BGP Support for Dual AS Configuration for Network AS Migrations

The BGP Support for Dual AS Configuration for Network AS Migrations feature extends the functionality of the BGP Local-AS feature by providing additional autonomous-system path customization configuration options. The configuration of this feature is transparent to customer peering sessions, allowing the provider to merge two autonomous-systems without interrupting customer peering arrangements. Customer peering sessions can later be updated during a maintenance window or during other scheduled downtime.

Prerequisites for BGP Support for Dual AS Configuration for Network AS Migrations

- This document assumes that BGP is configured and eBGP peering sessions have been established.

Restrictions for BGP Support for Dual AS Configuration for Network AS Migrations

- BGP prepends the autonomous system number from each BGP network that a route traverses to maintain network reachability information and to prevent routing loops. This feature should be configured only for autonomous-system migration, and should be deconfigured after the transition has been completed. This procedure should be attempted only by an experienced network operator, as routing loops can be created with improper configuration.
- This feature can be configured for only true eBGP peering sessions. This feature cannot be configured for two peers in different subautonomous systems of a confederation.
- This feature can be configured for individual peering sessions and configurations applied through peer-groups and peer templates. If this command is applied to a group of peers, the peers cannot be individually customized.

Information About BGP Support for Dual AS Configuration for Network AS Migrations

Autonomous-system migration can be necessary when a telecommunications or Internet service provider purchases another network. It is desirable for the provider to be able integrate the second autonomous system without disrupting existing customer peering arrangements. The amount of configuration required in the customer networks can make this a cumbersome task that is difficult to complete without disrupting service.

The BGP Support for Dual AS Configuration for Network AS Migrations feature allows you to merge a secondary autonomous system under a primary autonomous system, without disrupting customer peering sessions. The configuration of this feature is transparent to customer networks. This feature allows a router to appear, to external peers, as a member of secondary autonomous system during the autonomous-system migration. This feature allows the network operator to merge the autonomous systems and then later migrate customers to new configurations during normal service windows without disrupting existing peering arrangements.
How to Configure Autonomous System Migration

This section contains the following procedures:

- Configuring Dual-AS Peering for Network Migration, page 3
- Verifying Autonomous System Number Configuration, page 5

Configuring Dual-AS Peering for Network Migration

The `neighbor local-as` command is used to customize the AS_PATH attribute by adding and removing autonomous system numbers for routes received from eBGP neighbors. This feature allows a router to appear to external peers as a member of another autonomous system for the purpose of autonomous system number migration. This feature simplifies this process of changing the autonomous-system number in a BGP network by allowing the network operator to merge a secondary autonomous system into a primary autonomous system and then later update the customer configurations during normal service windows without disrupting existing peering arrangements.

Confederations, Individual Peering Sessions and Peer Groupings are Supported

This feature supports confederations, individual peering sessions and configurations applied through peer-groups and peer templates. If this feature is applied to a group of peers, the individual peers cannot be customized.

Ingress Filtering can be Applied to Minimize the Possibility of Routing Loop Creation

Autonomous-system path customization increases the possibility that routing loops can be created if misconfigured. The larger the number of customer peerings, the greater the risk. You can minimize this possibility by applying policies on the ingress interfaces to block the autonomous-system number that is in transition or routes that have no `local-as` configuration.

Caution

BGP prepends the autonomous system number from each BGP network that a route traverses to maintain network reachability information and to prevent routing loops. This feature should be configured only for autonomous-system migration, and should be deconfigured after the transition has been completed. This procedure should be attempted only by an experienced network operator, as routing loops can be created with improper configuration.

Restrictions

- This feature can be configured for only true eBGP peering sessions. This feature cannot be configured for two peers in different subautonomous systems of a confederation.
- This feature can be configured for individual peering sessions and configurations applied through peer-groups and peer templates. If this command is applied to a group of peers, the peers cannot be individually customized.

SUMMARY STEPS

1. enable
2. configure terminal
How to Configure Autonomous System Migration

3. `router bgp as-number`
4. `neighbor ip-address remote-as as-number`
5. `neighbor ip-address local-as [as-number [no-prepend [replace-as [dual-as]]]]`
6. `neighbor ip-address remove-private-as`
7. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td><em>Enter your password if prompted.</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enters router configuration mode, and creates a BGP routing process.</td>
</tr>
<tr>
<td><code>router bgp as-number</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# router bgp 100</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Establishes a peering session with a BGP neighbor.</td>
</tr>
<tr>
<td><code>neighbor ip-address remote-as as-number</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-router)# neighbor 10.0.0.1 remote-as 200</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Customizes the AS_PATH attribute for routes received from an eBGP neighbor.</td>
</tr>
<tr>
<td><code>neighbor ip-address local-as [as-number [no-prepend [replace-as [dual-as]]]]</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-router)# neighbor 10.0.0.1 local-as 300 no-prepend replace-as dual-as</td>
</tr>
</tbody>
</table>

- The `replace-as` keyword is used to prepend only the local autonomous-system number (as configured with the `ip-address` argument) to the AS_PATH attribute. The autonomous-system number from the local BGP routing process is not prepended.

- The `dual-as` keyword is used to configure the eBGP neighbor to establish a peering session using the real autonomous-system number (from the local BGP routing process) or by using the autonomous-system number configured with the `ip-address` argument (local-as).

- The example configures the peering session with the 10.0.0.1 neighbor to accept the real autonomous system number and the local-as number.
Verifying Autonomous System Number Configuration

The `show ip bgp` and `show ip bgp neighbors` EXEC commands can be used to verify autonomous system number for entries in the routing table and the status of this feature.

**SUMMARY STEPS**

1. `enable`
2. `show ip bgp [network] [network-mask] [longer-prefixes] [prefix-list prefix-list-name | route-map route-map-name] [shorter prefixes mask-length]`
3. `show ip bgp neighbors [neighbor-address] [received-routes | routes | advertised-routes | paths regexp | dampened-routes | received prefix-filter]`

Configuration Examples for Autonomous-System Migration

The following examples show how to configure and verify this feature:

- Dual-AS Configuration: Example, page 6
- Dual-AS Confederation Configuration: Example, page 7
- Replace-AS Configuration: Example, page 7

Dual-AS Configuration: Example

The following examples shows how this feature is used to merge two autonomous systems without interrupting peering arrangements with the customer network. The **neighbor local-as** command is configured to allow Router1 to maintain peering sessions through autonomous-system 100 and autonomous-system 200. Router2 is a customer router that runs a BGP routing process in autonomous system 300 and is configured to peer with autonomous-system 200:

**Autonomous System 100 (provider network):**

```
Router1(config)# interface Serial3/0
Router1(config-int)# ip address 10.3.3.11 255.255.255.0
Router1(config-int)# !
Router1(config)# router bgp 100
Router1(config-router)# no synchronization
Router1(config-router)# bgp router-id 100.0.0.11
Router1(config-router)# neighbor 10.3.3.33 remote-as 300
Router1(config-router)# neighbor 10.3.3.33 local-as 200 no-prepend replace-as dual-as
```
BGP Support for Dual AS Configuration for Network AS Migrations

Autonomous System 200 (provider network):

Router1(config)# interface Serial3/0
Router1(config-int)# ip address 10.3.3.11 255.255.255.0
Router1(config-int)# !
Router1(config)# router bgp 200
Router1(config-router)# bgp router-id 100.0.0.11
Router1(config-router)# neighbor 10.3.3.33 remote-as 300

Autonomous System 300 (customer network):

Router2(config)# interface Serial3/0
Router2(config-int)# ip address 10.3.3.33 255.255.255.0
Router2(config-int)# !
Router2(config)# router bgp 300
Router2(config-router)# bgp router-id 100.0.0.3
Router2(config-router)# neighbor 10.3.3.11 remote-as 200

After the transition is complete, the configuration on router 3 can be updated to peer with autonomous-system 100 during a normal maintenance window or during other scheduled downtime.

Router2(config-router)# neighbor 10.3.3.11 remote-as 100

Dual-AS Confederation Configuration: Example

The following example can be used in place of the Router 1 configuration in the previous example. The only difference between these configurations is that Router 1 is configured to be part of a confederation.

Router1(config)# interface Serial3/0
Router1(config-int)# ip address 10.3.3.11 255.255.255.0
Router1(config-int)# !
Router1(config)# router bgp 65534
Router1(config-router)# no synchronization
Router1(config-router)# bgp confederation identifier 100
Router1(config-router)# bgp router-id 100.0.0.11
Router1(config-router)# neighbor 10.3.3.33 remote-as 300
Router1(config-router)# neighbor 10.3.3.33 local-as 100 no-prepend replace-as dual-as

Replace-AS Configuration: Example

The following example strips private autonomous-system 64512 from outbound routing updates for the 10.3.3.33 neighbor and replaces it with autonomous-system 300:

Router(config)# router bgp 64512
Router(config-router)# neighbor 10.3.3.33 local-as 300 no-prepend replace-as

Command Reference

This section documents one modified command.

- neighbor local-as
neighbor local-as

To customize the AS_PATH attribute for routes received from an external Border Gateway Protocol (eBGP) neighbor, use the `neighbor local-as` command in address family or router configuration mode. To disable AS_PATH attribute customization, use the `no` form of this command.

```
neighbor ip-address local-as as-number [no-prepend [replace-as [dual-as]]]
no neighbor ip-address local-as as-number
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip-address</code></td>
<td>Specifies the IP address of the eBGP neighbor.</td>
</tr>
<tr>
<td><code>as-number</code></td>
<td>Specifies an autonomous-system number to prepend to the AS_PATH attribute.</td>
</tr>
<tr>
<td></td>
<td>The range of values for this argument is any valid autonomous system number from 1 to 65535.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> With this argument, you cannot specify the autonomous system number from the local BGP routing process or from the network of the remote peer.</td>
</tr>
<tr>
<td><code>no-prepend</code></td>
<td>(Optional) Does not prepend the local autonomous system number to any routes received from the eBGP neighbor.</td>
</tr>
<tr>
<td><code>replace-as</code></td>
<td>(Optional) Prepends only the local autonomous-system number to the AS_PATH attribute. The autonomous system number from the local BGP routing process is not prepended.</td>
</tr>
<tr>
<td><code>dual-as</code></td>
<td>(Optional) Configures the eBGP neighbor to establish a peering session using the real autonomous system number (from the local BGP routing process) or by using the autonomous-system number configured with the <code>ip-address</code> argument (local-as).</td>
</tr>
</tbody>
</table>

### Defaults

The autonomous system number from the local BGP routing process is prepended to all external routes by default, unless the `no-prepend` and/or `replace-as` keywords are configured.

### Command Modes

- Address-family configuration
- Router configuration

</tr>
</tbody>
</table>
The **neighbor local-as** command is used to customize the AS_PATH attribute by adding and removing autonomous system numbers for routes received from eBGP neighbors. The configuration of this command allows a router to appear to external peers as a member of another autonomous system for the purpose of autonomous system number migration. This feature simplifies the process of changing the autonomous system number in a BGP network by allowing the network operator to migrate customers to new configurations during normal service windows without disrupting existing peering arrangements.

---

**Caution**

BGP prepends the autonomous system number from each BGP network that a route traverses to maintain network reachability information and to prevent routing loops. This command should be configured only for autonomous system migration, and should be deconfigured after the transition has been completed. This procedure should be attempted only by an experienced network operator. Routing loops can be created through improper configuration.

This command can be used for only true eBGP peering sessions. This command does not work for two peers in different subautonomous systems of a confederation.

This command supports individual peering sessions and configurations applied through peer groups and peer templates. If this command is applied to a group of peers, the individual peers cannot be customized.

---

**Examples**

**Local-AS Configuration Example**

The following example establishes peering between router 1 and router 2 through autonomous system 300, using the local-as feature:

**Router 1 (Local Router)**

```
router bgp 100
  address-family ipv4 unicast
    neighbor 172.16.1.1 remote-as 200
    neighbor 172.16.1.1 local-as 300
```

**Router 2 (Remote Router)**

```
router bgp 200
  address-family ipv4 unicast
    neighbor 10.0.0.1 remote-as 300
```

**No Prepend Configuration Example**

The following example configures BGP to not prepend autonomous system 500 to routes received from the 192.168.1.1 neighbor:

```
router bgp 400
  address-family ipv4 multicast
    network 192.168.0.0
    neighbor 192.168.1.1 local-as 500 no-prepend
```

**Replace-AS Configuration Example**

The following example strips private autonomous system 64512 from outbound routing updates for the 172.20.1.1 neighbor and replaces it with autonomous system 600:

```
router bgp 64512
  address-family ipv4 unicast
    neighbor 172.20.1.1 local-as 600 no-prepend replace-as
    neighbor 172.20.1.1 remove-private-as
```
Dual-AS Configuration Example

The following examples show the configurations for two provider networks and one customer network. Router 1 belongs to autonomous system 100, and Router 2 belongs to autonomous system 200. Autonomous system 200 is being merged into autonomous system 100. This transition needs to occur without interrupting service to Router 3 in autonomous system 300 (customer network). The `neighbor local-as` command is configured on router 1 to allow Router 3 to maintain peering with autonomous system 200 during this transition. After the transition is complete, the configuration on Router 3 can be updated to peer with autonomous system 100 during a normal maintenance window or during other scheduled downtime.

Router 1 Configuration (Local Provider Network)

```conf
interface Serial3/0
ip address 10.3.3.11 255.255.255.0
!
router bgp 100
    no synchronization
    bgp router-id 100.0.0.11
    neighbor 10.3.3.33 remote-as 300
    neighbor 10.3.3.33 local-as 200 no-prepend replace-as dual-as
```

Router 2 Configuration (Remote Provider Network)

```conf
interface Serial3/0
ip address 10.3.3.11 255.255.255.0
!
router bgp 200
    bgp router-id 100.0.0.11
    neighbor 10.3.3.33 remote-as 300
```

Router 3 Configuration (Remote Customer Network)

```conf
interface Serial3/0
ip address 10.3.3.33 255.255.255.0
!
router bgp 300
    bgp router-id 100.0.0.3
    neighbor 10.3.3.11 remote-as 200
```

To complete the migration after the two autonomous systems have merged, the peering session is updated on Router 3:

```conf
neighbor 10.3.3.11 remote-as 100
```
