tr>
<td>Total/</td>
<td>Total number of packets received.</td>
</tr>
<tr>
<td>RPF failed/</td>
<td>Number of packets not forwarded due to a failed RPF or acceptance check (when bidir-PIM is configured).</td>
</tr>
<tr>
<td>Other drops(OIF-null, rate-limit etc)</td>
<td>Number of packets not forwarded for reasons other than an RPF or acceptance check (such as the OIF list was empty or because the packets were discarded because of a configuration, such as <code>ip multicast rate-limit</code>, was enabled).</td>
</tr>
<tr>
<td>Group:</td>
<td>Summary information about counters for (*, G) and the range of (S, G) states for one particular group G. The following RP-tree: and Source: output fields contain information about the individual states belonging to this group.</td>
</tr>
</tbody>
</table>

**Note** For SSM range groups, the Group: displays are statistical. All SSM range (S, G) states are individual, unrelated SSM channels.
### Table 10  show ip mroute count Field Descriptions (continued)

<table>
<thead>
<tr>

show ip pim bsr

To display the bootstrap router (BSR) information, use the `show ip pim bsr` command in EXEC mode.

```
show ip pim bsr
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3 T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The output includes elected BSR information and information about the locally configured candidate rendezvous point (RP) advertisement.

**Examples**

The following is sample output from the `show ip pim bsr` command:

```
Router# show ip pim bsr

PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 171.69.143.28
  Uptime: 04:37:59, BSR Priority: 4, Hash mask length: 30
  Next bootstrap message in 00:00:03 seconds

Next Cand_RP_advertisement in 00:00:03 seconds.
  RP: 171.69.143.28(Ethernet0), Group acl: 6
```

Table 11 describes the significant fields shown in the display.

**Table 11  show ip pim bsr Field Descriptions**

show ip pim interface

To display information about interfaces configured for Protocol Independent Multicast (PIM), use the `show ip pim interface` command in user EXEC or privileged EXEC mode.

```
show ip pim [vrf vrf-name] interface [interface-type interface-number] [df | count] [rp-address] [detail]
```

### Syntax Description

- **vrf** (Optional) Supports the multicast VPN routing and forwarding (VRF) instance. A space is not required between the values.
- **vrf-name** (Optional) Name assigned to the VRF.
- **interface-type interface-number** (Optional) Interface type and number. A space is not required between the values.
- **df** (Optional) When bidirectional PIM (bidir-PIM) is used, displays the IP address of the elected designated forwarder (DF) for each rendezvous point (RP) of an interface.
- **count** (Optional) Specifies the number of packets received and sent out the interface.
- **rp-address** (Optional) RP IP address.
- **detail** (Optional) Displays PIM details of each interface.

### Defaults

If no interface is specified, all interfaces are displayed.

### Command Modes

- User EXEC
- Privileged EXEC

### Command History

<table>

<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

This command works only on interfaces that are configured for PIM.

Use the `show ip pim interface count` command to display switching counts for Multicast Distributed Switching (MDS) and other fast-switching statistics.

**Examples**

The following is sample output from the `show ip pim interface` command:

```
Router# show ip pim interface
Address          Interface                Ver/   Nbr    Query  DR     DR
Mode   Count  Intvl  Prior
10.1.0.1         GigabitEthernet0/0       v2/SD  0      30     1      10.1.0.1
10.6.0.1         GigabitEthernet0/1       v2/SD  1      30     1      10.6.0.2
10.2.0.1         ATM1/0.1                 v2/SD  1      30     1      0.0.0.0
```

The following is sample output from the `show ip pim interface` command when an interface is specified:

```
Router# show ip pim interface Ethernet1/0
Address          Interface          Ver/   Nbr    Query  DR     DR
Mode   Count  Intvl  Prior
172.16.1.4       Ethernet1/0              v2/S   1      100 ms 1      172.16.1.4
```

The following is sample output from the `show ip pim interface` command when the `count` keyword is specified:

```
Router# show ip pim interface count
Address          Interface          FS  Mpackets In/Out
172.16.121.35    Ethernet0          *   548305239/13744856
172.16.121.35    Serial0.33         *   8256/67052912
192.168.12.73    Serial0.1719       *   219444/862191
```

The following is sample output from the `show ip pim interface` command when the `count` keyword is specified and IP MMLS is enabled. The example lists the PIM interfaces that are fast switched and process switched, and the packet counts for these interfaces. The H flag is added to interfaces where IP MMLS is enabled.

```
Router# show ip pim interface count
States: FS - Fast Switched, H - Hardware Switched
Address          Interface          FS  Mpackets In/Out
192.168.10.2       Vlan10             * H 40886/0
192.168.11.2       Vlan11             * H 0/40554
192.168.12.2       Vlan12             * H 0/40554
192.168.23.2       Vlan23             * 0/0
192.168.24.2       Vlan24             * 0/0
```

The following are two sample outputs from the `show ip pim interface` command when the `df` keyword is specified:

```
Router# show ip pim interface df
Interface RP    DF Winner  Metric  Uptime
Ethernet3/3 10.10.0.2        10.4.0.2   0   00:03:49
10.10.0.3        10.4.0.3   0   00:01:49
10.10.0.5        10.4.0.4   409600 00:01:49
10.10.0.2        10.5.0.2   0   00:03:49
10.10.0.3        10.5.0.2   0   00:02:32
10.10.0.5        10.5.0.2   435200 00:02:16
```

```
```
show ip pim interface

Designated Forwarder election for Ethernet3/3, 10.4.0.2, RP 10.10.0.3
State Non-DF
Offer count is 0
Current DF ip address 10.4.0.3
DF winner up time 00:02:33
Last winner metric preference 0
Last winner metric 0

Table 12 describes the significant fields shown in the displays.

Table 12  show ip pim interface Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</table>
**show ip pim neighbor**

To list the Protocol Independent Multicast (PIM) neighbors discovered by the Cisco IOS software, use the **show ip pim neighbor** command in user EXEC or privileged EXEC mode.

```
show ip pim [vrf vrf-name] neighbor [interface-type interface-number]
```

### Syntax Description

<table>
<thead>
<tr>

### Usage Guidelines

Use this command to determine which routers on the LAN are configured for PIM.

### Examples

The following is sample output from the **show ip pim neighbor** command:

```
Router# show ip pim neighbor

PIM Neighbor Table
Neighbor Address    Interface          Uptime/Expires Ver DR Prio/Mode
126.1.33.11         GigabitEthernet2/1 1d11h/00:00:02 v2 N / DR
126.1.34.12         GigabitEthernet2/1 1d11h/00:00:02 v2 N / DR
126.104.20.56       Serial1/1/0/1:0.104 1d11h/00:00:02 v2 1 / S
126.105.20.58       Serial1/1/0/2:0.105 1d00h/00:01:31 v2 1 / S

Table 14 describes the significant fields shown in the display.

show ip pim rp

To display active rendezvous points (RPs) that are cached with associated multicast routing entries, use the `show ip pim rp` command in EXEC mode.

```
show ip pim rp [mapping | [elected | in-use] | metric] [rp-address]
```

**Syntax Description**

- **mapping** (Optional) Displays all group-to-RP mappings of which the router is aware (either configured or learned from Auto-RP).
- **elected** (Optional) Displays only the elected Auto RPs.
- **in-use** (Optional) Displays the learned RPs in use.
- **metric** (Optional) Displays the unicast routing metric to the RPs configured statically or learned via Auto-RP or the bootstrap router (BSR).
- **rp-address** (Optional) RP IP address.

**Defaults**

If no RP is specified, all active RPs are displayed.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(2)T</td>
<td>The <code>metric</code> keyword and <code>rp-address</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Protocol Independent Multicast (PIM) version known for an RP influences the type of PIM register messages (version 1 or version 2) that the router sends when acting as the designated router (DR) for an active source. If an RP is statically configured, the PIM version of the RP is not set and the router, if required to send register packets, first tries to send PIM version 2 register packets. If that fails, the router sends PIM version 1 register packets.

The version of the RP displayed in the `show ip pim rp` command output can change according to the operations of the router. When the group is created, the version shown is for the RP in the RP mapping cache. Later, the version displayed by this command may change. If this router is acting as a DR for an active source, the router sends PIM register messages. The PIM register messages are answered by the RP with PIM register stop messages. The router learns from these PIM register stop messages the actual PIM version of the RP. Once the actual PIM version of the RP is learned, this command displays only this version. If the router is not acting as a DR for active sources on this group, then the version shown for the RP of the group does not change. In this case, the PIM version of the RP is irrelevant to the router because the version of the RP influences only the PIM register messages that this router must send.

When you enter the `show ip pim rp mapping` command, the version of the RP displayed in the output is determined only by the method through which an RP is learned. If the RP is learned from Auto-RP then the RP displayed is either “v1” or “v2, v1.” If the RP is learned from a static RP definition, the RP version is undetermined and no RP version is displayed in the output. If the RP is learned from the BSR, the RP version displayed is “v2.”
Use the `elected` keyword on an Auto-RP Mapping Agent to limit the output to only the elected RPs that the mapping agent will advertise to all other routers in the network via Auto-RP. This is useful when comparing the output of the `show ip pim rp mapping` command on non mapping agent routers with the output of the `show ip pim rp mapping elected` command on a mapping agent to verify that the Group-to-RP mapping information is consistent.

**Examples**

The following is sample output from the `show ip pim rp` command:

```
Router# show ip pim rp
Group:227.7.7.7, RP:10.10.0.2, v2, v1, next RP-reachable in 00:00:48
```

The following is sample output from the `show ip pim rp` command when the `mapping` keyword is specified:

```
Router# show ip pim rp mapping
PIM Group-to-RP Mappings
This system is an RP (Auto-RP)
This system is an RP-mapping agent

Group(s) 227.0.0.0/8
  RP 10.10.0.2 (?), v2v1, bidir
    Info source:10.10.0.2 (?), via Auto-RP
    Uptime:00:01:42, expires:00:00:32

Group(s) 228.0.0.0/8
  RP 10.10.0.3 (?), v2v1, bidir
    Info source:10.10.0.3 (?), via Auto-RP
    Uptime:00:01:26, expires:00:00:34

Group(s) 229.0.0.0/8
  RP 10.10.0.5 (mcast1.cisco.com), v2v1, bidir
    Info source:10.10.0.5 (mcast1.cisco.com), via Auto-RP
    Uptime:00:00:52, expires:00:00:37

Group(s) (-)230.0.0.0/8
  RP 10.10.0.5 (mcast1.cisco.com), v2v1, bidir
    Info source:10.10.0.5 (mcast1.cisco.com), via Auto-RP
    Uptime:00:00:52, expires:00:00:37
```

The following is sample output from the `show ip pim rp` command when the `metric` keyword is specified:

```
Router# show ip pim rp metric
RP Address Metric Pref Metric Flags RPF Type Interface
10.10.0.2 0 0 L unicast Loopback0
10.10.0.3 90 409600 L unicast Ethernet3/3
10.10.0.5 90 435200 L unicast Ethernet3/3
```

show ip pim rp-hash

To display which rendezvous point (RP) is being selected for a specified group, use the `show ip pim rp-hash` command in EXEC mode.

```
show ip pim rp-hash {group-address | group-name}
```

**Syntax Description**

- **group-address | group-name**: Displays the RP information for the specified group address or name as defined in the Domain Name System (DNS) hosts table.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3 T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays which RP was selected for the group specified. It also shows whether this RP was selected by Auto-RP or the PIM version 2 bootstrap mechanism.

**Examples**

The following is sample output from the `show ip pim rp-hash` command with the group address 239.1.1.1 specified:

```
Router# show ip pim rp-hash 239.1.1.1
RP 172.21.24.12 (mt1-47a.cisco.com), v2
  Info source: 172.21.24.12 (mt1-47a.cisco.com), via bootstrap
  Uptime: 05:15:33, expires: 00:02:01
```

Table 16 describes the significant fields shown in the display.

**Table 16: show ip pim rp-hash Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP 172.21.24.12 (mt1-47a.cisco.com), v2</td>
<td>Address of the RP for the group specified (239.1.1.1). Within parentheses is the Domain Name System (DNS) name of the RP. If the address of the RP is not registered in the DNS, a question mark (?) is displayed. PIM version 2 configured.</td>
</tr>
<tr>
<td>Info source: 172.21.24.12 (mt1-47a.cisco.com), via bootstrap</td>
<td>Indicates from which system the router learned this RP information, along with the DNS name of the source. RP was selected by the bootstrap mechanism. In this case, the BSR is also the RP.</td>
</tr>
</tbody>
</table>

<td>Time (in hours, minutes, and seconds) after which the information about this RP expires. If the router does not receive any refresh messages in this time, it will discard information about this RP.</td>
</tr>
</tbody>
</table>
show ip pim vc

To display ATM virtual circuit (VC) status information for multipoint VCs opened by Protocol Independent Multicast (PIM), use the `show ip pim vc` command in EXEC mode.

```
show ip pim vc [group-address | group-name] [type number]
```

**Syntax Description**
- `group-address | group-name` (Optional) IP multicast group or name. Displays only the single group.
- `type number` (Optional) Interface type and number. Displays only the single ATM interface.

**Defaults**
Displays VC status information for all ATM interfaces.

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

show ip rpf

To display how IP multicast routing does Reverse Path Forwarding (RPF), use the show ip rpf command in EXEC mode.

    show ip rpf [source-address | source-name] [metric]

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-address</td>
<td>Displays the RPF information for the specified source address or name.</td>
</tr>
<tr>
<td>source-name</td>
<td></td>
</tr>
<tr>
<td>metric</td>
<td>(Optional) Displays the unicast routing metric.</td>
</tr>
</tbody>
</table>

 Defaults

If no source is specified, all sources are displayed.

 Command Modes

EXEC

 Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(2)T</td>
<td>The metric keyword was added.</td>
</tr>
</tbody>
</table>

 Usage Guidelines

The router can reverse path forward from multiple routing tables (that is, the unicast routing table, Distance Vector Multicast Routing Protocol (DVMRP) routing table, or static mroutes). This command tells you from where the information is retrieved.

 Examples

The following is sample output of the show ip rpf command:

    Router# show ip rpf 171.69.10.13

RPF information for sj-eng-mbone.cisco.com (171.69.10.13)
RPF interface: BRI0
RPF neighbor: eng-isdn-pri3.cisco.com (171.69.121.10)
RPF route/mask: 171.69.0.0/255.255.0.0
RPF type: unicast
RPF recursion count: 0
Doing distance-preferred lookups across tables

The following is sample output of the show ip rpf command when the metric keyword is specified:

    Router# show ip rpf 171.69.10.13 metric

RPF information for sj-eng-mbone.cisco.com (171.69.10.13)
RPF interface: BRI0
RPF neighbor: eng-isdn-pri3.cisco.com (171.69.121.10)
RPF route/mask: 171.69.0.0/255.255.0.0
RPF type: unicast
RPF recursion count: 0
Doing distance-preferred lookups across tables
Metric preference: 110
Metric: 11
Table 18 describes the significant fields shown in the display.

**Table 18  show ip rpf Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPF information for &lt;host name (source address)&gt;</td>
<td>Host name and source address that this information concerns.</td>

</table>
show ip rtp header-compression

To show Real-Time Transport Protocol (RTP) header compression statistics, use the `show ip rtp header-compression` command in EXEC mode.

```
show ip rtp header-compression [type number] [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type number</code></td>
<td>(Optional) Interface type and number.</td>
</tr>
<tr>
<td><code>detail</code></td>
<td>(Optional) Displays details of each connection.</td>
</tr>
</tbody>
</table>

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(5)T</td>
<td>The command output was modified to include information related to the</td>
</tr>
<tr>
<td></td>
<td>Distributed Compressed Real-Time Transport Protocol (dCRTP) feature.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `detail` keyword is not available with the `show ip rtp header-compression` command on a Route Switch Processor (RSP). However, the `detail` keyword is available with the `show ip rtp header-compression` command on a Versatile Interface Processor (VIP). Enter the `show ip rtp header-compression type number detail` command on a VIP to retrieve detailed information regarding RTP header compression on a specific interface.

**Examples**

The following is sample output from the `show ip rtp header-compression` command:

```
Router# show ip rtp header-compression

RTP/UDP/IP header compression statistics:
Interface Serial1:
  Rcvd: 0 total, 0 compressed, 0 errors
     0 dropped, 0 buffer copies, 0 buffer failures
  Sent: 430 total 429 compressed,
       15122 bytes saved, 139318 bytes sent
       1.10 efficiency improvement factor
  Connect: 16 rx slots, 16 tx slots, 1 long searches, 1 misses
          99% hit ratio, five minute miss rate 0 misses/sec, 0 max.
```

**Table 19** describes the significant fields shown in the display.

<table>

show ip sap

To display the Session Announcement Protocol (SAP) cache, use the show ip sap command in EXEC mode.

show ip sap [group-address | “session-name” | detail]

Syntax Description

Parameter | Description
--- | ---
group-address | (Optional) Displays the sessions defining the specified multicast group address.
“session-name” | (Optional) Displays the single session in detail format. The session name is enclosed in quotation marks (””) that the user must enter.
detail | (Optional) Displays all sessions in detail format.

Command Modes

EXEC

Command History

Release | Modification
--- | ---
11.1 | The show ip sdr command was introduced.
12.2 | The show ip sdr command was replaced by the show ip sap command.

Usage Guidelines

If the router is configured to be a member of multicast group 224.2.127.254 (the default session directory group), it will cache SAP announcements.

If no arguments or keywords are used with this command, the system displays a sorted list of session names.

Examples

The following is sample output of the show ip sap command for a session using multicast group 224.2.197.250:

Router# show ip sap 224.2.197.250

SAP Cache - 198 entries
Session Name: The Sample Channel
  Description: This broadcast is brought to you courtesy of Sample Research Center.
  Group: 0.0.0.0, ttl: 0, Contiguous allocation: 1
  Lifetime: from 10:00:00 PDT Jul 4 1999 until 10:00:00 PDT Aug 1 1999
  Uptime: 4d05h, Last Heard: 00:01:40
  Announcement source: 128.102.84.134
  Created by: sample 1136541828 3139561476 IN IP4 128.102.84.134

show ip sdr

The `show ip sdr` command is replaced by the `show ip sap` command. See the description of the `show ip sap` command in this chapter for more information.
show ip sdr
Multicast Source Discovery Protocol Commands

Use the commands in this chapter to configure and monitor Multicast Source Discovery Protocol (MSDP). For configuration information and examples of MSDP, refer to the “Configuring Multicast Source Discovery Protocol” chapter of the Cisco IOS IP Configuration Guide.
**clear ip msdp peer**

To clear the TCP connection to the specified Multicast Source Discovery Protocol (MSDP) peer, use the `clear ip msdp peer` command in EXEC mode.

```
clear ip msdp peer {peer-address | peer-name}
```

**Syntax Description**

- `peer-address | peer-name`: IP address or name of the MSDP peer to which the TCP connection is cleared.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command closes the TCP connection to the peer, resets all the MSDP peer statistics, and clears the input and output queues to and from the MSDP peer.

**Examples**

The following example clears the TCP connection to the MSDP peer at 10.3.32.154:

```
Router# clear ip msdp peer 10.3.32.154
```

**Related Commands**

- `ip msdp peer`: Configures an MSDP peer.
clear ip msdp sa-cache

To clear Multicast Source Discovery Protocol (MSDP) Source-Active (SA) cache entries, use the `clear ip msdp sa-cache` command in EXEC mode.

```
clear ip msdp sa-cache [group-address | group-name]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`group-address</td>
<td>group-name`</td>
</tr>
</tbody>
</table>

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In order to have any SA entries in the cache to clear, SA caching must have been enabled with the `ip msdp cache-sa-state` command.

If no multicast group is identified by group address or name, all SA cache entries are cleared.

**Examples**

The following example clears the SA entries for the multicast group 10.3.53.154 from the cache:

```
Router# clear ip msdp sa-cache 10.3.53.154
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip msdp cache-sa-state</code></td>
<td>Enables the router to create SA state.</td>
</tr>
<tr>
<td><code>show ip msdp sa-cache</code></td>
<td>Displays (S,G) state learned from MSDP peers.</td>
</tr>
</tbody>
</table>
clear ip msdp statistics

To clear statistics counters for one or all of the Multicast Source Discovery Protocol (MSDP) peers without resetting the sessions, use the **clear ip msdp statistics** command in EXEC mode.

```
clear ip msdp statistics [peer-address | peer-name]
```

**Syntax Description**

- **peer-address | peer-name**: (Optional) Address or name of the MSDP peers whose statistics counters, reset count, and input/output count are cleared.

**Command Modes**

EXEC

**Command History**

```
Release    Modification
12.0(7)T    This command was introduced.
```

**Examples**

The following example clears the counters for the peer named sanjose:

```
Router# clear ip msdp statistics sanjose
```
ip msdp border

To configure a router that borders a Protocol Independent Multicast (PIM) sparse mode region and dense mode region to use Multicast Source Discovery Protocol (MSDP), use the `ip msdp border` command in global configuration mode. To prevent this action, use the `no` form of this command.

```
no ip msdp border sa-address type number
```

**Syntax Description**

<table>
<thead>
<tr>
<th>sa-address</th>
<th>Active source IP address.</th>
</tr>
</thead>
<tbody>
<tr>
<td>type number</td>
<td>Interface type and number from which the IP address is derived and used as the rendezvous point (RP) address in Source-Active (SA) messages. Thus, MSDP peers can forward SA messages away from this border. The IP address of the interface is used as the originator ID, which is the RP field in the MSDP SA message.</td>
</tr>
</tbody>
</table>

**Defaults**

The active sources in the dense mode region will not participate in MSDP.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command if you want the router to send SA messages for sources active in the PIM dense mode region to MSDP peers.

**Note**

We recommend configuring the border router in the sparse mode domain to proxy-register sources in the dense mode domain, and have the sparse mode domain use standard MSDP procedures to advertise these sources.

**Note**

If you use this command, you MUST constrain the sources advertised by using the `ip msdp redistribute` command. Configure the `ip msdp redistribute` command to apply to only local sources. Be aware that this configuration can result in (S, G) state remaining long after a source in the dense mode domain has stopped sending.

**Note**

The `ip msdp originator-id` command also identifies an interface type and number to be used as the RP address. If both the `ip msdp border` and the `ip msdp originator-id` command are configured, the latter command prevails. That is, the address derived from the `ip msdp originator-id` command determines the address of the RP.
Examples

In the following example, the local router is not an RP. It borders a PIM sparse mode region with a dense mode region. It uses the IP address of Ethernet interface 0 as the “RP” address in SA messages.

```
ip msdp border sa-address ethernet0
```

Related Commands

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip msdp originator-id</td>
<td>Allows an MSDP speaker that originates an SA message to use the IP address of its interface as the RP address in the SA message.</td>
</tr>
<tr>
<td>ip msdp redistribute</td>
<td>Configures which (S,G) entries from the multicast routing table are advertised in SA messages originated to MSDP peers.</td>
</tr>
</tbody>
</table>
ip msdp cache-rejected-sa

To cache Source-Active (SA) request messages rejected from Multicast Source Discovery Protocol (MSDP) peers, use the `ip msdp cache-rejected-sa` command in global configuration mode. To stop tracking SA request messages, use the `no` form of this command.

```
ip msdp cache-rejected-sa number-of-entries
no ip msdp cache-rejected-sa number-of-entries
```

**Syntax Description**

| `number-of-entries` | Number of entries to be cached. The range is from 1 to 32766. |

**Defaults**

Rejected SA request messages are not stored.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(22)S</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1E</td>
<td>This command was integrated into Cisco IOS Release 12.1E.</td>
</tr>
<tr>
<td>12.2</td>
<td>This command was integrated into Cisco IOS Release 12.2.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `ip msdp cache-rejected-sa` command to configure the router to store SA messages that have been recently received from an MSDP peer but were rejected. Once this command is enabled, the router will maintain a rejected SA cache that stores the most recent rejected SA messages. The number of rejected SA message entries to be stored in the rejected SA cache is configured with the `number-of-entries` argument. If the rejected SA cache overflows, entries are overwritten, starting from the first entry.

**Note**

Enabling the `ip msdp cache-rejected-sa` command will not impact the performance of MSDP.

Use the `show ip msdp sa-cache` command with the `rejected-sa` keyword to display SA messages rejected from MSDP peers.

**Examples**

The following example shows how to enable the router to store a maximum of 200 messages rejected from MSDP peers:

```
Router(config)# ip msdp cache-rejected-sa 200
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip msdp sa-cache</code></td>
<td>Displays the (S, G) state learned from MSDP peers.</td>
</tr>
</tbody>
</table>
ip msdp cache-sa-state

To have the router create Source-Active (SA) state, use the `ip msdp cache-sa-state` command in global configuration mode.

```
ip msdp cache-sa-state [vrf vrf-name]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>vrf</th>
<th>(Optional) Supports the multicast VPN routing and forwarding (VRF) instance.</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf-name</td>
<td>(Optional) Name assigned to the VRF.</td>
</tr>
</tbody>
</table>

**Defaults**

The router creates SA state for all Multicast Source Discovery Protocol (MSDP) SA messages it receives.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(7)</td>
<td>This command was modified such that it is enabled by default and cannot be disabled.</td>
</tr>
<tr>
<td>12.0(23)S</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is automatically configured if at least one MSDP peer is configured. It cannot be disabled.

If you are running a version of Cisco IOS software prior to Release 12.1(7), we recommend enabling the `ip msdp cache-sa-state` command.

**Examples**

The following example shows how the `ip msdp cache-sa-state` command is enabled when an MSDP peer is configured:

```
   .
   .
ip classless
ip msdp peer 192.168.1.2 connect-source Loopback0
ip msdp peer 192.169.1.7
ip msdp mesh-group outside-test 192.168.1.2
ip msdp cache-sa-state
ip msdp originator-id Loopback0
   .
   .
```
### Related Commands

**ip msdp default-peer**

To define a default peer from which to accept all Multicast Source Discovery Protocol (MSDP) Source-Active (SA) messages, use the `ip msdp default-peer` command in global configuration mode. To remove the default peer, use the `no` form of this command.

```
ip msdp default-peer {peer-address | peer-name} [prefix-list list]

no ip msdp default-peer
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>peer-address</td>
</tr>
<tr>
<td>prefix-list list</td>
</tr>
</tbody>
</table>

**Defaults**

No default MSDP peer exists.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `ip msdp default-peer` command if you do not want to configure your MSDP peer to be a BGP peer also.

If only one MSDP peer is configured (with the `ip msdp peer` command), it will be used as a default peer. Therefore, you need not configure a default peer with this command.

If the `prefix-list list` keyword and argument are not specified, all SA messages received from the configured default peer are accepted.

Remember to configure a BGP prefix list if you intend to configure the `prefix-list list` keyword and argument with the `ip msdp default-peer` command.

If the `prefix-list list` keyword and argument are specified, SA messages originated from rendezvous points (RPs) covered by the `prefix-list list` keyword and argument will be accepted from the configured default peer. If the `prefix-list list` keyword and argument are specified but no prefix list is configured, the default peer will be used for all prefixes.
You can enter multiple `ip msdp default-peer` commands, with or without the `prefix-list` keyword, as follows. However, all commands must either have the keyword or all must not have the keyword.

- When you use multiple `ip msdp default-peer` commands with the `prefix-list` keyword, you use all the default peers at the same time for different RP prefixes. This syntax is typically used in a service provider cloud that connects stub site clouds.
- When you use multiple `ip msdp default-peer` commands without the `prefix-list` keyword, you use a single active peer to accept all SA messages. If that peer goes down, then you move to the next configured default peer to accept all SA messages. This syntax is typically used at a stub site.

**Examples**

The following example configures the router at IP address 192.168.1.3 as the default peer to the local router:

```
ip msdp peer 192.168.1.3
ip msdp peer 192.168.3.5
ip msdp default-peer 192.168.1.3
```

The following example configures two default peers:

```
ip msdp peer 172.18.2.3
ip msdp peer 172.19.3.5
ip msdp default-peer 172.18.2.3 prefix-list site-c
ip prefix-list site-a permit 172.18.0.0/16
ip msdp default-peer 172.19.3.5 prefix-list site-a
ip prefix-list site-c permit 172.19.0.0/16
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip msdp peer</code></td>
<td>Configures an MSDP peer.</td>
</tr>
<tr>
<td><code>ip prefix-list</code></td>
<td>Creates a prefix list.</td>
</tr>
</tbody>
</table>
### ip msdp description

To add descriptive text to the configuration for a Multicast Source Discovery Protocol (MSDP) peer, use the **ip msdp description** command in global configuration mode. To remove the description, use the **no** form of this command.

```
ip msdp description {peer-name | peer-address} text
no ip msdp description {peer-name | peer-address}
```

#### Syntax Description

- **peer-name | peer-address**: Peer name or address to which this description applies.
- **text**: Description of the MSDP peer.

#### Defaults

No description is associated with an MSDP peer.

#### Command Modes

Global configuration

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

Configure a description to make the MSDP peer easier to identify. This description is visible in the output of the **show ip msdp peer** command.

#### Examples

The following example configures the router at the IP address 172.17.1.2 with a description indicating it is a router at customer A:

```
ip msdp description 172.17.1.2 router at customer a
```
ip msdp filter-sa-request

To configure the router to send Source-Active (SA) request messages to the Multicast Source Discovery Protocol (MSDP) peer when a new joiner from a group becomes active, use the ip msdp filter-sa-request command in global configuration mode. To prevent this action, use the no form of this command.

```
ip msdp filter-sa-request {peer-address | peer-name} [list access-list]
no ip msdp filter-sa-request {peer-address | peer-name}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peer-address</td>
<td>IP address or name of the MSDP peer from which the local router requests SA messages when a new joiner for the group becomes active.</td>
</tr>
<tr>
<td>peer-name</td>
<td>(Optional) Standard IP access list number or name that describes a multicast group address. If no access list is specified, all SA request messages are ignored.</td>
</tr>
<tr>
<td>list access-list</td>
<td>(Optional) Standard IP access list number or name. If no access list is specified, all SA request messages are ignored.</td>
</tr>
</tbody>
</table>

### Defaults

If this command is not configured, all SA request messages are honored. If this command is configured but no access list is specified, all SA request messages are ignored.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

By default, the router honors all SA request messages from peers. Use this command if you want to control exactly which SA request messages the router will honor.

If no access list is specified, all SA request messages are ignored. If an access list is specified, only SA request messages from those groups permitted will be honored, and all others will be ignored.

### Examples

The following example configures the router to filter SA request messages from the MSDP peer at 172.16.2.2. SA request messages from sources on the network 192.168.22.0 pass access list 1 and will be honored; all others will be ignored.

```
ip msdp filter-sa-request 172.16.2.2 list 1
access-list 1 permit 192.4.22.0 0.0.0.255
```

### Related Commands

</tbody>
</table>
**ip msdp mesh-group**

To configure a Multicast Source Discovery Protocol (MSDP) peer to be a member of a mesh group, use the `ip msdp mesh-group` command in global configuration mode. To remove an MSDP peer from a mesh group, use the `no` form of this command.

```
ip msdp mesh-group mesh-name {peer-address | peer-name}

no ip msdp mesh-group mesh-name {peer-address | peer-name}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mesh-name</td>
<td>Name of the mesh group.</td>
</tr>
<tr>
<td>peer-address</td>
<td>IP address of the MSDP peer to be a member of the mesh group.</td>
</tr>
<tr>
<td>peer-name</td>
<td>IP name of the MSDP peer to be a member of the mesh group.</td>
</tr>
</tbody>
</table>

**Defaults**

The MSDP peers do not belong to a mesh group.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A mesh group is a group of MSDP speakers that have fully meshed MSDP connectivity among themselves. Source-Active (SA) messages received from a peer in a mesh group are not forwarded to other peers in the same mesh group.

Mesh groups can be used to achieve two goals:

- To reduce SA message flooding
- To simplify peer-Reverse Path Forwarding (RPF) flooding (no need to run Border Gateway Protocol [BGP] or multiprotocol BGP among MSDP peers)

**Examples**

The following example configures the MSDP peer at address 192.168.1.3 to be a member of the mesh group named internal:

```
ip msdp mesh-group internal 192.168.1.3
```
**ip msdp originator-id**

To allow a Multicast Source Discovery Protocol (MSDP) speaker that originates a Source-Active (SA) message to use the IP address of the interface as the rendezvous point (RP) address in the SA message, use the `ip msdp originator-id` command in global configuration mode. To prevent the RP address from being derived in this way, use the `no` form of this command.

```
ip msdp originator-id type number

no ip msdp originator-id type number
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type number</code></td>
<td>Interface type and number on the local router, whose IP address is used as the RP address in SA messages.</td>
</tr>
</tbody>
</table>

**Defaults**

The RP address is used as the originator ID.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `ip msdp originator-id` command identifies an interface type and number to be used as the RP address in an SA message.

Use this command if you want to configure a logical RP. Because only RPs and MSDP border routers originate SAs, there are times when it is necessary to change the ID used for this purpose.

If both the `ip msdp border` and the `ip msdp originator-id` commands are configured, the latter command prevails. That is, the address derived from the `ip msdp originator-id` command determines the address of the RP to be used in the SA message.

**Examples**

The following example configures the IP address of Ethernet interface 1 as the RP address in SA messages:

```
ip msdp originator-id ethernet1
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip msdp border</code></td>
<td>Configures a router that borders a PIM sparse mode region and dense mode region to use MSDP.</td>
</tr>
</tbody>
</table>
ip msdp peer

To configure a Multicast Source Discovery Protocol (MSDP) peer, use the `ip msdp peer` command in global configuration mode. To remove the peer relationship, use the `no` form of this command.

```
ip msdp peer {peer-name | peer-address} [connect-source type number] [remote-as as-number]
no ip msdp peer {peer-name | peer-address}
```

**Syntax Description**

- `peer-name | peer-address`: Domain Name System (DNS) name or IP address of the router that is to be the MSDP peer.
- `connect-source type number`: (Optional) Interface type and number whose primary address becomes the source IP address for the TCP connection. This interface is on the router being configured.
- `remote-as as-number`: (Optional) Autonomous system number of the MSDP peer. This is used for display purposes only.

There are cases where a peer might appear to be in another autonomous system (other than the one it really resides in) when you have an MSDP peering session but do not have a BGP peer session with that peer. In this case, if the prefix of the peer is injected by another autonomous system, it is displayed as the autonomous system number of the peer (and is misleading).

**Defaults**

No MSDP peer is configured.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The router specified should also be configured as a BGP neighbor.

If you are also BGP peering with this MSDP peer, you should use the same IP address for MSDP as you do for BGP. However, you are not required to run BGP or multiprotocol BGP with the MSDP peer, as long as there is a BGP or MBGP path between the MSDP peers. If there is no path, you must configure the `ip msdp default-peer` command.

**Examples**

The following example configures the router at the IP address 192.168.1.2 as an MSDP peer to the local router. The neighbor belongs to autonomous system 109.

```
ip msdp peer 192.168.1.2 connect-source ethernet 0/0
router bgp 110
network 192.168.0.0
neighbor 192.168.1.2 remote-as 109
```
neighbor 192.168.1.2 update-source ethernet 0/0

The following example configures the router at the IP address 192.168.1.3 as an MSDP peer to the local router:

```bash
ip msdp peer 192.168.1.3
```

The following example configures the router at the IP address 192.168.1.4 to be an MSDP peer in autonomous system 109. The primary address of Ethernet interface 0/0 is used as the source address for the TCP connection.

```bash
ip msdp peer 192.168.1.4 connect-source ethernet 0/0 remote-as 109
```

<table>

<tbody>
<tr>
<td>neighbor remote-as</td>
<td>Adds an entry to the BGP neighbor table.</td>
<td></td>
</tr>
</tbody>
</table>
ip msdp redistribute

To configure which (S, G) entries from the multicast routing table are advertised in Source-Active (SA) messages originated to Multicast Source Discovery Protocol (MSDP) peers, use the **ip msdp redistribute** command in global configuration mode. To remove the filter, use the **no** form of this command.

```
ip msdp redistribute [list access-list] [asn as-access-list] [route-map map-name]
no ip msdp redistribute
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list access-list</td>
<td>(Optional) Standard or extended IP access list number or name that controls which local sources are advertised and to which groups they send.</td>
</tr>
<tr>
<td>asn as-access-list</td>
<td>(Optional) Standard or extended IP access list number in the range from 1 to 199. This access list number must also be configured in the ip as-path command.</td>
</tr>
<tr>
<td>route-map map-name</td>
<td>(Optional) Defines the route map.</td>
</tr>
</tbody>
</table>

### Defaults

If no portion of this command is configured, only local sources are advertised, provided they send to groups for which the router is a rendezvous point (RP).

If no portion of this command is configured and if the **ip msdp border sa-address** command is configured, all local sources are advertised.

If the **ip msdp redistribute** command is configured with no keywords, no multicast sources are advertised.

### Command Modes

Global configuration

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command affects SA message origination, not SA message forwarding. If you want to filter which SA messages are forwarded to MSDP peers, use the **ip msdp sa-filter in** or **ip msdp sa-filter out** command.
The **ip msdp redistribute** command controls which (S, G) pairs the router advertises from the multicast routing table. By default, only sources within the local domain are advertised. Use the following guidelines for the **ip msdp redistribute** command:

- If you specify the **list access-list-name** keyword and argument only, you filter which local sources are advertised and to what groups they send. The access list specifies a source address, source mask, group address, and group mask.
- If you specify the **asn aspath-access-list-number** keyword and argument only, you advertise all sources sending to any group which pass through the autonomous system path access list. The autonomous system path access list number refers to the **ip as-path** command, which specifies an access list. If the **asn 0** keyword is specified, sources from all autonomous systems are advertised. The **asn 0** keyword is useful when connecting dense mode domains to a sparse mode domain running MSDP, or when using MSDP in a router that is not configured with Border Gateway Protocol (BGP). In these cases, you do not know if a source is local.
- If you specify the **route-map map** keyword and argument only, you advertise all sources that satisfy the **match** criteria in the route map **map** argument.
- If you specify all three keywords (**list**, **asn**, and **route-map**), all conditions must be true before any multicast source is advertised in an SA message.
- If you specify the **ip multicast redistribute** command with no other keywords or arguments, no multicast sources are advertised.

### Examples

The following example configures which (S, G) entries from the multicast routing table are advertised in SA messages originated to MSDP peers:

```plaintext
ip msdp redistribute route-map customer-sources
route-map customer-sources permit
match as-path customer-as
ip as-path access-list ^109$
```

**ip msdp sa-filter in**

To configure an incoming filter list for Source-Active (SA) messages received from the specified Multicast Source Discovery Protocol (MSDP) peer, use the `ip msdp sa-filter in` command in global configuration mode. To remove the filter, use the `no` form of this command.

```
ip msdp sa-filter in {peer-address | peer-name} [list access-list] [route-map map-name]
no ip msdp sa-filter in {peer-address | peer-name} [list access-list] [route-map map-name]
```

### Syntax Description

- **peer-address | peer-name**
  - IP address or name of the MSDP peer from which the SA messages are filtered.

- **list access-list**
  - (Optional) IP access list number or name. If no access list is specified, all source/group pairs from the peer are filtered.

- **route-map map-name**
  - (Optional) Route map name. From the specified MSDP peer, passes only those SA messages that meet the match criteria in the route map `map-name` argument.
  - If all match criteria are true, a `permit` keyword from the route map will pass routes through the filter. A `deny` keyword will filter routes.

### Defaults

- If this command is not configured, no incoming messages are filtered; all SA messages are accepted from the peer.
- If the command is configured, but no access list or route map is specified, all source/group pairs from the peer are filtered.
- If both the `list` and the `route-map` keywords are used, all conditions must be true to pass any (S, G) pair in incoming SA messages.

### Command Modes

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Examples

The following example configures the router to filter all SA messages from the peer at 192.168.1.3:

```
ip msdp peer 192.168.1.3 connect-source Ethernet0/0
ip msdp sa-filter in 192.168.1.3
```

</tbody>
</table>
To configure an outgoing filter list for Source-Active (SA) messages sent to the specified Multicast Source Discovery Protocol (MSDP) peer, use the `ip msdp sa-filter out` command in global configuration mode. To remove the filter, use the `no` form of this command.

```
ip msdp sa-filter out {peer-address \ peer-name} [list access-list] [route-map map-name]
```

```
no ip msdp sa-filter out {peer-address \ peer-name} [list access-list] [route-map map-name]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peer-address</td>
<td>IP address or DNS name of the MSDP peer to which the SA messages are filtered.</td>
</tr>
<tr>
<td>peer-name</td>
<td>(Optional) Extended IP access list number or name. If no access list is specified, all source/group pairs are filtered. To the specified MSDP peer, passes only those SA messages that pass the extended access list. If both the <code>list</code> and the <code>route-map</code> keywords are used, all conditions must be true to pass any (S, G) pairs in outgoing SA messages.</td>
</tr>
<tr>
<td>list access-list</td>
<td>(Optional) Route map name. To the specified MSDP peer, passes only those SA messages that meet the match criteria in the route map <code>map-name</code> argument. If all match criteria are true, a <code>permit</code> keyword from the route map will pass routes through the filter. A <code>deny</code> keyword will filter routes.</td>
</tr>
<tr>
<td>route-map map-name</td>
<td>(Optional) Route map name. To the specified MSDP peer, passes only those SA messages that meet the match criteria in the route map <code>map-name</code> argument. If all match criteria are true, a <code>permit</code> keyword from the route map will pass routes through the filter. A <code>deny</code> keyword will filter routes.</td>
</tr>
</tbody>
</table>

### Defaults

If this command is not configured, no outgoing messages are filtered; all SA messages received are forwarded to the peer.

If the command is configured, but no access list or route map is specified, all source/group pairs are filtered.

If both the `list` and the `route-map` keywords are used, all conditions must be true to pass any (S, G) pairs in outgoing SA messages.

</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Examples

The following example allows only (S, G) pairs that pass access list 100 to be forwarded in an SA message to the peer at the IP address 192.168.1.5:

```
ip msdp peer 192.168.1.5 connect-source ethernet 0/0
ip msdp sa-filter out 192.168.1.5 list 100
access-list 100 permit ip 172.1.0.0 0.0.255.255 224.2.0.0 0.0.255.255
```
## Related Commands

</tr>
</tbody>
</table>
ip msdp sa-limit

To limit the number of Source-Active (SA) messages from a Multicast Source Discovery Protocol (MSDP) peer that the router will allow in the SA cache, use the `ip msdp sa-limit` command in global configuration mode. To remove this limit, use the `no` form of this command.

```
  ip msdp sa-limit {peer-name \ peer-address} sa-limit
  no ip msdp sa-limit {peer-name \ peer-address} sa-limit
```

**Syntax Description**

- `peer-name` | Domain Name System (DNS) name or IP address of the router that is to be the MSDP peer.
- `peer-address` | Maximum number of SA messages from an MSDP peer allowed in the SA cache.
- `sa-limit` | Maximum number of SA messages from an MSDP peer allowed in the SA cache.

**Defaults**

By default, no SA message limit is set.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(7)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to prevent distributed denial of service attacks. We recommend configuring this command on all MSDP peer connections.

The output of the `show ip msdp count`, `show ip msdp peer`, and `show ip msdp summary` commands will display the number of SA messages from each MSDP peer that is in the SA cache. If the `ip msdp sa-limit` command is configured, the output of the `show ip msdp peer` command will also display the value of the SA message limit for each MSDP peer.

**Examples**

The following example configures the SA message limit to 100 for the MSDP peer with IP address 172.16.10.2:

```
  ip msdp sa-limit 172.16.10.2 100
```

**Related Commands**

</tbody>
</table>
**ip msdp sa-request**

To configure the router to send Source-Active (SA) request messages to the Multicast Source Discovery Protocol (MSDP) peer when a new joiner from the group becomes active, use the `ip msdp sa-request` command in global configuration mode. To prevent this action, use the `no` form of this command.

```plaintext
ip msdp sa-request {peer-address | peer-name}
no ip msdp sa-request {peer-address | peer-name}
```

**Syntax Description**

- **peer-address | peer-name**
  
  IP address or name of the MSDP peer from which the local router requests SA messages when a new joiner for the group becomes active.

**Defaults**

The router does not send SA request messages to the MSDP peer.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, the router does not send any SA request messages to its MSDP peers when a new member joins a group and wants to receive multicast traffic. The new member waits to receive any SA messages that eventually arrive.

Use this command if you want a new member of a group to learn the current, active multicast sources in a connected Protocol Independent Multicast sparse mode (PIM-SM) domain that are sending to a group. The router will send SA request messages to the specified MSDP peer when a new member joins a group. The peer replies with the information in its SA cache. If the peer does not have a cache configured, this command provides nothing.

An alternative to this command is using the `ip msdp cache-sa-state` command to have the router cache messages.

**Examples**

The following example configures the router to send SA request messages to the MSDP peer at 172.16.10.2:

```
ip msdp sa-request 172.16.10.2
```

</tbody>
</table>

ip msdp shutdown

To administratively shut down a configured Multicast Source Discovery Protocol (MSDP) peer, use the **ip msdp shutdown** command in global configuration mode. To bring the peer back up, use the **no** form of this command.

```
ip msdp shutdown {peer-address | peer-name}
no ip msdp shutdown {peer-address | peer-name}
```

### Syntax Description

```
peer-address | peer-name
```

IP address or name of the MSDP peer to shut down.

### Defaults

No action is taken to shut down an MSDP peer.

### Command Modes

Global configuration

### Command History

```
Release  Modification
12.0(7)T   This command was introduced.
```

### Examples

The following example shuts down the MSDP peer at IP address 192.168.7.20:

```
ip msdp shutdown 192.168.7.20
```

### Related Commands

```
Command         Description
ip msdp peer    Configures an MSDP peer.
```
**ip msdp ttl-threshold**

To limit which multicast data packets are sent in Source-Active (SA) messages to a Multicast Source Discovery Protocol (MSDP) peer, use the `ip msdp ttl-threshold` command in global configuration mode. To restore the default value, use the `no` form of this command.

```
ip msdp ttl-threshold {peer-address | peer-name} ttl-value

no ip msdp ttl-threshold {peer-address | peer-name}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`peer-address</td>
<td>peer-name`</td>
</tr>
<tr>
<td><code>ttl-value</code></td>
<td>Time-to-live (TTL) value. The default value of the <code>ttl</code> argument is 0, meaning all multicast data packets are forwarded to the peer until the TTL is exhausted.</td>
</tr>
</tbody>
</table>

**Defaults**

`ttl-value`: 0

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command limits which multicast data packets are sent in data-encapsulated SA messages. Only multicast packets with an IP header TTL greater than or equal to the `ttl` argument are sent to the MSDP peer specified by the IP address or name.

Use this command if you want to use TTL to scope your multicast data traffic. For example, you could limit internal traffic to a TTL of 8. If you want other groups to go to external locations, you would need to send those packets with a TTL greater than 8.

**Examples**

The following example configures a TTL threshold of 8 hops:

```
ip msdp ttl-threshold 192.168.1.5 8
```

**Related Commands**

show ip msdp sa-cache

To display the (S,G) state learned from Multicast Source Discovery Protocol (MSDP) peers, use the `show ip msdp sa-cache` command in user EXEC or privileged EXEC mode.

```
show ip msdp [vrf vrf-name] sa-cache [group-address | source-address | group-name | source-name] [rejected-sa [detail] [read-only]]
```

**Syntax Description**

- **vrf** (Optional) Supports the multicast VPN routing and forwarding (VRF) instance.
- **vrf-name** (Optional) Name assigned to the VRF.
- **group-address | source-address | group-name | source-name** (Optional) Group address, source address, group name, or source name of the group or source about which (S, G) state information is displayed. If two addresses or names are specified, an (S, G) entry corresponding to those addresses is displayed. If only one group address is specified, all sources for that group are displayed.
  - If no options are specified, the entire Source-Active (SA) cache is displayed.
- **as-number** (Optional) Autonomous system (AS) number from which the SA message originated.
- **rejected-sa** (Optional) Displays the most recently received and rejected MSDP SA messages.
- **detail** (Optional) Displays detailed information about the IP address of the MSDP peer that sent the SA message and the reason that the SA message was rejected.
- **read-only** (Optional) Checkpoints the rejected SA cache. Once checkpointed, the rejected SA cache is emptied.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(7)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.0(23)S</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
<tr>
<td>12.2(13)T</td>
<td>The <code>vrf</code> keyword and <code>vrf-name</code> argument were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, (S,G) state is cached.

Rejected SA messages are cached only if the `ip msdp cache-rejected-sa` command is configured.
Use the **show ip msdp sa-cache** with the optional **rejected-sa** keyword to display SA messages stored in the rejected SA cache. When the **detail** keyword is added to the command string, the output includes the IP address of the MSDP peer router that sent the SA message and the reason that the SA message was rejected.

When the optional **read-only** keyword is added to the command string, the router checkpoints the rejected SA cache, which ensures that a consistent snapshot of the rejected SA cache is displayed in the output. After being checkpointed, the rejected SA cache is cleared.

**Note**
Checkpointing the rejected SA cache requires that the router make a second copy of the rejected SA cache, which could cause the command to fail if the router is low on memory.

When the optional **read-only** keyword is not added to the command string, the router displays rejected MSDP SA messages out of the active rejected SA cache, which could result in inconsistent display output if rejected SA message entries are overwritten by rejected SA message entries that are captured as the output is being processed for display.

### Examples

The following is sample output from the **show ip msdp sa-cache** command:

```
Router# show ip msdp sa-cache

MSDP Source-Active Cache - 2398 entries
(172.16.41.33, 238.105.148.0), RP 172.16.3.111, MBGP/AS 704, 2d10h/00:05:33

Table 23 describes the significant fields shown in the display.

### Table 23  **show ip msdp sa-cache** Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(172.16.41.33, 238.105.148.0)</td>
<td>The first address (source) is sending to the second address (group).</td>
</tr>
<tr>
<td>RP 172.16.3.111</td>
<td>IP address of the Rendezvous point (RP) where the SA message originated.</td>
</tr>
</tbody>
</table>
**Table 23**  
*show ip msdp sa-cache Field Descriptions (continued)*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MBGP/AS 704</td>
<td>The RP from which the SA message originated is in AS 704 according to multiprotocol Border Gateway Protocol (BGP).</td>
</tr>
<tr>
<td>2d10h/00:05:33</td>
<td>The route has been cached for 2 days and 10 hours. If no SA message is received in 5 minutes and 33 seconds, the route will be removed from the SA cache.</td>
</tr>
</tbody>
</table>

The following is sample output from the `show ip msdp sa-cache` command with the rejected, detail, and read-only keywords specified:

```
Router# show ip msdp sa-cache rejected detail read-only

MSDP Rejected SA Cache
35 rejected SAs received over 02:50:01, cache size: 50 entries
Timestamp (source, group)
2832.248, (10.10.10.4, 227.7.7.12), RP: 10.10.10.4, Peer: 10.10.10.4, Reason: sa-limit-exceeded
2915.232, (10.10.10.8, 224.1.1.1), RP: 10.11.11.11, Peer: 10.10.10.8, Reason: in-filter
```

Table 24 describes the significant fields shown in the display.

**Table 24**  
*show ip msdp sa-cache rejected detail read-only Field Descriptions*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>35 rejected SAs received over 02:50:01</td>
<td>The number of rejected SA message entries received in the length of time indicated in HH:MM:SS.</td>
</tr>
<tr>
<td>cache size:</td>
<td>Indicates the size of the rejected SA cache. This field is controlled by the <code>ip msdp rejected-sa-cache</code> command. If the rejected SA cache overflows, entries are overwritten, starting from the first entry.</td>
</tr>
<tr>
<td>Timestamp (source, group)</td>
<td>Indicates the router uptime in seconds.milliseconds.</td>
</tr>
<tr>
<td>RP:</td>
<td>The (S, G) information advertised in the rejected SA message.</td>
</tr>
<tr>
<td>Indicates the IP address of the Rendezvous Point (RP) that originated the SA message.</td>
<td></td>
</tr>
</tbody>
</table>
### show ip msdp sa-cache

#### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip msdp sa-cache</td>
<td>Clears MSDP SA cache entries.</td>
</tr>
<tr>
<td>ip msdp cache-sa-state</td>
<td>Enables the router to create SA state.</td>
</tr>
</tbody>
</table>

#### Table 24  `show ip msdp sa-cache rejected detail read-only` Field Descriptions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer:</td>
<td>Indicates the IP address of the MSDP peer that sent the rejected SA message.</td>
</tr>
<tr>
<td>Reason:</td>
<td>Indicates the reason that the router rejected the SA message.</td>
</tr>
</tbody>
</table>

The possible reasons are as follows:

- `autorp-group`—Indicates that the SA message was rejected because it included one of the two AutoRP groups (224.0.1.39 and 224.0.1.40).
- `in-filter`—Indicates that the SA message was rejected because it was filtered by a configured incoming filter list (configured by the `ip msdp sa-filter in` command).
- `no-memory`—Indicates that the SA message was rejected because the router ran out of memory while allocating storage for the MSDP SA message.
- `rpf-fail`—Indicates that the SA message was rejected because it failed the Reverse Path Forwarding (RPF) check.
- `rp-filter`—Indicates that the SA message was rejected because it was filtered by a configured incoming RP filter list (configured by the `ip msdp sa-filter in` command).
- `sa-limit-exceeded`—Indicates that the SA message was rejected because the maximum number of SA cache entries (controlled by the `ip msdp sa-limit` command) was already exhausted when the SA message was received.
- `ssm-range`—Indicates that the SA message was rejected because it indicated a group in the SSM range.
show ip msdp summary

To display Multicast Source Discovery Protocol (MSDP) peer status, use the `show ip msdp summary` command in EXEC mode.

```
show ip msdp summary
```

**Command Modes**

EXEC

**Command History**

show ip msdp summary
PGM Host and Router Assist Commands

Use the commands in this chapter to configure and monitor the Pragmatic General Multicast (PGM) Host and Router Assist features. For configuration information and examples of PGM Host and Router Assist, refer to the “Configuring PGM Host and Router Assist” chapter in the Cisco IOS IP Configuration Guide.
clear ip pgm host

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaults</td>
<td>Resets all PGM Host connections to their default values.</td>
</tr>
<tr>
<td>traffic</td>
<td>Clears all PGM Host traffic statistics.</td>
</tr>
</tbody>
</table>

**Defaults**

No default behavior or values.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(1)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command should be used only in rare cases or during debugging. A reason to reset all PGM Host connections to their default values is to eliminate configuration errors in one step. A reason to clear traffic statistics is to make diagnostic testing easier.

**Examples**

The following example resets all PGM Host connections to their default values:

```
Router# clear ip pgm host defaults
```

The following example clears all PGM Host traffic statistics:

```
Router# clear ip pgm host traffic
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip pgm host</td>
<td>Enables PGM Host.</td>
</tr>
<tr>
<td>show ip pgm host defaults</td>
<td>Displays default values for PGM Host traffic.</td>
</tr>
<tr>
<td>show ip pgm host traffic</td>
<td>Displays PGM Host traffic statistics.</td>
</tr>
</tbody>
</table>
clear ip pgm router

To clear Pragmatic General Multicast (PGM) traffic statistics, use the `clear ip pgm router` command in EXEC mode.

`clear ip pgm router [traffic [type number]] | [rtx-state [group-address]]`

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>traffic [type number]</td>
<td>(Optional) Interface type and number whose PGM traffic statistics are cleared. If no interface type and number are provided, all traffic statistics are cleared.</td>
</tr>
<tr>
<td>rtx-state [group-address]</td>
<td>(Optional) IP address of the multicast group whose PGM resend state is cleared. If no group address is provided, all resend state is cleared. Clearing resend state means the router will not forward any retransmissions corresponding to that state.</td>
</tr>
</tbody>
</table>

## Command Modes

EXEC

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

This command should be used only in rare cases or during debugging. Normally, the resend state memory is freed automatically when the information is no longer useful. Also, using this command briefly affects the normal PGM behavior.

A reason to clear traffic statistics is to make diagnostic testing easier.

A reason to clear state might be to free the memory consumed by such state. PGM resend state times out if no traffic keeps it alive.

## Examples

The following example clears all PGM resend state from the router:

```
Router# clear ip pgm router rtx-state
```

## Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip pgm router</td>
<td>Enables PGM Router Assist and thereby allows PGM to operate more efficiently on the router.</td>
</tr>
<tr>
<td>show ip pgm router</td>
<td>Displays PGM Reliable Transport Protocol state and statistics.</td>
</tr>
</tbody>
</table>
ip pgm host

**Note**
Support for the PGM Host feature has been removed. Use of this command is not recommended.

To enable Pragmatic General Multicast (PGM) Host, use the `ip pgm host` command in global configuration mode. To disable PGM Host and close all open PGM Host traffic sessions, use the `no` form of this command.

```
ip pgm host [source-interface {type number} | connection-parameter]
no ip pgm host
```

**Syntax Description**
- `source-interface type number` (Optional) Interface type and number on which to run PGM Host.
- `connection-parameter` (Optional) Configures advanced PGM Host connection parameters. The optional configuration parameters should only be configured by experts in PGM technology. See Table 26 for a comprehensive list of the optional connection parameters and their definitions.

**Defaults**
PGM Host is not enabled.

**Command Modes**
Global configuration

**Command History**
Release | Modification
--- | ---
12.1(1)T | This command was introduced.

**Usage Guidelines**
Using the `ip pgm host` command without a keyword or an argument enables PGM Host on the router and configures the router to source PGM packets through a virtual host interface (vif).

Specifying a physical or logical interface type (for example, an Ethernet, serial, or loopback interface) with the `ip pgm host source-interface` command configures the router to source PGM packets out of the physical or logical interface.

You must first enable PGM Host globally on the router using the `ip pgm host` command before sourcing PGM packets out of a physical or logical interface using the `ip pgm host source-interface` command.

Sourcing PGM packets through a vif enables the router to send and receive PGM packets through any router interface. The vif also serves as the interface to the multicast applications that reside at the PGM network layer.

Sourcing IP multicast traffic out a specific physical or logical interface configures the router to send PGM packets out that interface only and to receive packets on any router interface.
When both PGM Host and Router Assist are enabled on the router, the router can process received PGM packets as a virtual PGM Host, originate PGM packets and serve as its own first hop PGM network element, and forward received PGM packets. Refer to the “Configuring PGM Host and Router Assist” chapter of the Cisco IOS IP Configuration Guide for more information about PGM Router Assist.

Table 26 lists the available parameters for the `connection-parameter` argument. The parameters should be configured only by experts in PGM technology. Use the `no ip pgm host connection-parameter` command to return a parameter to its default value.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ihb-max milliseconds</code></td>
<td>(Optional) Sets the source path message (SPM) interheartbeat timer maximum. The default is 10000 milliseconds (ms).</td>
</tr>
<tr>
<td><code>ihb-min milliseconds</code></td>
<td>(Optional) Sets the SPM interheartbeat timer minimum. The default is 1000 ms.</td>
</tr>
<tr>
<td><code>join milliseconds</code></td>
<td>(Optional) Sets the amount of time the PGM Host waits, when running in router mode, for client requests. The default is 0 ms.</td>
</tr>
<tr>
<td><code>nak-gen-ivl milliseconds</code></td>
<td>(Optional) Sets the amount of time the PGM Host waits for a PGM negative acknowledgment (NAK) data packet. The default is 60000 ms.</td>
</tr>
<tr>
<td><code>nak-rb-ivl milliseconds</code></td>
<td>(Optional) Sets the amount of time the PGM Host waits before sending a PGM NAK data packet. The default is 500 ms.</td>
</tr>
<tr>
<td><code>nak-rdata-ivl milliseconds</code></td>
<td>(Optional) Sets the amount of time the PGM Host waits for a re-sent PGM NAK (NAK RDATA) data packet. The default is 2000 ms.</td>
</tr>
<tr>
<td><code>nak-rpt-ivl milliseconds</code></td>
<td>(Optional) Sets the amount of time the PGM Host waits for a PGM NAK confirmation (NAK NCF) data packet. The default is 2000 ms.</td>
</tr>
<tr>
<td><code>ncf-max packets-per-second</code></td>
<td>(Optional) Sets the maximum number of PGM NAK confirmation data packets (NAK NCFs) the PGM Host sends per second. The default is infinite.</td>
</tr>
<tr>
<td>`rx-buffer-mgmt { full</td>
<td>minimum }`</td>
</tr>
<tr>
<td><code>spm-ambient-ivl milliseconds</code></td>
<td>(Optional) Sets the amount of time the PGM Host waits for a PGM SPM ambient data packet. The default is 6000 ms.</td>

<tr>
<td><code>spm-rpt-ivl milliseconds</code></td>
<td>(Optional) Sets the amount of time the PGM Host waits for a PGM SPM repeat data packet. The default is 3000 ms.</td>
</tr>
<tr>
<td>`stream-type { apdu</td>
<td>byte }`</td>
</tr>
<tr>
<td><code>tpdu-size number</code></td>
<td>(Optional) Sets the size of the source transport data unit (TPDU) for the PGM Host. The available range is 41 through 16384 bytes. The default is 1400 bytes.</td>
</tr>
</tbody>
</table>
Table 26  ip pgm host Connection Parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>ttl number</td>
<td>(Optional) Sets the time-to-live (TTL) value on the PGM Host for sent multicast data packets. The default is 255 hops. The TTL value for a packet is decremented by 1 as the packet passes through a router.</td>
</tr>
<tr>
<td>tx-buffer-mgmt {keep</td>
<td>(Optional) Sets the type of transmit data buffers (keep or return) for the PGM Host. The default is return.</td>
</tr>
<tr>
<td>time}</td>
<td></td>
</tr>
<tr>
<td>tx-adv-method {data</td>
<td>(Optional) Sets the type of advanced transmit window method (data or time) for the PGM Host. The default is time.</td>
</tr>
<tr>
<td>time}</td>
<td></td>
</tr>
<tr>
<td>txw-adv-secs milliseconds</td>
<td>(Optional) Sets the size of advanced transmit window for the PGM Host. The default is 6000 ms.</td>
</tr>
<tr>
<td>txw-rte bytes-per-second</td>
<td>(Optional) Sets the data transmit rate for the PGM Host. The default is 16,384 bytes per second.</td>
</tr>
<tr>
<td>txw-secs milliseconds</td>
<td>(Optional) Sets the data transmit window size for the PGM Host. The default is 30,000 ms.</td>
</tr>
<tr>
<td>txw-timeout-max millis</td>
<td>(Optional) Sets the amount of time the PGM Host waits for data packets, even if the PGM Host receives PGM NAK data packets. The default is 3,600,000 ms.</td>
</tr>
</tbody>
</table>

Examples

The following example enables PGM Host (both the source and receiver part of the PGM network layer) globally on the router and configures the router to source PGM packets through a vif:

```
ip pgm host
```

The following example enables PGM Host globally on the router and configures the router to source PGM packets out of physical Ethernet interface 0/1:

```
ip pgm host
ip pgm host source-interface ethernet 0/1
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip pgm host</td>
<td>Resets PGM Host connections to their default values and clears traffic statistics.</td>
</tr>
<tr>
<td>ip pgm router</td>
<td>Enables PGM Router Assist and thereby allows PGM to operate more efficiently on the router.</td>

</tbody>
</table>
**ip pgm router**

To enable Pragmatic General Multicast (PGM) Router Assist and thereby allow PGM to operate more efficiently on the router, use the `ip pgm router` command in interface configuration mode. To disable PGM Router Assist for the interface, use the `no` form of this command.

```
ip pgm router
no ip pgm router
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

PGM Router Assist is disabled for the interface.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is highly recommended for optimal deployment of PGM Reliable Transport Protocol on a host.

**Examples**

In the following example, PGM Router Assist is configured on Ethernet interfaces 0 and 1:

```
ip multicast-routing
interface ethernet 0
  ip pim sparse-dense-mode
  ip pgm router
interface ethernet 1
  ip pim sparse-dense-mode
  ip pgm router
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear ip pgm router</code></td>
<td>Clears PGM traffic statistics.</td>
</tr>
<tr>
<td><code>ip pgm host</code></td>
<td>Enables PGM Host.</td>
</tr>
<tr>
<td><code>show ip pgm router</code></td>
<td>Displays PGM Reliable Transport Protocol state and statistics.</td>
</tr>
</tbody>
</table>
**show ip pgm host defaults**

*Note*  
Support for the PGM Host feature has been removed. Use of this command is not recommended.

To display the default values for Pragmatic General Multicast (PGM) Host traffic, use the `show ip pgm host defaults` command in EXEC mode.

```
show ip pgm host defaults
```

**Syntax Description**  
This command has no arguments or keywords.

**Defaults**  
No default behavior or values.

**Command Modes**  
EXEC

**Command History**  

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(1)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**  
The default values displayed in the `show ip pgm host defaults` command output are applied to every new host connection that is opened.

**Examples**  
The following is sample output from the `show ip pgm host defaults` command:

```
Router> show ip pgm host defaults

Source Session Default Values:

   spm-ambient-ivl (6000), txw-adv-secs (6000)
   txw-adv-timeout-max (3600000), txw-rte (16384), txw-secs (30000)
   ncf-max (infinite), spm-rpt-ivl (3000), ihb-min (1000)
   ihb-max (10000), join (0), tpdu-size (16384)
   txw-adv-method (time), tx-buffer-mgmt (return)

Receiver Session Default Values:

   nak-rpt-ivl (2000), rx-buffer-mgmt (minimum), rx-local-retrans (none)

Common Default Values:

   stream-type (apdu), ttl (255)

Address used to source packets: (10.1.1.1)
```
Table 27 describes the fields Source Session Default Values, Receiver Session Default Values, Common Default Values, and Address used to source packets shown in the sample output. See Table 26 for a definition of each individual default value in the sample output.

Table 27  show ip pgm host defaults Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Session Default Values</td>
<td>Displays the values for source-specific PGM Host traffic defaults.</td>
</tr>
<tr>
<td>Receiver Session Default Values</td>
<td>Displays the values for receiver-specific PGM Host traffic defaults.</td>
</tr>
<tr>
<td>Common Default Values</td>
<td>Displays the values for PGM Host traffic defaults that are common between a source and a receiver.</td>
</tr>
<tr>
<td>Address used to source packets</td>
<td>The unicast IP address that the virtual host is using to originate PGM packets.</td>
</tr>
</tbody>
</table>

Related Commands

<table>

</tbody>
</table>
show ip pgm host sessions

**Note**
Support for the PGM Host feature has been removed. Use of this command is not recommended.

To display open Pragmatic General Multicast (PGM) Host traffic sessions, use the **show ip pgm host sessions** command in EXEC mode.

```
show ip pgm host sessions [session-number | group-address]
```

**Syntax Description**
- **session-number** (Optional) PGM Host traffic session number.
- **group-address** (Optional) PGM Host multicast group address.

**Defaults**
No default behavior or values.

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(1)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If a session number or multicast group address is not specified, all open traffic sessions are displayed.

**Examples**
The following example shows all open traffic sessions:

```
Router> show ip pgm host sessions

Idx GSI Source Port Type State Dest Port Mcast Address
1 000000000000 0 receiver listen 48059 224.3.3.3
2 9CD72EF099FA 1025 source conn 48059 224.1.1.1
```

The following example shows traffic information for traffic session number 2:

```
Router> show ip pgm host sessions 2

Idx GSI Source Port Type State Dest Port Mcast Address

**show ip pgm router**

To display Pragmatic General Multicast (PGM) Reliable Transport Protocol state and statistics, use the `show ip pgm router` command in EXEC mode.

```
show ip pgm router [interface [type number]] [state [group-address]] [traffic [type number]] [verbose]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface [type number]</td>
<td>(Optional) Displays interfaces on which PGM Router Assist is configured.</td>
</tr>
<tr>
<td>state [group-address]</td>
<td>(Optional) Displays PGM resend state information per transport session identifier (TSI). If no group address is specified, resend state for all groups is shown.</td>
</tr>
<tr>
<td>traffic [type number]</td>
<td>(Optional) Displays PGM packet counters. If no interface type and number are specified, traffic on all interfaces is displayed. These statistics do not reflect the number of PGM data packets (ODATA) that are forwarded in a session, because these are forwarded transparently by IP multicast.</td>
</tr>
<tr>
<td>verbose</td>
<td>(Optional) Displays extended information about outgoing interface lists, timers, Forward Error Connections (FECs), and Designated Local Retransmitters (DLRs).</td>
</tr>
</tbody>
</table>

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output of the `show ip pgm router` command with the `interface` keyword:

```
Router# show ip pgm router interface

Address | Interface         | Drop Rate |
--------|-------------------|-----------|
10.1.0.2| Ethernet1/0/0     | 0%        |
10.3.0.2| Ethernet1/0/4     | 0%        |
```

*Table 30* describes the significant fields shown in the display.

**Table 30 show ip pgm router Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>IP address of the interface running PGM Router Assist.</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface type and number on the router that is running PGM Router Assist, plus the drop rate measured on the interface.</td>
</tr>
</tbody>
</table>
The following is sample output of the `show ip pgm router` command with the `traffic` keyword. An RDATA fragment is a part of an RDATA packet that has been fragmented at the IP layer while in transit. The PGM network element has seen two RDATA packets that were each fragmented into three IP fragments.

Router# `show ip pgm router traffic`

```
FastEthernet0/0
NAKs received                  2
NCFs transmitted               2
RDATA forwarded                2
RDATA frags forwarded           6
SPMs received                   4
       used                      4
SPMs forwarded                  33
Serial0/0
NAKs forwarded                  2
NAKs retransmitted              2
NCFs received                   4
RDATA received                  2
       RDATA frags received      6
SPMs received                   33
       used                      33
```

The following is sample output of the `show ip pgm router` command with the `state` and `verbose` keywords. The timer associated with each session is an idle timer; the TSI state is deleted when this timer expires. The measured loss rates are indicated as follows:

- `link_lr`: worst reported link loss rate
- `path_lr`: worst reported path loss rate
- `receiver_lr`: worst reported receiver loss rate
- `cr_lead`: sequence number associated with worst receiver loss rate
- `cr_worst_rec`: IP address that reported worst loss rate

Router# `show ip pgm router state verbose`

```
TSI                Group            Neighbor        TGSIZE
0A0700C85555-1000  227.7.7.7        rpf/source       N/A        00:04:25
       (link_lr 7%, path_lr 4%, receiver_lr 10%
       cr_lead 6256421, cr_worst_rec 134.45.0.126)
```

The following sample output shows state after receivers have reported loss of certain packets. Negative acknowledgments (NAKs) have been received for each of the two sessions in the previous example. After the loss, the router has state for the lost packets. The “sqn 1990” indicates that a receiver lost a packet with sequence number 1990 and is requesting that it be re-sent.

Router# `show ip pgm router state verbose`

```
TSI                Group            Neighbor        TGSIZE
0A0700C85555-1000  227.7.7.7        rpf/source       N/A        00:04:55
       sqn        1990            age   4 ELIM TMR
       Ethernet1/0/0
       sqn        1991            age   5 (anticipated)
0A0700C85555-2000  234.4.3.2        rpf/source       16        00:04:55
       sqn (       125,          7) age   10
       Serial5/0 prty # 7
```
For the selective TSI, the output shows resend state for sequence number 1990. This state was created by a NAK received on Ethernet interface 1/0/0. “ELIM TMR” indicates that the state is currently eliminating duplicates of any NAK that is pending and any new NAKs for this sequence number will not be forwarded.

State shown for sequence 1991 is anticipated state, indicating that it was created by a NAK confirmation (NCF) for a NAK sent by some other PGM router with the same PGM upstream neighbor as this router.

For the TSI with parity, the state shown was created by a parity NAK for seven packets of the Transmission Group 125. This state was received on Serial interface 5/0; “# 7” indicates that seven parity packets must be forwarded out this interface.

Unidirectional Link Routing Commands

Use the commands in this chapter to configure and monitor unidirectional link routing (UDLR). For configuration information and examples of UDLR, refer to the “Configuring Unidirectional Link Routing” chapter of the *Cisco IOS IP Configuration Guide*.
ip igmp helper-address (UDL)

To configure Internet Group Management Protocol (IGMP) helpering as required for IGMP unidirectional link routing (UDLR), use the `ip igmp helper-address` command in interface configuration mode. To disable such report forwarding, use the `no` form of this command.

```
ip igmp helper-address udl type number

no ip igmp helper-address
```

Syntax Description

```
udl type number
```

Interface type and number of a unidirectional interface.

Defaults

No forwarding occurs.

Command Modes

Interface configuration

Command History

```
Release     Modification
12.0(3)T     This command was introduced.
```

Usage Guidelines

This command is required on a downstream router on each interface connected to a potential multicast receiver. The command allows the downstream router to helper IGMP reports received from hosts to an upstream router connected to a unidirectional link (UDL) associated with the configured `type` and `number` arguments.

Examples

The following example configures a helper address on a downstream router:

```
ip multicast-routing
!
! Interface that receiver is attached to, configure for IGMP reports to be
! helpered for the unidirectional interface.
!
interface ethernet 0
description Forward IGMP reports from this interface to UDL querier
ip address 14.0.0.2 255.0.0.0
ip pim sparse-dense-mode
ip igmp helper-address udl serial 0
```

</tr>
<tr>
<td><code>ip igmp unidirectional-link</code></td>
<td>Configures an interface to be unidirectional and enables it for IGMP UDLR.</td>
</tr>
</tbody>
</table>
**ip igmp mroute-proxy**

To enable Internet Group Management Protocol (IGMP) report forwarding of proxied (*, G) mroute entries, use the `ip igmp mroute-proxy` command in interface configuration mode. To disable this service, use the `no` form of this command.

```
  ip igmp mroute-proxy type number
  no ip igmp mroute-proxy type number
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type number</code></td>
<td>Interface type and number.</td>
</tr>
</tbody>
</table>

**Defaults**

Disabled

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(5)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When used with the `ip igmp proxy-service` interface command, this command enables forwarding of IGMP reports to a proxy service interface for all (*, G) forwarding entries for this interface in the multicast forwarding table.

**Examples**

The following example shows how to configure the `ip igmp mroute-proxy` command on Ethernet interface 1 to request that IGMP reports be sent to loopback interface 0 for all groups in the mroute table that are forwarded to Ethernet interface 1. This example also shows how to configure the `ip igmp proxy-service` command on loopback interface 0 to enable the forwarding of IGMP reports out the interface for all groups on interfaces registered through the `ip igmp mroute-proxy` command.

```
interface loopback 0
ip address 10.7.1.1 255.255.255.0
ip pim dense-mode
ip igmp helper-address udl ethernet 0
ip igmp proxy-service
!
interface ethernet 0
ip address 10.2.1.1 255.255.255.0
ip pim dense-mode
ip igmp unidirectional link
!
interface ethernet 1
ip address 10.1.1.1 255.255.255.0
ip pim sparse-mode
ip igmp mroute-proxy loopback 0
```

<tr>
<td>ip igmp unidirectional-link</td>
<td>Configures an interface to be unidirectional and enables it for IGMP UDLR.</td>
</tr>
</tbody>
</table>
ip igmp proxy-service

To enable the mroute proxy service, use the `ip igmp proxy-service` command in interface configuration mode. To disable forwarding, use the `no` form of this command.

```
ip igmp proxy-service
no ip igmp proxy-service
```

Syntax Description
This command has no arguments or keywords.

Defaults
Disabled

Command Modes
Interface configuration

Command History
```
Release       Modification
12.1(5)T       This command was introduced.
```

Usage Guidelines
Based on the Internet Group Management Protocol (IGMP) query interval, the router periodically checks the mroute table for (*, G) forwarding entries that match interfaces configured with the `ip igmp mroute-proxy` command. Where there is a match, one IGMP report is created and received on this interface. This command was intended to be used with the `ip igmp helper-address udl` command, in which case the IGMP report would be forwarded to an upstream router.

Examples
The following example shows how to configure the `ip igmp mroute-proxy` command on Ethernet interface 1 to request that IGMP reports be sent to loopback interface 0 for all groups in the mroute table that are forwarded to Ethernet interface 1. This example also shows how to configure the `ip igmp proxy-service` command on loopback interface 0 to enable the forwarding of IGMP reports out the interface for all groups on interfaces registered through the `ip igmp mroute-proxy` command.

```
interface loopback 0
ip address 10.7.1.1 255.255.255.0
ip pim dense-mode
ip igmp helper-address udl ethernet 0
ip igmp proxy-service
!
interface ethernet 0
ip address 10.2.1.1 255.255.255.0
ip pim dense-mode
ip igmp unidirectional link
!
interface ethernet 1
ip address 10.1.1.1 255.255.255.0
ip pim sparse-mode
ip igmp mroute-proxy loopback 0
```

Unidirectional Link Routing Commands
### Unidirectional Link Routing Commands

**ip igmp proxy-service**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp helper-address (UDL)</td>
<td>Configures IGMP helpering as required for IGMP UDLR.</td>
</tr>
<tr>
<td>ip igmp mroute-proxy</td>
<td>Enables IGMP report forwarding of proxied (*, G) mroute entries.</td>
</tr>
<tr>
<td>ip igmp unidirectional-link</td>
<td>Configures an interface to be unidirectional and enables it for IGMP UDLR.</td>
</tr>
</tbody>
</table>
ip igmp unidirectional-link

To configure an interface to be unidirectional and enable it for Internet Group Management Protocol (IGMP) unidirectional link routing (UDLR), use the `ip igmp unidirectional-link` command in interface configuration mode. To disable the unidirectional link (UDL), use the `no` form of this command.

```
ip igmp unidirectional-link

no ip igmp unidirectional-link
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
No UDLR occurs.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.0(3)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
One example of when you might configure this command is if you have traffic traveling via a satellite. If you have a small number of receivers, another way to achieve UDLR is to configure a UDLR tunnel. See the descriptions of the `tunnel udlr receive-only` and `tunnel udlr send-only` commands later in this chapter.

**Examples**
The following example configures an upstream router with UDLR on serial interface 0:

```
ip multicast-routing
!
! Unidirectional link
!
interface serial 0
description Unidirectional to downlink-rtr
ip address 10.0.0.1 255.0.0.0
ip pim sparse-dense-mode
ip igmp unidirectional-link
no keepalive
```

</tr>
</tbody>
</table>
ip multicast default-rpf-distance

When configuring Internet Group Management Protocol (IGMP) unidirectional link routing (UDLR), to change the distance given to the default Reverse Path Forwarding (RPF) interface, use the `ip multicast default-rpf-distance` command in global configuration mode. To restore the default value, use the `no` form of this command.

`ip multicast default-rpf-distance distance`

`no ip multicast default-rpf-distance`

**Syntax Description**

| distance | Distance given to the default RPF interface. The default value is 15. |

**Defaults**

The distance default value is 15.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(3)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is optional. If you want to receive all multicast traffic from all sources on the unidirectional link (UDL), as long as 15 is the lowest distance, you need not change the value of 15. The default RPF interface is selected when an IGMP query message is received on a UDL and indicates to the router that all sources will use RPF to reach the UDL interface.

Any explicit sources learned by routing protocols will take preference as long as their distance is less than the `distance` argument configured with the `ip multicast default-rpf-distance` command.

You might consider changing the default value for one of the following reasons:

- To make IGMP prefer the UDL.
- To configure a value less than existing routing protocols.
- If you want to receive multicast packets from sources on interfaces other than the UDL interface. Configure a value greater than the distances of the existing routing protocols to make IGMP prefer the nonunidirectional link.

**Examples**

The following example configures a distance of 20:

```
ip multicast default-rpf-distance 20
```
### Related Commands

show ip igmp udlr

To display unidirectional link routing (UDLR) information for directly connected multicast groups on interfaces that have a unidirectional link (UDL) helper address configured, use the `show ip igmp udlr` command in EXEC mode.

```
show ip igmp udlr [group-name | group-address | type number]
```

**Syntax Description**
- **group-name** | **group-address**
  - (Optional) Name or address of the multicast group for which to show UDLR information.
- **type number**
  - (Optional) Interface type and number for which to show UDLR information.

**Command Modes**
- EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(3)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays which groups are being forwarded and received over the UDL.

On the upstream router, this command shows which interface is a UDL interface and which IP multicast groups are being forwarded out that interface. The UDL Reporter is the IP address of the downstream interface on the receiving router. If there is more than one downstream router, this field shows which downstream router forwarded the IGMP host report to the upstream router over the ground-based network. This report is forwarded over the UDL so that all downstream routers know which groups have already been requested by other downstream routers, so that additional IGMP host reports are suppressed.

On the downstream router, this command (in the Interface field) shows which local interface received an IGMP host report (from a directly connected host for a specific group). The UDL Reporter is the IP address of the router that had forwarded the IGMP host report to the upstream router over the ground-based network. The UDL Interfaces column shows the interface on which IP multicast packets are being received.

**Examples**

The following is sample output of the `show ip igmp udlr` command on an upstream router:

```
upstream-rtr# show ip igmp udlr

IGMP UDLR Status, UDL Interfaces: Serial0
Group Address  Interface  UDL Reporter  Reporter Expires
224.0.127.254  Serial0   10.0.0.2      00:02:12
224.0.1.40     Serial0   10.0.0.2      00:02:11
225.7.7.7      Serial0   10.0.0.2      00:02:15
```

The following is sample output of the `show ip igmp udlr` command on a downstream router:

```
downstream-rtr# show ip igmp udlr
```
IGMP UDLR Status, UDL Interfaces: Serial0

<table>
<thead>

tunnel udlr address-resolution

To enable the forwarding of the Address Resolution Protocol (ARP) and Next Hop Resolution Protocol (NHRP) over a unidirectional link (UDL), use the `tunnel udlr address-resolution` command in interface configuration mode. To disable forwarding, use the `no` form of this command.

```plaintext
    tunnel udlr address-resolution

    no tunnel udlr address-resolution
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
Interface configuration

**Command History**
```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(5)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**
This command is configured on the send-only tunnel interface of a downstream router.

**Examples**
The following example shows how to configure the `tunnel udlr address-resolution` command on an interface to enable ARP and NHRP over a send-only tunnel. An ARP address resolution request received from the upstream router on the UDL (Ethernet interface 0) will be replied to over the send-only tunnel of the receiver. Likewise, an ARP request may be sent by the downstream router over the send-only tunnel, and the response will be received over the UDL.

```plaintext
interface tunnel 0
tunnel udlr send-only ethernet 0
tunnel udlr address-resolution
```

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(3)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to configure a router that has a unidirectional interface with send-only capabilities. One example of when you might configure this command is if you have traffic traveling via a satellite. The `type` and `number` arguments must match the send-only interface type and number specified by the `interface` command.

You must configure the `tunnel udlr send-only` command at the opposite end of the tunnel.

If you have a large number of receivers, you should configure UDLR by an alternative means: Internet Group Management Protocol (IGMP) UDLR. See the description of the `ip igmp unidirectional-link` command earlier in this chapter.

**Examples**

In the following example, Router A (the upstream router) is configured with Open Shortest Path First (OSPF) and Protocol Independent Multicast (PIM). Serial interface 0 has send-only capability. Therefore, the UDLR tunnel is configured as receive-only, and points to serial interface 0.
Router A Configuration

```conf
tunnel udlr receive-only
interface serial 0
enapsulation hdlc
ip address 10.1.0.1 255.255.0.0
ip pim sparse-dense-mode
interface tunnel 0
tunnel source ethernet 0
tunnel destination <downstream-router>
tunnel udlr receive-only serial 0
router ospf <pid>
```

Router B (the downstream router) is configured with OSPF and PIM. Serial interface 1 has receive-only capability. Therefore, the UDLR tunnel is configured as send-only, and points to serial interface 1.

Router B Configuration

```conf
interface serial 1
enapsulation hdlc
ip address 10.1.0.2 255.255.0.0
ip pim sparse-dense-mode
interface tunnel 0
tunnel source ethernet 0
tunnel destination <upstream-router>
tunnel udlr send-only serial 1
router ospf <pid>
```

IP Multicast Tools Commands

Use the commands in this chapter to configure and use IP multicast tools such as Multicast Routing Monitor (MRM), mrinfo, mstat, and mtrace. For configuration information and examples of IP multicast tools, refer to the “Using IP Multicast Tools” chapter of the Cisco IOS IP Configuration Guide.
beacon

To change the frequency, duration, or scope of beacon messages that the Manager sends to Test Senders and Test Receivers during a multicast routing monitor test, use the `beacon` command in manager configuration mode. To restore the default value, use the `no` form of this command.

```
beacon [interval seconds] [holdtime seconds] [ttl ttl-value]  
no beacon [interval seconds] [holdtime seconds] [ttl ttl-value]
```

**Syntax Description**

- **interval seconds**: (Optional) Frequency of beacon messages (in seconds). The default value is 60 seconds, meaning one beacon message every 60 seconds.
- **holdtime seconds**: (Optional) Length of the test period in seconds. The Test Sender and Test Receiver are respectively sending and receiving test data constantly during the hold time. The default value is 1 day (86,400 seconds).
- **ttl ttl-value**: (Optional) Time-to-live (TTL) value of the beacon messages. The default value is 32 hops.

**Defaults**

- **interval seconds**: 60.
- **holdtime seconds**: 86400 (1 day).
- **ttl hops**: 32.

**Command Modes**

Manager configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)S</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The beacon message functions like a keepalive message. The Manager multicasts beacon messages to the Test Sender and Test Receiver. Beacon messages include the sender requests and receiver requests to start the test, thus providing redundancy in case the Test Sender or Test Receiver goes down.

You can increase the default `interval` keyword to reduce beacon traffic.

You can decrease the `holdtime` keyword to shorten the test time.

You can change the default number of TTL hops if your network is large and the beacon needs more than 32 hops to get from the Manager to the Test Sender or Test Receiver.

**Examples**

The following example customizes the Manager to send beacon messages every 30 minutes (1800 seconds), for a test period of 12 hours (43,200 seconds), with a TTL of 40 hops:

```
beacon interval 1800 holdtime 43200 ttl 40
```

</table>
clear ip mrm status-report

To clear the status report cache buffer, use the clear ip mrm status-report command in EXEC mode.

    clear ip mrm status-report [ip-address]

**Syntax Description**

- **ip-address**  (Optional) Address of the Test Receiver. Clears only those status reports received from the Test Receiver that has this IP address. If no address is specified, all status reports are cleared from the cache buffer.

**Command Modes**

- EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)S</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You typically need not clear this circular cache buffer.

**Examples**

The following example clears status reports from the Test Receiver at 175.2.3.4:

    Router# clear ip mrm status-report 175.2.3.4

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip mrm status-report</td>
<td>Displays MRM status reports of errors in the circular cache buffer.</td>
</tr>
</tbody>
</table>
To configure an interface to operate as a Test Sender or Test Receiver, or both, for Multicast Routing Monitor (MRM), use the `ip mrm` command in interface configuration mode. To remove the interface as a Test Sender or Test Receiver, use the `no` form of this command.

```
ip mrm [ test-sender | test-receiver | test-sender-receiver ]
no ip mrm [ test-sender | test-receiver | test-sender-receiver ]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>test-sender</code></td>
<td>Configures the interface to be a Test Sender.</td>
</tr>
<tr>
<td><code>test-receiver</code></td>
<td>Configures the interface to be a Test Receiver.</td>
</tr>
<tr>
<td><code>test-sender-receiver</code></td>
<td>Configures the interface to be both a Test Sender and Test Receiver (for different groups).</td>
</tr>
</tbody>
</table>

**Defaults**
The interface is neither a Test Sender nor a Test Receiver.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)S</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The Test Sender and Test Receiver can be either a router or a host.

If a router (or host) belongs to more than one test group, it can be a Test Sender for one group and a Test Receiver for the other group. It cannot be the Test Sender and Test Receiver for the same group.

**Examples**
The following example configures Ethernet interface 0 to be a Test Sender:

```
interface ethernet 0
ip mrm test-sender
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>receivers</code></td>
<td>Establishes Test Receivers for MRM.</td>
</tr>
<tr>
<td><code>senders</code></td>
<td>Configures Test Sender parameters used in MRM.</td>
</tr>
</tbody>
</table>
ip mrm accept-manager

To configure a Test Sender or Test Receiver to accept requests only from Managers that pass an access list, use the **ip mrm accept-manager** command in global configuration mode. To remove the restriction, use the **no** form of this command.

```
ip mrm accept-manager {access-list} [test-sender | test-receiver]
no ip mrm accept-manager {access-list}
```

### Syntax Description

- **access-list**  
  Number or name of IP access list applied to the Managers.
- **test-sender**  
  (Optional) The access list applies only to the Test Sender.
- **test-receiver**  
  (Optional) The access list applies only to the Test Receiver.

### Defaults

If neither the **test-sender** nor **test-receiver** keyword is configured, the access list applies to both.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)S</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use this command to control which Managers a Test Sender or Test Receiver must respond to.

### Examples

The following example configures the Test Sender to respond only to Managers that pass the access list named supervisor:

```
ip access-list standard supervisor
remark Permit only the Manager from Central Office
permit 172.18.2.4
ip mrm accept-manager supervisor test-sender
```

### Related Commands

</tbody>
</table>
### ip mrm manager

To identify a Multicast Routing Monitor (MRM) test and enter the mode in which you specify the test parameters, use the `ip mrm manager` command in global configuration mode. To remove the test, use the `no` form of this command.

```
ip mrm manager test-name
no ip mrm manager test-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>test-name</code></td>
<td>Name of the group of MRM test parameters that follow.</td>
</tr>
</tbody>
</table>

| Defaults | There is no MRM test. |
| Command Modes | Global configuration |
| Command History | Release | Modification |
| | 12.0(5)S | This command was introduced. |

| Usage Guidelines | The `test-name` argument identifies a test so that you can start, stop, or monitor the test. After you enter this command, the router is in manager configuration mode and you must set the test parameters. |

<table>
<thead>
<tr>
<th>Examples</th>
<th>The following example identifies an MRM test named test1 and causes the system to enter manager configuration mode:</th>
</tr>
</thead>
</table>
|          | `ip mrm manager test1`  
|          | manager ethernet 0 group 239.1.1.1  
|          | senders 1 |

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td><code>show ip mrm manager</code></td>
<td>Displays test information for MRM.</td>
</tr>
</tbody>
</table>
To specify that an interface is the Manager for Multicast Routing Monitor (MRM), and to specify the multicast group address the Test Receiver will listen to, use the `manager` command in manager configuration mode. To remove the Manager or group address, use the `no` form of this command.

```plaintext
manager type number group ip-address

no manager type number group ip-address
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type number</code></td>
<td>Interface type and number of the Manager. The IP address associated with this interface is the source address of the Manager.</td>
</tr>
<tr>
<td><code>group ip-address</code></td>
<td>IP multicast group address that the Test Receiver will listen to.</td>
</tr>
</tbody>
</table>

**Defaults**

There is no MRM Manager.

**Command Modes**

Manager configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)S</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command identifies the interface that acts as the Manager, and therefore is required in order to run MRM.

**Examples**

The following example configures Ethernet interface 0 as the Manager. It also configures the Test Receiver to listen to multicast group 239.1.1.1.

```plaintext
ip mrm manager test1
manager ethernet 0 group 239.1.1.1
```

**Related Commands**

</tbody>
</table>
mrinfo

To query which neighboring multicast routers are “peering” with the local router, use the mrinfo command in EXEC mode.

```
mrinfo [host-name | host-address] [source-address | interface]
```

**Syntax Description**

- **host-name | host-address** (Optional) Queries the Domain Name System (DNS) name or IP address of the multicast router. If omitted, the router queries itself.
- **source-address** (Optional) Source address used on mrinfo requests. If omitted, the source is based on the outbound interface for the destination.
- **interface** (Optional) Source interface used on mrinfo requests. If omitted, the source is based on the outbound interface for the destination.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The mrinfo command is the original tool of the multicast backbone (MBONE) to determine which neighboring multicast routers are peering with a multicast router. Cisco routers have supported responding to mrinfo requests since Cisco IOS Release 10.2.

Now you can query a multicast router using this command. The output format is identical to the mrouted version of Distance Vector Multicast Routing Protocol (DVMRP). (The mrouted software is the UNIX software that implements DVMRP.)

**Examples**

The following is sample output of the mrinfo command:

```
Router # mrinfo

192.31.7.37 (barrnet-gw.cisco.com) [version cisco 11.1] [flags: PMSA]:
192.31.7.37 -> 192.31.7.34 (aj-wall-2.cisco.com) [1/0/pim]
192.31.7.37 -> 192.31.7.47 (dirtylab-gw-2.cisco.com) [1/0/pim]
192.31.7.37 -> 192.31.7.44 (dirtylab-gw-1.cisco.com) [1/0/pim]
131.119.26.10 -> 131.119.26.9 (su-pr2.bbnplanet.net) [1/32/pim]
```

The flags indicate the following:

- **P**: prune-capable
- **M**: mtrace-capable
- **S**: SNMP-capable
- **A**: Auto-RP-capable
To start or stop a Multicast Routing Monitor (MRM) test, use the `mrm` command in EXEC mode.

```
mrm test-name {start | stop}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>test-name</code></td>
<td>Name of the MRM test, as defined by the <code>ip mrm manager</code> command.</td>
</tr>
<tr>
<td><code>start</code></td>
<td>Starts the MRM test specified by the <code>test-name</code> argument.</td>
</tr>
<tr>
<td><code>stop</code></td>
<td>Stops the MRM test specified by the <code>test-name</code> argument.</td>
</tr>
</tbody>
</table>

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)S</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must use this command to run an MRM test. When the test runs, the Test Sender sends User Datagram Protocol (UDP) or UDP/Real-Time Transport Protocol (RTP) packets (depending on the `senders` command) to the Test Receiver.

**Examples**

The following example starts the MRM test named test1:

```
Router# mrm test1 start
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip mrm manager</code></td>
<td>Identifies an MRM test and enters the mode in which you specify the test parameters.</td>
</tr>
<tr>
<td><code>show ip mrm status-report</code></td>
<td>Displays MRM status reports of errors in the circular cache buffer.</td>
</tr>
</tbody>
</table>
mstat

To display IP multicast packet rate and loss information, use the mstat command in user EXEC mode.

```
mstat [source-name | source-address] [destination-name | destination-address] [group-name | group-address]
```

**Syntax Description**

- `source-name | source-address`: Domain Name System (DNS) name or the IP address of the multicast-capable source.
- `destination-name | destination-address`: (Optional) DNS name or address of the destination. If omitted, the command uses the system at which the command is typed.
- `group-name | group-address`: (Optional) DNS name or multicast address of the group to be displayed. Default address is 224.2.0.1 (the group used for multicast backbone [MBONE] Audio).

**Command Modes**

User EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If no arguments are entered, the router will interactively prompt you for them.

This command is a form of UNIX mtrace that reports packet rate and loss information.

**Examples**

The following is sample output from the mstat command:

```
Router> mstat lwei-home-ss2 171.69.58.88 224.0.255.255

Type escape sequence to abort.
Mtrace from 171.69.143.27 to 171.69.58.88 via group 224.0.255.255
>From source (lwei-home-ss2.cisco.com) to destination (lwei-ss20.cisco.com)
Waiting to accumulate statistics......
Results after 10 seconds:

<tr>
<td>mtrace</td>
<td>Traces the path from a source to a destination branch for a multicast distribution tree.</td>
</tr>
</tbody>
</table>
mtrace

To trace the path from a source to a destination branch for a multicast distribution tree, use the `mtrace` user command in EXEC mode.

```
mtrace [source-name | source-address] [destination-name | destination-address] [group-name | group-address]
```

**Syntax Description**
- `source-name | source-address`: Domain Name System (DNS) name or the IP address of the multicast-capable source. This is a unicast address of the beginning of the path to be traced.
- `destination-name | destination-address`: (Optional) DNS name or address of the unicast destination. If omitted, the mtrace starts from the system at which the command is typed.
- `group-name | group-address`: (Optional) DNS name or multicast address of the group to be traced. Default address is 224.2.0.1 (the group used for multicast backbone [MBONE] Audio). When address 0.0.0.0 is used, the software invokes a weak `mtrace`. A weak `mtrace` is one that follows the RPF path to the source, regardless of whether any router along the path has multicast routing table state.

**Command Modes**
User EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The trace request generated by the `mtrace` command is multicast to the multicast group to find the last hop router to the specified destination. The trace then follows the multicast path from destination to source by passing the mtrace request packet via unicast to each hop. Responses are unicast to the querying router by the first hop router to the source. This command allows you to isolate multicast routing failures.

If no arguments are entered, the router will interactively prompt you for them.

This command is identical in function to the UNIX version of mtrace.

**Examples**
The following is sample output from the `mtrace` command:

```
Router> mtrace 171.69.215.41 171.69.215.67 239.254.254.254

Type escape sequence to abort.
Mtrace from 171.69.215.41 to 171.69.215.67 via group 239.254.254.254
From source (?) to destination (?)
Querying full reverse path...
  0  171.69.215.67  PIM  thresh  0  0 ms
  -1 171.69.215.67  PIM  thresh  0  0 ms
  -2 171.69.215.74  PIM  thresh  0  2 ms
  -3 171.69.215.97  PIM  thresh  0  894 ms
  -4 171.69.215.41  PIM  thresh  0  893 ms
  -5 171.69.215.12  PIM  thresh  0  894 ms
  -6 171.69.215.98  PIM  thresh  0  893 ms
```

</table>
receivers

To establish Test Receivers for Multicast Routing Monitor (MRM), use the `receivers` command in manager configuration mode. To restore the default values, use the `no receivers` command.

```
receivers {access-list} [sender-list {access-list} [packet-delay]] [window seconds] [report-delay seconds] [loss percentage] [no-join] [monitor | poll]
```

```
no receivers {access-list} [sender-list {access-list} [packet-delay]] [window seconds] [report-delay seconds] [loss percentage] [no-join] [monitor | poll]
```

**Syntax Description**

- **access-list**
  - IP named or numbered access list that establishes the Test Receivers. Only these Test Receivers are subject to the other keywords and arguments specified in this command.

- **sender-list access-list**
  - (Optional) Specifies the sources that the Test Receiver should monitor. If the named or numbered access list matches any access list specified in the senders command, the associated `packet-delay` milliseconds keyword and argument of that senders command are used in this command. Otherwise, the `packet-delay` argument is required in this receivers command.

- **packet-delay**
  - (Optional) Specifies the delay between test packets (in milliseconds). If the sender-list access list matches any access list specified in the senders command, the associated `packet-delay` milliseconds keyword and argument of that senders command are used in this command. Otherwise, the `packet-delay` argument is required in this receivers command.

- **window seconds**
  - (Optional) Duration (in seconds) of a test period. This is a sliding window of time in which packet count is collected, so that the loss percentage can be calculated. Default is 5 seconds.

- **report-delay seconds**
  - (Optional) Delay (in seconds) between staggered status reports from multiple Test Receivers to the Manager. The delay prevents multiple receivers from sending status reports to the Manager at the same time for the same failure. Receiver 1 sends status, `seconds` later Receiver 2 sends status, `seconds` later Receiver 3 sends status, and so on. This value is relevant only if there are multiple Test Receivers. The default is 1 second.

- **loss percentage**
  - (Optional) Threshold percentage of packet loss required before a status report is triggered. The default is 0 percent, which means that a status report is sent for any packet loss. (This value is not applied to packet duplication; a fault report is sent for any duplicated packets.) Loss percentage calculation is explained in the “Usage Guidelines” section of this command.

- **no-join**
  - (Optional) Specifies that the Test Receiver does not join the monitored group. The default is that the Test Receiver joins the monitored group.

- **monitor | poll**
  - (Optional) Specifies whether the Test Receiver monitors the test group or polls for receiver statistics. The `monitor` keyword means the Test Receiver reports only if the test criteria are met. The `poll` keyword means the Test Receiver sends status reports regularly, whether test criteria are met or not. The default is the `monitor` keyword.
Defaults

- `window seconds`: 5 seconds
- `report-delay seconds`: 1 second
- `loss percentage`: 0 percent
- `monitor`

Command Modes

Manager configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)S</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command is required for MRM to work; the `receivers` keyword and the first access list must be specified. The rest of the command is optional.

Loss percentage is calculated based on the `packet-delay` value of the `senders` command, which defaults to 200 milliseconds, or 5 packets per second. If the `window` keyword defaults to 5 seconds, then the Test Receiver expects 5 packets per second for 5 seconds = 25 packets. If the Test Receiver receives only 15 packets, then 25–15 = 10 lost packets. Lost packets divided by packets expected equals loss percentage. 10/25 equals a loss percentage of 40 percent.

Examples

In the following example, the test2 group has the proxy-sender address 10.1.1.10, and the corresponding `receivers` command has an explicit packet delay configured to match the default packet delay of the sender:

```
ip mrm manager test1
  manager e4/0/1 group 239.1.1.1
  senders 1
  receivers 2 sender-list 1
ip mrm manager test2
  manager e4/0/1 group 239.1.1.1
  senders 1 10.1.1.10
  receivers 2 sender-list 3 200
  udp-port test-packet 16386 status-report 65533
!
access-list 1 permit 10.1.1.2
access-list 2 permit 10.1.4.2
access-list 3 permit 10.1.1.10
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>senders</code></td>
<td>Configures Test Sender parameters used in MRM.</td>
</tr>
</tbody>
</table>
To configure Test Sender parameters used in Multicast Routing Monitor (MRM), use the `senders` command in manager configuration mode. To restore the default values, use the `no` form of this command.

```
senders {access-list} [packet-delay milliseconds] [rtp | udp] [target-only | all-multicasts | all-test-senders] [proxy_src]
```

```
no senders {access-list} [packet-delay milliseconds] [rtp | udp] [target-only | all-multicasts | all-test-senders] [proxy_src]
```

**Syntax Description**

- `access-list` IP named or numbered access list that defines which Test Senders are involved in the test and which Test Senders these parameters apply to.
- `packet-delay milliseconds` (Optional) Specifies the delay between test packets (in milliseconds). The default is 200 milliseconds, which results in 5 packets per second.
- `rtp | udp` (Optional) Encapsulation of test packets, either Real-Time Transport Protocol (RTP-encapsulated or User Datagram Protocol (UDP)-encapsulated. The default is RTP-encapsulated.
- `target-only` (Optional) Specifies that test packets are sent out on the targeted interface only (that is, the interface with the IP address that is specified in the Test Sender request target field). By default, test packets are sent as described in the `all-multicasts` keyword.
- `all-multicasts` (Optional) Specifies that the test packets are sent out on all interfaces that are enabled with IP multicast. This is the default way that test packets are sent.
- `all-test-senders` (Optional) Specifies that test packets are sent out on all interfaces that have test-sender mode enabled. By default, test packets are sent as described in the `all-multicasts` keyword.
- `proxy_src` (Optional) Source IP address for which the Test Sender will proxy test packets. Use this if you want to test, for a specific source, whether the multicast distribution tree is working.

**Defaults**

- `packet-delay milliseconds`: 200 milliseconds (that is, 5 packets per second)
- `rtp`
- `all-multicasts`

**Command Modes**

Manager configuration

**Command History**

- **Release** 12.0(5)S
- **Modification** This command was introduced.
Usage Guidelines

Use this command to specify which Test Senders are involved in the test and are affected by these parameters.

Examples

In the following example, the test2 group has the proxy-sender address 10.1.1.10, and the corresponding receivers command has an explicit packet delay configured to match the default packet delay of the sender:

```
ip mrm manager test1
  manager e4/0/1 group 239.1.1.1
  senders 1
  receivers 2 sender-list 1

ip mrm manager test2
  manager e4/0/1 group 239.1.1.1
  senders 1 10.1.1.10
  receivers 2 sender-list 3 200
  udp-port test-packet 16386 status-report 65533
```

```
! access-list 1 permit 10.1.1.2
access-list 2 permit 10.1.4.2
access-list 3 permit 10.1.1.10
```

show ip mrm status-report

To display Multicast Routing Monitor (MRM) status reports of errors in the circular cache buffer, use the `show ip mrm status-report` command in EXEC mode.

```
show ip mrm status-report [ip-address]
```

**Syntax Description**

*ip-address*  
(Optional) Displays information received from this IP address only. If no address is specified, all status reports in the cache buffer are displayed.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.0(5)S</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command during your MRM test period to learn if any errors are reported. The Manager immediately displays error reports and sends error reports, if any, to the circular cache buffer. The buffer holds up to 1024 lines, with one line for each error report.

No errors reported indicates that the Test Receiver is receiving test packets without loss or duplicates from the Test Sender.

**Examples**

The following example is sample output for the `show ip mrm status-report` command:

```
Router# show ip mrm status-report

IP MRM status report cache:
Timestamp Manager Test Receiver Pkt Loss/Dup (%) Ehsr
*Apr 20 07:36:08 1.1.1.1 3.3.3.3 5 (20%) 0
*Apr 20 07:36:09 1.1.1.1 3.3.3.3 10 (40%) 0
*Apr 20 07:36:10 1.1.1.1 3.3.3.3 15 (60%) 0
```

Table 36 describes the significant fields shown in the display.
